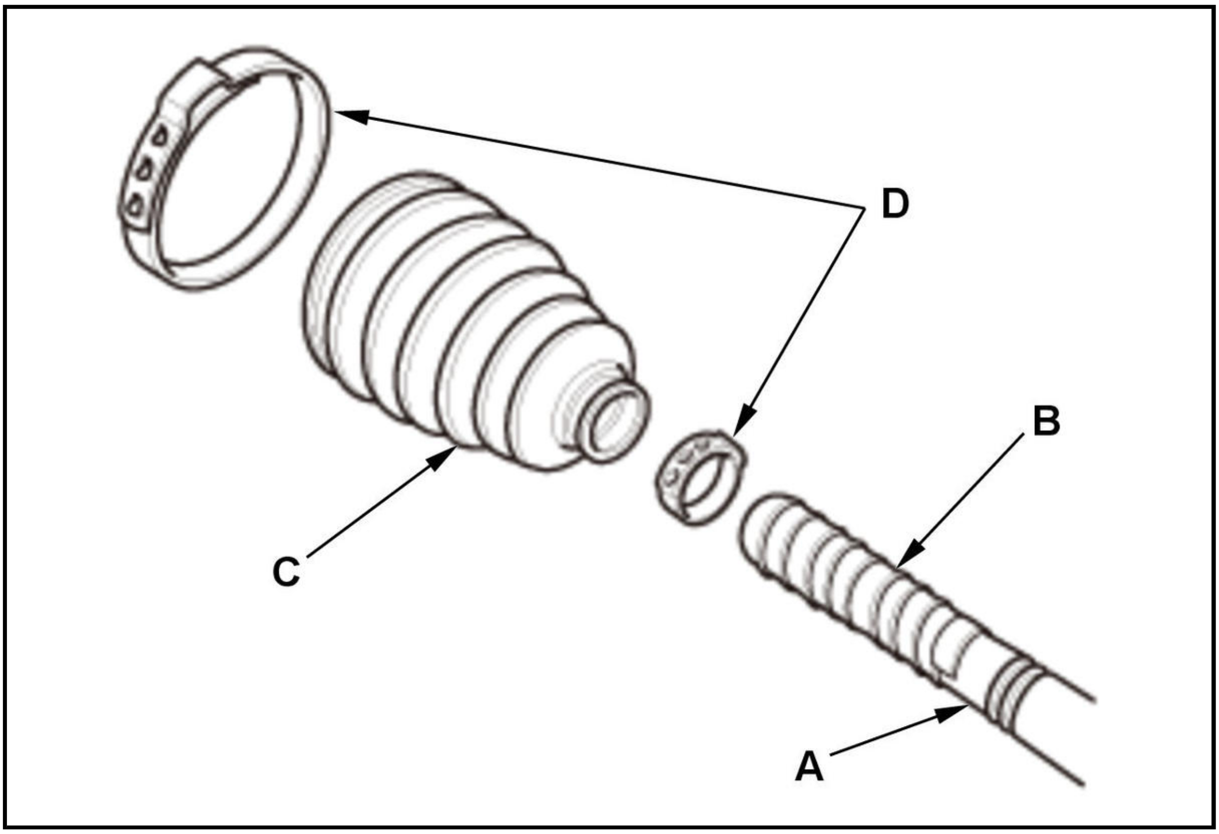
 	4. Check the alignment of the paint mark (A) you made with the outboard joint end (B). **NOTICE:** To avoid driveshaft and vehicle damage, the shaft must be all the way into the outboard joint to ensure the stop ring is properly seated.

 GREASE Use the grease included in the outboard boot set. A	5. Pack the outboard joint (A) with the remaining joint grease included in the outboard boot set. **Total grease quantity**

B	**Outboard joint:**
B	**82-102 g (2.89-3.60 oz)**

 	6. Fit the boot ends (A) onto the driveshaft (B) and the outboard joint (C). 7. Bleed any excess air from the outboard boot by inserting a flat-tipped screwdriver between the outboard boot and the outboard joint.

4. Inboard Boot - Install



NOTE:

- Wrap the splines on the driveshaft (A) with vinyl tape (B) to prevent damaging the inboard boot (C).
- Install new ear clamp bands (D) with the boot to prevent damaging the band.

5. Bearing Retainer and Bearing Race - Install

	1. Assemble the steel balls (A), the bearing retainer (B) and the bearing race (C) by aligning the marks (D) you made on the bearing retainer and the bearing race. 2. Install the bearing onto the driveshaft (E) by aligning the marks you made on the bearing and the driveshaft. Be careful not to drop the steel balls when installing the bearing onto the driveshaft.

6. Circlip - Install
7. Inboard Joint - Install

 GREASE Use the grease included in the inboard boot set.	1. Pack the inboard joint with the joint grease included in the new inboard boot set.

Grease quantity	
B	**Inboard joint:**
B	**87-103 g (3.07-3.63 oz)**

	2. Install the inboard joint onto the driveshaft by aligning the marks (A) you made on the inboard joint and the bearing retainer. 3. Install the snap ring (B) into the inboard joint groove.

	4. Fit the boot ends (A) onto the driveshaft (B) and the inboard joint (C).

	5. Adjust the length (A) of the driveshafts in the figure as shown, then adjust the boots to halfway between full compression and full extension. **Driveshaft length:** 6. Bleed excess air from the boots by inserting a flat-tipped screwdriver between the boot and the joint. **NOTE:** Install the joints at exactly the same length.

Left/Right driveshaft	Specified length (A)
Left	**677.2-682.2 mm (26.661-26.855 in)**
Right	**722.2-727.2 mm (28.433-28.630 in)**

8. Boot Bands - Install

 B A 7.5 mm (0.295 in) max. 1.0−3.6 mm (0.039−0.142 in)	1. Close the ear portion (A) of the band using a commercially available boot band clamp tool (Kent-Moore J-35910 or equivalent) (B). 2. Check the clearance of the closed ear portion of the band. If the clearance is not within the standard, close the ear portion of the band tighter. **NOTE:** Replace the ear clamp band with the one when the ear portion exceeds the prescribed length.

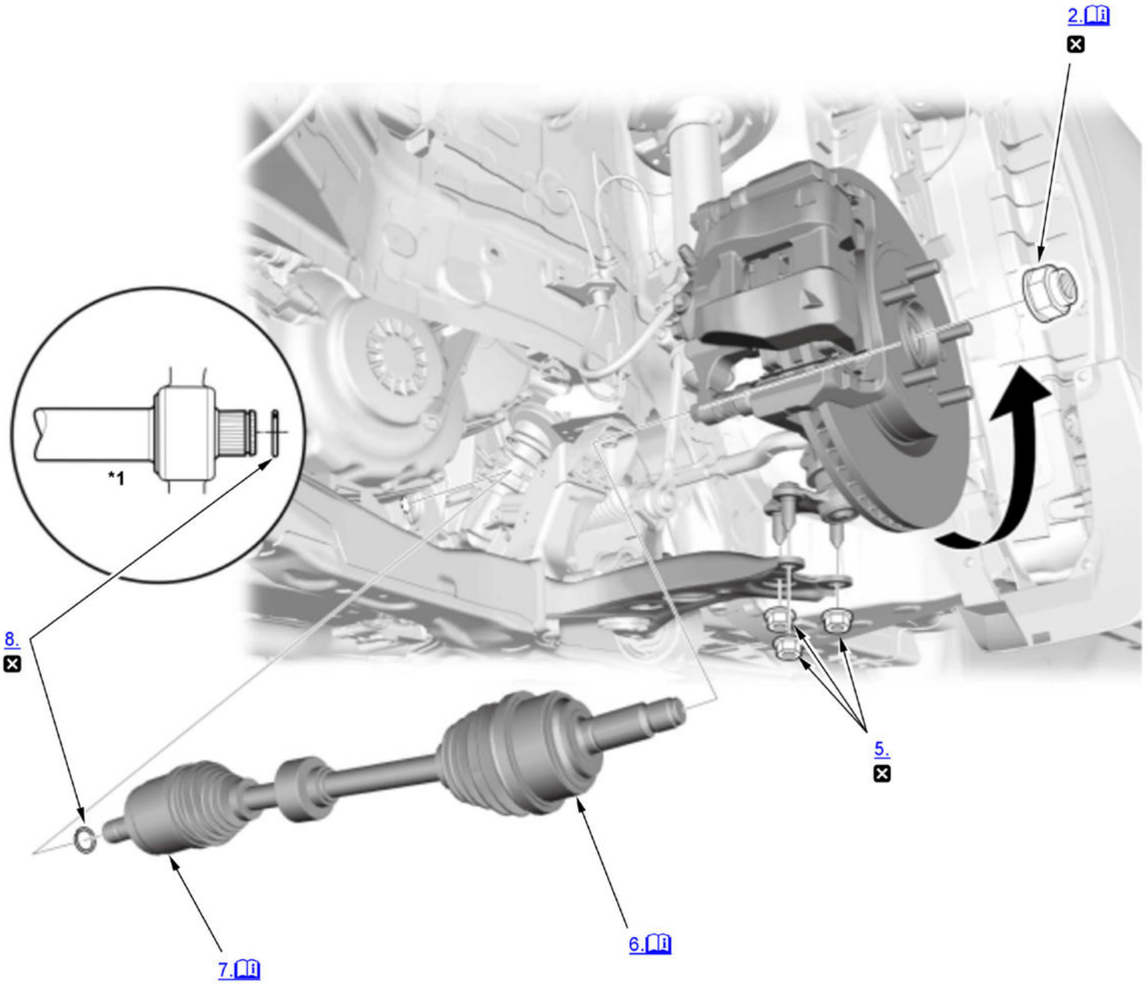
REMOVAL AND INSTALLATION

FRONT DRIVESHAFT REMOVAL AND INSTALLATION

Removal

NOTE: 🛈 Where icon is shown, for further information continue to the information below.

1

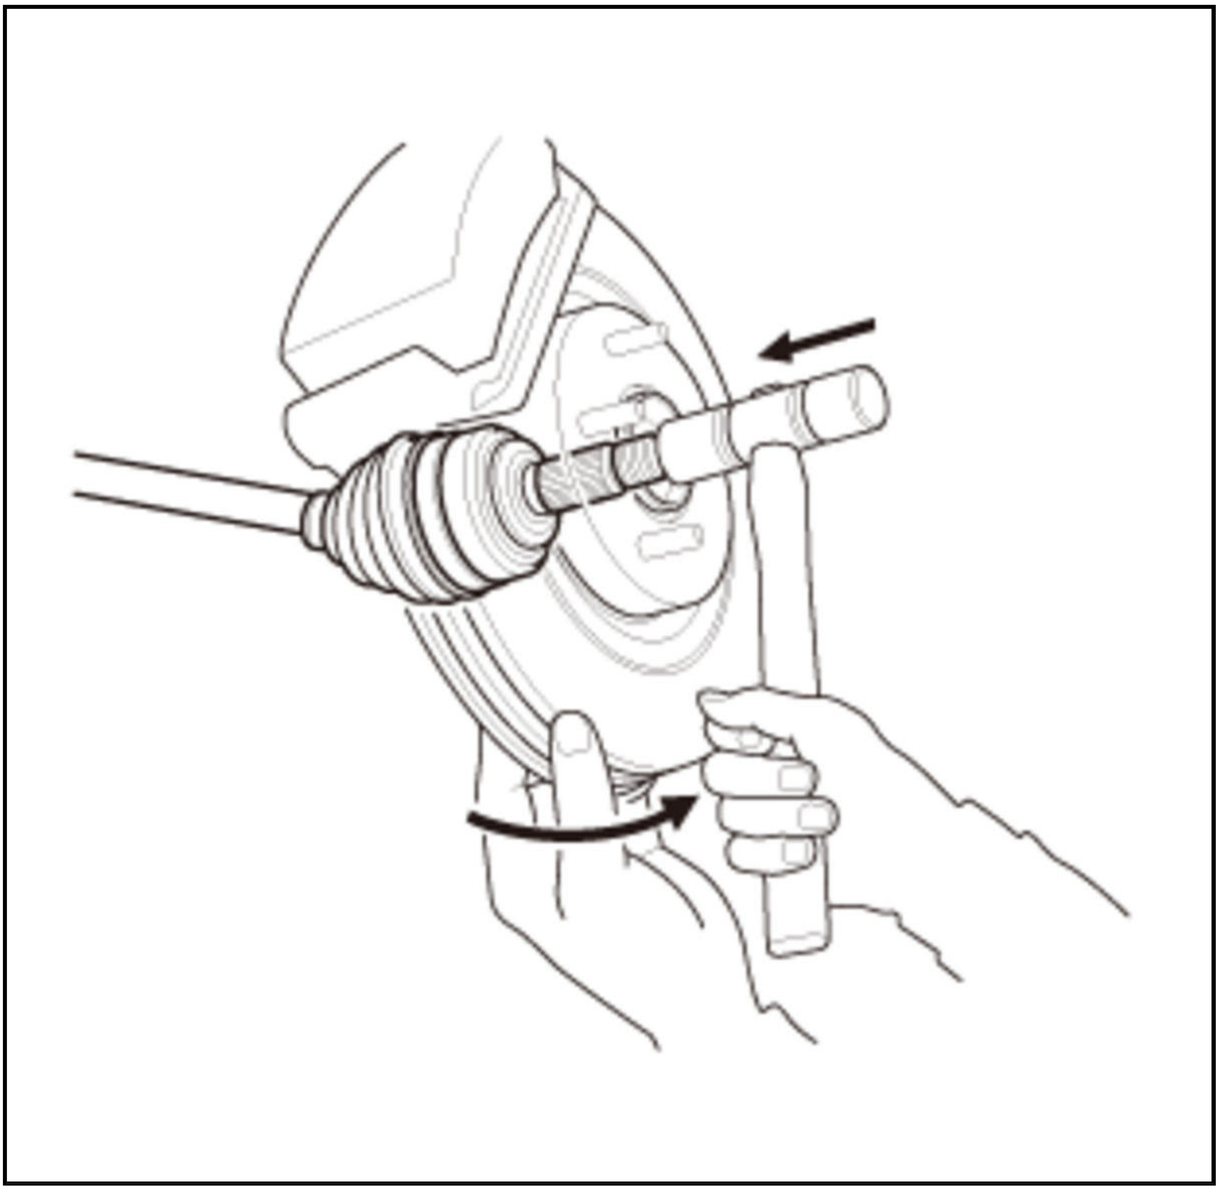


ℹ	Detailed information, notes, and precautions
☒	Replace
*1	Intermediate shaft

1. **Front Wheel - Remove**
2. Spindle Nut - Remove

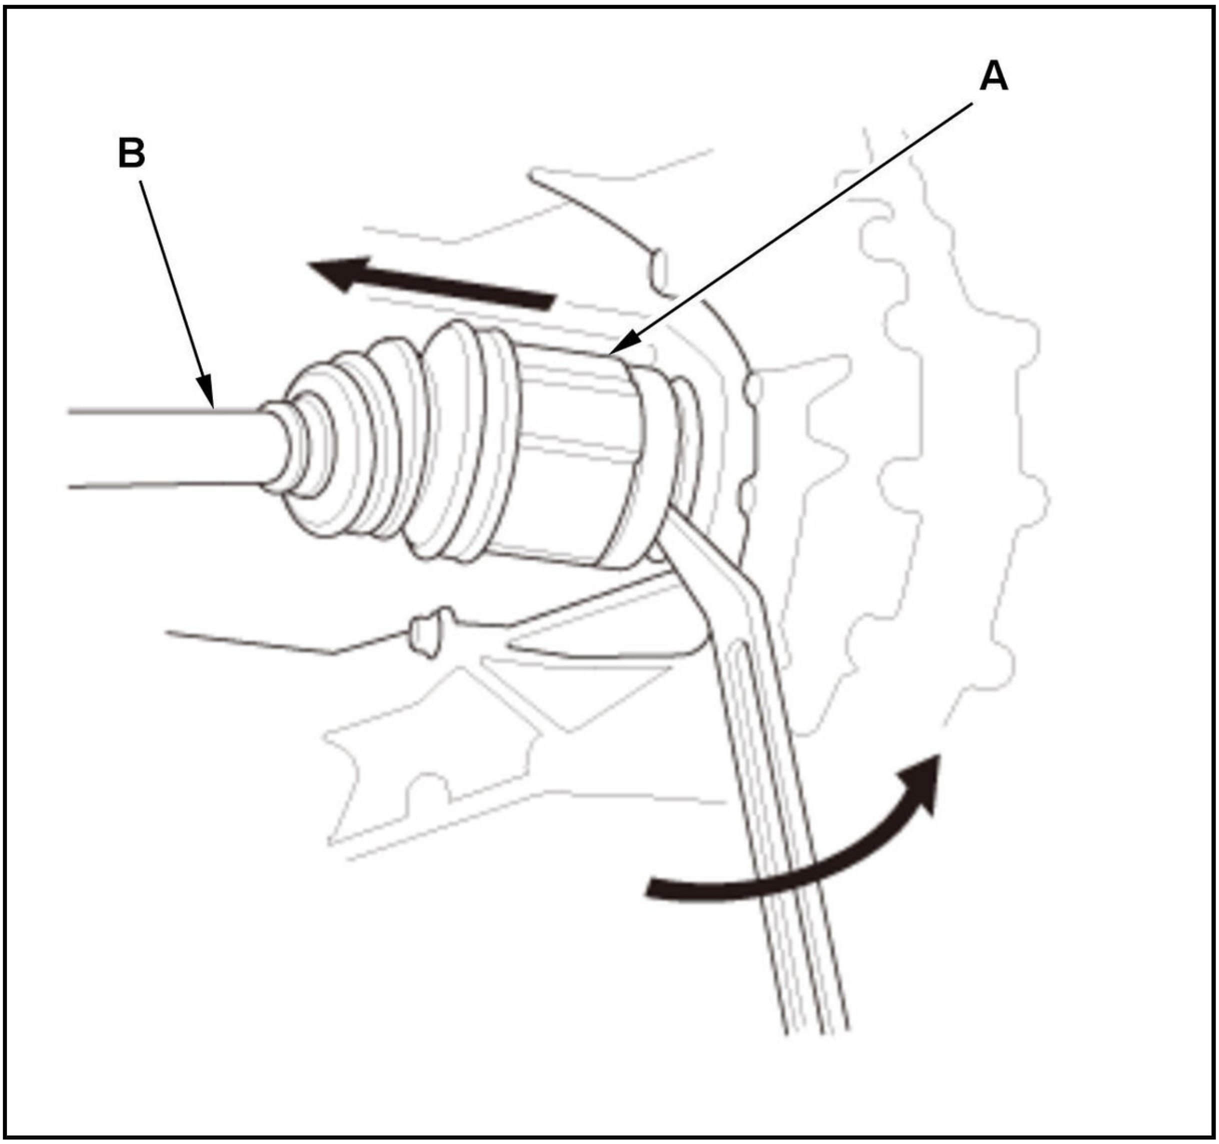
	1. Pry up the stake (A) on the spindle nut (B). 2. Remove the spindle nut.

3. **Engine Undercover - Remove**
4. **Transmission Fluid - Drain**
5. **Lower Arm Ball Joint - Disconnect**
6. Outboard Joint - Disconnect



NOTE: Be careful not to damage the outboard joint threads and the wheel speed sensor.

7. Inboard Joint - Disconnect (Both Sides)



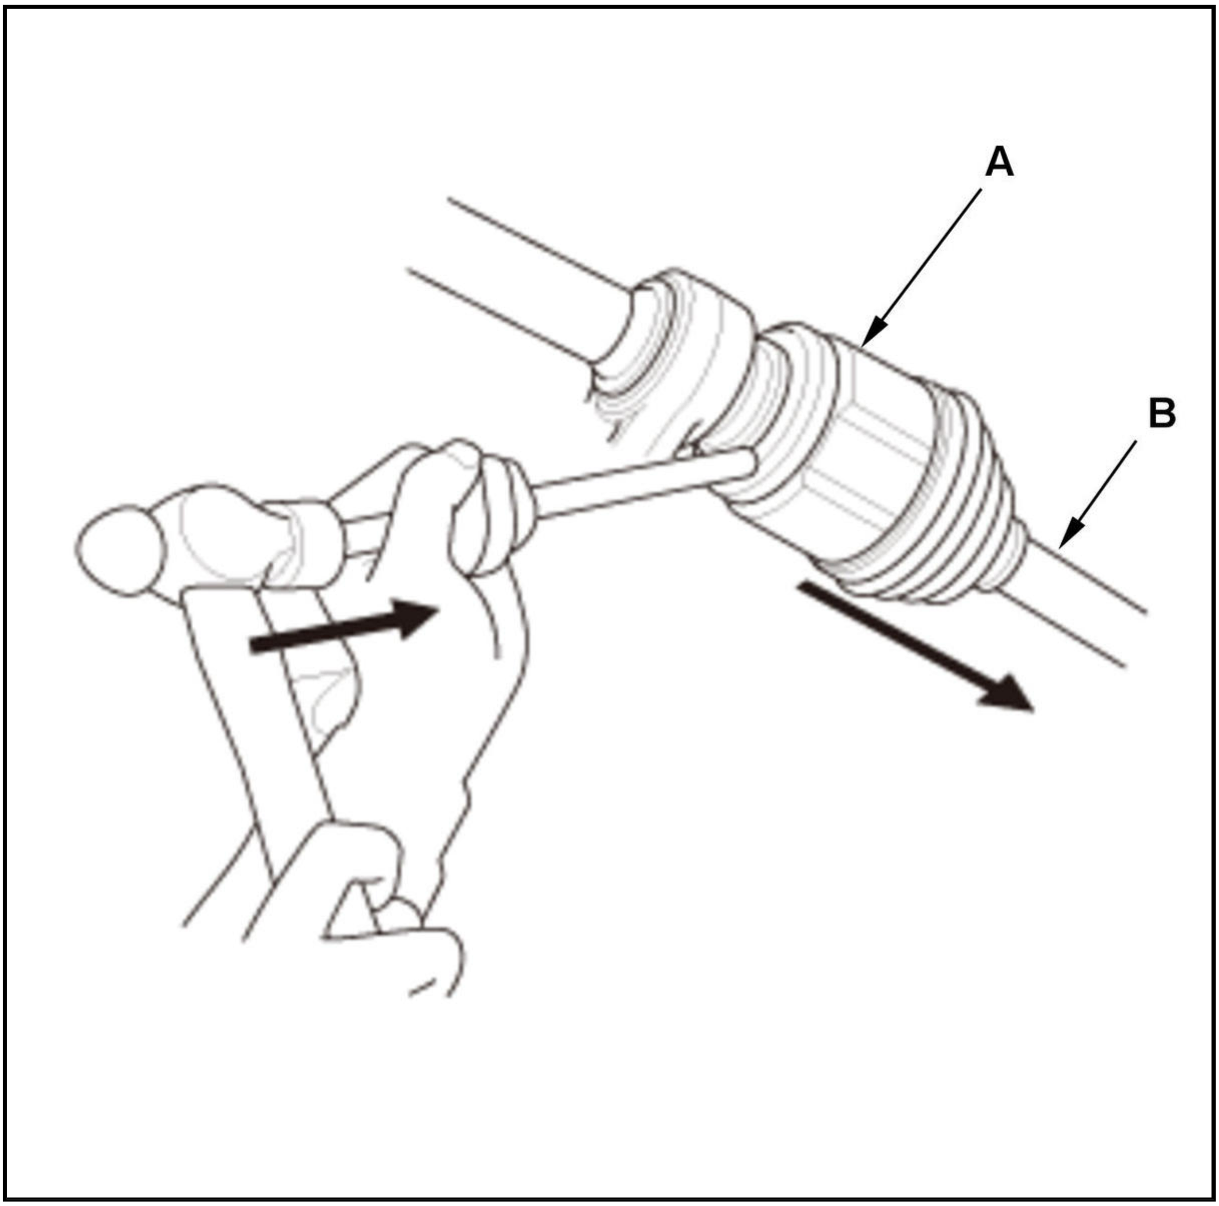
Left driveshaft

1. Pry the inboard joint (A) using a pry bar.

NOTE: Be careful not to damage the oil seal or the end of the inboard joint with the pry bar.

2. Remove the driveshaft as an assembly.

NOTE: Do not pull on the driveshaft (B), or the inboard joint may come apart. Pull the inboard joint straight out to avoid damaging the oil seal.



Right driveshaft

1. Drive the inboard joint (A) off of the intermediate shaft using a drift punch and a hammer.

2. Remove the driveshaft as an assembly.

NOTE: Do not pull on the driveshaft (B), or the inboard joint may come apart. Pull the inboard joint straight out.

8. Set Ring - Remove

Installation

NOTE: 🛈 Where icon is shown, for further information continue to the information below.

1

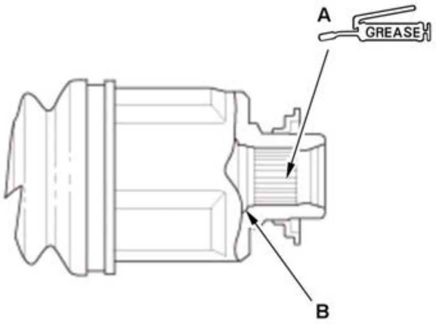
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
🛢	Engine oil
*1	Intermediate shaft

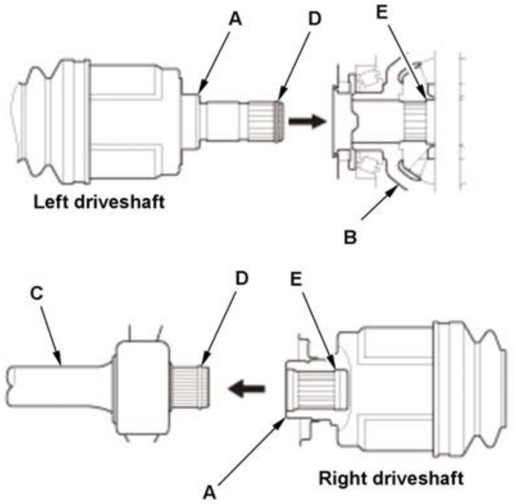
1. Set Ring - Install
2. Inboard Joint - Connect (Both Sides)

Right driveshaft



1. Apply 2.0-3.0 g (0.071-0.106 oz) of UM246 (P/N 41211-PY5-305) to the whole splined surface (A) of the right driveshaft.

2. After applying grease, remove the grease from the splined grooves at intervals of 2-3 splines and from the set ring groove (B) so that air can bleed from the intermediate shaft.



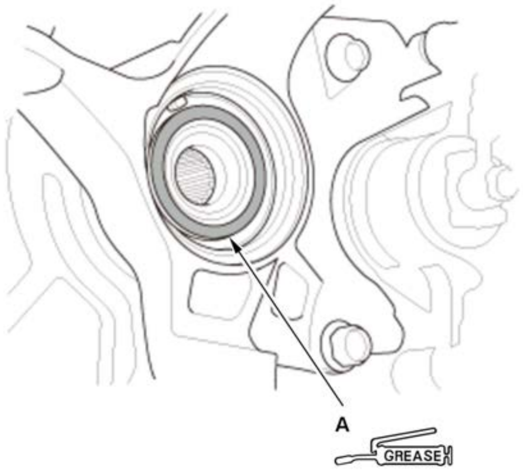
3. Left driveshaft: Clean the areas where the driveshaft contacts the differential thoroughly with solvent, then dry them with compressed air.

NOTE: Do not wash the rubber parts with solvent.

4. Insert the inboard end (A) of the driveshaft into the differential (B) or the intermediate shaft (C) until the set ring (D) locks in the groove (E).

NOTE: Insert the driveshaft horizontally to prevent damaging the oil seal.

3. Outboard Joint - Connect



1. Apply about 3 g (0.11 oz) of molybdenum grease to the contact area (A) of the outboard joint and the front wheel bearing.
NOTE: The paste helps prevent noise and vibration.

4. **Lower Arm Ball Joint - Connect**

NOTE: During reassembly, loosely install new flange nuts, then tighten them to the specified torque.

5. Spindle Nut - Install

	1. Use a drift to stake the spindle nut shoulder (A) against the driveshaft.

6. Front Wheel - Install
7. Front Driveshaft - After Install Check

1. Turn the wheel by hand and make sure there is no interference between the driveshaft and surrounding parts.

8. Transmission Fluid - Refill
9. Engine Undercover - Install
10. Wheel Alignment - Check
11. Test Drive - Check

INTERMEDIATE SHAFT REMOVAL AND INSTALLATION

Removal and Installation

Where icon is shown, for further information continue to the information below.

1

INSPECTION

DRIVESHAFT INSPECTION

Inspection

1. Driveshaft - Inspect

	1. Check the inboard boot (A) and the outboard boot (B) on the driveshaft (C) for cracks, damage, leaking grease and loose boot bands (D). If any damage is found, replace the boot and the boot bands. 2. Check the driveshaft for cracks and damage. If any damage is found, replace the driveshaft. 3. Check the inboard joint (E) and the outboard joint (F) for cracks and damage. If any damage is found, replace the inboard joint or the outboard joint as an assembly. 4. Hold the inboard joint and turn the front wheel by hand, then make sure the joint is not excessively loose. If necessary, replace the inboard joint or the outboard joint as an assembly.

REMOVAL & INSTALLATION INSPECTION

PROPELLER SHAFT REMOVAL, INSTALLATION, AND INSPECTION (AWD)

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Engine Undercover - Remove
3. Middle Floor Undercover - Remove
4. Propeller Shaft - Remove

    1. Remove the propeller shaft protector (A).

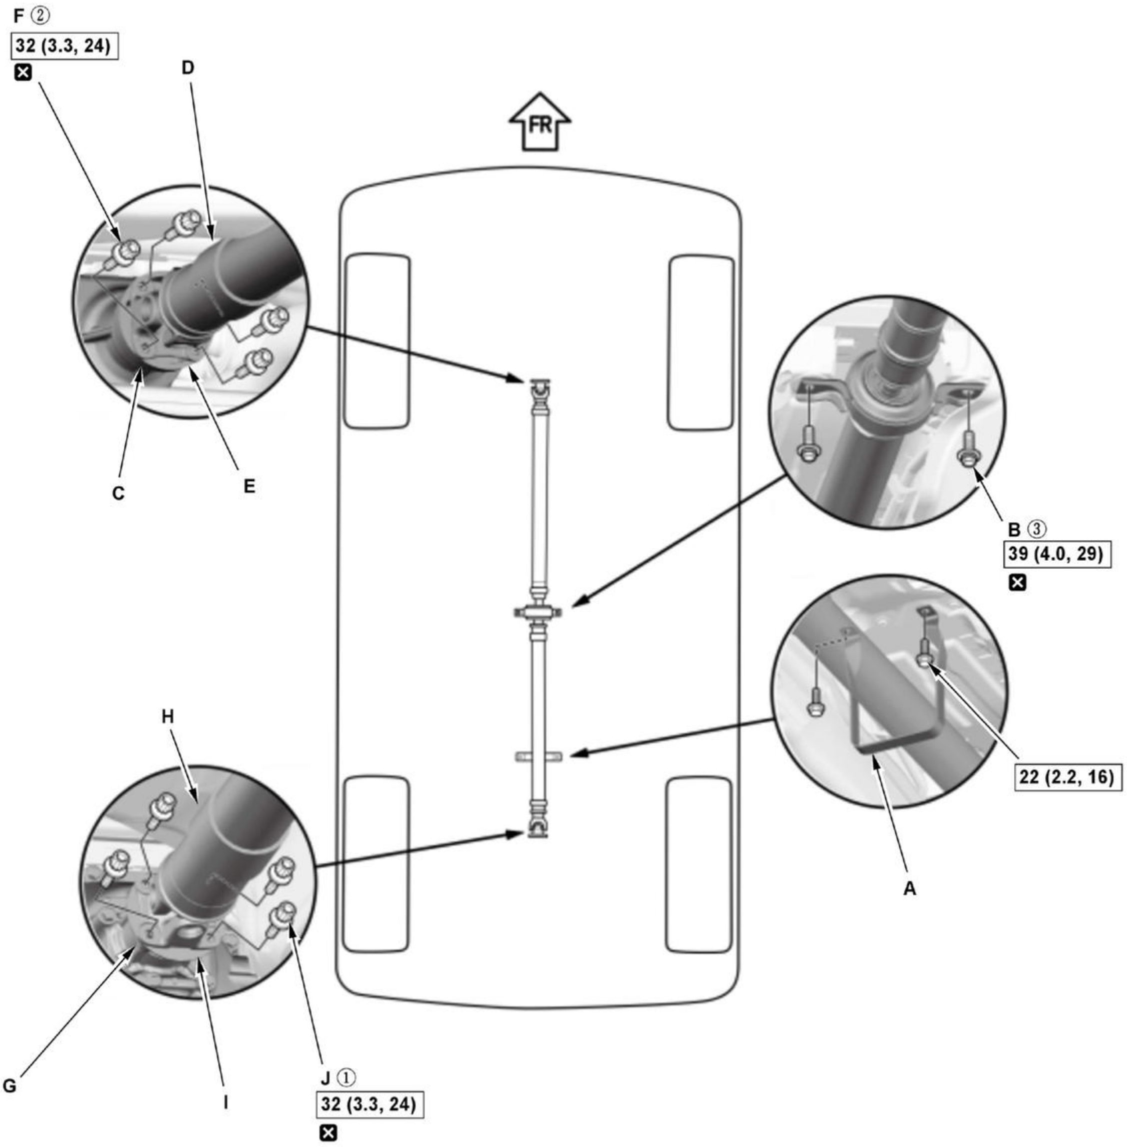

Fig. 1: Tightening Propeller Shaft In Sequence With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

2. Remove the center support bearing mounting bolts (B).

3. Make a reference mark (C) across the No. 1 propeller shaft (D) and the transfer companion flange (E).

4. Remove the No. 1 propeller shaft flange bolts (F).

5. Make a reference mark (G) across the No. 2 propeller shaft (H) and the rear differential companion flange (I).

6. Remove the No. 2 propeller shaft flange bolts (J).

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

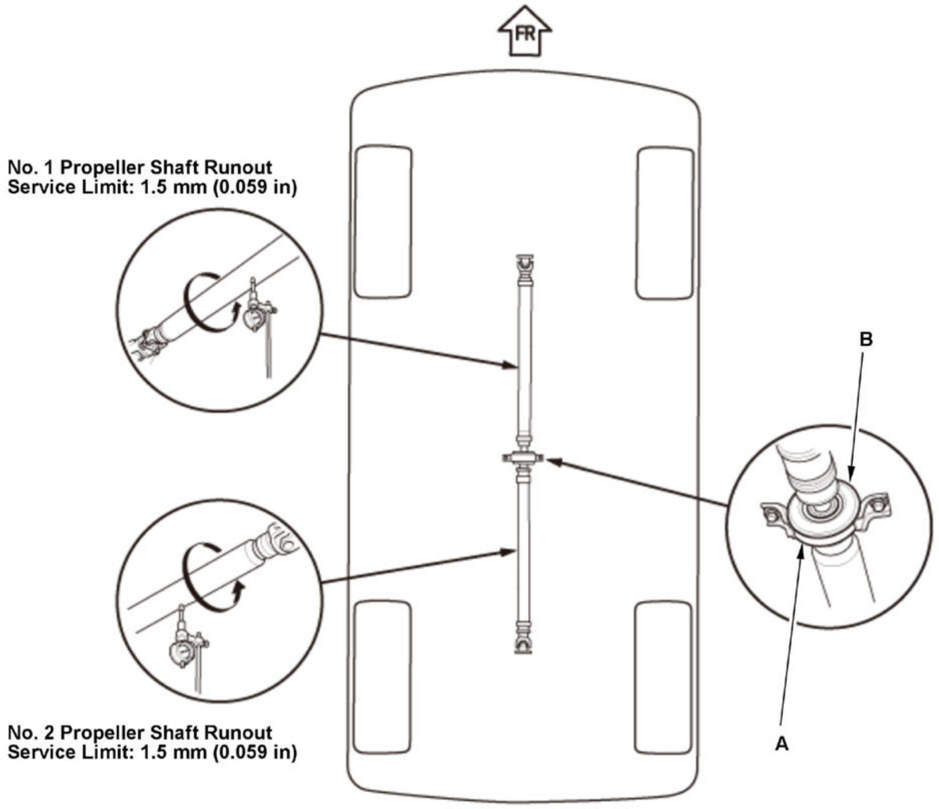
Tighten the propeller shaft flange bolts, the

center support bearing mounting bolts in the numbered sequence shown in illustration.	

Inspection

1. Propeller Shaft - Inspect

Propeller Shaft - Inspect



FR
No. 1 Propeller Shaft Runout
Service Limit: 1.5 mm (0.059 in)
B
No. 2 Propeller Shaft Runout
Service Limit: 1.5 mm (0.059 in)
A

Universal Joint and Boot

1. Shift the transmission to N position/mode.

2. Release the parking brake.

3. Check the center support bearing (A) for excessive play or noise. If the center support has excessive play or noise, replace the propeller shaft assembly.

4. Check the rubber portion (B) of the center support bearing for damage and deterioration. If the rubber portion is damaged or deteriorated, replace the propeller shaft assembly.

5. Check the universal joints for excessive play or noise. If the universal joints have excessive play or noise, replace the propeller shaft assembly.

Propeller Shaft Runout

6. Shift the transmission to N position/mode.

7. Install a dial indicator with its needle on the center of the No. 1 and No. 2 propeller shaft.

8. Turn the other propeller shaft slowly and check the runout. Repeat this procedure for the other propeller shaft.

9. If the runout on either propeller shaft exceeds the service limit, replace the propeller shaft assembly.

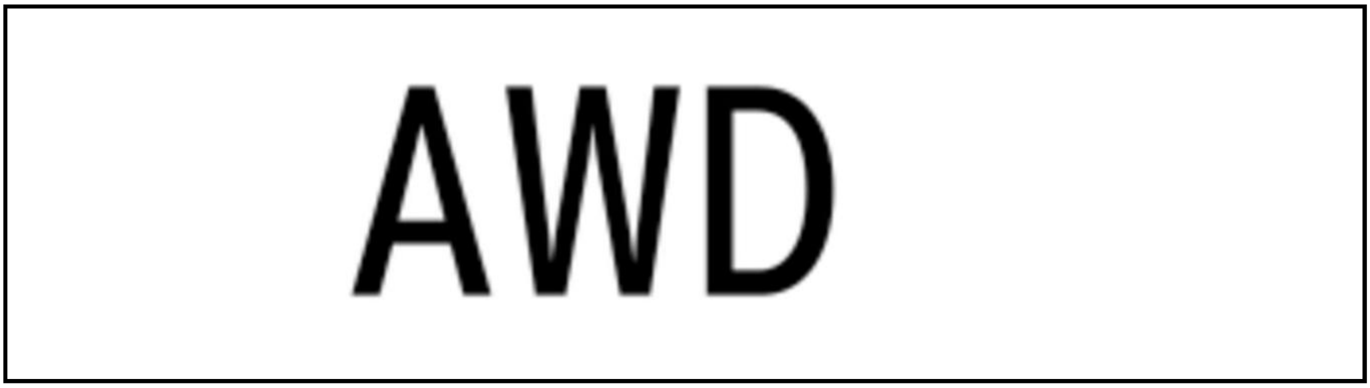
HOW TO INFORMATION

HOW TO TROUBLESHOOT THE REAL TIME AWD SYSTEM

System Indicator

The system has AWD system indicator comes on in the MID.



NOTE: For locations of each indicator, refer to gauge control module component location index .

AWD System Indicator

The AWD system indicator will come on under certain conditions even if the real time AWD system is working normally. Here are some examples:

- When you use high-powered wireless equipment such as a CB or Ham radio in the vehicle.
- When you keep spinning the rear wheels while the vehicle is stuck in sand, mud, snow, etc.
- When the 12 volt battery voltage suddenly drops below 8 volts.

After the AWD system indicator comes on, it stays on until you turn the vehicle to the OFF (LOCK) mode.

Diagnostic Trouble Code (DTC)

- The real time AWD control unit can memorize up to eight different DTCs. The system displays the DTCs by blinking the AWD system indicator. Multiple DTCs are displayed in the order they occurred, beginning with the most recent.

- If the same DTC is detected more than once, the most recent DTC is written over the earlier one. Therefore, when the same problem is detected more than once, it is memorized as a single DTC.
- The DTCs are memorized in the real time AWD control units EEPROM (non-volatile memory). Therefore, the memorized DTCs are not cleared when the 12 volt battery is disconnected or when the real time AWD control unit is disconnected.
- If there is a problem in the central processing unit (CPU) of the real time AWD control unit, the AWD system indicator comes on, but no DTC is memorized. Refer to the symptom troubleshooting.

Self-Diagnosis

When a problem is detected during self-diagnosis, the system does the following:

- Turns the AWD system indicator on.
- Memorizes the DTC if possible.
- Stops AWD control and returns the vehicle back to two-wheel drive mode (front wheel only).

How to Use the HDS (Honda Diagnostic System)

1. Turn the vehicle to the OFF (LOCK) mode, then connect the Honda Diagnostic System (HDS) to the DLC

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the real time AWD control unit. If it does not communicate, go to the real time AWD system symptom troubleshooting for HDS does not communicate

Check the diagnostic trouble code (DTC) and the freeze data for all systems in the vehicle, troubleshoot the powertrain DTCs first and note them. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- **The HDS can read the DTC, the freeze data, the current data, and other system data.**
- **For specific operations, refer to the help menu that came with the HDS.**
- **It is best do an ALL DTC CHECK to look for other systems DTCs that are related to the problem.**

How to Check for Diagnostic Trouble Codes (DTCs)

When the real time AWD control unit senses an abnormality in the input or output systems, the AWD system indicator in the gauge control module will usually come on, the MIL, the D indicator, the VSA indicator, and/or the ABS indicator may also come on.

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. Turn the vehicle to the OFF (LOCK) mode, then connect the HDS to the DLC .

2. Turn the vehicle to the ON mode. Make sure the HDS communicates with the vehicle and the real time AWD control unit. If it does not communicate, go to the real time AWD system symptom troubleshooting for HDS does not communicate . Follow the prompts on the HDS to display the DTC(s) on the screen. Check the DTC and the freeze data for all systems. After determining the DTC(s), refer to the DTC Troubleshooting.

NOTE: See the HDS help menu for specific instructions.

3. If there are PGM-FI system DTCs and other system DTCs at the same time, troubleshoot the PGM-FI system DTCs first, otherwise the real time AWD DTC may return.

4. After recording the DTCs, clear all DTCs.

5. Test-drive the vehicle for several minutes in 4WD mode, and check for DTCs. If the DTC returns, refer to the DTC Troubleshooting. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all connectors and terminals in the circuit are tight.

How to Clear DTCs

1. Turn the vehicle to the OFF (LOCK) mode, then connect the HDS to the DLC

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the real time AWD control unit. If it does not communicate, go to the real time AWD system symptom troubleshooting for HDS does not communicate

4. Clear the DTC(s) by following the screen prompts on the HDS.

5. Turn the vehicle to the OFF (LOCK) mode.

NOTE: If the DTC that was cleared is related to another system, that system's DTC must be repaired, or the real time AWD DTC will return.

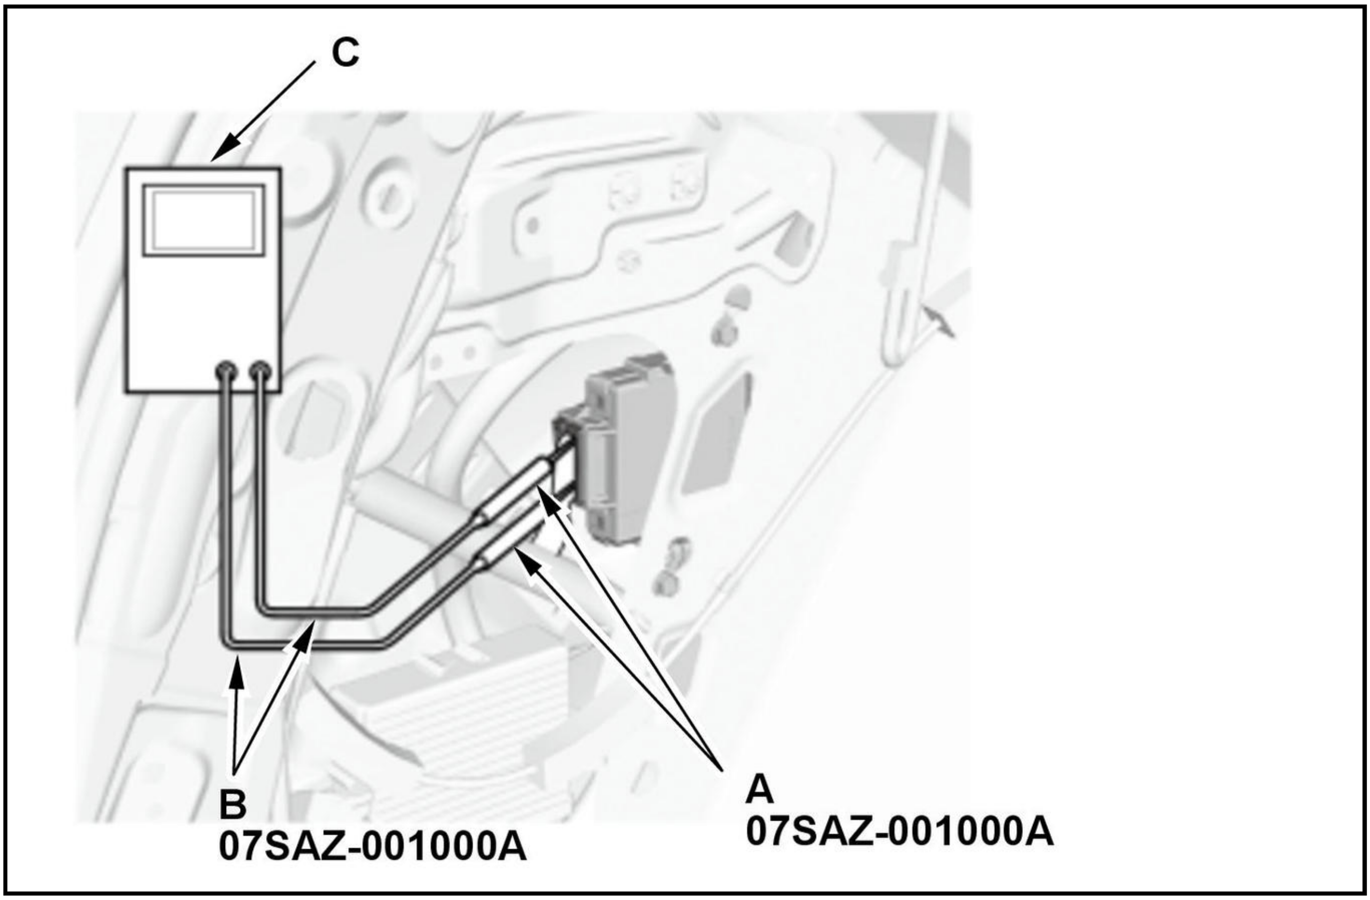
How to Troubleshoot Circuits at the AWD Control Unit

Special Tools Required

Backprobe Set 07SAZ-001000A (2)

1. Remove the rear left side trim panel .

2. Inspect the circuit on the AWD control unit according to the DTC Troubleshooting using the backprobe set and a digital multimeter or an analog circuit tester.



3. Connect the backprobe adapters (A) to the stacking patch cords (B), and connect the cords to a digital multimeter or an analog circuit tester (C). Using the wire insulator as a guide for the contoured-tip of the

backprobe adapter, gently slide the tip into the connector from the wire side until it comes in contact with the terminal end of the wires.

TROUBLESHOOTING

DTC C0051-00

DTC C0051-00 : The Functional Abnormalities of Steering Angle Sensor

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C0051-00 The Functional Abnormalities of Steering Angle Sensor	B	B

DTC (Real Time AWD)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Enter the maintenance mode and start the engine** .

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0051-00 The Functional Abnormalities of Steering Angle Sensor	B	B

   Is DTC C0051-00 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. DTC check (VSA system)

   -1. Check for DTCs with the HDS.

DTC Description	DTC
C0051-62 Steering Angle Sensor Failure (Signal Compare Failure)	B

DTC Description	DTC
C0051-96 Steering Angle Sensor Failure (Sensor Detects Internal Failure)	B

   Is DTC C0051-62 or C0051-96 indicated?

   YES

   Go to the **indicated DTC's troubleshooting**.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C0061-96 (REAL TIME AWD CONTROL UNIT)

DTC C0061-96 : The Functional Abnormalities of Lateral Acceleration Sensor

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C0061-96 The Functional Abnormalities of Lateral Acceleration Sensor	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. **Enter the maintenance mode and start the engine** .

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-96 The Functional Abnormalities of Lateral Acceleration Sensor	B	B

Is DTC C0061-96 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (VSA system)

-1. Check for DTCs with the HDS.

DTC Description	DTC
C0061-49 Acceleration Sensor Failure (Internal Circuit Failure)	B

DTC Description	DTC
C0061-62 Lateral Acceleration Sensor Failure (Signal Compare Failure)	B

Is DTC C0061-49 or C0061-62 indicated?

YES

Go to the **indicated DTC's troubleshooting**.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C0061-F0, C0062-F0, C0063-F0 (REAL TIME AWD CONTROL UNIT)

DTC C0061-F0 : Lateral Acceleration Sensor Range/Performance Problem

DTC C0062-F0 : Longitudinal Acceleration Sensor Range/Performance Problem

DTC C0063-F0 : Yaw Rate Sensor Range/Performance Problem

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C0061-F0 Lateral Acceleration Sensor Range/Performance Problem	B	B
C0062-F0 Longitudinal Acceleration Sensor Range/Performance Problem	B	B
C0063-F0 Yaw Rate Sensor Range/Performance Problem	B	B

DTC (Real Time AWD)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Enter the maintenance mode and start the engine** .

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-F0 Lateral Acceleration Sensor Range/Performance Problem	B	B
C0062-F0 Longitudinal Acceleration Sensor Range/Performance Problem	B	B
C0063-F0 Yaw Rate Sensor Range/Performance Problem	B	B

   Is DTC C0061-F0, C0062-F0, or C0063-F0 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. VSA system DTC check

-1. Check for DTCs in the VSA system with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting in the VSA system .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C0062-96 (REAL TIME AWD CONTROL UNIT)

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (VSA system)

   -1. Check for DTCs with the HDS.

DTC Description	DTC
C0063-49 Yaw Rate Sensor Failure (Internal Circuit Failure)	B

DTC Description	DTC
C0063-62 Yaw Rate Sensor Failure (Signal Compare Failure)	B

Is DTC C0063-49 or C0063-62 indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C1840-12

DTC C1840-12 : Differential Fluid Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1840-12 Differential Fluid Pressure Sensor Circuit High Voltage	B	B

DTC (Real Time AWD)

1. Determine possible failure area (electrical circuit problem, hydraulic circuit problem)

-1. **Enter the maintenance mode and start the engine** .

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	More than 4.14	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode.

-4. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

-5. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

Oil Pressure Control Test

Is the test result OK?

YES

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

The failure is duplicated. **Follow the instructions indicated on the HDS according to the test result** .

3. Determine possible failure area (short to power in PS1 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

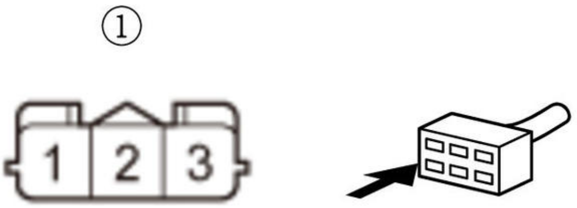
-2. Disconnect the following connector.

Rear differential fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①



Is there about 4.14 V or more?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (PS1 line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

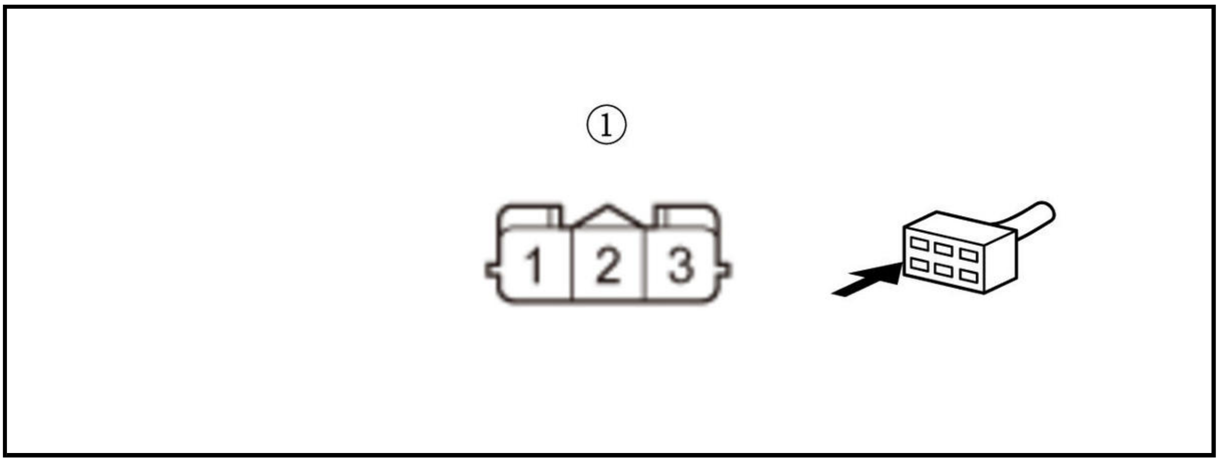
-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 0.5 V or more?

YES

Repair a short to power in the PS1 wire between the rear differential fluid pressure sensor and the AWD control unit.

NO

Go to the 5.

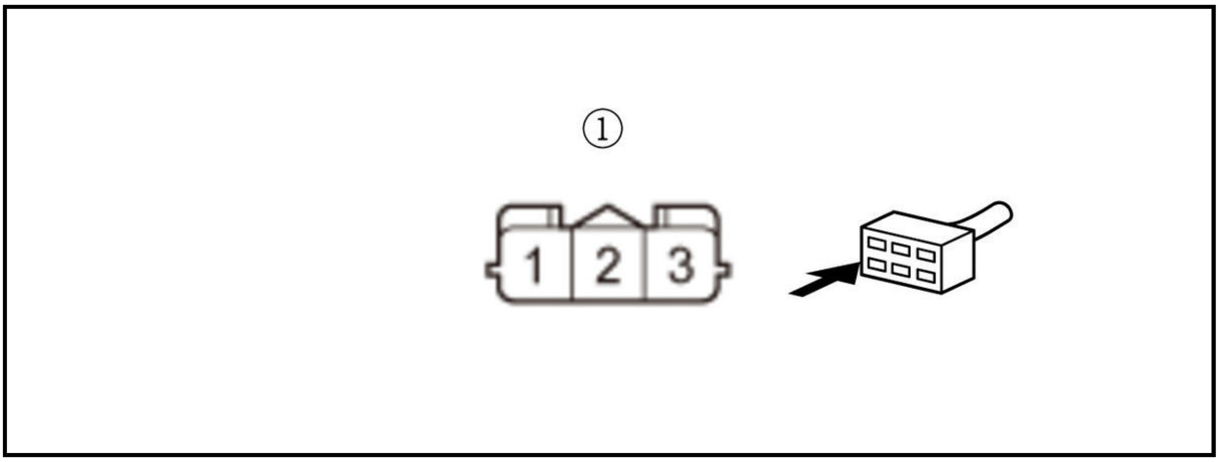
5. Shorted wire check (PS1 line to SVCC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected

Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Rear differential fluid pressure sensor 3P connector (female terminals) No. 3: ①



Is there 1.0 MΩ or more?

YES

Go to step 6.

NO

Repair a short in the PS1 wire to the SVCC wire between the rear differential fluid pressure sensor and the AWD control unit.

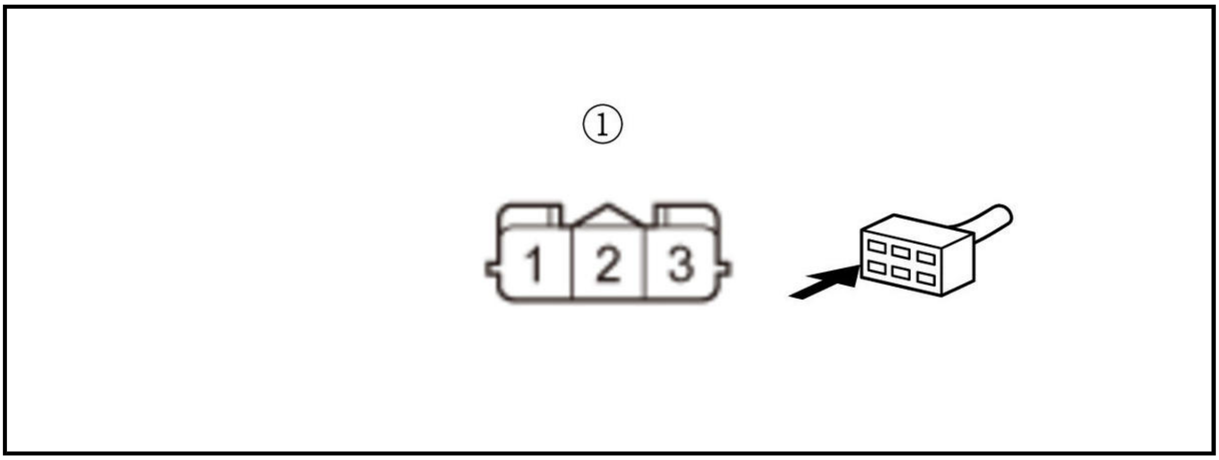
6. Rear differential fluid pressure sensor check

-1. Connect the following connector.

AWD control unit 24P connector

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear differential fluid pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①



-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	Less than 0.1	V	B	B

Do the current condition(s) match the threshold?

YES

Replace the rear differential fluid pressure sensor .

NO

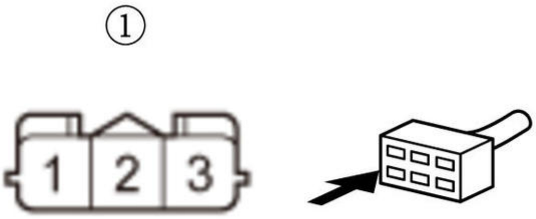
Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

7. Determine possible failure area (open in PS1 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Terminal B	Body ground



-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	Less than 0.1	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 9.

NO

Go to step 8.

8. Open wire check (PS1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

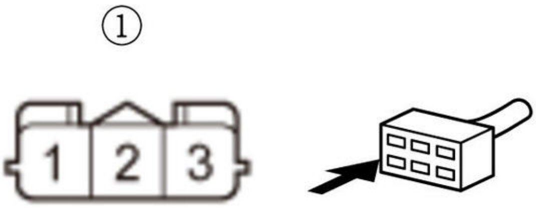
-2. Remove the jumper wire.

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**AWD control unit 24P connector No. 21**



Is there 1.0 Ω or less?

YES

The PS1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the PS1 wire between the rear differential fluid pressure sensor and the AWD control unit.

9. Open wire check (SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

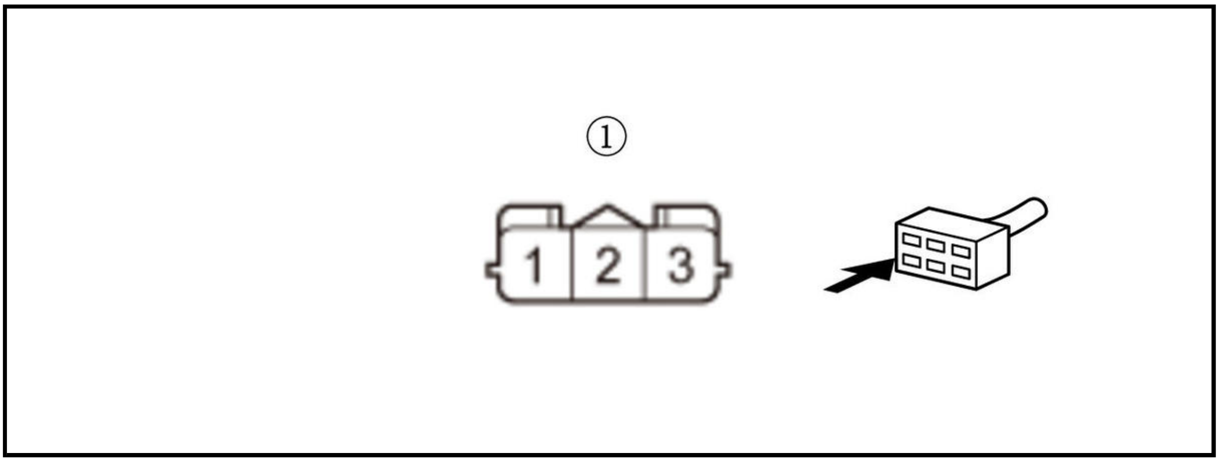
-2. Remove the jumper wire.

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**AWD control unit 24P connector No. 11**



Is there 1.0 Ω or less?

YES

The SG wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the SG wire between the rear differential fluid pressure sensor and the AWD control unit.

DTC C1840-14

DTC C1840-14 : Differential Fluid Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1840-14 Differential Fluid Pressure Sensor Circuit Low Voltage	B	B

DTC (Real Time AWD)

1. Problem verification

-1. **Enter the maintenance mode and start the engine** .

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	Less than 0.34	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (PS1 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Voltage of the oil pressure sensor for rear differential	About 5	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted wire check (PS1 line)

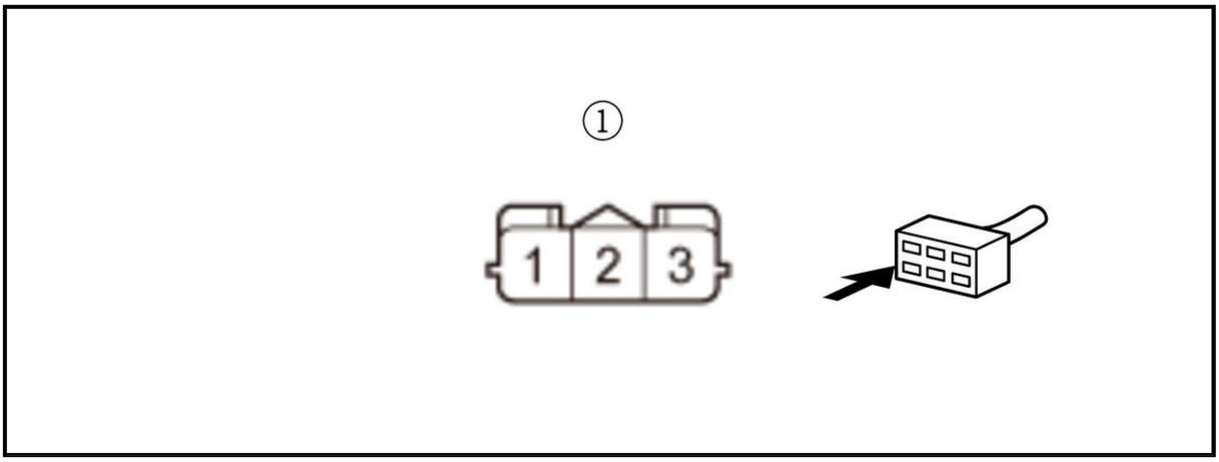
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

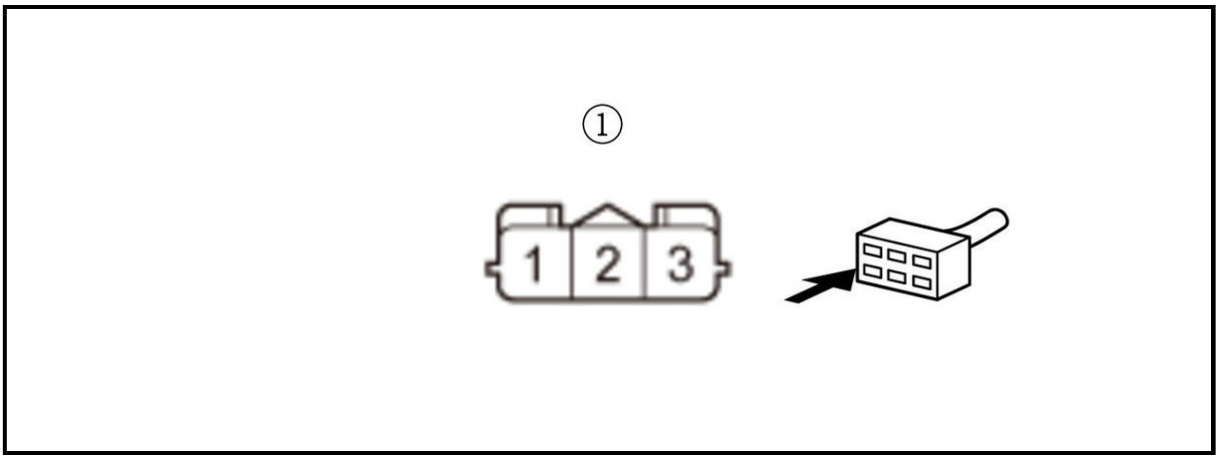
NO

Repair a short to ground or the SG wire in the PS1 wire between the rear differential fluid pressure sensor and the AWD control unit.

4. Determine possible failure area (Rear differential fluid pressure sensor, SVCC line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Rear differential fluid pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5 V?

YES

Replace the rear differential fluid pressure sensor .

NO

Go to step 5.

5. Open wire check (SVCC line)

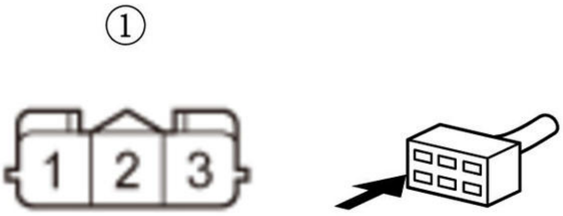
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**AWD control unit 24P connector No. 20**



Is there 1.0 Ω or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the SVCC wire between the rear differential fluid pressure sensor and the AWD control unit.

DTC C1841-11

DTC C1841-11 : Differential Fluid Temperature Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1841-11 Differential Fluid Temperature Sensor Circuit Low Voltage	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil temperature sensor for rear differential	Less than 0.08	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the Freeze data/on-board snapshot.

2. Rear differential fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential fluid temperature sensor 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil temperature sensor for rear differential	About 5	V	B	B

Do the current condition(s) match the threshold?

YES

Replace the rear differential fluid temperature sensor .

NO

The rear differential fluid temperature sensor is OK. Go to step 3.

3. Shorted wire check (TOH line)

-1. Turn the vehicle to the OFF (LOCK) mode.

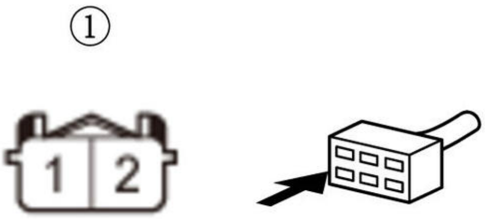
-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid temperature sensor 2P connector: disconnected

B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair a short to ground or the TOL wire in the TOH wire between the rear differential fluid temperature sensor and the AWD control unit.

DTC C1841-13

DTC C1841-13 : Differential Fluid Temperature Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1841-13 Differential Fluid Temperature Sensor Circuit High Voltage	B	B

DTC (Real Time AWD)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil temperature sensor for rear differential	More than 4.9	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (short to power in TOH line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

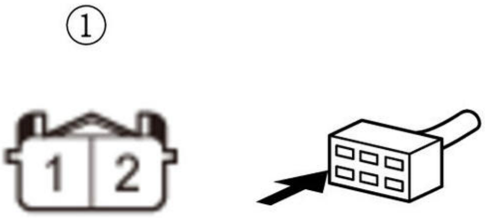
-2. Disconnect the following connector.

Rear differential fluid temperature sensor 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid temperature sensor 2P connector: disconnected
Test point 1	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 4.9 V or more?

YES

Go to step 5.

NO

Go to step 3.

3. Open wire check (TOH line)

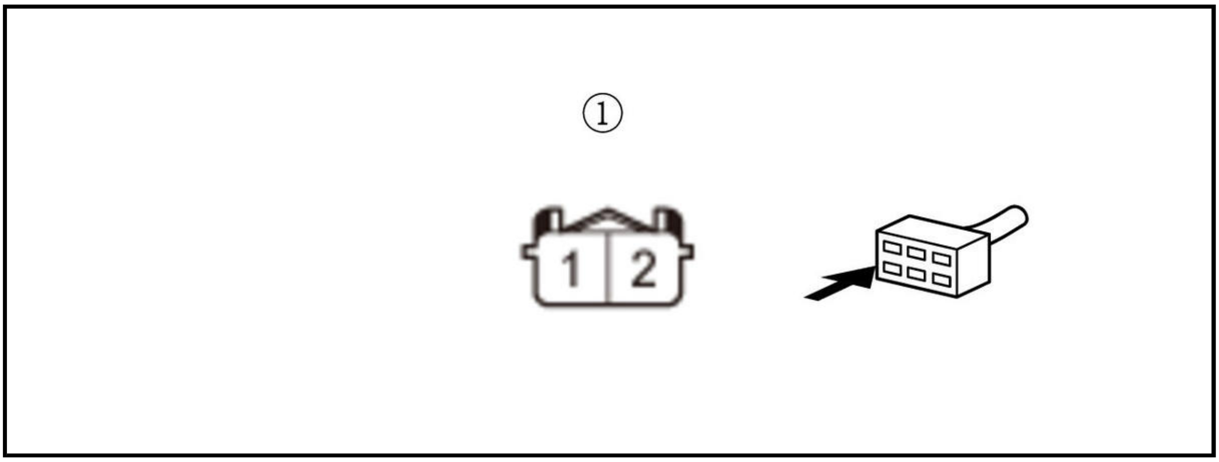
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF mode
B	Rear differential fluid temperature sensor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 18**
Test point 2	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The TOH wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the TOH wire between the rear differential fluid temperature sensor and the AWD control unit.

4. Open wire check (TOL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

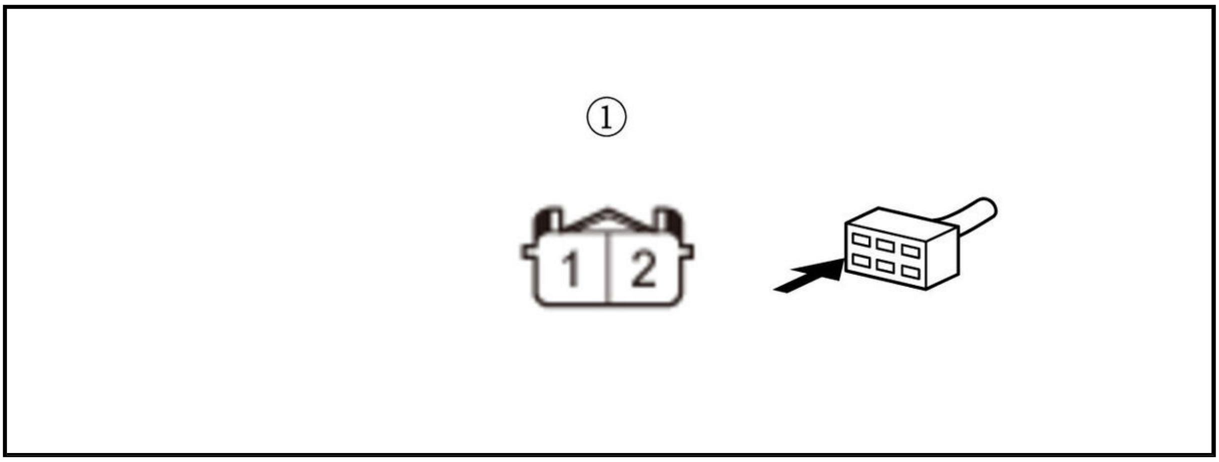
-2. Remove the jumper wire.

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid temperature sensor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 22**
Test point 2	Rear differential fluid temperature sensor 2P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the TOL wire between the rear differential fluid temperature sensor and the AWD control unit.

5. Shorted wire check (TOH line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

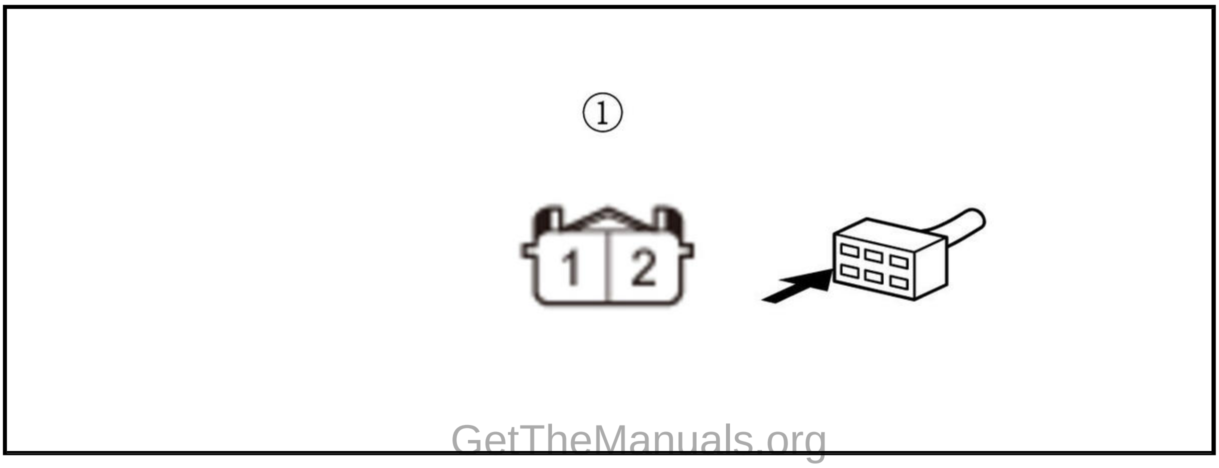
-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid temperature sensor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 0.5 V or more?

YES

Repair a short to power in the TOH wire between the rear differential fluid temperature sensor and the AWD control unit.

NO

Go to step 6.

6. Rear differential fluid temperature sensor check

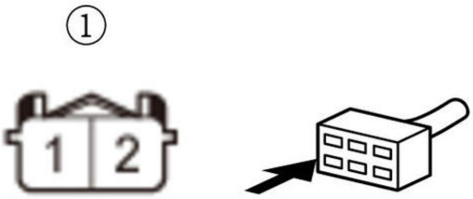
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the following connector.

AWD control unit 24P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Terminal B	Rear differential fluid temperature sensor 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil temperature sensor for rear differential	Less than 0.1	V	B	B

Do the current condition(s) match the threshold?

YES

Replace the rear differential fluid temperature sensor .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C1841-27

DTC C1841-27 : Differential Fluid Temperature Sensor Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1841-27 Differential Fluid Temperature Sensor Circuit Range/Performance Problem	B	B

DTC (Real Time AWD)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1841-11 Differential Fluid Temperature Sensor Circuit Low Voltage	B	B
C1841-13 Differential Fluid Temperature Sensor Circuit High Voltage	B	B
C1841-27 Differential Fluid Temperature Sensor Circuit Range/Performance Problem	B	B

Is DTC C1841-11, C1841-13, or C1841-27 indicated?

DTC C1841-11 is indicated

Go to the DTC C1841-11 troubleshooting.

DTC C1841-13 is indicated

Go to the DTC C1841-13 troubleshooting.

DTC C1841-27 is indicated

Go to step 2.

2. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. **Enter the maintenance mode and start the engine** , and let it idle for 1 minute.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1841-27 Differential Fluid Temperature Sensor Circuit Range/Performance Problem	B	B

Is DTC C1841-27 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Rear differential fluid temperature sensor check

-1. Check the parameter(s) below with the HDS. Make note of this value as it will be needed in the following steps.

Signal	**Current conditions**	
	Values	**Unit**
Voltage of the oil temperature sensor for rear differential	B	B

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS then compare with the value checked in step 3

Signal	**Current conditions**	
	Values	**Unit**
Voltage of the oil temperature sensor for rear differential	B	B

Did the sensor value change?

YES

The rear differential fluid temperature sensor is OK. Check for an intermittent open or short in the TOH and/or TOL wires between the rear differential fluid temperature sensor and the AWD control unit, and recheck.

NO

Replace the rear differential fluid temperature sensor .

DTC C1850-14

DTC C1850-14 : Fail Safe Relay Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1850-14 Fail Safe Relay Stuck OFF	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. **Enter the maintenance mode and start the engine** .

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1850-14 Fail Safe Relay Stuck OFF	B	B

Is DTC C1850-14 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A4-3**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A4-3 fuse circuit, then go to step 4

3. Open wire check (+B_E-DPS line)

-1. Disconnect the following connector.

AWD control unit 24P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_E-DPS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the +B_E-DPS wire between the No. A4-3 fuse and the AWD control unit.

4. Determine possible failure area (MH line, others)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 5.

NO

Go to step 6.

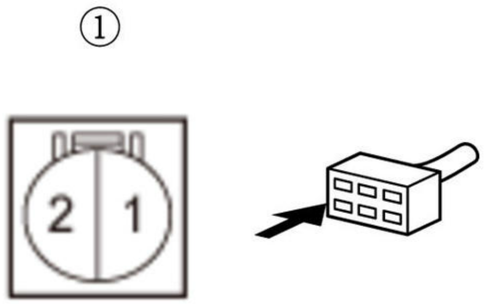
5. Rear differential pump motor internal shorted check

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
B	Rear differential pump motor 2P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (male terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Replace the rear differential pump motor .

NO

The rear differential pump motor is OK. Repair a short to ground in the MH wires between the rear differential pump motor and the AWD control unit.

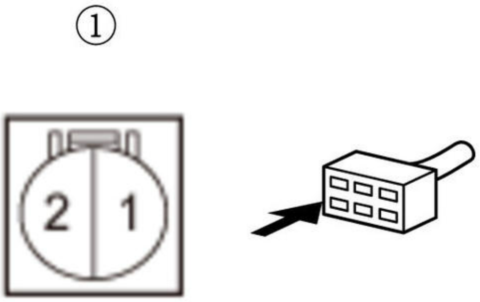
6. Rear differential pump motor internal shorted check

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. On the pump motor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF mode
B	AWD control unit 24P connector: disconnected
B	Rear differential pump motor 2P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (male terminals) No. 1: ①
Test point 2	Rear differential pump motor 2P connector (male terminals) No. 2: ①



Is there 1.0 MΩ or more?

YES

The rear differential pump motor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Replace the rear differential pump motor .

DTC C1851-18

DTC C1851-18 : Motor Circuit Low Current

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1851-18 Motor Circuit Low Current	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Enter the maintenance mode and start the engine** .

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1851-18 Motor Circuit Low Current	B	B

   Is DTC C1851-18 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Go to step 2.

2. Problem verification (with rear differential pump motor running)

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. **Enter the maintenance mode and start the engine** .

   -4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -5. With the engine running, **do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

   Air Bleeding

   Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1851-18 Motor Circuit Low Current	B	B

   Is DTC C1851-18 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 4**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 4.

NO

Check for poor connections or loose terminals between the AWD control unit and ground (G503). If the connections are OK, repair an open in the GND wire between the AWD control unit and ground (G503).

4. Determine possible failure area (short in MH, ML lines, open in MH, ML lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 7.

NO

Go to step 5.

5. Determine possible failure area (MH, ML lines, AWD control unit)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode, At normal air temperature
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	**AWD control unit 24P connector No. 3**

Is there about 10 Ω or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Go to step 6.

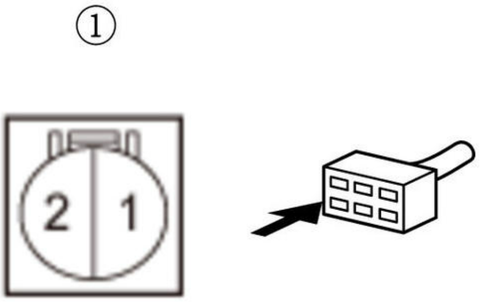
6. Rear differential pump motor internal open check

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. On the rear differential pump motor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
B	Rear differential pump motor 2P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (male terminals) No. 1: ①
Test point 2	Rear differential pump motor 2P connector (male terminals) No. 2: ①



Is there about 10 Ω or less?

YES

Repair an open in the MH and/or ML wires between the rear differential pump motor and the AWD control unit.

NO

Replace the rear differential pump motor .

7. Rear differential pump motor internal shorted check

-1. Disconnect the following connector.

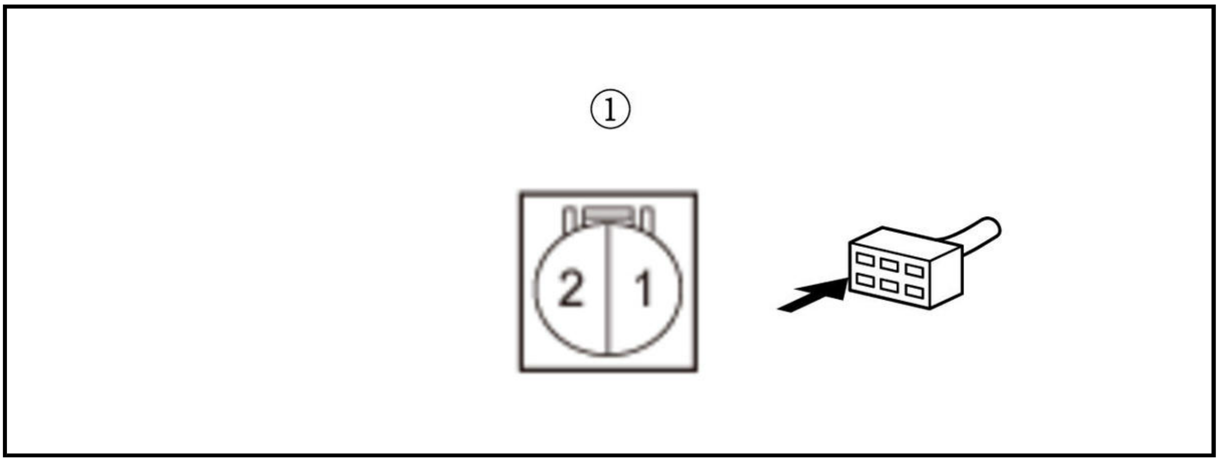
Rear differential pump motor 2P connector

-2. Measure the resistance between the following test points 1 and 2 individually (see table).

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected

B	Rear differential pump motor 2P connector: disconnected

Connector	Test point 1	Test point 2
Rear differential pump motor 2P connector (male terminals)	No. 1: ①	Rear differential pump motor body
	No. 2: ①	



Are there 1.0 MΩ or more?

YES

The rear differential pump motor is OK. Repair a short to ground in the MH and/or ML wires between the rear differential pump motor and the AWD control unit.

NO

Replace the rear differential pump motor .

DTC C1851-19, C1851-1E

DTC C1851-19 : Control Module Internal Control Module Malfunction

DTC C1851-1E : Motor Circuit High Current

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1851-19 Control Module Internal Control Module Malfunction	B	B
C1851-1E Motor Circuit High Current	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Enter the maintenance mode and start the engine** .

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1851-19 Control Module Internal Control Module Malfunction	B	B
C1851-1E Motor Circuit High Current	B	B

Is DTC C1851-19 or C1851-1E indicated?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification (with rear differential pump motor running)

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. **Enter the maintenance mode and start the engine** .

-4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

-5. With the engine running, **do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

Air Bleeding

Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1851-19 Control Module Internal Control Module Malfunction	B	B

DTC Description	DTC	Freeze Frame
C1851-1E Motor Circuit High Current	B	B

Is DTC C1851-19 or C1851-1E indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Determine possible failure area (short to power in MH, ML lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential pump motor 2P connector

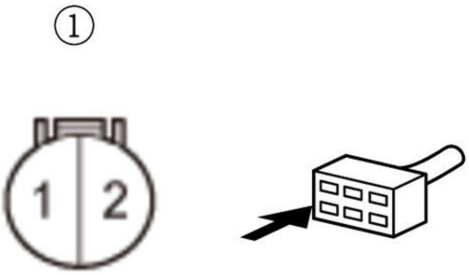
-3. Turn the vehicle to the ON mode.

-4. Wait for 10 seconds.

-5. Measure the voltage between the following test points 1 and 2 individually.

Test condition	Vehicle ON mode
B	Rear differential pump motor 2P connector: disconnected

Connector	Test point 1	Test point 2
Rear differential pump motor 2P connector (female terminals)	No. 1: ①	Body ground
	No. 2: ①	



Is there about 0.1 V or less?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (MH line to power, ML line to power)

-1. Disconnect the following connector.

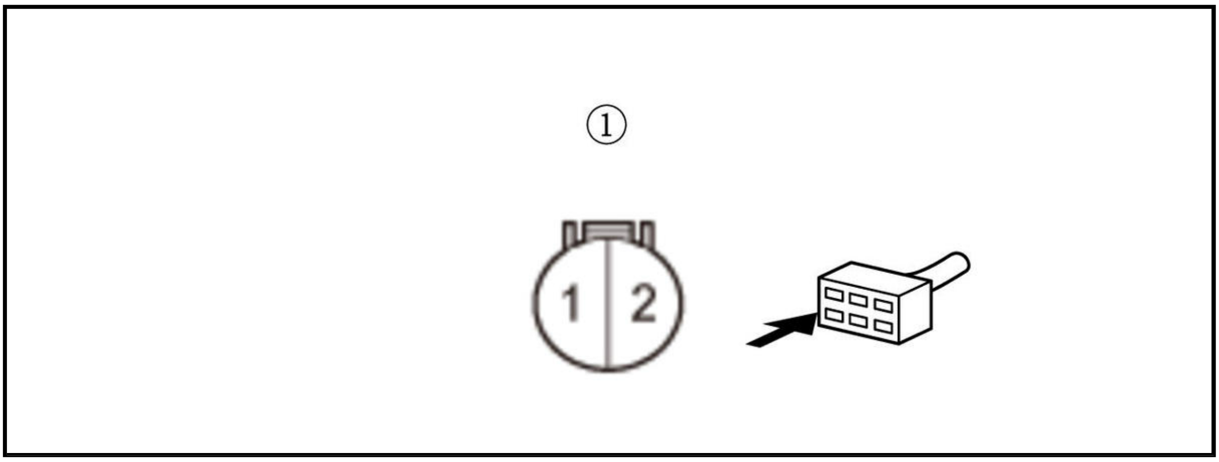
AWD control unit 24P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between the following test points 1 and 2 individually.

Test condition	Vehicle ON mode
B	Rear differential pump motor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected

Connector	Test point 1	Test point 2
Rear differential pump motor 2P connector (female terminals)	No. 1: ①	Body ground
	No. 2: ①	



Is there about 0.1 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair short to power in the MH and/or ML wires between the rear differential pump motor and the AWD control unit.

5. Determine possible failure area (short to ground in MH line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the following connector.

Rear differential pump motor 2P connector

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Measure the resistance between the following test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

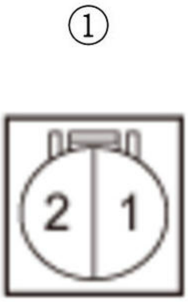
6. Rear differential pump motor check

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. On the rear differential pump motor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rear differential pump motor 2P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (male terminals) No. 1: ①
Test point 2	Rear differential pump motor 2P connector (male terminals) No. 2: ①



Is there about 0.6 Ω or more?

YES

The rear differential pump motor is OK. Go to step 7.

NO

Replace the rear differential pump motor .

7. Determine possible failure area (short in MH, ML line, others)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	**AWD control unit 24P connector No. 3**

Is there 1.0 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Go to step 8.

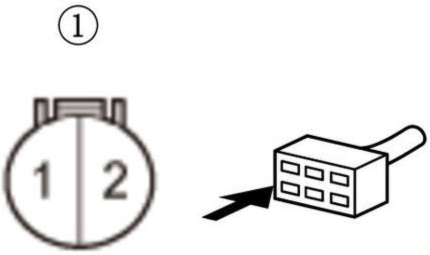
8. Shorted wire check (MH line to ML line)

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential pump motor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (female terminals) No. 1: ①
Test point 2	Rear differential pump motor 2P connector (female terminals) No. 2: ①



Is there 1.0 MΩ or more?

YES

The MH wire to the ML wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair a short in the MH wire to the ML wire between the rear differential pump motor and the AWD control unit.

DTC C1852-18

DTC C1852-18 : Solenoid Valve Circuit Low Current

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1852-18 Solenoid Valve Circuit Low Current	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. **Enter the maintenance mode and start the engine** .

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1852-18 Solenoid Valve Circuit Low Current	B	B

Is DTC C1852-18 indicated?

YES

The failure is duplicated. Go to step 5.

NO

Go to step 2.

2. Problem verification (with rear differential pump motor running)

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. **Enter the maintenance mode and start the engine** .

-4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

-5. With the engine running, **do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

Air Bleeding

Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1852-18 Solenoid Valve Circuit Low Current	B	B

Is DTC C1852-18 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Determine possible failure area (DTYH1 line)

-1. Turn the vehicle to the OFF (LOCK) mode

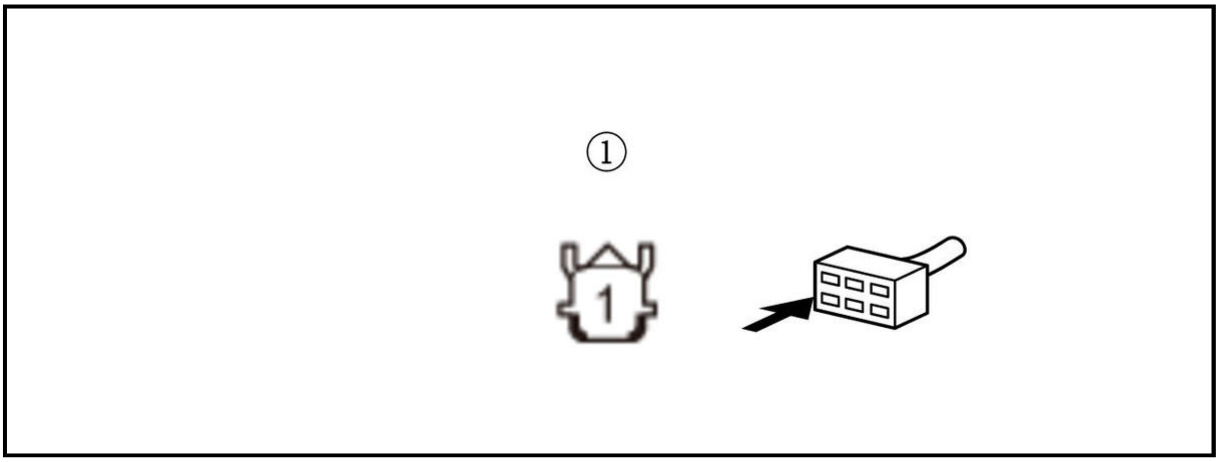
-2. Disconnect the following connector.

Rear differential solenoid valve 1P connector
AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential solenoid valve 1P connector (female terminals) No. 1: ①
Test point 2	**AWD control unit 24P connector No. 15**



Is there 1.0 Ω or less?

YES

The DTYH1 wire is not open. Go to step 4.

NO

Repair an open in the DTYH1 wire between the rear differential solenoid valve and the AWD control unit.

4. Shorted wire check (DTYH1 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 15**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The DTYH1 wire is not shorted. Go to step 5.

NO

Repair a short to ground in the DTYH1 wire between the rear differential solenoid valve and the AWD control unit.

5. Determine possible failure area (D-GND/GND line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the rear differential subharness D-GND/GND wire terminal from the rear differential assembly.

-3. Measure the resistance between the following test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rear differential subharness D-GND/GND wire terminal: disconnected
Test point 1	Rear differential subharness D-GND/GND wire terminal
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 6.

NO

Repair an open in the D-GND/GND wires between the AWD control unit and ground (G503).

6. Determine possible failure area (D-GND2/GND line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the rear differential subharness D-GND2/GND wire terminal from the rear differential assembly.

-3. Measure the resistance between the following test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rear differential subharness D-GND2/GND wire terminal: disconnected
Test point 1	Rear differential subharness D-GND2/GND terminal
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 7.

NO

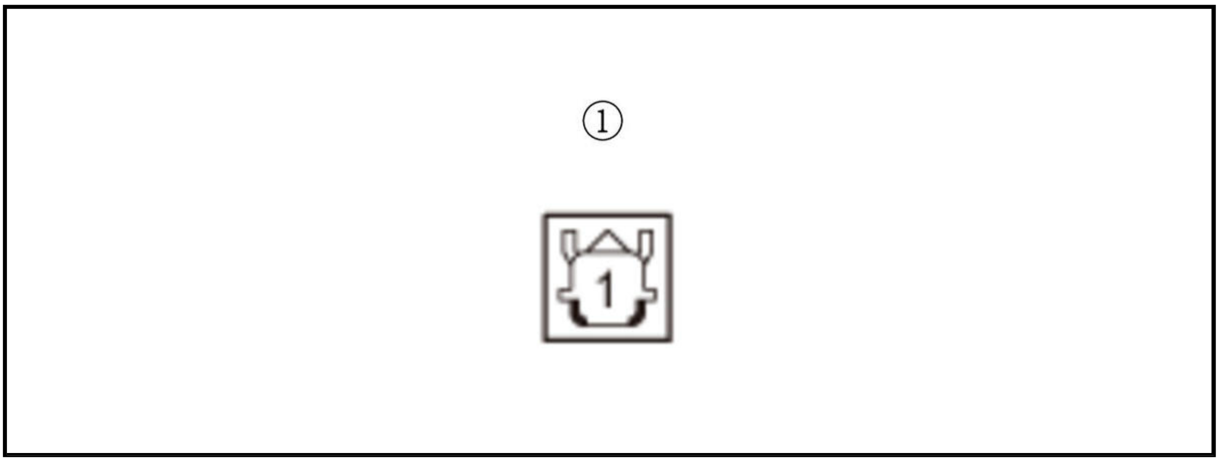
Repair an open in the D-GND2/GND wires between the AWD control unit and ground (G503).

7. Rear differential solenoid valve check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. On the solenoid valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
B	Rear differential subharness D-GND/GND and D-GND2/GND wire terminal: disconnected
Test point 1	Rear differential solenoid valve 1P connector (male terminals) No. 1: ①
Test point 2	Rear differential solenoid valve body



Is there about 100 Ω or less?

YES

The rear differential solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Replace the rear differential solenoid valve .

DTC C1852-19

DTC C1852-19 : Solenoid Valve Circuit High Current

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1852-19 Solenoid Valve Circuit High Current	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. **Enter the maintenance mode and start the engine** .

    -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1852-19 Solenoid Valve Circuit High Current	B	B

Is DTC C1852-19 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification (with rear differential pump motor running)

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. **Enter the maintenance mode and start the engine** .

-4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

-5. With the engine running, **do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

Air Bleeding

Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1852-19 Solenoid Valve Circuit High Current	B	B

Is DTC C1852-19 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Shorted wire check (DTYH1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Rear differential solenoid valve 1P connector
AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 15**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The DTYH1 wire is OK. Go to step 4.

NO

Repair a short to ground in the DTYH1 wire between the rear differential solenoid valve and the AWD control unit.

4. Rear differential solenoid valve check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

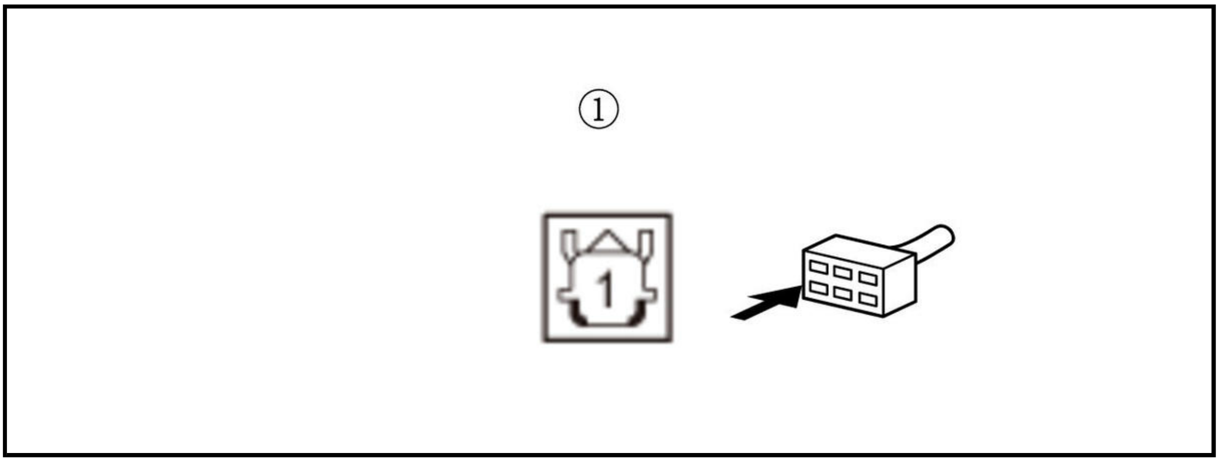
NOTE: The rear differential fluid temperature should be 50 deg.F (10 deg.C) - 86 deg.F (30 deg.C). If the value is not within the enable temperature, warm up the rear differential fluid temperature by raising the vehicle on a lift and run the vehicle at 13 mph (20 km/h) for 5 seconds then slow down, and stop the wheels.

Signal	**Current conditions**	
	Values	**Unit**
Oil temperature for rear differential	B	B

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. On the solenoid valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential solenoid valve 1P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there about 10 Ω or more?

YES

The rear differential solenoid valve is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Replace the rear differential solenoid valve .

DTC C1858-72

DTC C1858-72 : Differential Fluid Pressure Deviation Low

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1858-72 Differential Fluid Pressure Deviation Low	B	B

DTC (Real Time AWD)

1. Rear differential fluid level check

   -1. **Check the rear differential fluid level** , and check for rear differential fluid leakage.

   Is the check result OK?

   YES

   The rear differential fluid level is OK. Go to step 2.

   NO

   Find and repair the source of the fluid leak then **add recommended fluid** .

2. Problem verification (function test with HDS)

   -1. Turn the vehicle to the ON mode.

   -2. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -3. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

   Oil Pressure Control Test

   Is fault code indicated?

   Fault code is not indicated

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   Fault code 2-1 or 5-1 is indicated

   Go to step 3.

   Fault code 3-1 is indicated

   Go to step 4.

   Fault code except 2-1, 3-1, and 5-1 is indicated

   Go to step 5.

3. Hydraulic system check

   -1. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -2. **Do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

   Air Bleeding

   Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

-4. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

Oil Pressure Control Test

Is the test result OK?

YES

Hydraulic system is OK at this time.

NO

Replace the rear differential fluid then **do the rear differential fluid pressure sensor test** and **do the rear differential solenoid valve test** . If they are OK, **replace the rear differential assembly** .

4. Hydraulic system check

-1. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

-2. **Do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

Air Bleeding

Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

-4. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

Oil Pressure Control Test

Is the test result OK?

YES

Hydraulic system is OK at this time.

NO

Replace the rear differential fluid , then **do the rear differential solenoid valve test** . If it is OK, **replace the rear differential assembly** .

5. DTC check

-1. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

-2. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** three times.

Oil Pressure Control Test

Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Are there any DTCs?

YES

Go to the indicated DTC's troubleshooting.

NO

The system is OK at this time.

DTC C1858-73

DTC C1858-73 : Differential Fluid Pressure Deviation High

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1858-73 Differential Fluid Pressure Deviation High	B	B

DTC (Real Time AWD)

1. Problem verification (function test with HDS)

   -1. Turn the vehicle to the ON mode.

   -2. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -3. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

   Oil Pressure Control Test

   Are fault codes indicated?

   Fault code is not indicated

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   Fault code 4-1 or 6-1 is indicated

   Replace the rear differential fluid , then **do the rear differential solenoid valve test** . If it is OK, **replace the rear differential assembly** .

   Fault code except 4-1 and 6-1 is indicated

   The failure is duplicated. Go to step 2.

2. DTC check

   -1. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -2. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** three times.

   Oil Pressure Control Test

   Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Are there any DTCs?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

The system is OK at this time.

DTC C1860-98

DTC C1860-98 : Differential Fluid Overheats

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information**.
- When the clutch is presumed to be overheated, DTC C1860-98 is set and the system turns off the clutch engagement to protect the clutch. This DTC may also set under the following conditions.
-
    - -

      When spinning the rear wheels while the vehicle is stuck in sand, mud, snow, etc
    - -

      When the VSA system is OFF
- If other DTCs are stored at the same time as DTC C1860-98 and/or DTC C1861-9A, troubleshoot other DTCs first, then recheck for DTC C1860-98 and/or DTC C1861-9A.

DTC Description	DTC	Freeze Frame
C1860-98 Differential Fluid Overheats	B	B

DTC (Real Time AWD)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Is DTC C1860-98, C1861-9A, or other DTC indicated?

   DTC C1860-98 or C1861-9A is indicated

   Go to step 2.

   Other DTC is indicated

   Go to the indicated DTC's troubleshooting.

2. Tire size check

   -1. Check the tire size of the four wheels.

   Are all tire sizes same?

   YES

   The tire sizes are OK. Go to step 3.

   NO

Replace the tire with the standard size .

3. Brake drag check

   -1. Check for brake drag.

   Are the brakes OK?

   YES

   The brakes are OK. Go to step 4.

   NO

   Repair the front/rear hydraulic brake system or the parking brake system.

4. Rear differential fluid temperature sensor check

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Oil temperature for rear differential	B	B

   -2. Measure the actual temperature of the rear differential fluid, then compare it with the HDS value checked in step 4

   Are the values almost the same?

   YES

   The rear differential fluid temperature sensor is OK. Go to step 5.

   NO

   Replace the rear differential fluid temperature sensor .

5. Rear differential fluid pressure sensor test

   -1. Do the rear differential fluid pressure sensor test .

   Is the test result OK?

   YES

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   NO

   Do the repair depending on the test result .

DTC C1861-9A

DTC C1861-9A : Vehicle Spin Detected

NOTE:

- Before you troubleshoot, review the General Troubleshooting Information.

- When a vehicle spin is detected, DTC C1861-9A is set for the purpose of protecting the real time AWD system. When this condition occurs, the system will temporarily stop the real time AWD function. This DTC may also set under these conditions.
-
    - -

      When spinning the rear wheels while stuck in sand, mud, snow, etc
    - -

      When the VSA system is OFF
- If other DTCs are stored at the same time as DTC C1860-98 and/or DTC C1861-9A, troubleshoot other DTCs first, then recheck for DTC C1860-98 and/or DTC C1861-9A.

DTC Description	DTC	Freeze Frame
C1861-9A Vehicle Spin Detected	B	B

DTC (Real Time AWD)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Is DTC C1860-98, C1861-9A, or other DTCs indicated?

   DTC C1860-98 or C1861-9A is indicated

   Go to step 2.

   Other DTC is indicated

   Go to the indicated DTC's troubleshooting.

2. Tire size check

   -1. Check the tire size of the four wheels.

   Are all tire sizes same?

   YES

   The tire sizes are OK. Go to step 3.

   NO

   Replace the tire with the standard size .

3. Brake drag check

   -1. Check for brakes drag.

   Are the brakes OK?

YES

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Repair the front/rear hydraulic brake system or the parking brake system .

DTC C1870-00, C1872-00

DTC C1870-00 : (The Functional Abnormalities of Fuel and Emissions)

DTC C1872-00 : (The Functional Abnormalities of VSA Modulator-Control Unit)

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1870-00 (The Functional Abnormalities of Fuel and Emissions)	B	B
C1872-00 (The Functional Abnormalities of VSA Modulator-Control Unit)	B	B

DTC (Real Time AWD)

1. Problem verification (DTC check)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. **Enter the maintenance mode and start the engine** .

Check for DTCs with the HDS.

NOTE: These codes are stored whenever the following systems DTCs are detected.

- When DTC C1870-00 is indicated, check the PGM-FI system and CVT system DTC.
- When DTC C1872-00 is indicated, check the VSA system DTC.

DTC Description	DTC	Freeze Frame
C1870-00 (The Functional Abnormalities of Fuel and Emissions)	B	B
C1872-00 (The Functional Abnormalities of VSA Modulator-Control Unit)	B	B

Is DTC C1870-00 and/or C1872-00 indicated?

DTC C1870-00 is indicated

The failure is duplicated. Check the **PGM-FI system DTC** .

DTC C1872-00 is indicated

The failure is duplicated. **Check the VSA system DTC** .

DTC is not indicated

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1873-00

DTC C1873-00 : Steering Angle Sensor Malfunction

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1873-00 Steering Angle Sensor Malfunction	B	B

DTC (Real Time AWD)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Enter the maintenance mode and start the engine** .

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1873-00 Steering Angle Sensor Malfunction	B	B

   Is DTC C1873-00 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. VSA system DTC check

   -1. Check for DTCs in the VSA system with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U0100-00, U0101-00, U0122-00, U0131-00, U0151-00 (REAL TIME AWD CONTROL UNIT)

DTC U0100-00 : F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))

DTC U0101-00 : F-CAN Malfunction (Lost Communication with A/T Control System)

DTC U0122-00 : F-CAN Malfunction (Lost Communication with VSA Modulator-Control Unit)

DTC U0131-00 : F-CAN Malfunction (Lost Communication with EPS System)

DTC U0151-00 : F-CAN Malfunction (Lost Communication with SRS unit)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the real time AWD control unit.
- Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))	B	B
U0101-00 F-CAN Malfunction (Lost Communication with A/T Control System)	B	B
U0122-00 F-CAN Malfunction (Lost Communication with VSA Modulator-Control Unit)	B	B
U0131-00 F-CAN Malfunction (Lost Communication with EPS System)	B	B
U0151-00 F-CAN Malfunction (Lost Communication with SRS unit)	B	B

DTC (Real Time AWD)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

Which result is indicated?

Bus D is Not Available

Go to step 3.

Bus D is Available

Go to step 4.

3. Open wire check (F-CAN D_H line, F-CAN D_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

CAN gateway 16P connector
AWD control unit 24P connector

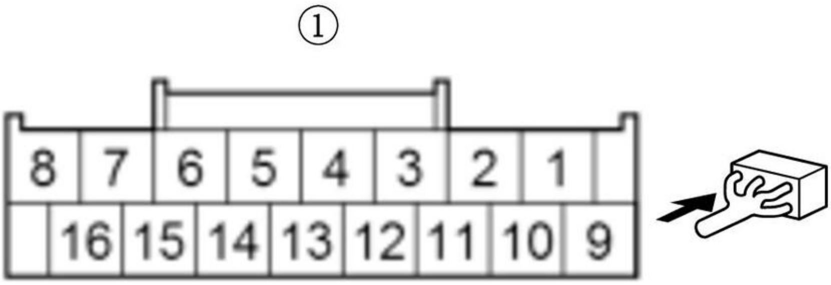
-3. Measure the resistance between test points 1 and 2 individually.

F-CAN D_H wire

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 7: ①
Test point 2	AWD control unit 24P connector No. 14

F-CAN D_L wire

Test condition	Vehicle OFF (LOCK) mode
	CAN gateway 16P connector: disconnected
	AWD control unit 24P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 15: ①
Test point 2	AWD control unit 24P connector No. 24



Is there 1.0 Ω or less?

YES

The F-CAN D_H wire and the F-CAN D_L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the AWD control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good AWD control unit** , then recheck. If indicated DTC goes away and the AWD control unit was substituted, **replace the original AWD control unit** .

NO

Repair an open in the F-CAN D_H wire and/or the F-CAN D_L wire between the AWD control unit and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-00	PCM	A, B
U0101-00	PCM	A, B
U0122-00	VSA modulator-control unit	B, C
U0131-00	EPS control unit	C
U0151-00	SRS unit	C

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-00: PCM is Not Available for Bus A

Go to step 5.

U0100-00: PCM is Not Available for Bus B

Go to step 6.

U0101-00: PCM is Not Available for Bus A

Go to step 5.

U0101-00: PCM is Not Available for Bus B

Go to step 6.

U0122-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0122-00: VSA modulator-control unit is Not Available for Bus C

Go to step 7.

U0131-00: EPS control unit is Not Available for Bus C

Go to step 7.

U0151-00: SRS unit is Not Available for Bus C

Go to step 7.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

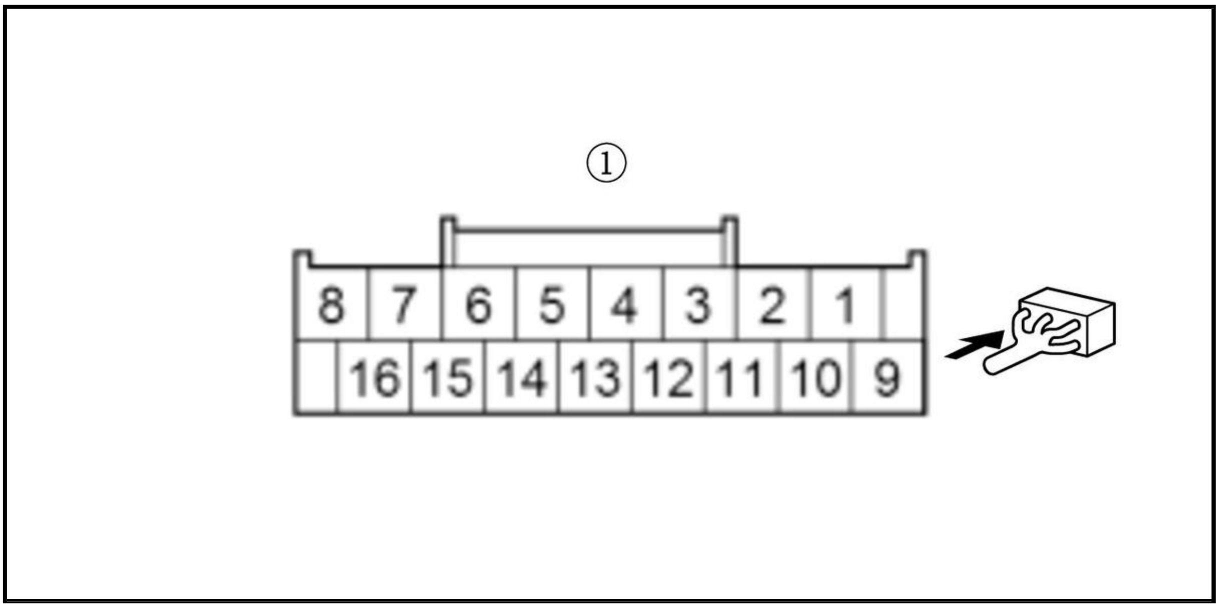
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	**Connector**
-	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	**Circuit name**	**Test point 1 (Receiving control unit)**		**Test point 2 (Transmitting control unit)**	
		Connector	**Terminal**	**Connector**	**Terminal**
U0100-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A_L		No. 11		No. 36
U0101-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A_L		No. 11		No. 36



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Substitute a known-good PCM** , then recheck. If DTC U0100-00 goes away and the PCM was substituted, **replace the original PCM** .
U0101-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Substitute a known-good PCM** , then recheck. If DTC U0101-00 goes away and the PCM was substituted, **replace the original PCM** .

NO

Repair an open in the F-CAN A_H wire and/or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100-00 and/or U0101-00: Jump the SCS line with the HDS, and wait more than 1 minute.

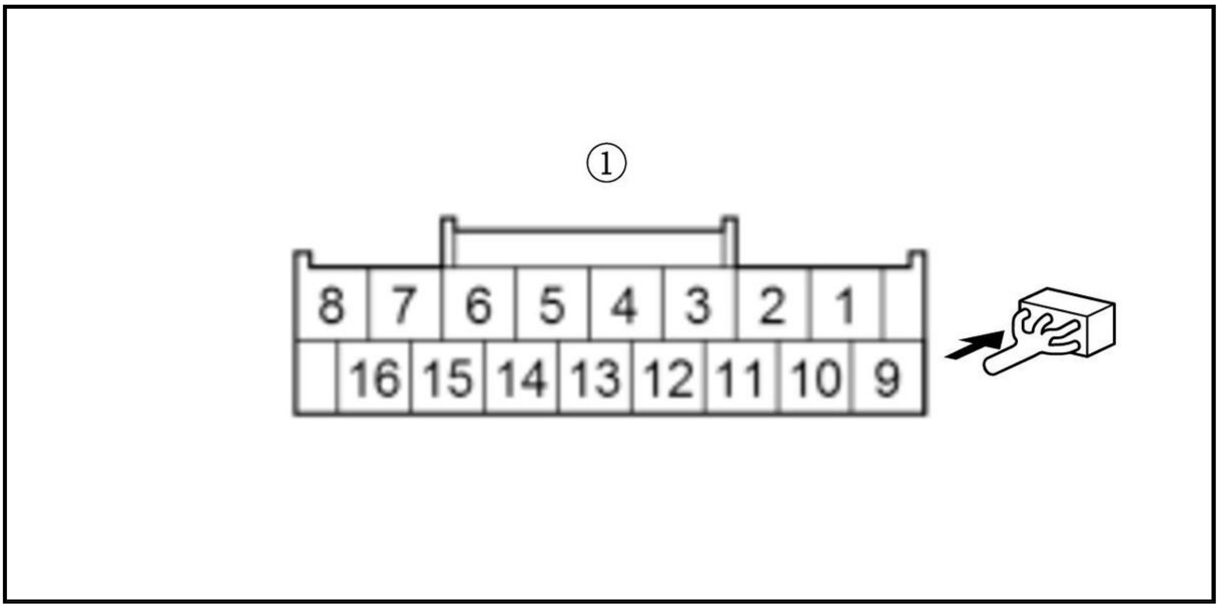
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0101-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0122-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN B_L		No. 14		No. 28



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Substitute a known-good PCM** , then recheck. If DTC U0100-00 goes away and the PCM was substituted, **replace the original PCM** .
U0101-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Substitute a known-good PCM** , then recheck. If DTC U0101-00 goes away and the PCM was substituted, **replace the original PCM** .
U0122-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .

NO

Repair an open in the F-CAN B_H wire and/or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

7. Open wire check (F-CAN C_H line, F-CAN C_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

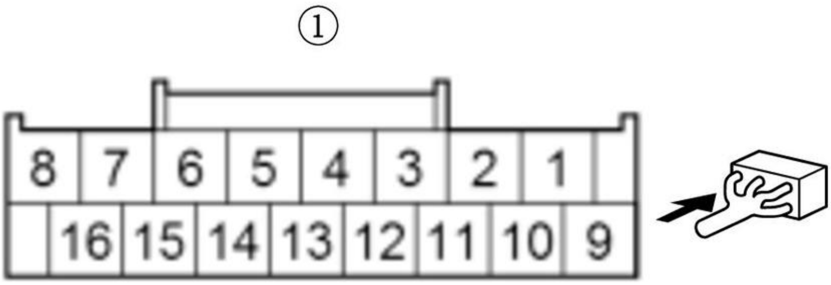
NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.

DTC	Connector
-	CAN gateway 16P connector
U0122-00	VSA modulator-control unit 46P connector
U0131-00	EPS control unit connector B (6P)
U0151-00	SRS unit connector A (39P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0122-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**VSA modulator-control unit 46P connector**	No. 46
	F-CAN C_L		No. 13		No. 34
U0131-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**EPS control unit connector B (6P)**	No. 1
	F-CAN C_L		No. 13		No. 3
U0151-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**SRS unit connector A (39P)**	No. 34
	F-CAN C_L		No. 13		No. 35



Is there 1.0 Ω or less?

YES

The F-CAN C_H wire and the F-CAN C_L wire are OK. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0122-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0131-00	Check for poor connections or loose terminals at the CAN gateway and the EPS control unit. **replace the EPS motor/control unit** .
U0151-00	Check for poor connections or loose terminals at the CAN gateway and the SRS unit. **Substitute the SRS unit** , then recheck. If DTC U0151-00 goes away and the SRS unit was substituted, **replace the original SRS unit** .

NO

Repair an open in the F-CAN C_H wire and/or the F-CAN C_L wire between the transmitting control unit and the CAN gateway.

DTC U3000-49 (REAL TIME AWD CONTROL UNIT)

DTC U3000-49 : Control Module Internal Control Module Malfunction

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
U3000-49 Control Module Internal Control Module Malfunction	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. **Enter the maintenance mode and start the engine** .

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-49 Control Module Internal Control Module Malfunction	B	B

Is DTC U3000-49 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U3000-51 (REAL TIME AWD CONTROL UNIT)

DTC U3000-51 : Control Module Programming Error

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
U3000-51 Control Module Programming Error	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. **Update the AWD control unit if it does not have the latest software** .

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. **Enter the maintenance mode and start the engine** .

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-51 Control Module Programming Error	B	B

Is DTC U3000-51 indicated?

YES

The failure is duplicated. **Substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

Real Time Awd Control Unit - Diagnostics (Except Hybrid) - CR-V

DTC TROUBLESHOOTING

DTC C0051-00 (77-06) (AWD)

DTC C0051-00 : The Functional Abnormalities of Steering Angle Sensor

NOTE: Before you troubleshoot, review the General Troubleshooting Information.

DTC Description	DTC	Freeze Frame
C0051-00 The Functional Abnormalities of Steering Angle Sensor	B	B

DTC (Real Time AWD)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0051-00 The Functional Abnormalities of Steering Angle Sensor	B	B

   Is DTC C0051-00 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. DTC check (VSA system)

   -1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0051-62 Steering Angle Sensor Failure (Signal Compare Failure)	B	B

DTC Description	DTC	Freeze Frame
C0051-96 Steering Angle Sensor Failure (Sensor Detects Internal Failure)	B	B

   Is DTC C0051-62 or C0051-96 indicated?

YES

Go to the **DTC C0051-62 troubleshooting** or **DTC C0051-96 Troubleshooting** .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C0061-96 (77-09) (AWD)

DTC C0061-96 : The Functional Abnormalities of Lateral Acceleration Sensor

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C0061-96 The Functional Abnormalities of Lateral Acceleration Sensor	B	B

DTC (Real Time AWD)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-96 The Functional Abnormalities of Lateral Acceleration Sensor	B	B

   Is DTC C0061-96 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. DTC check (VSA system)

   -1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-49 Acceleration Sensor Failure (Internal Circuit Failure)	B	B

DTC Description	DTC	Freeze Frame
C0061-62 Lateral Acceleration Sensor Failure (Signal Compare Failure)	B	B

Is DTC C0061-49 or C0061-62 indicated?

YES

Go to the DTC C0061-49 troubleshooting or DTC C0061-62 Troubleshooting .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good AWD control unit , and recheck. If the symptom/indication goes away with a known-good AWD control unit, replace the original AWD control unit .

DTC C0061-F0 (77-12), C0062-F0 (77-13), C0063-F0 (77-14) (AWD)

DTC C0061-F0 : Lateral Acceleration Sensor Range/Performance Problem **DTC C0062-F0** : Longitudinal Acceleration Sensor Range/Performance Problem **DTC C0063-F0** : Yaw Rate Sensor Range/Performance Problem

NOTE: Before you troubleshoot, review the General Troubleshooting Information.

DTC Description	DTC	Freeze Frame
C0061-F0 Lateral Acceleration Sensor Range/Performance Problem	B	B
C0062-F0 Longitudinal Acceleration Sensor Range/Performance Problem	B	B
C0063-F0 Yaw Rate Sensor Range/Performance Problem	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-F0 Lateral Acceleration Sensor Range/Performance Problem	B	B
C0062-F0 Longitudinal Acceleration Sensor Range/Performance Problem	B	B
C0063-F0 Yaw Rate Sensor Range/Performance Problem	B	B

Is DTC C0061-F0, C0062-F0, or C0063-F0 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. VSA system DTC check

-1. Check for DTCs in the VSA system with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting in the VSA system .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C0062-96 (77-10) (AWD)

DTC C0062-96 : The Functional Abnormalities of Longitudinal Acceleration Sensor

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C0062-96 The Functional Abnormalities of Longitudinal Acceleration Sensor	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0062-96 The Functional Abnormalities of Longitudinal Acceleration Sensor	B	B

Is DTC C0062-96 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. DTC check (VSA system)

-1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0062-62 Longitudinal Acceleration Sensor Failure (Signal Compare Failure)	B	B

Is DTC C0062-62 indicated?

YES

Go to the DTC C0062-62 troubleshooting .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C0063-96 (77-11) (AWD)

DTC C0063-96 : The Functional Abnormalities of Yaw Rate Sensor

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C0063-96 The Functional Abnormalities of Yaw Rate Sensor	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0063-96 The Functional Abnormalities of Yaw Rate Sensor	B	B

Is DTC C0063-96 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. DTC check (VSA system)

-1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0063-49 Yaw Rate Sensor Failure (Internal Circuit Failure)	B	B

DTC Description	DTC	Freeze Frame
C0063-62 Yaw Rate Sensor Failure (Signal Compare Failure)	B	B

Is DTC C0063-49 or C0063-62 indicated?

YES

Go to the **DTC C0063-49 troubleshooting** or **DTC C0063-62 Troubleshooting** .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C1840-12 (47-01) (AWD)

DTC C1840-12 : Differential Fluid Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1840-12 Differential Fluid Pressure Sensor Circuit High Voltage	B	B

DTC (Real Time AWD)

1. Determine possible failure area (electrical circuit problem, hydraulic circuit problem)

   -1. Start the engine.

   -2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	More than 4.14	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Turn the vehicle to the ON mode.

-4. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

-5. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

Oil Pressure Control Test

Is the test result OK?

YES

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

The failure is duplicated. **Follow the instructions indicated on the HDS according to the test result** .

3. Determine possible failure area (short to power in PS1 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

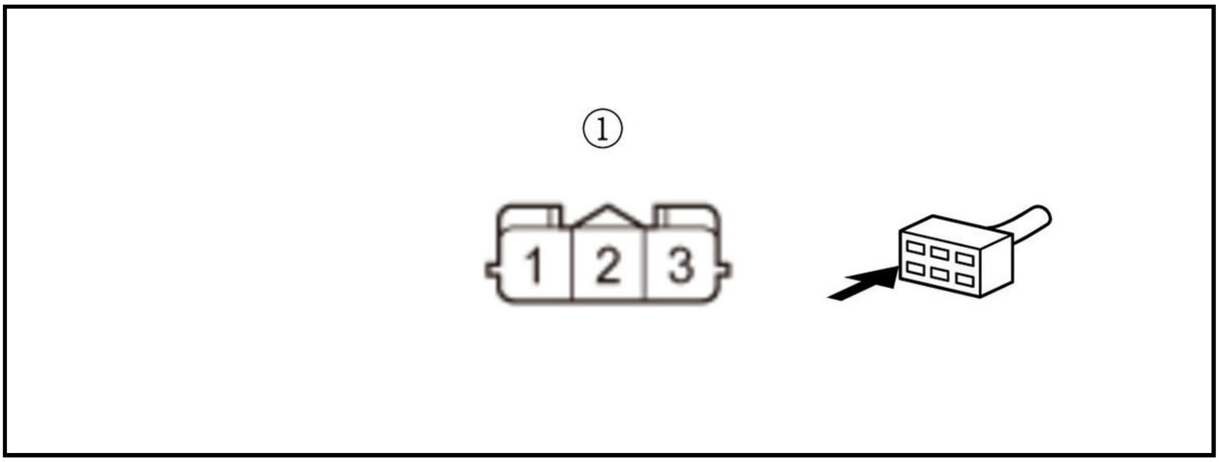
-2. Disconnect the following connector.

Rear differential fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①



Is there about 4.14 V or more?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (PS1 line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

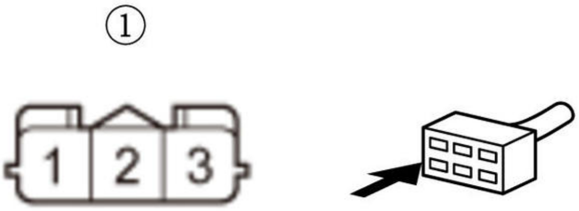
-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 0.5 V or more?

YES

Repair a short to power in the PS1 wire between the rear differential fluid pressure sensor and the AWD control unit.

NO

Go to the 5.

5. Shorted wire check (PS1 line to SVCC line)

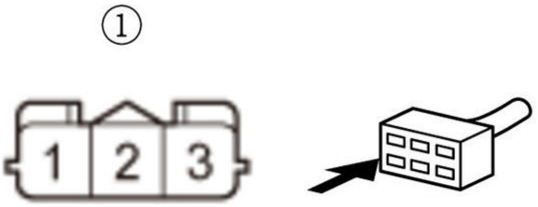
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected

Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①

Test point 2	Rear differential fluid pressure sensor 3P connector (female terminals) No. 3: ①



Is there continuity?

YES

Repair a short in the PS1 wire to the SVCC wire between the rear differential fluid pressure sensor and the AWD control unit.

NO

Go to step 6.

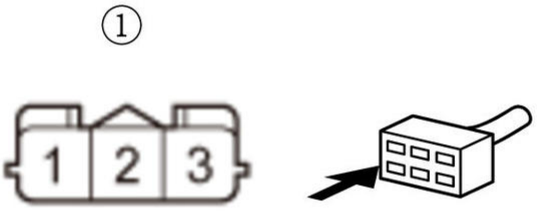
6. Rear differential fluid pressure sensor check

-1. Connect the following connector.

AWD control unit 24P connector

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear differential fluid pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①



-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	Less than 0.1	V	B	B

Do the current condition (s) match the threshold?

YES

Replace the rear differential fluid pressure sensor .

NO

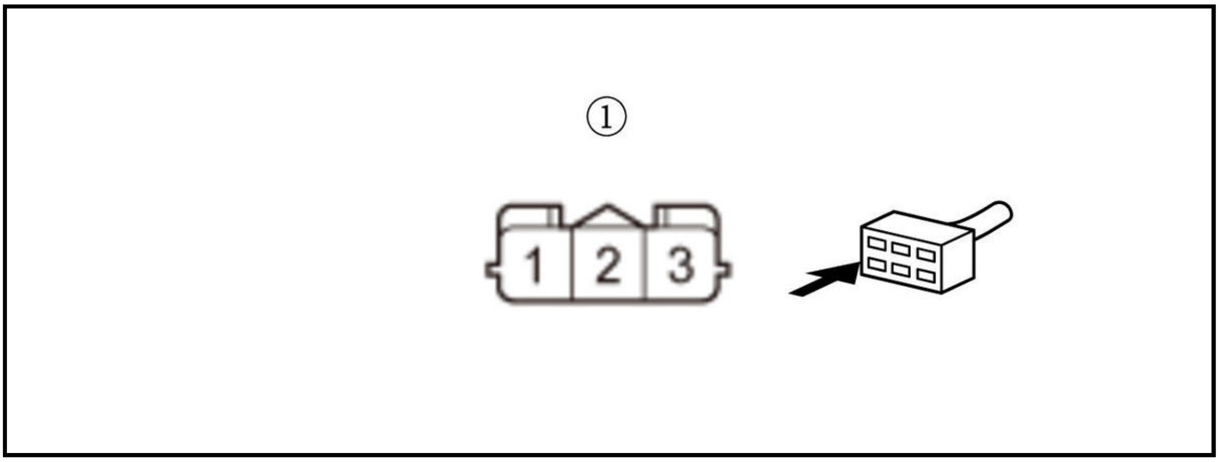
Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

7. Determine possible failure area (open in PS1 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Terminal B	Body ground



-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	Less than 0.1	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 9.

NO

Go to step 8.

8. Open wire check (PS1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

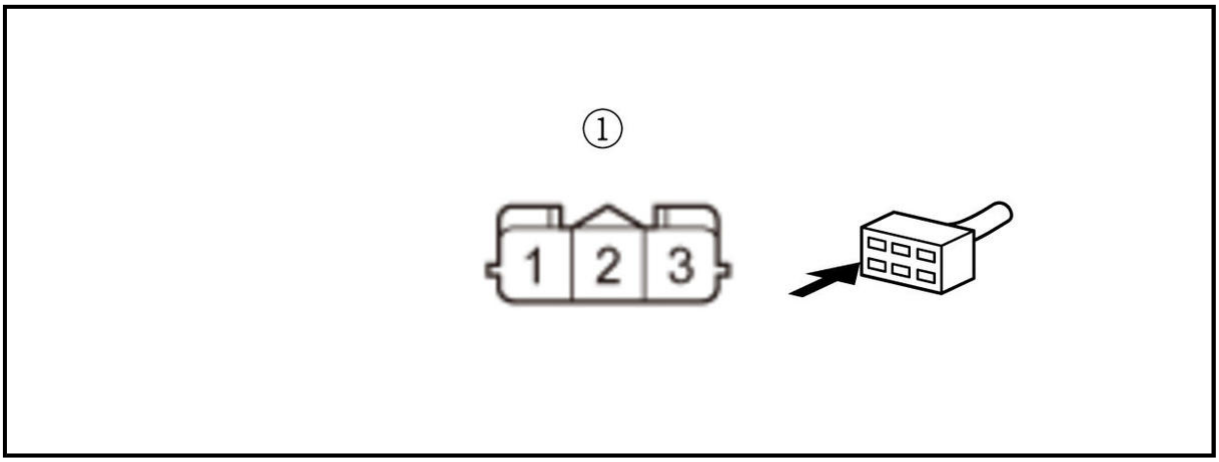
-2. Remove the jumper wire.

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**AWD control unit 24P connector No. 21**



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the PS1 wire between the rear differential fluid pressure sensor and the AWD control unit.

9. Open wire check (SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

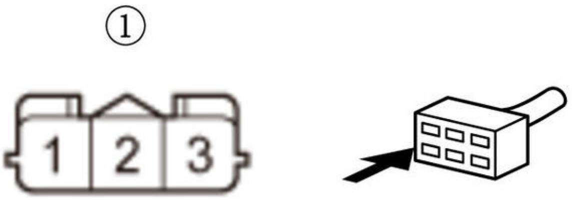
-2. Remove the jumper wire.

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**Real time AWD control unit 24P connector No. 11**



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the SG wire between the rear differential fluid pressure sensor and the AWD control unit.

DTC C1840-14 (47-02) (AWD)

DTC C1840-14 : Differential Fluid Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1840-14 Differential Fluid Pressure Sensor Circuit Low Voltage	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Start the engine.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	Less than 0.34	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (PS1 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil pressure sensor for rear differential	About 5	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted wire check (PS1 line)

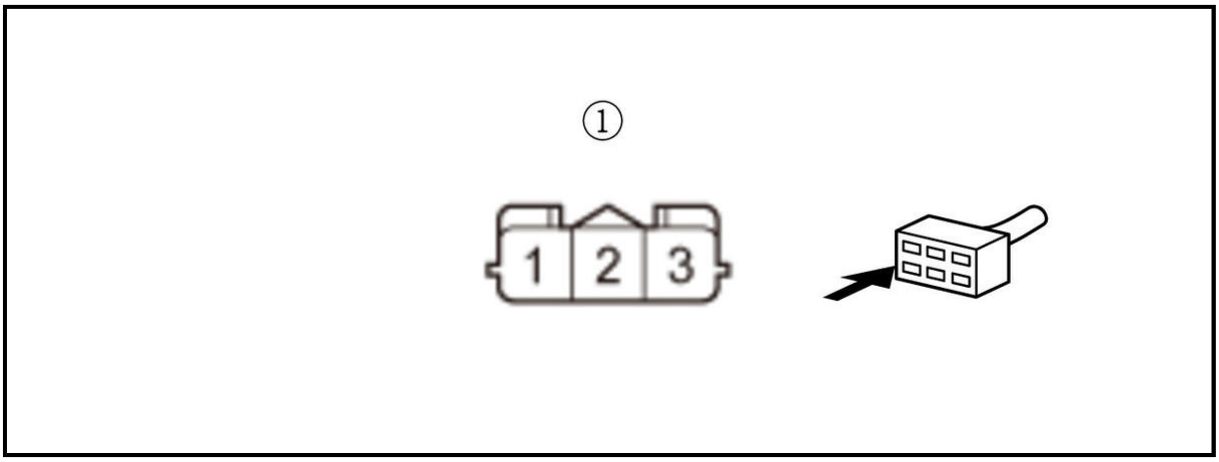
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground or the SG wire in the PS1 wire between the rear differential fluid pressure sensor and the AWD control unit.

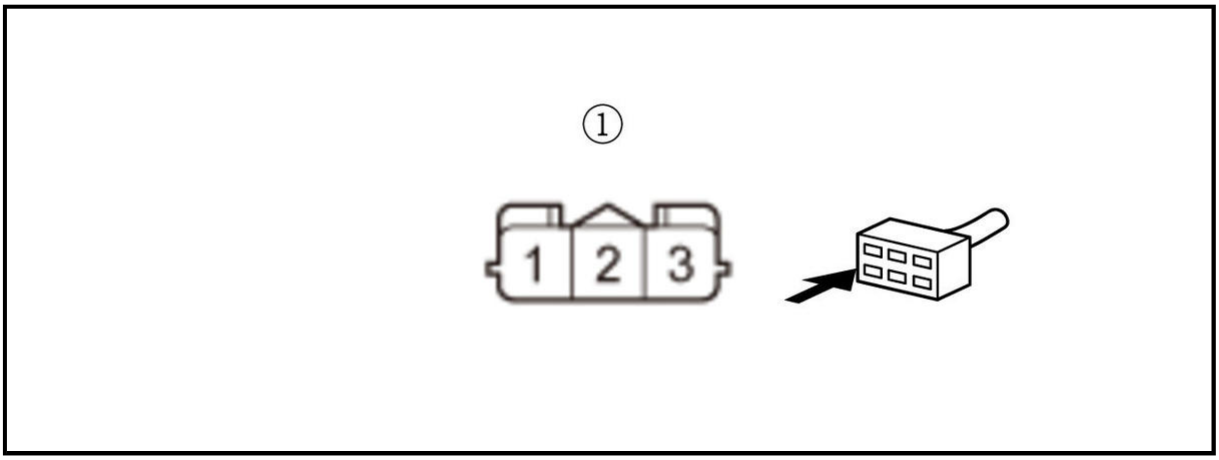
NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

4. Determine possible failure area (Rear differential fluid pressure sensor, SVCC line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Rear differential fluid pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5 V?

YES

Replace the rear differential fluid pressure sensor .

NO

Go to step 5.

5. Open wire check (SVCC line)

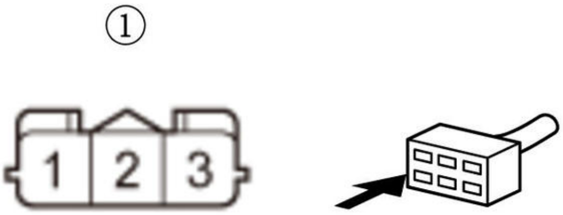
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**AWD control unit 24P connector No. 20**



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the SVCC wire between the rear differential fluid pressure sensor and the AWD control unit.

DTC C1841-11 (42-02) (AWD)

DTC C1841-11 : Differential Fluid Temperature Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1841-11 Differential Fluid Temperature Sensor Circuit Low Voltage	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil temperature sensor for rear differential	Less than 0.08	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the Freeze data/on-board snapshot.

2. Rear differential fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential fluid temperature sensor 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil temperature sensor for rear differential	About 5	V	B	B

Do the current condition (s) match the threshold?

YES

Replace the rear differential fluid temperature sensor .

NO

The rear differential fluid temperature sensor is OK. Go to step 3.

3. Shorted wire check (TOH line)

-1. Turn the vehicle to the OFF (LOCK) mode.

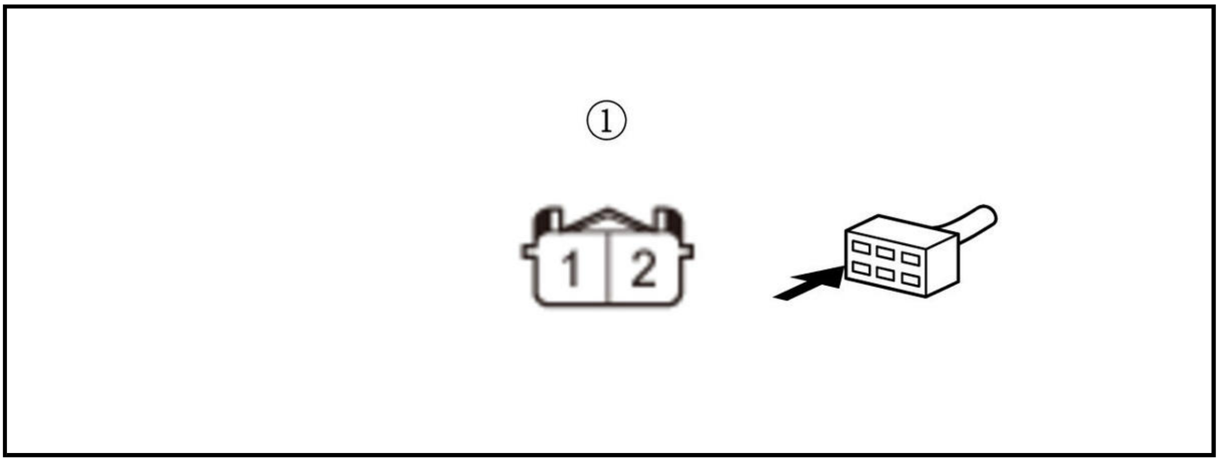
-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid temperature sensor 2P connector: disconnected

B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground or the TOL wire in the TOH wire between the rear differential fluid temperature sensor and the AWD control unit.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C1841-13 (42-01) (AWD)

DTC C1841-13 : Differential Fluid Temperature Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1841-13 Differential Fluid Temperature Sensor Circuit High Voltage	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Voltage of the oil temperature sensor for rear differential	More than 4.9	V	B	B

Do the current condition (s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (short to power in TOH line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

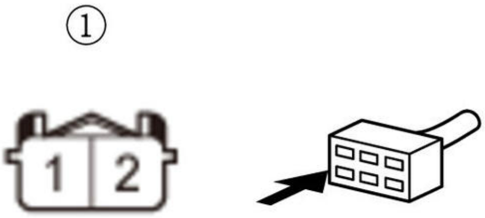
-2. Disconnect the following connector.

Rear differential fluid temperature sensor 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid temperature sensor 2P connector: disconnected
Test point 1	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 4.9 V or more?

YES

Go to step 6.

NO

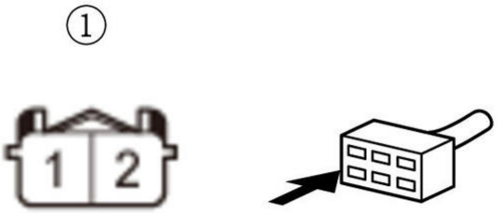
Go to step 3.

3. Determine possible failure area (open in TOH line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Terminal B	Body ground



-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
Voltage of the oil temperature sensor for rear differential	Less than 0.1	V	B	B

Do the current condition (s) match the threshold?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (TOH line)

-1. Turn the vehicle to the OFF (LOCK) mode.

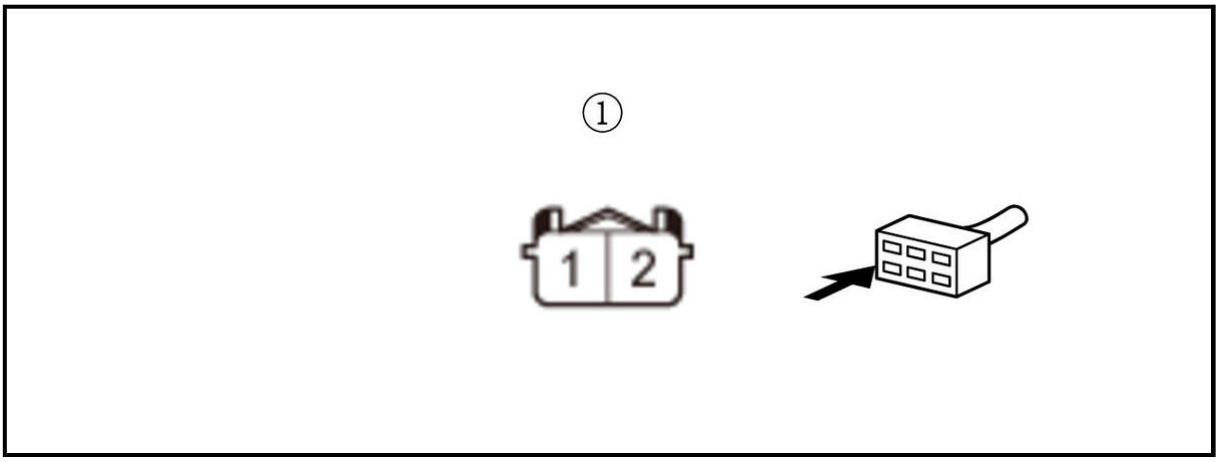
-2. Remove the jumper wire.

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF mode
B	Rear differential fluid temperature sensor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 18**
Test point 2	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the TOH wire between the rear differential fluid temperature sensor and the AWD control unit.

5. Open wire check (TOL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

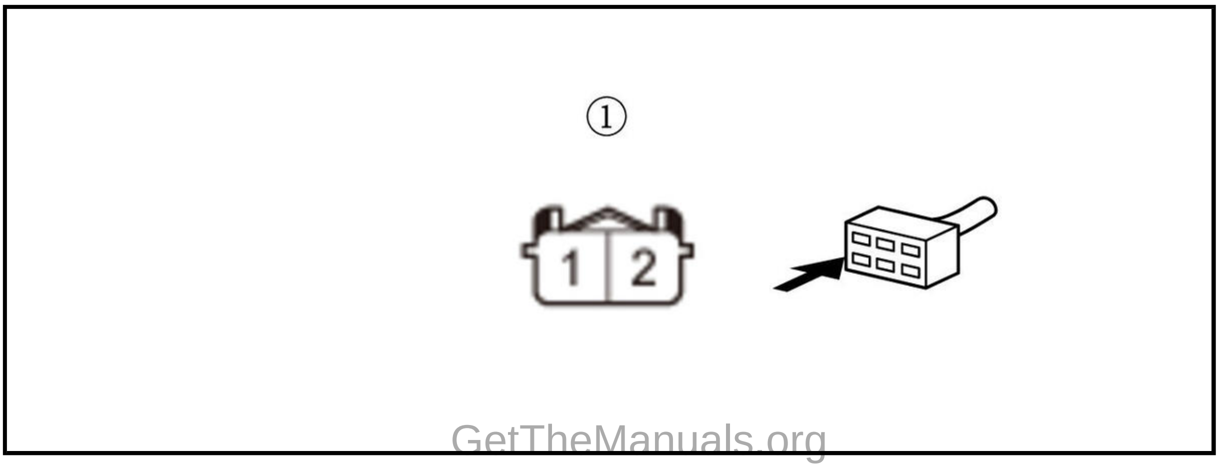
-2. Remove the jumper wire.

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid temperature sensor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 22**
Test point 2	Rear differential fluid temperature sensor 2P connector (female terminals) No. 2: ①



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the TOL wire between the rear differential fluid temperature sensor and the AWD control unit.

6. Shorted wire check (TOH line to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

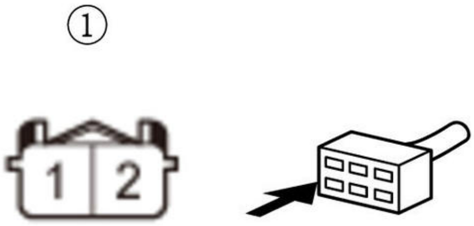
   -2. Disconnect the following connector.

AWD control unit 24P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential fluid temperature sensor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 0.5 V or more?

YES

Repair a short to power in the TOH wire between the rear differential fluid temperature sensor and the AWD control unit.

NO

Go to step 7.

7. Rear differential fluid temperature sensor check

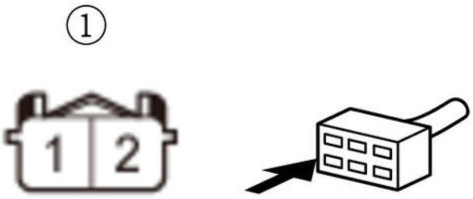
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the following connector.

AWD control unit 24P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Rear differential fluid temperature sensor 2P connector (female terminals) No. 1: ①
Terminal B	Rear differential fluid temperature sensor 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter (s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
Voltage of the oil temperature sensor for rear differential	Less than 0.1	V	B	B

Do the current condition (s) match the threshold?

YES

Replace the rear differential fluid temperature sensor .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

DTC C1841-27 (43-01) (AWD)

DTC C1841-27 : Differential Fluid Temperature Sensor Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	**DTC**	**Freeze Frame**
C1841-27 Differential Fluid Temperature Sensor Circuit	B	B

DTC Description	DTC	Freeze Frame
Range/Performance Problem		

DTC (Real Time AWD)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1841-11 Differential Fluid Temperature Sensor Circuit Low Voltage	B	B
C1841-13 Differential Fluid Temperature Sensor Circuit High Voltage	B	B
C1841-27 Differential Fluid Temperature Sensor Circuit Range/Performance Problem	B	B

Is DTC C1841-11, C1841-13, or C1841-27 indicated?

DTC C1841-11 is indicated

Go to the DTC C1841-11 troubleshooting.

DTC C1841-13 is indicated

Go to the DTC C1841-13 troubleshooting.

DTC C1841-27 is indicated

Go to step 2.

2. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Start the engine, and let it idle for 1 minute.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1841-27 Differential Fluid Temperature Sensor Circuit Range/Performance Problem	B	B

Is DTC C1841-27 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Rear differential fluid temperature sensor check

-1. Check the parameter (s) below with the HDS. Make note of this value as it will be needed in the following steps.

Signal	Current conditions	
	Values	Unit
Voltage of the oil temperature sensor for rear differential	B	B

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS then compare with the value checked in step 3

Signal	Current conditions	
	Values	Unit
Voltage of the oil temperature sensor for rear differential	B	B

Did the sensor value change?

YES

Check for an intermittent open or short in the TOH and/or TOL wires between the rear differential fluid temperature sensor and the AWD control unit, and recheck.

NO

Replace the rear differential fluid temperature sensor .

DTC C1850-14 (44-50) (AWD)

DTC C1850-14 : Fail Safe Relay Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1850-14 Fail Safe Relay Stuck OFF	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1850-14 Fail Safe Relay Stuck OFF	B	B

Is DTC C1850-14 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A20 (20 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A20 (20 A) fuse circuit, then go to step 4

3. Open wire check (+B E-DPS line)

-1. Disconnect the following connector.

AWD control unit 24P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the +B E-DPS wire between the No. A20 (20 A) fuse and the AWD control unit.

4. Determine possible failure area (MH line, others)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	Body ground

Is there continuity?

YES

Go to step 5.

NO

Go to step 6.

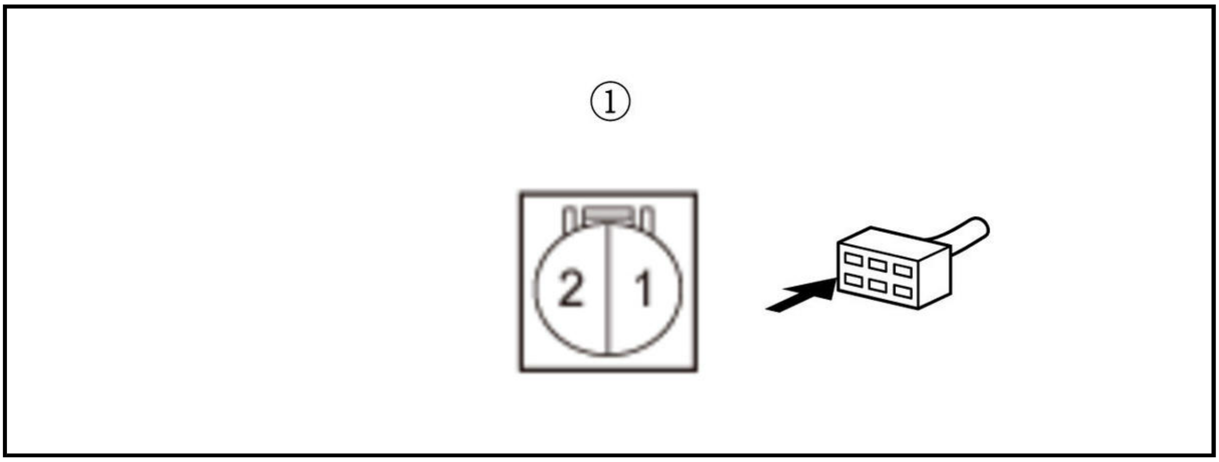
5. Rear differential pump motor internal shorted check

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Real time AWD control unit 24P connector: disconnected
B	Rear differential pump motor 2P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (male terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the rear differential pump motor .

NO

Repair a short to ground in the MH wires between the rear differential pump motor and the AWD control unit.

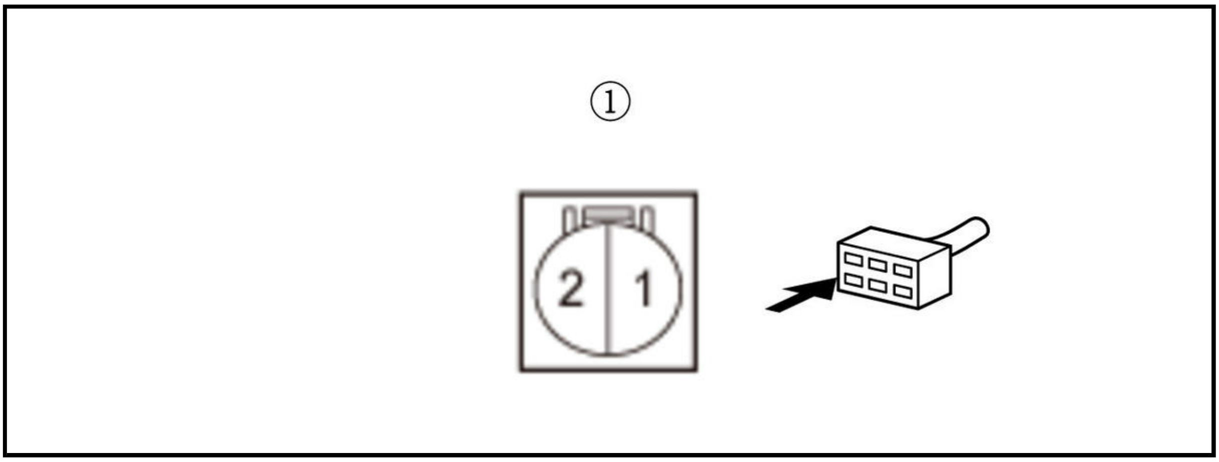
6. Rear differential pump motor internal shorted check

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF mode
B	AWD control unit 24P connector: disconnected
B	Rear differential pump motor 2P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (male terminals) No. 1: ①
Test point 2	Rear differential pump motor 2P connector (male terminals) No. 2: ①



Is there continuity?

YES

Replace the rear differential pump motor .

NO

Go to step 7.

7. AWD control unit check

-1. On the AWD control unit side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF mode
B	AWD control unit 24P connector: disconnected
B	Rear differential pump motor 2P connector: disconnected
Test point 1	AWD control unit 24P connector No. 1
Test point 2	AWD control unit 24P connector No. 3

Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good AWD control unit , and recheck. If the symptom/indication goes away with a known-good AWD control unit, replace the original AWD control unit .

NO

Replace the No. A20 (20 A) fuse.

DTC C1851-18 (63-01) (AWD)

DTC C1851-18 : Motor Circuit Low Current

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1851-18 Motor Circuit Low Current	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1851-18 Motor Circuit Low Current	B	B

   Is DTC C1851-18 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Go to step 2.

2. Problem verification (with rear differential pump motor running)

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Turn the vehicle to the ON mode.

   -4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -5. With the engine running, **do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

   Air Bleeding

   Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1851-18 Motor Circuit Low Current	B	B

   Is DTC C1851-18 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 4**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 4.

NO

Check for poor connections or loose terminals between the AWD control unit and ground (G503). If the connections are OK, repair an open in the GND wire between the AWD control unit and ground (G503).

4. Determine possible failure area (short in MH, ML lines, open in MH, ML lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	Body ground

Is there continuity?

YES

Go to step 7.

NO

Go to step 5.

5. Determine possible failure area (MH, ML lines, AWD control unit)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode, At normal air temperature
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	**AWD control unit 24P connector No. 3**

Is there about 10 Ω or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Go to step 6.

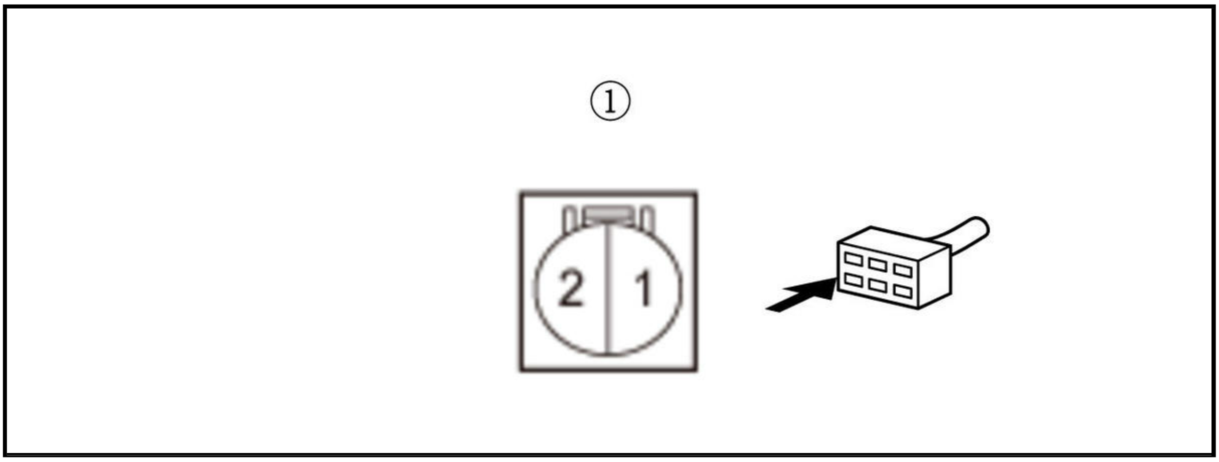
6. Rear differential pump motor internal open check

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. On the rear differential pump motor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
B	Rear differential pump motor 2P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (male terminals) No. 1: ①
Test point 2	Rear differential pump motor 2P connector (male terminals) No. 2: ①



Is there about 10 Ω or less?

YES

Repair an open in the MH and/or ML wires between the rear differential pump motor and the AWD control unit.

NO

Replace the rear differential pump motor .

7. Rear differential pump motor internal shorted check

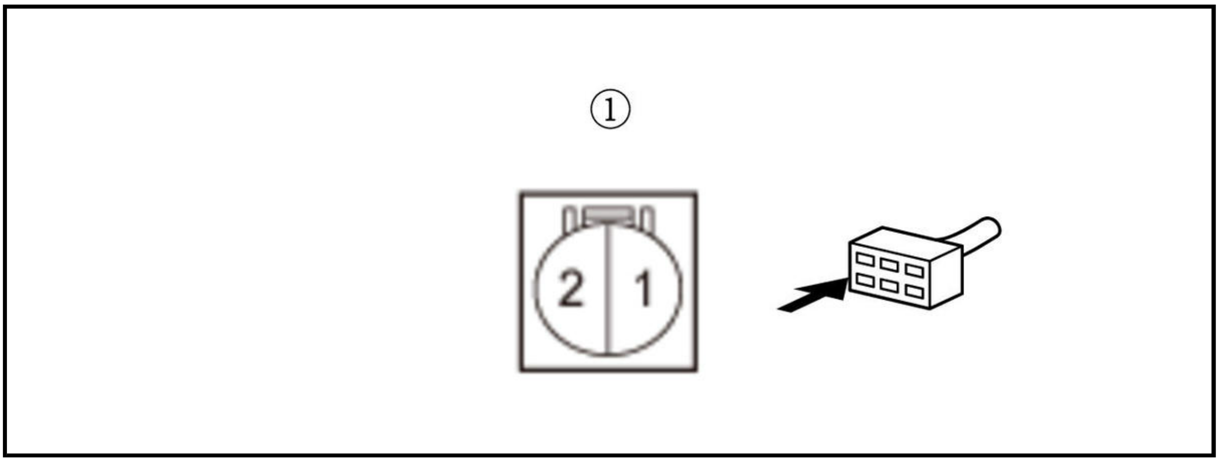
-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. Check for continuity between the following test points 1 and 2 individually (see table).

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
B	Rear differential pump motor 2P connector: disconnected

Connector	Test point 1	Test point 2
Rear differential pump motor 2P connector (male terminals)	No. 1: ①	Rear differential pump motor body
	No. 2: ①	



Are there continuity?

YES

Replace the rear differential pump motor .

NO

Repair a short to ground in the MH and/or ML wires between the rear differential pump motor and the AWD control unit.

DTC C1851-19 (63-02), C1851-1E (63-03), C1851-1E (63-04) (AWD)

DTC C1851-19 : Control Module Internal Control Module Malfunction **DTC C1851-1E** : Motor Circuit High Current

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1851-19 Control Module Internal Control Module Malfunction	B	B
C1851-1E Motor Circuit High Current	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1851-19 Control Module Internal Control Module Malfunction	B	B
C1851-1E Motor Circuit High Current	B	B

Is DTC C1851-19 or C1851-1E indicated?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification (with rear differential pump motor running)

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode.

-4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

-5. With the engine running, **do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

Air Bleeding

Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1851-19 Control Module Internal Control Module Malfunction	B	B

DTC Description	DTC	Freeze Frame
C1851-1E Motor Circuit High Current	B	B

Is DTC C1851-19 or C1851-1E indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Determine possible failure area (short to power in MH, ML lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential pump motor 2P connector

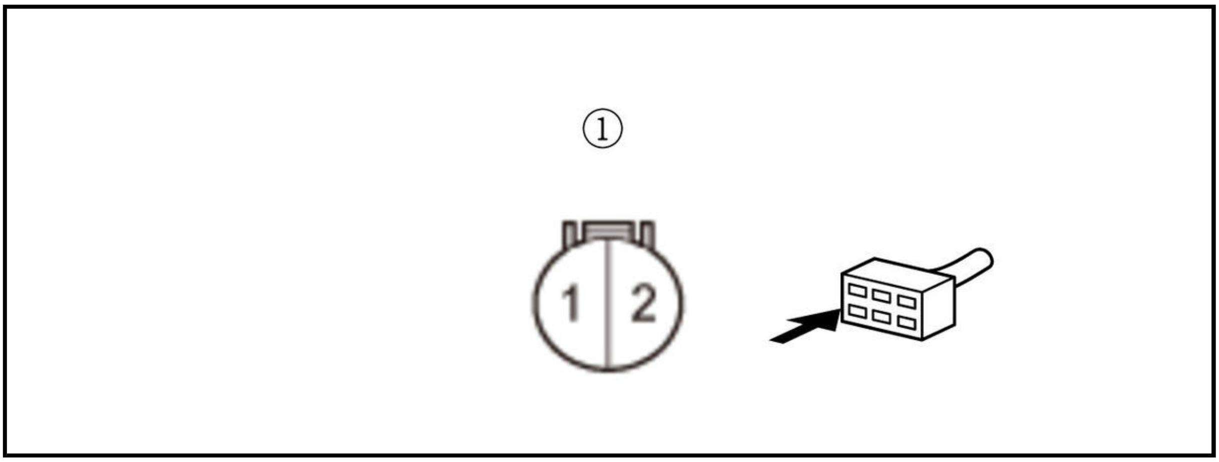
-3. Turn the vehicle to the ON mode.

-4. Wait for 10 seconds.

-5. Measure the voltage between the following test points 1 and 2 individually (see table).

Test condition	Vehicle ON mode
B	Rear differential pump motor 2P connector: disconnected

Connector	**Test point 1**	**Test point 2**
Rear differential pump motor 2P connector (female terminals)	No. 1: ①	Body ground
	No. 2: ①	



Is there about 0.1 V or less?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (MH line to power, ML line to power)

-1. Disconnect the following connector.

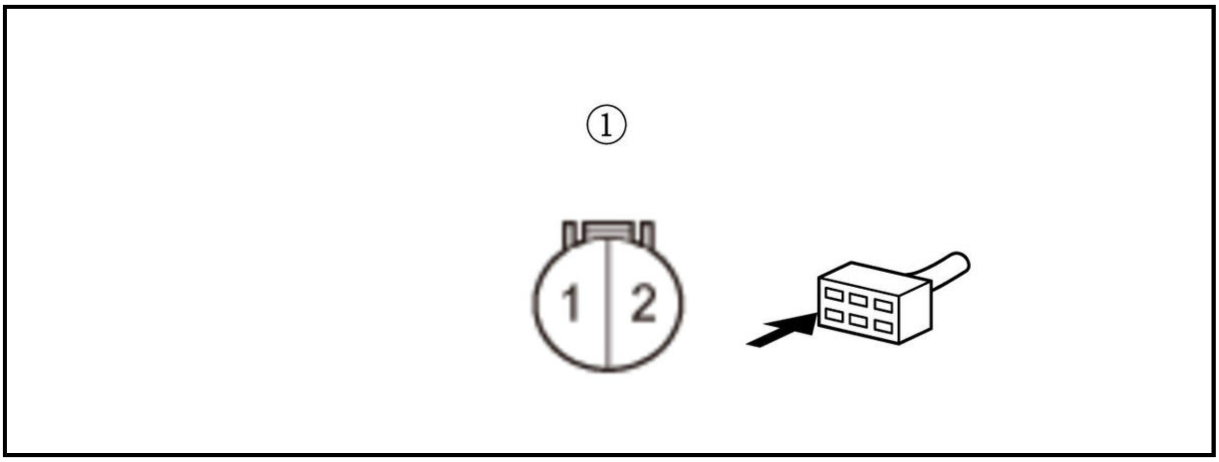
AWD control unit 24P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between the following test points 1 and 2 individually (see table).

Test condition	Vehicle ON mode
B	Rear differential pump motor 2P connector: disconnected
B	Real time AWD control unit 24P connector: disconnected

Connector	**Test point 1**	**Test point 2**
Rear differential pump motor 2P connector (female terminals)	No. 1: ①	Body ground
	No. 2: ①	



Is there about 0.1 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair short to power in the MH and/or ML wires between the rear differential pump motor and the AWD control unit.

5. Determine possible failure area (short to ground in MH line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the following connector.

Rear differential pump motor 2P connector

-3. Disconnect the following connector.

AWD control unit 24P connector

-4. Check for continuity between the following test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	Body ground

Is there continuity?

YES

Go to step 6.

NO

Go to step 7.

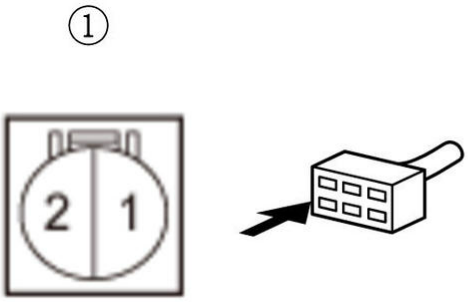
6. Rear differential pump motor internal shorted check

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. On the rear differential pump motor side, check for continuity between the test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rear differential pump motor 2P connector: disconnected
	AWD control unit 24P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (male terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the rear differential pump motor .

NO

Repair short to ground in the MH wire between the rear differential pump motor and the AWD control unit.

7. Determine possible failure area (short in MH, ML line, others)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 1**
Test point 2	**AWD control unit 24P connector No. 3**

Is there continuity?

YES

Go to step 8.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

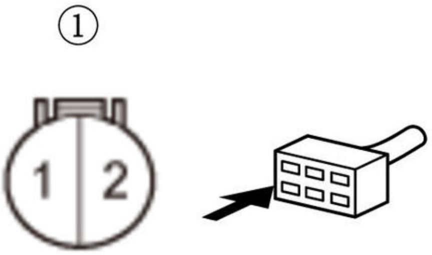
8. Shorted wire check (MH line to ML line)

-1. Disconnect the following connector.

Rear differential pump motor 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential pump motor 2P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential pump motor 2P connector (female terminals) No. 1: ①
Test point 2	Rear differential pump motor 2P connector (female terminals) No. 2: ①



Is there continuity?

YES

Repair a short in the MH wire to the ML wire between the rear differential pump motor and the AWD control unit.

NO

Replace the rear differential pump motor .

DTC C1852-18 (62-01) (AWD)

DTC C1852-18 : Solenoid Valve Circuit Low Current

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1852-18 Solenoid Valve Circuit Low Current	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1852-18 Solenoid Valve Circuit Low Current	B	B

Is DTC C1852-18 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification (with rear differential pump motor running)

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode.

-4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

-5. With the engine running, **do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

Air Bleeding

Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1852-18 Solenoid Valve Circuit Low Current	B	B

Is DTC C1852-18 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Determine possible failure area (D-GND line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the rear differential subharness D-GND wire terminal from the rear differential assembly.

-3. Check for continuity between the following test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rear differential subharness D-GND wire terminal: disconnected
Test point 1	Rear differential subharness D-GND wire terminal
Test point 2	Body ground

Is there continuity?

YES

Go to step 4.

NO

Repair an open in the D-GND wires between the AWD control unit and ground (G503).

4. Determine possible failure area (D-GND2 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the rear differential subharness D-GND2 wire terminal from the rear differential assembly.

-3. Check for continuity between the following test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rear differential subharness D-GND2 wire terminal: disconnected
Test point 1	Rear differential subharness D-GND2 terminal
Test point 2	Body ground

Is there continuity?

YES

Go to step 5.

NO

Repair an open in the D-GND2 wires between the AWD control unit and ground (G503).

5. Determine possible failure area (DTYH1 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode

-2. Disconnect the following connector.

Rear differential solenoid valve 1P connector

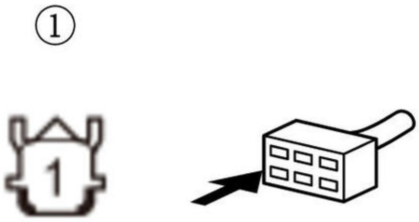
-3. Turn the vehicle to the ON mode.

-4. Wait for 10 seconds.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential solenoid valve 1P connector: disconnected

Test point 1	Rear differential solenoid valve 1P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 0.1 V or less?

YES

Go to step 7.

NO

Go to step 6.

6. Shorted wire check (DTYH1 line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

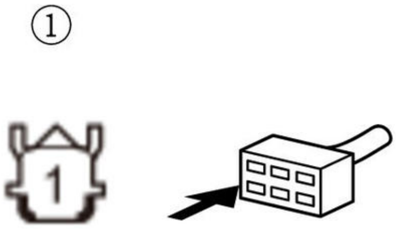
-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential solenoid valve 1P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 0.1 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good real time AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

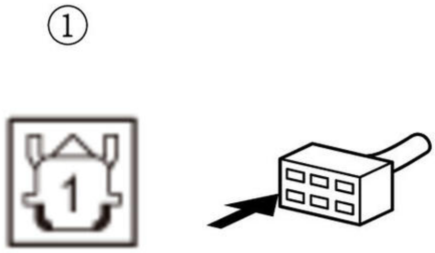
Repair a short to power in the DTYH1 wire between the rear differential solenoid valve and the AWD control unit.

7. Rear differential solenoid valve check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. On the solenoid valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
Test point 1	Rear differential solenoid valve 1P connector (male terminals) No. 1: ①
Test point 2	Rear differential solenoid valve body



Is there about 100 Ω or less?

YES

The rear differential solenoid valve is OK. Go to step 8.

NO

Replace the rear differential solenoid valve .

8. Shorted wire check (DTYH1 line)

-1. Disconnect the following connector.

AWD control unit 24P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 15**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the DTYH1 wire between the rear differential solenoid valve and the AWD control unit.

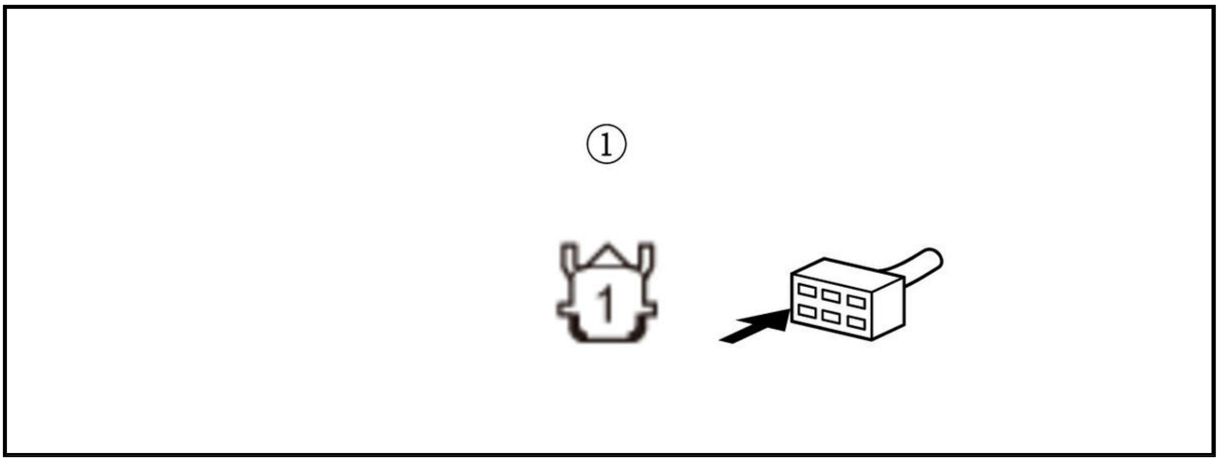
NO

The DTYH1 wire is not shorted. Go to step 9.

9. Open wire check (DTYH1 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential solenoid valve 1P connector (female terminals) No. 1: ①
Test point 2	AWD control unit 24P connector No. 15



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good AWD control unit , and recheck. If the symptom/indication goes away with a known-good AWD control unit, replace the original AWD control unit .

NO

Repair an open in the DTYH1 wire between the rear differential solenoid valve and the AWD control unit.

DTC C1852-19 (62-04) (AWD)

DTC C1852-19 : Solenoid Valve Circuit High Current

NOTE: Before you troubleshoot, review the General Troubleshooting Information.

DTC Description	DTC	Freeze Frame
C1852-19 Solenoid Valve Circuit High Current	B	B

DTC (Real Time AWD)

1. Problem verification (with engine idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1852-19 Solenoid Valve Circuit High Current	B	B

   Is DTC C1852-19 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Go to step 2.

2. Problem verification (with rear differential pump motor running)

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Turn the vehicle to the ON mode.

   -4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -5. With the engine running, **do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

   Air Bleeding

   Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1852-19 Solenoid Valve Circuit High Current	B	B

   Is DTC C1852-19 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Shorted wire check (DTYH1 line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Rear differential solenoid valve 1P connector
AWD control unit 24P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 15**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the DTYH1 wire between the rear differential solenoid valve and the AWD control unit.

NO

The DTYH1 wire is OK. Go to step 4.

4. Rear differential solenoid valve check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

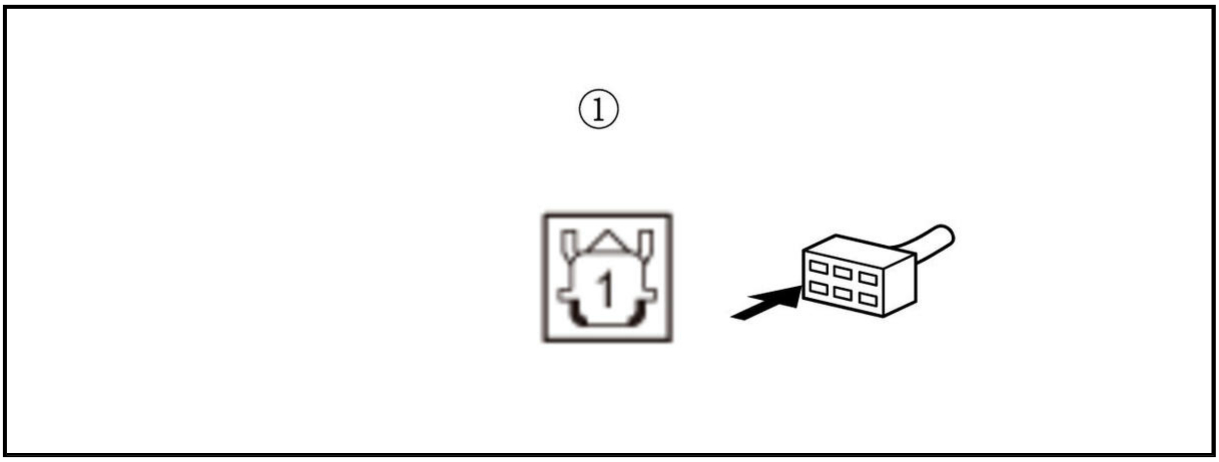
NOTE: The rear differential fluid temperature should be 50 deg. F (10 deg. C) - 86 deg. F (30 deg. C). If the value is not within the enable temperature, warm up the rear differential fluid temperature by raising the vehicle on a lift and run the vehicle at 13 mph (20 km/h) for 5 seconds then slow down, and stop the wheels.

Signal	**Current conditions**	
	Values	**Unit**
Oil temperature for rear differential	B	B

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. On the solenoid valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential solenoid valve 1P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	Rear differential solenoid valve 1P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there about 10 Ω or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Replace the rear differential solenoid valve .

DTC C1858-72 (71-02) (AWD)

DTC C1858-72 : Differential Fluid Pressure Deviation Low

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1858-72 Differential Fluid Pressure Deviation Low	B	B

DTC (Real Time AWD)

1. Rear differential fluid level check

   -1. **Check the rear differential fluid level** , and check for rear differential fluid leakage.

   Is the check result OK?

   YES

   The rear differential fluid level is OK. Go to step 2.

   NO

   Find and repair the source of the fluid leak then **add recommended fluid** .

2. Problem verification (function test with HDS)

   -1. Turn the vehicle to the ON mode.

   -2. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -3. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

   Oil Pressure Control Test

Is fault code indicated?

Fault code is not indicated

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

Fault code 2-1 or 5-1 is indicated

Go to step 3.

Fault code 3-1 is indicated

Go to step 4.

Fault code except 2-1, 3-1, and 5-1 is indicated

Go to step 5.

3. Hydraulic system check

   -1. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -2. **Do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

   Air Bleeding

   -3. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -4. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

   Oil Pressure Control Test

   Is the test result OK?

   YES

   Hydraulic system is OK at this time.

   NO

   Replace the rear differential fluid then **do the rear differential fluid pressure sensor test** and **do the rear differential solenoid valve test** . If they are OK, **replace the rear differential assembly** .

4. Hydraulic system check

   -1. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -2. **Do the AIR BLEEDING in the ADJUSTMENT with the HDS** .

   Air Bleeding

   Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -4. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

   Oil Pressure Control Test

   Is the test result OK?

   YES

Hydraulic system is OK at this time.

NO

Replace the rear differential fluid , then **do the rear differential solenoid valve test** . If it is OK, **replace the rear differential assembly** .

5. DTC check

   -1. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -2. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** three times.

   Oil Pressure Control Test

   Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Are there any DTCs?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   The system is OK at this time.

DTC C1858-73 (71-01) (AWD)

DTC C1858-73 : Differential Fluid Pressure Deviation High

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1858-73 Differential Fluid Pressure Deviation High	B	B

DTC (Real Time AWD)

1. Problem verification (function test with HDS)

   -1. Turn the vehicle to the ON mode.

   -2. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -3. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS** .

   Oil Pressure Control Test

   Are fault codes indicated?

   Fault code is not indicated

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   Fault code 4-1 or 6-1 is indicated

Replace the rear differential fluid , then do the rear differential solenoid valve test . If it is OK, replace the rear differential assembly .

Fault code except 4-1 and 6-1 is indicated

The failure is duplicated. Go to step 2.

2. DTC check

   -1. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -2. Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS three times.

   Oil Pressure Control Test

   Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Are there any DTCs?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   The system is OK at this time.

DTC C1860-98 (76-01) (AWD)

DTC C1860-98 : Differential Fluid Overheats

NOTE:

- Before you troubleshoot, review the General Troubleshooting Information.
- When the clutch is presumed to be overheated, DTC C1860-98 is set and the system turns off the clutch engagement to protect the clutch. This DTC may also set under the following conditions.
-
  - -

    When spinning the rear wheels while the vehicle is stuck in sand, mud, snow, etc
  - -

    When the VSA system is OFF
- If other DTCs are stored at the same time as DTC C1860-98 and/or DTC C1861-9A, troubleshoot other DTCs first, then recheck for DTC C1860-98 and/or DTC C1861-9A.

DTC Description	DTC	Freeze Frame
C1860-98 Differential Fluid Overheats	B	B

DTC (Real Time AWD)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC C1860-98, C1861-9A, or other DTC indicated?

DTC C1860-98 or C1861-9A is indicated

Go to step 2.

Other DTC is indicated

Go to the indicated DTC's troubleshooting.

2. Tire size check

-1. Check the tire size of the four wheels.

Are all tire sizes same?

YES

The tire sizes are OK. Go to step 3.

NO

Replace the tire with the standard size .

3. Brake drag check

-1. Check for brake drag.

Are the brakes OK?

YES

The brakes are OK. Go to step 4.

NO

Repair the front/rear hydraulic brake system or the parking brake system .

4. Rear differential fluid temperature sensor check

-1. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Oil temperature for rear differential	B	B

-2. Measure the actual temperature of the rear differential fluid, then compare it with the HDS value checked in step 4

Are the values almost the same?

YES

The rear differential fluid temperature sensor is OK. Go to step 5.

NO

Replace the rear differential fluid temperature sensor .

5. Rear differential fluid pressure sensor test

-1. **Do the rear differential fluid pressure sensor test** .

Is the test result OK?

YES

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Do the repair depending on the test result .

DTC C1861-9A (76-02) (AWD)

DTC C1861-9A : Vehicle Spin Detected

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information**.
- When a vehicle spin is detected, DTC C1861-9A is set for the purpose of protecting the real time AWD system. When this condition occurs, the system will temporarily stop the real time AWD function. This DTC may also set under these conditions.
-
    - -

      When spinning the rear wheels while stuck in sand, mud, snow, etc
    - -

      When the VSA system is OFF
- If other DTCs are stored at the same time as DTC C1860-98 and/or DTC C1861-9A, troubleshoot other DTCs first, then recheck for DTC C1860-98 and/or DTC C1861-9A.

DTC Description	DTC	Freeze Frame
C1861-9A Vehicle Spin Detected	B	B

DTC (Real Time AWD)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC C1860-98, C1861-9A, or other DTCs indicated?

DTC C1860-98 or C1861-9A is indicated

Go to step 2.

Other DTC is indicated

Go to the indicated DTC's troubleshooting.

2. Tire size check

   -1. Check the tire size of the four wheels.

   Are all tire sizes same?

   YES

   The tire sizes are OK. Go to step 3.

   NO

   Replace the tire with the standard size .

3. Brake drag check

   -1. Check for brake drag.

   Are the brakes OK?

   YES

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   NO

   Repair the front/rear hydraulic brake system or the parking brake system .

DTC C1870-00 (77-01), C1871-00 (77-04), C1872-00 (77-02) (AWD)

DTC C1870-00 : The Functional Abnormalities of Fuel and Emissions **DTC C1871-00** : The Functional Abnormalities of Automatic Transmission **DTC C1872-00** : The Functional Abnormalities of VSA Modulator-Control Unit

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1870-00 The Functional Abnormalities of Fuel and Emissions	B	B
C1871-00 The Functional Abnormalities of Automatic Transmission	B	B
C1872-00 The Functional Abnormalities of VSA Modulator-Control Unit	B	B

DTC (Real Time AWD)

1. Problem verification (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

Check for DTCs with the HDS.

NOTE: These codes are stored whenever the following systems DTCs are detected.

- When DTC C1870-00 is indicated, check the PGM-FI system and CVT system DTC.
- When DTC C1871-00 is indicated, check the CVT system DTC.
- When DTC C1872-00 is indicated, check the VSA system DTC.

DTC Description	DTC	Freeze Frame
C1870-00 The Functional Abnormalities of Fuel and Emissions	B	B

DTC Description	DTC	Freeze Frame
C1871-00 The Functional Abnormalities of Automatic Transmission	B	B
C1872-00 The Functional Abnormalities of VSA Modulator-Control Unit	B	B

Is DTC C1870-00, C1871-00 and/or C1872-00 indicated?

DTC C1870-00 is indicated

The failure is duplicated. Check the **PGM-FI system DTC** and **CVT system DTC** .

DTC C1871-00 is indicated

The failure is duplicated. Check the **CVT system DTC** .

DTC C1872-00 is indicated

The failure is duplicated. **Check the VSA system DTC** .

DTC is not indicated

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1873-00 (16-04) (AWD)

DTC C1873-00 : Steering Angle Sensor Malfunction

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
C1873-00 Steering Angle Sensor Malfunction	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1873-00 Steering Angle Sensor Malfunction	B	B

Is DTC C1873-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. VSA system DTC check

-1. Check for DTCs in the VSA system with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting in the VSA system .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U0100-00 (41-01), U0101-00 (41-04), U0122-00 (41-02), U0131-00 (41-09), U0151-00 (41-08) (AWD (WITH CAN GATEWAY)) (2017 2018 2019)

DTC U0100-00 : F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))**DTC U0101-00** : F-CAN Malfunction (Lost Communication with A/T Control System)**DTC U0122-00** : F-CAN Malfunction (Lost Communication with VSA Modulator-Control Unit)**DTC U0131-00** : F-CAN Malfunction (Lost Communication with EPS Control Unit)**DTC U0151-00** : F-CAN Malfunction (Lost Communication with SRS unit)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- According to the detected DTC (s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the AWD control unit.
- Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))	B	B
U0101-00 F-CAN Malfunction (Lost Communication with	B	B

DTC Description	DTC	Freeze Frame
A/T Control System)		
U0122-00 F-CAN Malfunction (Lost Communication with VSA Modulator-Control Unit)	B	B
U0131-00 F-CAN Malfunction (Lost Communication with EPS control unit)	B	B
U0151-00 F-CAN Malfunction (Lost Communication with SRS unit)	B	B

DTC (Real Time AWD)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

   Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC (s) .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Which result is indicated?

   Bus B is Not Available

   Go to step 3.

   Bus B is Available

   Go to step 4.

3. Open wire check (F-CAN B H line, F-CAN B L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

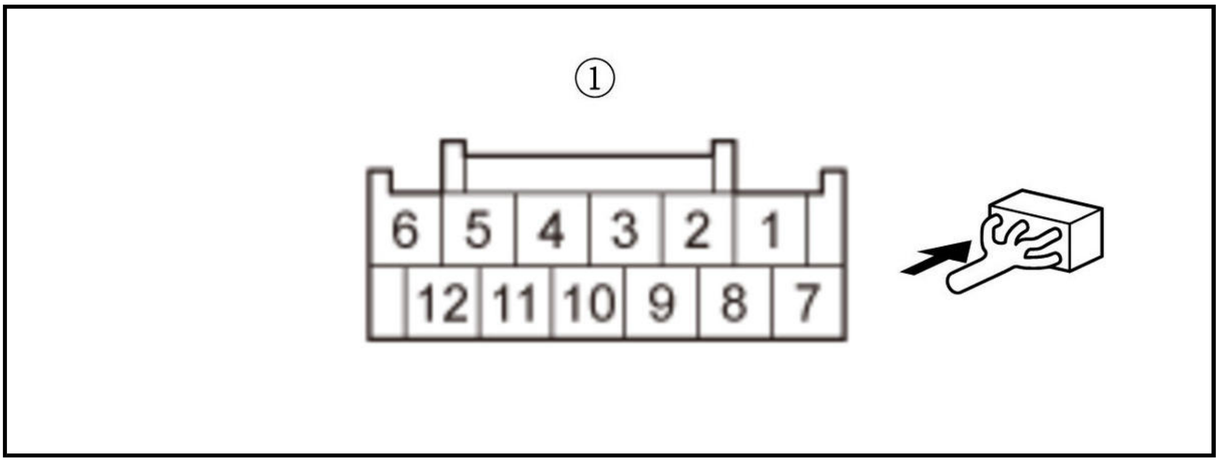
   -2. Disconnect the following connectors.

CAN gateway 12P connector	
Real time AWD control unit 24P connector	

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Real time AWD control unit 24P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 12: ①
Test point 2	**AWD control unit 24P connector No. 14**

Test point 1	CAN gateway 12P connector (female terminals) No. 5: ①
Test point 2	**AWD control unit 24P connector No. 24**



Is there continuity?

YES

The F-CAN B H wire and the F-CAN B L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the AWD control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good real time AWD control unit** , then recheck. If indicated DTC goes away and the AWD control unit was substituted, **replace the original real time AWD control unit** .

NO

Repair an open in the F-CAN B H wire or the F-CAN B L wire between the AWD control unit and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

-2. According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel (s) normally.

DTC	Transmitting control unit	Detected CAN getaway Bus channel (s) at normal
U0100-00	PCM	A, B
U0101-00	TCM	A
U0122-00	VSA modulator-control unit	A, B
U0131-00	EPS control unit	B
U0151-00	SRS unit	B

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-00: PCM is Not Available for Bus A

Go to step 5.

U0100-00: PCM is Not Available for Bus B

Go to step 6.

U0101-00: TCM is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0131-00: EPS control unit is Not Available for Bus B

Go to step 6.

U0151-00: SRS unit is Not Available for Bus B

Go to step 6.

5. Open wire check (F-CAN A H line, F-CAN A L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. According to the detected DTC on the following table, disconnect the transmitting control unit connector (s).

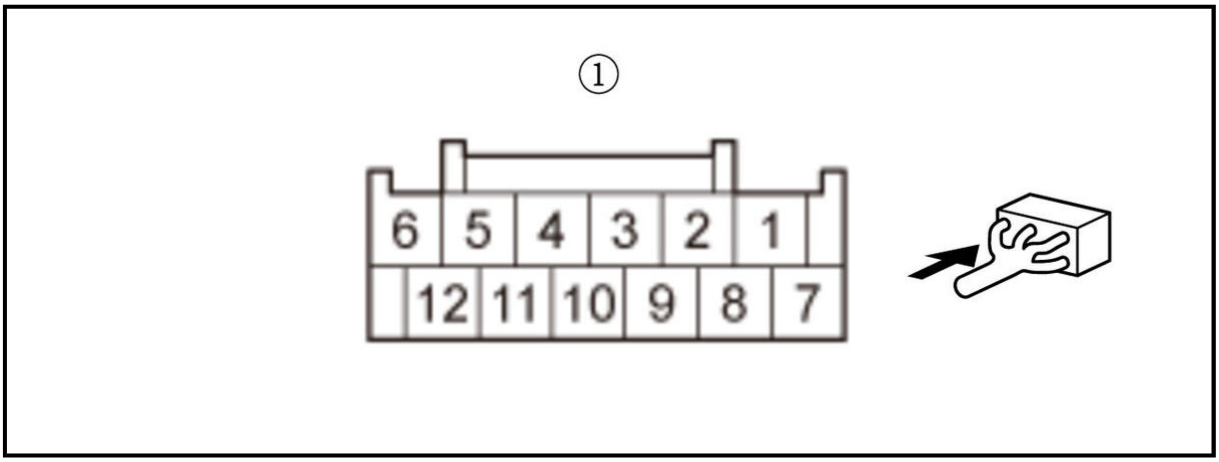
DTC	Connector
-	CAN gateway 12P connector
U0100-00	PCM connector A (50P)
U0101-00	TCM 50P connector
U0122-00	VSA modulator-control unit 46P connector

   NOTE: Before disconnecting the PCM and TCM connector, jump the SCS line with the HDS, and wait for more than 1 minute.

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Transmitting control unit connector (s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN A H	CAN gateway 12P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A L		No. 9		No. 36
U0101-00	F-CAN A H	CAN gateway 12P connector (female terminals): ①	No. 3	**TCM 50P connector**	No. 3
	F-CAN A L		No. 9		No. 11
U0122-00	F-CAN A H	CAN gateway 12P connector (female terminals): ①	No. 3	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN A L		No. 9		No. 28



Is there continuity?

YES

The F-CAN A H wire and the F-CAN A L wire are OK. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Substitute a known-good PCM** , then recheck. If DTC U0100-00 goes away and the PCM was substituted, **replace the original PCM** .
U0101-00	Check for poor connections or loose terminals at the CAN gateway and the TCM. **Substitute a known-good TCM** , then recheck. If DTC U0101-00 goes away and the TCM was substituted, **replace the original TCM** .
U0122-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .

NO

Repair an open in the F-CAN A H wire or the F-CAN A L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B H line, F-CAN B L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector (s).

DTC	Connector
-	CAN gateway 12P connector
U0100-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector
U0131-00	EPS control unit connector B (6P)
U0151-00	SRS unit connector A (39P)

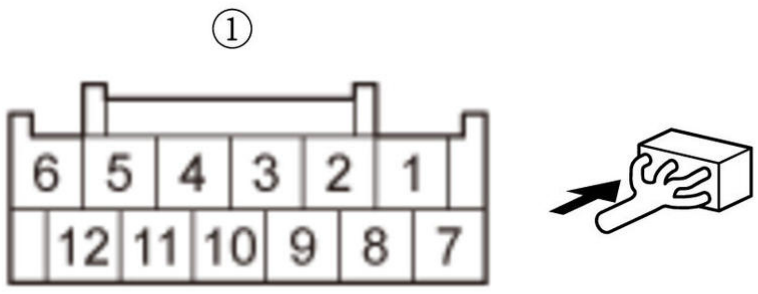
NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait for more than 1 minute.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Transmitting control unit connector (s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	**Terminal**	**Connector**	**Terminal**
U0100-00	F-CAN B H	CAN gateway 12P connector (female terminals): ①	No. 12	PCM connector A (50P)	No. 39
	F-CAN B L		No. 5		No. 38
U0122-00	F-CAN B H	CAN gateway 12P connector (female terminals): ①	No. 12	VSA modulator-control unit 46P connector	No. 46
	F-CAN B L		No. 5		No. 34
U0131-00	F-CAN B H	CAN gateway 12P connector (female terminals): ①	No. 12	EPS control unit connector B (6P)	No. 3
	F-CAN B L		No. 5		No. 1

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	**Terminal**	**Connector**	**Terminal**
U0151-00	F-CAN B H	CAN gateway 12P connector (female terminals): ①	No. 12	SRS unit connector A (39P)	No. 34
	F-CAN B L		No. 5		No. 35



Is there continuity?

YES

The F-CAN B H wire and the F-CAN B L wire are OK. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Substitute a known-good PCM** , then recheck. If DTC U0100-00 goes away and the multipurpose camera unit was substituted, **replace the original PCM** .
U0122-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0131-00	Check for poor connections or loose terminals at the CAN gateway and the EPS control unit. **Substitute the EPS control unit** , then recheck. If DTC U0131-00 goes away and the EPS control unit was substituted, **replace the original EPS control unit** .
U0151-00	Check for poor connections or loose terminals at the CAN gateway and the SRS unit. **Substitute the SRS unit** , then recheck. If DTC U0151-00 goes away and the SRS unit was substituted, **replace the original SRS unit** .

NO

Repair an open in the F-CAN B H wire or the F-CAN B L wire between the transmitting control unit and the CAN gateway.

DTC U0100-00 (41-01), U0101-00 (41-04), U0122-00 (41-02), U0131-00 (41-09), U0151-00 (41-08) (AWD (WITH CAN GATEWAY)) (2020 2021)

DTC U0100-00 : F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))**DTC U0101-00** : F-CAN Malfunction (Lost Communication with A/T Control System)**DTC U0122-00** : F-CAN Malfunction (Lost Communication with VSA Modulator-Control Unit)**DTC U0131-00** : F-CAN Malfunction (Lost Communication with EPS Control Unit)**DTC U0151-00** : F-CAN Malfunction (Lost Communication with SRS unit)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- According to the detected DTC (s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the AWD control unit.
- Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))	B	B
U0101-00 F-CAN Malfunction (Lost Communication with A/T Control System)	B	B
U0122-00 F-CAN Malfunction (Lost Communication with VSA Modulator-Control Unit)	B	B
U0131-00 F-CAN Malfunction (Lost Communication with EPS control unit)	B	B
U0151-00 F-CAN Malfunction (Lost Communication with SRS unit)	B	B

DTC (Real Time AWD)

1. CAN gateway system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC (s) .

NO

Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Bus B is Not Available

Go to step 3.

Bus B is Available

Go to step 4.

3. Open wire check (F-CAN B H line, F-CAN B L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

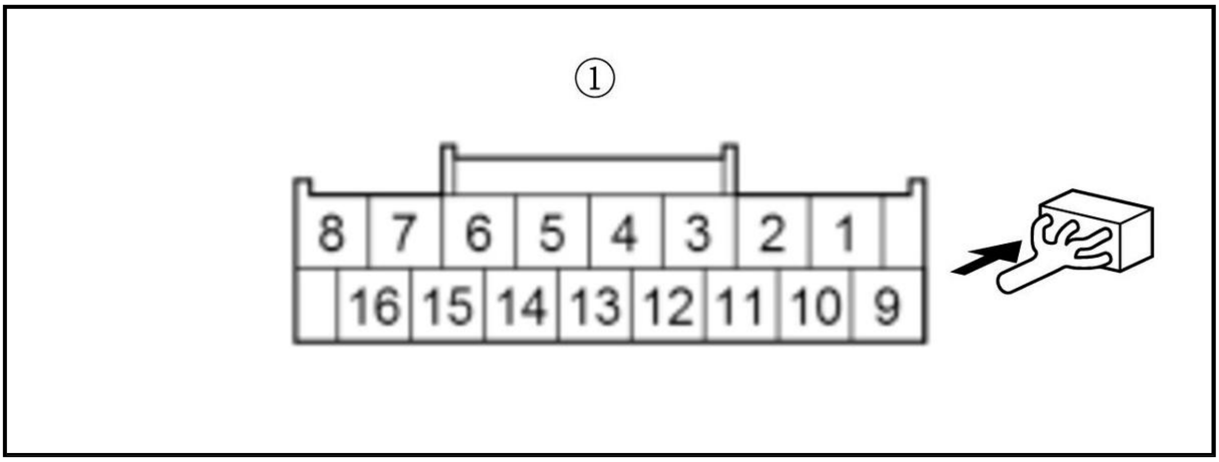
-2. Disconnect the following connectors.

CAN gateway 16P connector
Real time AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Real time AWD control unit 24P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**AWD control unit 24P connector No. 14**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**AWD control unit 24P connector No. 24**



Is there 1.0 Ω or less?

YES

The F-CAN B H wire and the F-CAN B L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the AWD control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good real time AWD control unit** , then recheck. If indicated DTC goes away and the AWD control unit was substituted, **replace the original real time AWD control unit** .

NO

Repair an open in the F-CAN B H wire or the F-CAN B L wire between the AWD control unit and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

-2. According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel (s) normally.

DTC	Transmitting control unit	Detected CAN getaway Bus channel (s) at normal
U0100-00	PCM	A, B
U0101-00	TCM	A
U0122-00	VSA modulator-control unit	A, B
U0131-00	EPS control unit	B
U0151-00	SRS unit	B

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-00: PCM is Not Available for Bus A

Go to step 5.

U0100-00: PCM is Not Available for Bus B

Go to step 6.

U0101-00: TCM is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0131-00: EPS control unit is Not Available for Bus B

Go to step 6.

U0151-00: SRS unit is Not Available for Bus B

Go to step 6.

5. Open wire check (F-CAN A H line, F-CAN A L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector (s).

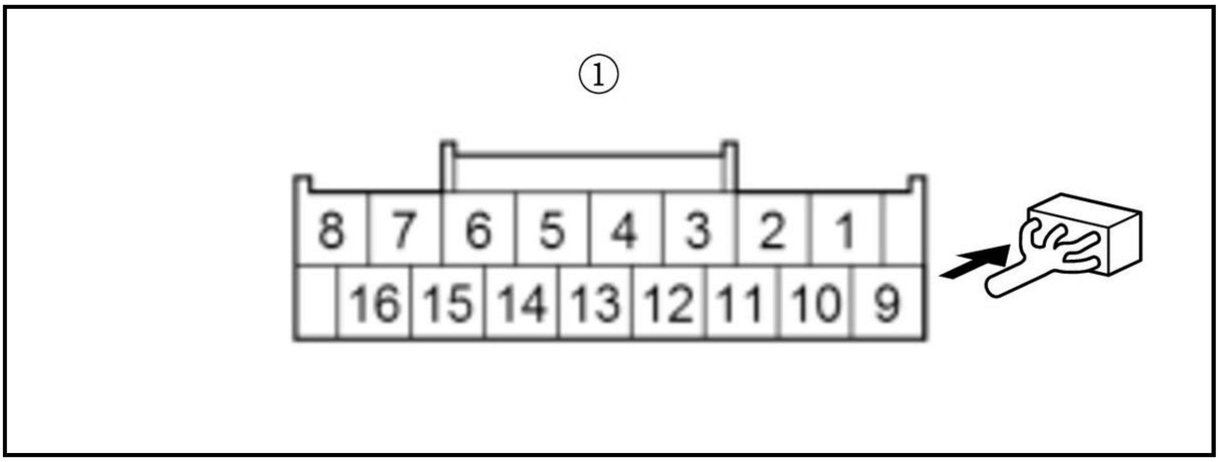
DTC	Connector
-	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	TCM 50P connector
U0122-00	VSA modulator-control unit 46P connector

NOTE: Before disconnecting the PCM and TCM connector, jump the SCS line with the HDS, and wait for more than 1 minute.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector (s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN A H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A L		No. 11		No. 36
U0101-00	F-CAN A H	CAN gateway 16P connector (female terminals): ①	No. 3	**TCM 50P connector**	No. 3
	F-CAN A L		No. 11		No. 11
U0122-00	F-CAN A H	CAN gateway 16P connector (female terminals): ①	No. 3	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN A L		No. 11		No. 28



Is there 1.0 Ω or less?

YES

The F-CAN A H wire and the F-CAN A L wire are OK. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Substitute a known-good PCM** , then recheck. If DTC U0100-00 goes away and the PCM was substituted, **replace the original PCM** .
U0101-00	Check for poor connections or loose terminals at the CAN gateway and the TCM. **Substitute a known-good TCM** , then recheck. If DTC U0101-00 goes away and the TCM was substituted, **replace the original TCM** .
U0122-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .

NO

Repair an open in the F-CAN A H wire or the F-CAN A L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B H line, F-CAN B L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector (s).

DTC	Connector
-	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector
U0131-00	EPS control unit connector B (6P)
U0151-00	SRS unit connector A (39P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait for more than 1 minute.

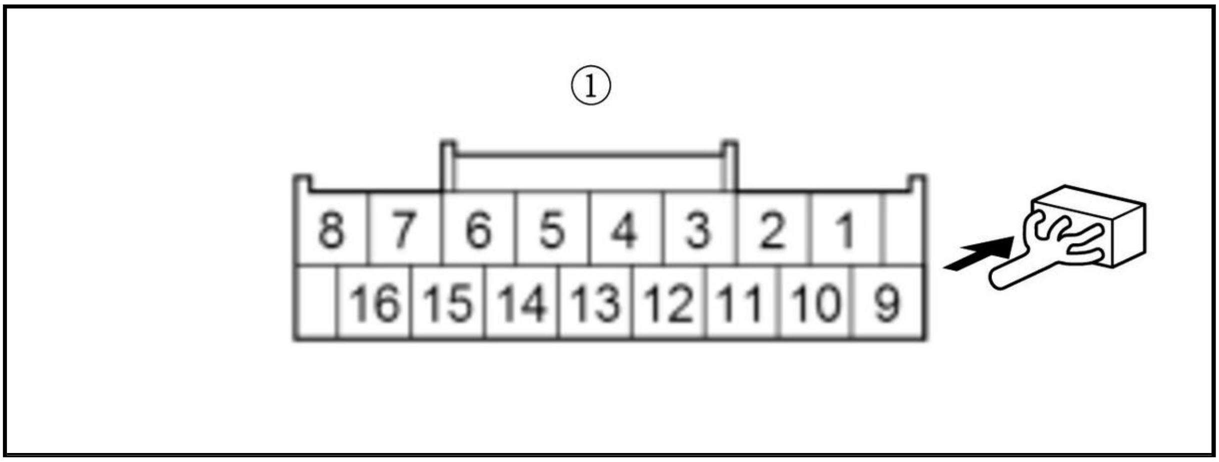
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected

B	Transmitting control unit connector (s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN B H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B L		No. 14		No. 38
U0122-00	F-CAN B H	CAN gateway 16P connector (female terminals): ①	No. 6	**VSA modulator-control unit 46P connector**	No. 46
	F-CAN B L		No. 14		No. 34
U0131-00	F-CAN B H	CAN gateway 16P connector (female terminals): ①	No. 6	**EPS control unit connector B (6P)**	No. 3
	F-CAN B L		No. 14		No. 1

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0151-00	F-CAN B H	CAN gateway 16P connector (female terminals): ①	No. 6	**SRS unit connector A (39P)**	No. 34
	F-CAN B L		No. 14		No. 35



Is there 1.0 Ω or less?

YES

The F-CAN B H wire and the F-CAN B L wire are OK. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Substitute a known-good PCM** , then recheck. If DTC U0100-00 goes away and the multipurpose camera unit was substituted, **replace the original PCM** .
U0122-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0131-00	Check for poor connections or loose terminals at the CAN gateway and the EPS control unit. **Substitute the EPS control unit** , then recheck. If DTC U0131-00 goes away and the EPS control unit was substituted, **replace the original EPS control unit** .

DTC	Operation for transmitting control unit
U0151-00	Check for poor connections or loose terminals at the CAN gateway and the SRS unit. **Substitute the SRS unit** , then recheck. If DTC U0151-00 goes away and the SRS unit was substituted, **replace the original SRS unit** .

NO

Repair an open in the F-CAN B H wire or the F-CAN B L wire between the transmitting control unit and the CAN gateway.

DTC U0100-00 (41-01), U0122-00 (41-02), U0131-00 (41-09), U0151-00 (41-08) (AWD (WITHOUT CAN GATEWAY))

DTC U0100-00 : F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))**DTC U0101-00** : F-CAN Malfunction (Lost Communication with AT Control System)**DTC U0122-00** : F-CAN Malfunction (Lost Communication with VSA Modulator-Control Unit)**DTC U0131-00** : F-CAN Malfunction (Lost Communication with EPS System)**DTC U0151-00** : F-CAN Malfunction (Lost Communication with SRS unit)

NOTE: Before you troubleshoot, **review the General Troubleshooting Information for the AWD with intelligent control system**.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))	B	B
U0101-00 F-CAN Malfunction (Lost Communication with A/T Control System)	B	B
U0122-00 F-CAN Malfunction (Lost Communication with VSA Modulator-Control Unit)	B	B
U0131-00 F-CAN Malfunction (Lost Communication with EPS control unit)	B	B
U0151-00 F-CAN Malfunction (Lost Communication with SRS unit)	B	B

1. Problem verification (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Start the engine.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (Lost Communication with Powertrain Control Module (PCM))	B	B
U0101-00 F-CAN Malfunction (Lost Communication with A/T Control System)	B	B

U0151-00 F-CAN Malfunction (Lost Communication with	B	B

DTC Description	DTC	Freeze Frame
SRS unit)		

Is DTC U0100-00, U0101-00, U0122-00, U0131-00 or U0151-00 indicated?

DTC U0100-00 or U0101-00 is indicated

The failure is duplicated. Go to step 2.

DTC U0122-00 is indicate

The failure is duplicated. Go to step 3.

DTC U0131-00 is indicated

The failure is duplicated. Go to step 4.

DTC U0151-00 is indicated

The failure is duplicated. Go to step 4.

DTC is not indicated

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (F-CAN H, F-CAN L lines)1

-1. Turn the vehicle to the OFF (LOCK) mode, and wait 2 minutes.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

AWD control unit 24P connector
PCM connector A 51P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
B	PCM connector A: disconnected
Test point 1	**AWD control unit 24P connector No. 14**
Test point 2	**PCM connector A (51P) No. 2**

Test point 1	**AWD control unit 24P connector No. 24**
Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

Substitute a known-good PCM and recheck. If the symptom/indication goes away with the PCM, troubleshooting is complete. If the symptom/indication goes away with a known-good PCM, **replace the original PCM** .

NO

Repair an open in the F-CAN H and/or F-CAN L wires between the AWD control unit and the PCM.

3. Open wire check (F-CAN H, F-CAN L lines)2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

AWD control unit 24P connector
VSA modulator-control unit 46P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
B	VSA modulator-control unit 46P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 14**
Test point 2	**VSA modulator-control unit 46P connector No. 40**

Test point 1	**AWD control unit 24P connector No. 24**

Test point 2	**VSA modulator-control unit 46P connector No. 28**

Is there continuity?

YES

Update the VSA modulator-control unit if it does not have the latest software , and recheck. If the symptom/indication goes away with the updated VSA modulator-control unit, troubleshooting is complete. If the symptom/indication does not goes away with the updated the VSA modulator-control unit, **replace the VSA modulator-control unit** .

NO

Repair an open in the F-CAN H and/or F-CAN L wires between the AWD control unit and the VSA modulator-control unit.

4. Open wire check (F-CAN H, F-CAN L lines)3

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

AWD control unit 24P connector
EPS control unit B 6P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
B	EPS control unit B 6P connector
Test point 1	**AWD control unit 24P connector No. 14**
Test point 2	**EPS control unit B 6P connector No. 3**

Test point 1	**AWD control unit 24P connector No. 24**
Test point 2	**EPS control unit B 6P connector No. 1**

Is there continuity?

YES

Replace the EPS control unit .

NO

Repair an open in the F-CAN H and/or F-CAN L wires between the AWD control unit and the EPS control unit.

5. Open wire check (F-CAN H, F-CAN L lines)4

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

AWD control unit 24P connector
SRS unit A 39P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	AWD control unit 24P connector: disconnected
B	SRS unit A 39P connector
Test point 1	AWD control unit 24P connector No. 14
Test point 2	SRS unit A 39P connector No. A34

Test point 1	AWD control unit 24P connector No. 24
Test point 2	SRS unit A 39P connector No. A35

Is there continuity?

YES

Replace the SRS unit .

NO

Repair an open in the F-CAN H and/or F-CAN L wires between the AWD control unit and the SRS unit.

DTC U3000-49 (78-XX) (AWD)

DTC U3000-49 : Control Module Internal Control Module Malfunction

NOTE: Before you troubleshoot, review the General Troubleshooting Information.

DTC Description	DTC	Freeze Frame
U3000-49 Control Module Internal Control Module Malfunction	B	B

DTC (Real Time AWD)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

-4. Start the engine.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-49 Control Module Internal Control Module Malfunction	B	B

Is DTC U3000-49 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U3000-51 (91-01) (AWD)

DTC U3000-51 : Control Module Programming Error

NOTE: Before you troubleshoot, **review the General Troubleshooting Information**.

DTC Description	DTC	Freeze Frame
U3000-51 Control Module Programming Error	B	B

DTC (Real Time AWD)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. **Update the AWD control unit if it does not have the latest software** .

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Start the engine.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-51 Control Module Programming Error	B	B

Is DTC U3000-51 indicated?

YES

The failure is duplicated. **Substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

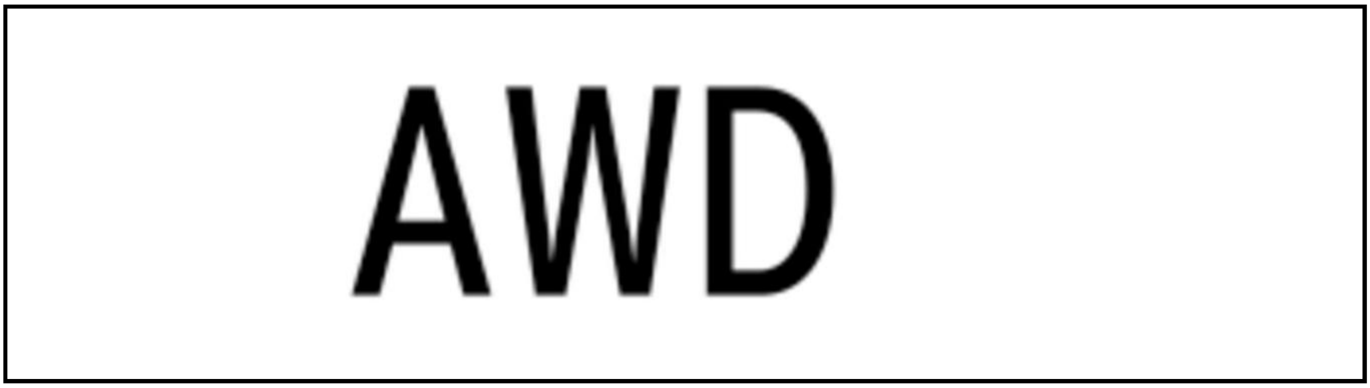
Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE REAL TIME AWD SYSTEM (AWD)

System Indicator

The system has AWD system indicator comes on in the MID.



NOTE: For locations of each indicator, refer to gauge control module component location index .

AWD System Indicator

The AWD system indicator will come on under certain conditions even if the real time AWD system is working normally. Here are some examples:

- When you use high-powered wireless equipment such as a CB or Ham radio in the vehicle.
- When you keep spinning the rear wheels while the vehicle is stuck in sand, mud, snow, etc.
- When the 12 volt battery voltage suddenly drops below 8 volts.

After the AWD system indicator comes on, it stays on until you turn the vehicle to the OFF (LOCK) mode.

Diagnostic Trouble Code (DTC)

- The real time AWD control unit can memorize up to eight different DTCs. The system displays the DTCs by blinking the AWD system indicator. Multiple DTCs are displayed in the order they occurred, beginning with the most recent.
- If the same DTC is detected more than once, the most recent DTC is written over the earlier one. Therefore, when the same problem is detected more than once, it is memorized as a single DTC.
- The DTCs are memorized in the real time AWD control units EEPROM (non-volatile memory). Therefore, the memorized DTCs are not cleared when the 12 volt battery is disconnected or when the real time AWD control unit is disconnected.
- If there is a problem in the central processing unit (CPU) of the real time AWD control unit, the AWD system indicator comes on, but no DTC is memorized. Refer to the symptom troubleshooting.

Self-Diagnosis

When a problem is detected during self-diagnosis, the system does the following:

- Turns the AWD system indicator on.
- Memorizes the DTC if possible.
- Stops AWD control and returns the vehicle back to two-wheel drive mode (front wheel only).

How to Use the HDS (Honda Diagnostic System)

1. Turn the vehicle to the OFF (LOCK) mode, then connect the Honda Diagnostic System (HDS) to the DLC

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the real time AWD control unit. If it does not communicate, go to the real time AWD system symptom troubleshooting for HDS does not communicate

4. Check the diagnostic trouble code (DTC) and the freeze data for all systems in the vehicle, troubleshoot the powertrain DTCs first and note them. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- The HDS can read the DTC, the freeze data, the current data, and other system data.
- For specific operations, refer to the help menu that came with the HDS.
- It is best do an ALL DTC CHECK to look for other systems DTCs that are related to the problem.

How to Check for Diagnostic Trouble Codes (DTCs)

When the real time AWD control unit senses an abnormality in the input or output systems, the AWD system indicator in the gauge control module will usually come on, the MIL, the D indicator, the VSA indicator, and/or the ABS indicator may also come on.

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. Turn the vehicle to the OFF (LOCK) mode, then connect the HDS to the DLC .

2. Turn the vehicle to the ON mode. Make sure the HDS communicates with the vehicle and the real time AWD control unit. If it does not communicate, go to the real time AWD system symptom troubleshooting for HDS does not communicate . Follow the prompts on the HDS to display the DTC (s) on the screen. Check the DTC and the freeze data for all systems. After determining the DTC (s), refer to the DTC Troubleshooting.

NOTE: See the HDS help menu for specific instructions.

3. If there are PGM-FI system DTCs and other system DTCs at the same time, troubleshoot the PGM-FI system DTCs first, otherwise the real time AWD DTC may return.

4. After recording the DTCs, clear all DTCs.

5. Test-drive the vehicle for several minutes in 4WD mode, and check for DTCs. If the DTC returns, refer to the DTC Troubleshooting. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all connectors and terminals in the circuit are tight.

How to Clear DTCs

1. Turn the vehicle to the OFF (LOCK) mode, then connect the HDS to the DLC

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the real time AWD control unit. If it does not communicate, go to the real time AWD system symptom troubleshooting for HDS does not communicate

4. Clear the DTC (s) by following the screen prompts on the HDS in the REAL TIME AWD DATA LIST.

5. Turn the vehicle to the OFF (LOCK) mode.

NOTE: If the DTC that was cleared is related to another system, that system's DTC must be repaired, or the real time AWD DTC will return.

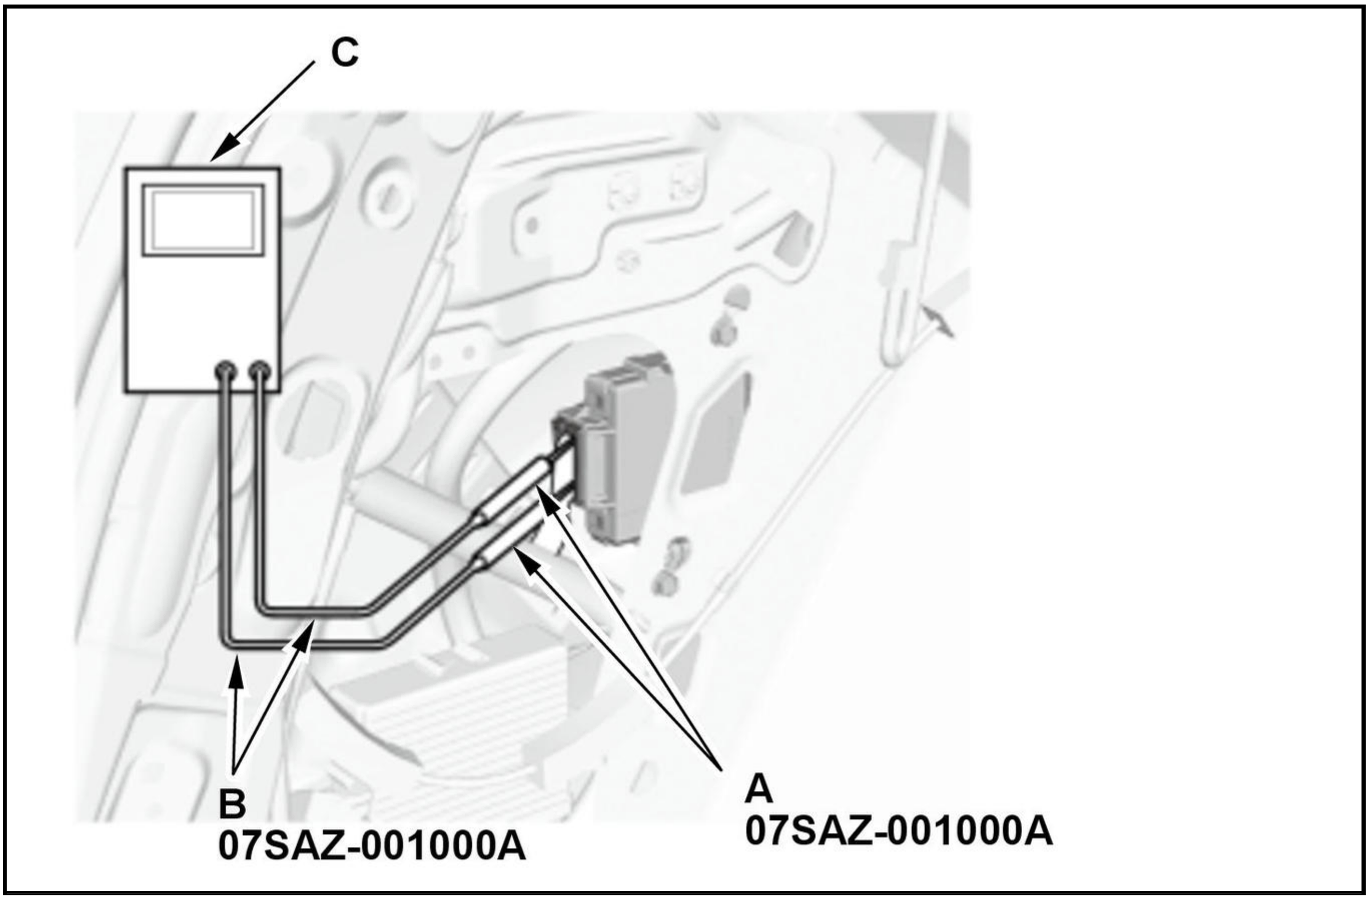
How to Troubleshoot Circuits at the Real Time AWD Control Unit

Special Tools Required

Backprobe Set 07SAZ-001000A (2)

1. **Remove the rear left side trim panel** .

2. Inspect the circuit on the real time AWD control unit according to the DTC Troubleshooting using the backprobe set and a digital multimeter or an analog circuit tester.



3. Connect the backprobe adapters (A) to the stacking patch cords (B), and connect the cords to a digital multimeter or an analog circuit tester (C). Using the wire insulator as a guide for the contoured-tip of the backprobe adapter, gently slide the tip into the connector from the wire side until it comes in contact with the terminal end of the wires.

2017-22 DTC INDEX

CR-V (Except Hybrid)

AUDIO-NAVIGATION SYSTEM DTCS

DTC	Description	Circuit
1102	USB Diag	USB
1301	GPS Antenna Error	GPS antenna
1302	GPS Receiver Error 1	GPS receiver
1306	Vehicle Speed Pulse	PCM or TCM
1702	XM Antenna Error	XM antenna
2608	R-Camera Diag	Rearview camera
2610	DRAM Diag	Audio unit DRAM
2618	LaneWatch Diag	LaneWatch camera
2701	GPS Diag: Antenna	GPS antenna
2703	Aircon Diag	Climate control unit

AUTOMATIC LIGHTING SYSTEM DTCS

DTC	Description	DTC type
B1575	Auto light sensor error	Internal error
U1280	BUS OFF state is detected by CAN controller	Loss of communication
U1281	Auto light control unit lost communication with MICU	Loss of communication
U128D	Auto light control unit lost communication with gauge control module	Loss of communication

BLIND SPOT INFORMATION DTCS

Left Side BSI Radar Unit DTC

DTC	Detection Item
B18A1	Left Side BSI Radar Unit Internal Circuit Error
B18A5	Left Side BSI Radar Unit Temperature High
B18B4	Left Side BSI Radar Unit Dirty
B18B8	Left Side BSI Radar Unit Azimuth Off Alignment
B18BA	Different Version in the Left and Right Side BSI Radar Unit
B18C5	Short to GND in the Left Side BSI Radar Unit Indicator Circuit
B18C6	Short to Power in the Left Side BSI Radar Unit Indicator Circuit
B18C7	Open in the Left Side BSI Radar Unit Indicator Circuit
B18DB	Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information
B18EA	Left Side BSI Radar Unit received PCM (A/T System) Failure Information
U1280	Communication Bus Line Error (Bus-Off)
U1281	Left Side BSI Radar Unit Lost Communication With MICU or BCM
U128D	Left Side BSI Radar Unit Lost Communication With Gauge Control Module
U1297	Left Side BSI Radar Unit Lost Communication With Right Side BSI Radar Unit

Right Side BSI Radar Unit DTC

DTC	Detection Item
B1E51	Right Side BSI Radar Unit Internal Circuit Error

DTC	Detection Item
B1E55	Right Side BSI Radar Unit Temperature High
B1E64	Right Side BSI Radar Unit Dirty
B1E68	Right Side BSI Radar Unit Azimuth Off Alignment
B1E6A	Different Version in the Left and Right Side BSI Radar Unit
B1E75	Short to GND in the Right Side BSI Radar Unit Indicator Circuit
B1E76	Short to Power in the Right Side BSI Radar Unit Indicator Circuit
B1E77	Open in the Right Side BSI Radar Unit Indicator Circuit
B1E9A	Right Side BSI Radar Unit received PCM (A/T System) Failure Information
U1280	Communication Bus Line Error (Bus-Off)
U1281	Right Side BSI Radar Unit Lost Communication With MICU or BCM
U128D	Right Side BSI Radar Unit Lost Communication With Gauge Control Module
U128F	Right Side BSI Radar Unit Lost Communication With Left Side BSI Radar Unit

BODY CONTROL MODULE DTCS

DTC	Description	DTC type
B1002	MICU internal error (EEPROM error)	Internal error
B1003	MICU Update Error	Internal error
B1028	Rear wiper motor(Park) signal error	Signal error
B1032	MICU lost communication with SRS unit (CDS message)	Signal error
B1036	IG1 Power Supply Circuit Malfunction	Signal error
B1038	IMMOBILIZER F-CAN Authentication ID Not Received	Signal error
B1039	IMMOBILIZER F-CAN Authentication ID Unmatch	Signal error
B1040	BCM lost communication with Front wiper	Loss of communication
B1041	Front Wiper motor malfunction	Signal error
B1042	Front Wiper security line error	Signal error
B1043	Front Wiper unit internal error (EEPROM error)	Internal error
B1077	Windshield wiper motor (Park) signal error	Signal error
B1275	Head light OFF position Circuit Malfunction	Signal error
B1276	Head light switch parking (small) position Circuit Malfunction	Signal error
B1277	Head light AUTO position Circuit Malfunction	Signal error
B1278	Head light ON position Circuit Malfunction	Signal error
B1279	Dimmer switch Circuit Malfunction	Signal error
B1280	Turn signal switch Circuit Malfunction	Signal error
B1281	Front wiper MIST position Circuit Malfunction	Signal error
B1282	Front wiper INT(AUTO) position Circuit Malfunction	Signal error
B1283	Front wiper LOW position Circuit Malfunction	Signal error
B1284	Front wiper HIGH position Circuit Malfunction	Signal error
B2352	Rain Light Sensor Unit Internal error (EEPROM error)	Signal error
B2375	Rain Sensing malfunction	Signal error
B2376	Light sensing malfunction	Signal error
U0073	F-CAN communication bus line error	Loss of communication
U0100	BCM lost communication with ECM/PCM	Loss of communication
U0122	BCM lost communication with VSA/ABS	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U128D	MICU lost communication with gauge control module	Loss of communication

DTC	Description	DTC type
U1291	MICU lost communication with relay control module	Loss of communication

GAUGE CONTROL MODULE DTCS

DTC	Description	DTC type
B1175	Fuel level sensor (Fuel gauge sending unit) circuit malfunction	Signal error
B1176	Fuel level sensor (Fuel gauge sending unit) circuit short	Signal error
B1195	Gauge control module lost communication with Audio Remote Switch(LIN bus connected)	Loss of communication
U0029	F-CAN communication line error	Loss of communication
U0100	Gauge control module lost communication with ENG/AT	Loss of communication
U0101	Gauge control module lost communication with AT	Loss of communication
U0104	Gauge Control Module Lost Communication With Driving Support System Control Unit	Loss of communication
U0114	Gauge control module lost communication with All Wheel Drive Control Module	Loss of communication
U0122	Gauge control module lost communication with VSA modulator-control unit	Loss of communication
U0128	Gauge control module lost communication with EPB	Loss of communication
U0131	Gauge control module lost communication with EPS Unit	Loss of communication
U0151	Gauge control module lost communication with SRS unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1281	Gauge control module lost communication with MICU (MICU frame)	Loss of communication
U1288	Gauge control module lost communication with PARKSR	Loss of communication
U128F	Gauge control module lost communication with BSI unit	Loss of communication
U129C	Gauge control module lost communication with multi purpose camera unit	Loss of communication
U3000-49	ECU internal circuit malfunction	Internal error

DTC	Description	DTC type
U3000-51	Reprogramming error	Internal error

HVAC SYSTEM DTCS

2017 2018 2019

DTC	Detection Item or Symptom	ECU	DTC Type
B120A	Climate Control Unit LIN Communication Bus Line Error	Climate control unit	Loss of communication
B121A	An open in the mode control motor circuit	Climate control unit	Signal error
B121B	A short in the mode control motor circuit	Climate control unit	Signal error
B1220	A short in the recirculation control motor circuit	Climate control unit	Signal error
B1225	An open in the in-car temperature sensor circuit	Climate control unit	Signal error
B1226	A short in the in-car temperature sensor circuit	Climate control unit	Signal error
B1227	An open in the outside air temperature sensor circuit	Climate control unit	Signal error
B1228	A short in the outside air temperature sensor circuit	Climate control unit	Signal error
B1231	An open in the evaporator temperature sensor circuit	Climate control unit	Signal error
B1232	A short in the evaporator temperature sensor circuit	Climate control unit	Signal error
B1233	An open in the air mix control motor circuit (driver's)	Climate control unit	Signal error
B1234	A short in the air mix control motor circuit (driver's)	Climate control unit	Signal error
B1235	A problem in the air mix control motor circuit, linkage, door, or motor (driver's)	Climate control unit	Signal error
B1236	An open in the passenger's air mix control motor circuit	Climate control unit	Signal error
B1237	A short in the passenger's air mix control motor circuit	Climate control unit	Signal error
B1238	A problem in the passenger's air mix control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B123F	Automatic lighting control unit/sunlight sensor error	Climate control unit	Signal error
B1240	A problem in the mode control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B1241	A problem in the blower motor circuit	Climate control unit	Signal error
B2964	Climate control unit lost communication with front panel (climate control panel)	Climate control unit	Loss of communication
B2983	A problem in the recirculation control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B2986	An open in the recirculation control motor circuit	Climate control unit	Signal error

DTC	Detection Item or Symptom	ECU	DTC Type
B2988	A problem in the A/C compressor variable capacity control solenoid circuit	Climate control unit	Signal error
U1280	Communication bus line error (BUS-OFF)	Climate control unit	Loss of communication
U1281	Climate control unit lost communication with MICU (body control module)	Climate control unit	Loss of communication
U128D	Climate control unit lost communication with gauge control module	Climate control unit	Loss of communication
U1290	Climate control unit lost communication with seat heater control unit (front)	Climate control unit	Loss of communication

2020 2021

DTC	Detection Item or Symptom	ECU	DTC Type
B120A	Climate Control Unit LIN Communication Bus Line Error	Climate control unit	Loss of communication
B121A	An open in the mode control motor circuit	Climate control unit	Signal error
B121B	A short in the mode control motor circuit	Climate control unit	Signal error

*1: With auto idle stop system

*2: Without auto idle stop system

DTC	Detection Item or Symptom	ECU	DTC Type
U128D	Climate control unit lost communication with gauge control module	Climate control unit	Loss of communication
U1290	Climate control unit lost communication with seat heater control unit (front)	Climate control unit	Loss of communication

*1: With auto idle stop system

*2: Without auto idle stop system

IMMOBILIZER / KEYLESS ENTRY CONTROL UNIT DTCS

DTC	Description	DTC type
B1901	Immobilizer Unit Internal error (CPU error)	Internal error
B1902	Immobilizer Unit Internal error (EEPROM error)	Internal error
U1280	Communication bus line error (BUS-OFF)	Loss of communication

DTC	Description	DTC type
U0155	Immobilizer-keyless control unit lost communication with gauge control module	Loss of communication
U0199	Immobilizer-keyless control unit lost communication with door multiplex control unit	Loss of communication
U1281	Lost communication with MICU (MICU frame)	Loss of communication
U128D	Lost communication with METER	Loss of communication

KEYLESS ACCESS / BACKUP CONTROL UNIT DTCS

DTC	Description	DTC type
B1926	Backup Control Antenna Open or Short	Internal error
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U128D	Backup Control Unit Lost Communication with Gauge Control Module	Loss of communication

KEYLESS ACCESS CONTROL UNIT DTCS

DTC	Description	DTC type
B1601	Keyless access control unit internal (CPU) error	Internal error
B1602	Keyless access control unit internal (EEPROM) error	Internal error
B1632	MTR CONT Signal Error	Signal error
B1640	RF1 antenna not connected or malfunction	Signal error
B1645	Driver's Door LF Antenna Circuit Short	Signal error
B1646	Driver's Door LF Antenna Circuit Open	Signal error
B1647	Passenger's Door LF Antenna Circuit Short	Signal error
B1648	Passenger's Door LF Antenna Circuit Open	Signal error
B1657	Rear Bumper LF Antenna Circuit Short	Signal error
B1658	Rear Bumper LF Antenna Circuit Open	Signal error
B1659	Front Interior LF Antenna Circuit Short	Signal error
B1660	Front Interior LF Antenna Circuit Open	Signal error
B1661	Middle Interior Antenna Circuit Shorted	Signal error
B1662	Middle Interior Antenna Circuit Opened	Signal error
B1663	Rear Interior LF Antenna Circuit Short	Signal error
B1664	Rear Interior LF Antenna Circuit Open	Signal error
B1667	Rear Shelf (Middle Interior) LF Antenna Circuit Short	Signal error
B1668	Rear Shelf (Middle Interior) LF Antenna Circuit Open	Signal error
U1280	Keyless access control unit communication bus line error (BUS-OFF)	Loss of communication
U1281	Keyless Access Control Unit Lost Communication with MICU	Loss of communication
U128D	Keyless Access Control Unit Lost Communication with Gauge Control Module	Loss of communication

KEYLESS ACCCESS POWER CONTROL UNIT DTCS

DTC	Description	DTC type
B12C5	Engine Start/Stop Switch Failure	Signal error
B12C6	Electric Steering Lock Switch C/D Monitor Circuit Failure	Signal error
B12C7	Electric Steering Lock Motor Circuit Failure	Signal error
B12D0	Power Control Unit IG1A Circuit Error	Internal error
B12D1	Power Control Unit IG1B Circuit Error	Internal error
B12D2	Power Control Unit IG2 Circuit Error	Internal error
B12D3	Power Control Unit IG Latch Circuit Error	Internal error
B12E0	Electric Steering Lock Switch Internal Error	Internal error

DTC	Description	DTC type
B12E1	Electric Steering Lock Motor Internal Error	Internal error
B12E2	Electric Steering Lock Low Level Failure of MTRCUT1	Signal error
B12E3	Electric Steering Lock High Level Failure of MTRCUT1	Signal error
B12E4	Electric Steering Lock High Level Failure of MTRCUT2	Signal error
B12E5	Incorrect assembly of control unit for electric steering lock equipped vehicle	Signal error
B12F0	Power Control Unit Lost Communication with Electric Steering Lock	Loss of communication

DTC	Description	DTC type
U0073	F-CAN Communication Bus Line Error	Loss of communication
U0100	Power Control Unit Lost Communication with PCM	Loss of communication
U0122	Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Power Control Unit Lost Communication with MICU	Loss of communication
U128D	Power Control Unit Lost Communication with Gauge Control Module	Loss of communication

PARKING AND BACK-UP SENSOR CONTROL UNIT DTCS

DTC	Description	DTC type
B2601	Parking Sensor CPU Error	Internal error
B2602	Parking Sensor EEPROM Error	Internal error
B2610	Front 1st sensor failure	Signal error
B2611	Front 2nd sensor failure	Signal error
B2612	Front 3rd sensor failure	Signal error
B2613	Front 4th sensor failure	Signal error
B2614	Rear 1st sensor failure	Signal error
B2615	Rear 2nd sensor failure	Signal error
B2616	Rear 3rd sensor failure	Signal error
B2617	Rear 4th sensor failure	Signal error

DTC	Description	DTC type
B2618	Front 1st sensor data failure	Signal error
B2619	Front 2nd sensor data failure	Signal error
B261A	Front 3rd sensor data failure	Signal error
B261B	Front 4th sensor data failure	Signal error
B261C	Rear 1st sensor data failure	Signal error
B261D	Rear 2nd sensor data failure	Signal error
B261E	Rear 3rd sensor data failure	Signal error
B261F	Rear 4th sensor data failure	Signal error
B2646	Front sensor power failure	Signal error
B2647	Rear sensor power failure	Signal error
B2648	Front sensor signal short to ground	Signal error
B2649	Rear sensor signal short to ground	Signal error
B264A	Indicator circuit short to power	Signal error
B264B	Indicator circuit short to ground	Signal error
B264D	Front sensor combination error	Signal error
U0155	Lost communication with Gauge Control Module	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Lost communication with MICU	Loss of communication

POWER SEAT CONTROL DTCS

DTC	Description	DTC type
B1802	Power seat control unit internal (EEPROM) error	Internal error
B1825	Slide pulse error(no change in pulse for 1 second)	Signal error
B1826	Front height pulse error(no change in pulse for 1 second)	Signal error

DTC	Description	DTC type
B1827	Rear height pulse error(no change in pulse for 1 second)	Signal error
B1828	Recline pulse error(no change in pulse for 1 second)	Signal error
B1829	AT-P signal and VSP signal mismatch	Signal error
B1836	Power Seat Position Sensor circuit short	Signal error
B1837	Memory position calling timeout	Signal error
B1844	Power Seat Slide switch circuit malfunction	Signal error
B1845	Power Seat Recline switch circuit malfunction	Signal error
B1846	Power Seat Front Up-Down switch circuit malfunction	Signal error
B1847	Power Seat Rear Up-Down switch circuit malfunction	Signal error
U0199	Power seat control unit lost communication with door multiplex control unit (DRLockSW frame)	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Power seat control unit lost communication with MICU (MICU frame)	Loss of communication
U128D	Lost Communication With Gauge Control Module (VSP/NE frame)	Loss of communication

POWER WINDOW MASTER SWITCH DTCS

DTC	Description	DTC type
B1125	Driver's power window motor A pulse malfunction	Signal error
B1126	Driver's power window motor B pulse malfunction	Signal error
B1127	Driver's door lock key cylinder switch malfunction	Signal error
B1128	Driver's door lock switch malfunction	Signal error
B1129	Driver's door lock knob switch malfunction	Signal error
B1130	Front passenger's power window motor A pulse malfunction	Signal error
B1131	Front passenger's power window motor B pulse malfunction	Signal error
B1140	Driver's power window position detect circuit malfunction	Signal error
B1142	Door Multiplex Control Unit lost communication with front passenger's power window switch (UART line open)	Loss of communication
B1145	Front passenger's power window position detect circuit malfunction	Signal error
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1281	Door multiplex control unit lost communication with MICU	Loss of communication
U128D	Door multiplex control unit lost communication with gauge control module	Loss of communication
U1299	Door multiplex control unit lost communication with climate control unit	Loss of communication

POWER TAILGATE CONTROL UNIT DTCS

DTC	Description	DTC type
B1352	Power Tailgate Control Unit Internal error (EEPROM error)	Internal error
B1375	Driver's side PTG switch circuit malfunction	Signal error
B1376	Tailgate Outer Handle switch circuit malfunction	Signal error

DTC	Description	DTC type
B1377	Power Tailgate Inner switch circuit malfunction	Signal error
B1378	Power Tailgate Right Touch/Pinch sensor circuit malfunction	Signal error
B1379	Power Tailgate Left Touch/Pinch sensor circuit malfunction	Signal error
B1380	Tailgate Closer Unit Neutral switch circuit malfunction	Signal error

DTC	Description	DTC type
B1382	Tailgate Closer Unit Full Latch switch circuit malfunction	Signal error
B1383	Tailgate Closer Unit Ratchet switch circuit malfunction	Signal error
B1384	Tailgate Closer Unit Half Latch switch circuit malfunction	Signal error
B1385	Power Tailgate temperature sensor malfunction	Signal error
B1386	Power Tailgate sensor Pulse A circuit malfunction	Signal error
B1387	Power Tailgate sensor Pulse B circuit malfunction	Signal error
B1388	Power Tailgate Drive Motor circuit malfunction	Signal error
B1390	Power Tailgate Closer Motor function error	Signal error
U0199	Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)	Loss of communication
U1280	Communication Bus line Error(a bus OFF state is detected by Power Tail Gate ECU)	Loss of communication
U1281	Lost communication with MICU (MICU frame)	Loss of communication
U128D	Power Tailgate Control Unit lost communication with GAUGE Control Module	Loss of communication

REAL TIME 4WD SYSTEM DTCS

B0011-2B	Short to another wire harness in the front passenger's airbag second inflator
B0020-11	Short to ground in the driver's side airbag inflator
B0020-12	Short to power in the driver's side airbag inflator
B0020-13	Open or increased resistance in the driver's side airbag inflator
B0020-1A	Decreased resistance in the driver's side airbag inflator
B0020-2B	Short to another wire harness in the driver's side airbag first inflator
B0021-11	Short to ground in the left side curtain airbag first inflator
B0021-12	Short to power in the left side curtain airbag first inflator
B0021-13	Open or increased resistance in the left side curtain airbag first inflator
B0021-1A	Decreased resistance in the left side curtain airbag first inflator
B0021-2B	Short to another wire harness in the left side curtain airbag first inflator

DTC	Detection Item
B0028-11	Short to ground in the front passenger's side airbag inflator
B0028-12	Short to power in the front passenger's side airbag inflator
B0028-13	Open or increased resistance in the front passenger's side airbag inflator
B0028-1A	Decreased resistance in the front passenger's side airbag inflator
B0028-2B	Short to another wire harness in the front passenger's side airbag inflator
B0029-11	Short to ground in the right side curtain airbag first inflator
B0029-12	Short to power in the right side curtain airbag first inflator
B0029-13	Open or increased resistance in the right side curtain airbag first inflator
B0029-1A	Decreased resistance in the right side curtain airbag first inflator
B0029-2B	Short to another wire harness in the right side curtain airbag first inflator
B0050-11	Short or decreased resistance in the driver's seat belt buckle switch
B0050-13	Open or increased resistance in the driver's seat belt buckle switch
B0050-2B	Short to another wire harness in the driver's seat belt buckle switch
B0052-11	Short or decreased resistance in the front passenger's seat belt buckle switch
B0052-13	Open or increased resistance in the front passenger's seat belt buckle switch
B0052-2B	Short to another wire harness in the front passenger's seat belt buckle switch
B0070-11	Short to ground in the driver's seat belt tensioner

DTC	Detection Item
B0070-12	Short to power in the driver's seat belt tensioner
B0070-13	Open or increased resistance in the driver's seat belt tensioner
B0070-1A	Decreased resistance in the driver's seat belt tensioner
B0070-2B	Short to another wire harness in the driver's seat belt tensioner
B0072-11	Short to ground in the front passenger's seat belt tensioner
B0072-12	Short to power in the front passenger's seat belt tensioner
B0072-13	Open or increased resistance in the front passenger's seat belt tensioner
B0072-1A	Decreased resistance in the front passenger's seat belt tensioner
B0072-2B	Short to another wire harness in the front passenger's seat belt tensioner
B0079-11	Short to ground in the driver's seat belt outer lap tensioner
B0079-12	Short to power in the driver's seat belt outer lap tensioner
B0079-13	Open or increased resistance in the driver's seat belt outer lap tensioner
B0079-1A	Decreased resistance in the driver's seat belt outer lap tensioner
B0079-2B	Short to another wire harness in the driver's seat belt outer lap tensioner
B007A-11	Short to ground in the front passenger's seat belt outer lap tensioner
B007A-12	Short to power in the front passenger's seat belt outer lap tensioner
B007A-13	Open or increased resistance in the front passenger's seat belt outer lap tensioner
B007A-1A	Decreased resistance in the front passenger's seat belt outer lap tensioner
B007A-2B	Short to another wire harness in the front passenger's seat belt outer lap tensioner
B0082-11	Short to Ground in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner
B0082-12	Short to Power in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner
B0082-13	Open or Increased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner
B0082-1A	Decreased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner
B0082-2B	Short to Another Wire Harness in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner
B0090-4A	Internal failure of the left front impact sensor

DTC	Detection Item
B0090-87	No signal from the left front impact sensor
B0090-92	Internal failure of the left front impact sensor
B0091-4A	Internal failure of the left side impact sensor (first)
B0091-87	No signal from the left side impact sensor (first)
B0091-92	Internal failure of the left side impact sensor (first)
B0092-4A	Internal failure of the left side impact sensor (second)
B0092-87	No signal from the left side impact sensor (second)
B0092-92	Internal failure of the left side impact sensor (second)
B0095-4A	Internal failure of the right front impact sensor
B0095-87	No signal from the right front impact sensor
B0095-92	Internal failure of the right front impact sensor
B0096-4A	Internal failure of the right side impact sensor (first)
B0096-87	No signal from the right side impact sensor (first)
B0096-92	Internal failure of the right side impact sensor (first)
B0097-4A	Internal failure of the right side impact sensor (second)
B0097-87	No signal from the right side impact sensor (second)
B0097-92	Internal failure of the right side impact sensor (second)
B00A0-54	Front passenger's weight sensor not calibrated
B00B5-11	Short or decreased resistance in the driver's seat position sensor

DTC	Detection Item
B00B5-13	Open or increased resistance in the driver's seat position sensor
B00B5-2B	Short to another wire harness in the driver's seat position sensor
B00C0-16	Internal failure of the front passenger's weight sensor (front inner side)
B00C0-4A	Different supplier ID/function ID of the front passenger's weight sensor (front inner side)
B00C0-54	Different serial ID of the front passenger's weight sensor (front inner side)
B00C0-87	No signal from the front passenger's weight sensor (front inner side)
B00C0-96	Internal failure of the front passenger's weight sensor (front inner side)
B00C2-16	Internal failure of the front passenger's weight sensor (rear inner side)
B00C2-4A	Different supplier ID/function ID of the front passenger's weight sensor (rear inner side)
B00C2-54	Different Serial ID of the front passenger's weight sensor (rear inner side)
B00C2-87	No signal from the front passenger's weight sensor (rear inner side)
B00C2-96	Internal failure of the front passenger's weight sensor (rear inner side)
B00D5-14	Open or short to ground in the front passenger's airbag cutoff indicator
B00D5-17	Short to power in the front passenger's airbag cutoff indicator
B2800-49	Internal failure of the SRS unit
B2801-49	Internal failure of the SRS unit
B2802-49	Internal failure of the SRS unit
B2840-13	SRS unit connector A not properly installed
B2841-13	SRS unit connector B not properly installed
C0061-96	Internal failure of the SRS unit
C0063-96	Internal failure of the SRS unit
U0122-00	Lost communication with the VSA modulator-control unit (wheel speed sensor signal error)
U3000-49	Internal failure of the SRS unit
U3000-51	SRS unit programming error

WIRELESS CHARGER DTCS

DTC	Description	DTC Type
B22A0	Wireless charger unit failure	Internal error
B22A1	Wireless charger unit ACC input circuit failure	Signal error
U1280	Communication bus line Error (BUS-OFF)	Loss of communication

DTC	Description	DTC Type
U1281	Wireless charger unit lost communication with MICU	Loss of communication
U1286	Wireless charger unit lost communication with Keyless Access Control Unit	Loss of communication
U128D	Wireless charger unit lost communication with Gauge control module	Loss of communication
U128E	Wireless charger unit lost communication with Audio-Navigation Unit	Loss of communication

2020-22 DTC INDEX

CR-V (Hybrid)

AUDIO-NAVIGATION SYSTEM DTCS

DTC	Description	Circuit
1102	USB Diag	USB
1301	GPS Antenna Error	GPS antenna
1302	GPS Receiver Error 1	GPS receiver
1306	Vehicle Speed Pulse	PCM or TCM
1702	XM Antenna Error	XM antenna
2608	R-Camera Diag	Rearview camera
2610	DRAM Diag	Audio unit DRAM
2701	GPS Diag: Antenna	GPS antenna
2703	Aircon Diag	Climate control unit

AUTOMATIC LIGHTING SYSTEM DTCS

DTC	Description	DTC type
B1575	Auto light sensor error	Internal error
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Auto Light Control Unit lost communication with MICU (body control module)	Loss of communication
U128D	Auto light control unit lost communication with gauge control module	Loss of communication

BLIND SPOT INFORMATION DTCS

Left Side BSI Radar Unit DTC

DTC	Detection Item
B18A1	Left Side BSI Radar Unit Internal Circuit Error
B18A5	Left Side BSI Radar Unit Temperature High
B18B4	Left Side BSI Radar Unit Dirty
B18B8	Left Side BSI Radar Unit Azimuth Off Alignment
B18BA	Different Version in the Left and Right Side BSI Radar Unit
B18C5	Short to GND in the Left Side BSI Radar Unit Indicator Circuit
B18C6	Short to Power in the Left Side BSI Radar Unit Indicator Circuit
B18C7	Open in the Left Side BSI Radar Unit Indicator Circuit
B18DB	Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information
B18EA	(Left Side BSI Radar Unit Received PCM (A/T System) Failure Information)
U1280	Communication Bus Line Error (Bus-Off)
U1281	Left Side BSI Radar Unit Lost Communication With MICU or BCM
U128D	Left Side BSI Radar Unit Lost Communication With Gauge Control Module
U1297	Left Side BSI Radar Unit Lost Communication With Right Side BSI Radar Unit

Right Side BSI Radar Unit DTC

DTC	Detection Item
B1E51	Right Side BSI Radar Unit Internal Circuit Error

DTC	Detection Item
B1E55	Right Side BSI Radar Unit Temperature High
B1E64	Right Side BSI Radar Unit Dirty
B1E68	Right Side BSI Radar Unit Azimuth Off Alignment
B1E6A	Different Version in the Left and Right Side BSI Radar Unit
B1E75	Short to GND in the Right Side BSI Radar Unit Indicator Circuit
B1E76	Short to Power in the Right Side BSI Radar Unit Indicator Circuit
B1E77	Open in the Right Side BSI Radar Unit Indicator Circuit
B1E9A	(Right Side BSI Radar Unit Received PCM (A/T System) Failure Information)
U1280	Communication Bus Line Error (Bus-Off)
U1281	Right Side BSI Radar Unit Lost Communication With MICU or BCM
U128D	Right Side BSI Radar Unit Lost Communication With Gauge Control Module
U128F	Right Side BSI Radar Unit Lost Communication With Left Side BSI Radar Unit

BODY CONTROL MODULE DTCS

DTC	Description	DTC type
B1002	BCM internal error (EEPROM error)	Internal error
B1003	BCM Update error	Internal error
B1028	Rear wiper motor (park) signal error	Signal error
B1032	CDS (Collision detection signal) signal error	Signal error
B1036	IG1 Power supply Circuit Malfunction	Signal error
B1038	IMMOBILIZER F-CAN Authentication ID Not Received	Signal error
B1039	IMMOBILIZER F-CAN Authentication ID Unmatch	Signal error
B1040	BCM lost communication with Front wiper	Loss of communication
B1041	Front Wiper motor malfunction	Signal error
B1042	Front Wiper security line error	Signal error
B1043	Front Wiper unit internal error (EEPROM error)	Internal error
B1077	Front wiper auto stop switch signal error	Signal error
B1275	Head light OFF position Circuit Malfunction	Signal error
B1276	Headlight Switch Parking (Small) Position Circuit Malfunction	Signal error
B1277	Head light AUTO position Circuit Malfunction	Signal error
B1278	Head light ON position Circuit Malfunction	Signal error
B1279	Dimmer switch Circuit Malfunction	Signal error
B1280	Turn signal switch Circuit Malfunction	Signal error

DTC	Description	DTC type
B1281	Front wiper MIST position Circuit Malfunction	Signal error
B1282	Front wiper INT(AUTO) position Circuit Malfunction	Signal error
B1283	Front wiper LOW position Circuit Malfunction	Signal error
B1284	Front wiper HIGH position Circuit Malfunction	Signal error
B2352	Rain Light Sensor Unit Internal error (EEPROM error)	Signal error
B2375	Rain Sensing malfunction in Rain/Light sensor	Signal error
B2376	Light sensing malfunction in Rain/Light sensor	Signal error
U0073	F-CAN communication bus line error (BUS-OFF)	Loss of communication
U0100	BCM lost communication with ECM/PCM	Loss of communication
U0122	BCM lost communication with VSA/ABS	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication

DTC	Description	DTC type
U128D	BCM lost communication with gauge control module	Loss of communication
U1291	BCM lost communication with relay control module	Loss of communication

*1: When the system detects the ACC failure while operating.

*2: When the system detects the CMBS failure while operating.

*3: When the millimeter wave radar receives gauge control module failure information.

*4: When related B-CAN system or switch failure information (judged by the gauge control module) is received.

*5: After the DTC is stored, the message (Radar Obstructed) is displayed on the MID at the initial stage, and then the indicators come on.

ELECTRIC SERVO BRAKE SYSTEM DTCS

DTC		Detection Item
B0050	-F0	(Driver's Seat Belt Buckle Switch Malfunction)
C0023	-12	Brake Diag Circuit ON Failure
	-14	Brake Diag Circuit OFF Failure
C0049	-7A	Brake Fluid Leak or Seal Failure

DTC		Detection Item
C0062	-F0	Longitudinal Acceleration Sensor Malfunction
C0063	-F0	Yaw Rate Sensor Malfunction
C1260	-7A	Brake Fluid Leak or Seal Failure in Pedal Feel Simulator
C1270	-11	Automatic Brake Hold Switch Signal Circuit Short
	-15	Automatic Brake Hold Switch Signal Circuit Open
P057B	-00	Brake Pedal Stroke Sensor Circuit Range/Performance Problem
P057C	-00	Brake Pedal Stroke Sensor Circuit Low Voltage
P057D	-00	Brake Pedal Stroke Sensor Circuit High Voltage
P0602	-00	Electric Servo Brake Control Unit Programming Error
P0606	-00	Electric Servo Brake Control Unit Internal Circuit Malfunction
P062F	-00	Electric Servo Brake Control Unit Internal Circuit EEPROM Error
P0642	-00	Sensor Power Source Circuit Low Voltage
P0643	-00	Sensor Power Source Circuit High Voltage
P1E20	-00	Brake Fluid Pressure Sensor PL/PLR Incorrect Correlation
P1E24	-00	Brake Pedal Stroke Redundant Sensor Circuit High Voltage
P1E25	-00	Brake Pedal Stroke Redundant Sensor Circuit Low Voltage
P1E26	-00	Brake Pedal Stroke Sensor/Brake Pedal Stroke Redundant Sensor Incorrect Correlation
P1E27	-00	Brake Fluid Pressure Sensor PU Circuit High Voltage
P1E28	-00	Brake Fluid Pressure Sensor PU Circuit Low Voltage
P1E29	-00	Brake Fluid Pressure Sensor PUR Circuit High Voltage
P1E2A	-00	Brake Fluid Pressure Sensor PUR Circuit Low Voltage
P1E2B	-00	Brake Fluid Pressure Sensor PU/PUR Incorrect Correlation
P1E2C	-00	Brake Fluid Pressure Sensor PL Circuit High Voltage
P1E2D	-00	Brake Fluid Pressure Sensor PL Circuit Low Voltage
P1E2E	-00	Brake Fluid Pressure Sensor PLR Circuit High Voltage
P1E2F	-00	Brake Fluid Pressure Sensor PLR Circuit Low Voltage
P1E32	-00	Master Cylinder Cut Valve Stuck OFF (Stuck Open)
P1E33	-00	Master Cylinder Cut Valve Incorrect Operation
P1E34	-00	Master Cylinder Cut Valve Stuck ON (Stuck Close)
P1E35	-00	Brake Pedal Feel Simulator Cut Valve Incorrect Operation
P1E36	-00	Brake Pedal Feel Simulator Cut Valve No Operation
P1E37	-00	Brake Pedal Feel Simulator Cut Valve Stuck OFF (Stuck Close)
P1E38	-00	Brake Pedal Feel Simulator Cut Valve Stuck ON (Stuck Open)
P1E41	-00	Electric Servo Brake System Fail-Safe Relay Stuck ON
P1E42	-00	Electric Servo Brake System Fail-Safe Relay Stuck OFF
P1E44	-00	Electric Servo Brake Control Unit Internal Circuit Malfunction (Charge Pump Circuit)
P1E46	-00	Electric Servo Brake Control Unit Internal Circuit Malfunction (FET Stuck ON)
P1E47	-00	Electric Servo Brake Control Unit Internal Circuit Malfunction (FET Stuck OFF)
P1E48	-00	Slave Cylinder Drive Motor Current Malfunction (Offset)
P1E49	-00	Slave Cylinder Drive Motor Current Malfunction (Stuck)
P1E4A	-00	Slave Cylinder Drive Motor Current Malfunction (Over Current)
P1E4B	-00	Slave Cylinder Drive Motor Circuit Open
P1E4C	-00	Slave Cylinder Drive Motor Power Source Circuit High Voltage
P1E4D	-00	Motor Angle Signal Malfunction
P1E51	-00	Tandem Motor Cylinder Gearbox Mechanical Linkage Failure

DTC		Detection Item
P1E52	-00	Tandem Motor Cylinder Gearbox Stuck
P1E63	-00	Brake Pedal Stroke Sensor Signal Stuck
P1E68	-00	Brake Master Cylinder Cut Valve Self Lock
P2531	-00	Electric Servo Brake Control Unit Power Source Circuit (IG1) Low Voltage
P2532	-00	Electric Servo Brake Control Unit Power Source Circuit (IG1) High Voltage

GAUGE CONTROL MODULE DTCS

DTC	Description	DTC type
B1175	Fuel level sensor (Fuel gauge sending unit) circuit malfunction	Signal error
B1176	Fuel level sensor (Fuel gauge sending unit) circuit short	Signal error

DTC	Description	DTC type
B1195	Gauge control module lost communication with Audio Remote Switch (LIN bus connected)	Loss of communication
U0029	F-CAN communication line error	Loss of communication
U0100	Gauge control module lost communication with ENG/AT	Loss of communication
U0101	Gauge control module lost communication with AT	Loss of communication
U0104	Gauge Control Module Lost Communication With Driving Support System Control Unit	Loss of communication
U0111	Gauge control module lost communication with Battery Condition Monitor Module	Loss of communication
U0114	Gauge control module lost communication with All Wheel Drive Control Module	Loss of communication
U0122	Gauge control module lost communication with VSA modulator-control unit	Loss of communication
U0128	Gauge control module lost communication with EPB	Loss of communication

DTC	Description	DTC type
U0131	Gauge control module lost communication with EPS Unit	Loss of communication
U0151	Gauge control module lost communication with SRS unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1281	Gauge control module lost communication with MICU (body control module) (MICU frame)	Loss of communication
U1288	Gauge control module lost communication with PARKSR	Loss of communication
U128F	Gauge control module lost communication with BSI unit	Loss of communication
U129C	Gauge control module lost communication with multi purpose camera unit	Loss of communication
U12A0	Gauge control module lost communication with Acoustic Vehicle Alert System (AVAS)	Loss of communication
U3000-49	ECU internal circuit malfunction	Internal error
U3000-51	Reprogramming error	Internal error

HVAC SYSTEM DTCS

DTC	Detection Item or Symptom	ECU	DTC Type
B120A	Climate Control Unit LIN Communication Bus Line Error	Climate control unit	Loss of communication
B121A	An open in the mode control motor circuit	Climate control unit	Signal error
B121B	A short in the mode control motor circuit	Climate control unit	Signal error
B121D	Humidity/in-car temperature sensor communication error	Climate control unit	Loss of communication
B1220	A Short in the recirculation control motor circuit	Climate control unit	Signal error
B1227	An open in the outside air temperature sensor circuit	Climate control unit	Signal error
B1228	A short in the outside air temperature sensor circuit	Climate control unit	Signal error

DTC	Detection Item or Symptom	ECU	DTC Type
B1231	An open in the evaporator temperature sensor circuit	Climate control unit	Signal error
B1232	A short in the evaporator temperature sensor circuit	Climate control unit	Signal error
B1233	An open in the air mix control motor circuit (driver's)	Climate control unit	Signal error
B1234	A short in the air mix control motor circuit (driver's)	Climate control unit	Signal error
B1235	A problem in the air mix control motor circuit, linkage, door, or motor (driver's)	Climate control unit	Signal error
B1236*1	An open in the passenger's air mix control motor circuit	Climate control unit	Signal error
B1237*1	A short in the passenger's air mix control motor circuit	Climate control unit	Signal error
B1238*1	A problem in the passenger's air mix control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B123F	Automatic lighting control unit/sunlight sensor error	Climate control unit	Signal error
B1240	A problem in the mode control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B1241	A problem in the blower motor circuit	Climate control unit	Signal error
B2964	Climate control unit lost communication with Front PANEL (Climate Control Panel)	Climate control unit	Loss of communication
B296D	Electric heater coolant Pump Communication Fail	Climate control unit	Loss of communication
B296E	Electric heater coolant Pump Fail	Climate control unit	Signal error
B2983	A problem in the recirculation control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B2986	An open in the recirculation control motor circuit	Climate control unit	Signal error
B2990	A problem in the A/C compressor driving circuit (A Problem in the Electric A/C Compressor Driving Circuit)	Climate control unit	Signal error
B2998	A problem in the A/C compressor driver (A Problem in the Electric A/C Compressor Driver)	Climate control unit	Signal error
U1280	Communication bus line error (BUS-OFF)	Climate control unit	Loss of communication
U1281	Climate Control Unit Lost Communication with MICU (body control module)	Climate control unit	Loss of communication
U128D	Climate Control Unit Lost communication with gauge control module	Climate control unit	Loss of communication
U1290*2	Climate Control Unit Lost Communication With Seat Heater Control Unit (Front)	Climate control unit	Loss of communication

*1: With dual zone climate control

*2: With seat heater

KEYLESS ACCESS / BACKUP CONTROL UNIT DTCS

DTC	Description	DTC type
B1926	Backup Control Antenna Open or Short	Internal error
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U128D	Backup Control Unit Lost Communication with Gauge Control Module	Loss of communication

KEYLESS ACCESS CONTROL UNIT DTCS

DTC	Description	DTC type
B1601	Keyless access control unit internal (CPU) error	Internal error
B1602	Keyless access control unit internal (EEPROM) error	Internal error
B1640	RF1 antenna not connected or malfunction	Signal error
B1645	Driver's Door LF Antenna Circuit Short	Signal error
B1646	Driver's Door LF Antenna Circuit Open	Signal error
B1647	Passenger's Door LF Antenna Circuit Short	Signal error
B1648	Passenger's Door LF Antenna Circuit Open	Signal error
B1657	Rear Bumper LF Antenna Circuit Short	Signal error
B1658	Rear Bumper LF Antenna Circuit Open	Signal error
B1659	Front Interior LF Antenna Circuit Short	Signal error
B1660	Front Interior LF Antenna Circuit Open	Signal error
B1661	Middle Interior Antenna Circuit Shorted	Signal error
B1662	Middle Interior Antenna Circuit Opened	Signal error
B1663	Rear Interior LF Antenna Circuit Short	Signal error
B1664	Rear Interior LF Antenna Circuit Open	Signal error
B1667	Rear Shelf (Middle Interior) LF Antenna Circuit Short	Signal error
B1668	Rear Shelf (Middle Interior) LF Antenna Circuit Open	Signal error
U1280	Keyless access control unit communication bus line error (BUS-OFF)	Loss of communication
U1281	Keyless Access Control Unit Lost Communication with MICU	Loss of communication
U128D	Keyless Access Control Unit Lost Communication with Gauge Control Module	Loss of communication

KEYLESS ACCCESS POWER CONTROL UNIT DTCS

DTC	Description	DTC type
B12C5	Engine Start/Stop Switch (Power Switch) Failure	Signal error
B12D0	Power Control Unit IG1A Circuit Error	Internal error

DTC	Description	DTC type
B12D1	Power Control Unit IG1B Circuit Error	Internal error
B12D2	Power Control Unit IG2 Circuit Error	Internal error
B12D3	Power Control Unit IG Latch Circuit Error	Internal error
B12E5	Incorrect assembly of control unit for electric steering lock equipped vehicle	Signal error
B12F3	Power Control Unit Lost Communication with Transmission Control Unit	Loss of communication
U0073	F-CAN Communication Bus Line Error	Loss of communication
U0100	Power Control Unit Lost Communication with PCM	Loss of communication
U0122	Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit	Loss of communication

DTC	Description	DTC type
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Power Control Unit Lost Communication with MICU	Loss of communication
U128D	Power Control Unit Lost Communication with Gauge Control Module	Loss of communication

PARKING AND BACK-UP SENSOR CONTROL UNIT DTCS

DTC	Description	DTC type
B2601	Parking Sensor CPU Error	Internal error
B2602	Parking Sensor EEPROM Error	Internal error
B2610	Front 1st sensor failure	Signal error
B2611	Front 2nd sensor failure	Signal error
B2612	Front 3rd sensor failure	Signal error
B2613	Front 4th sensor failure	Signal error
B2614	Rear 1st sensor failure	Signal error
B2615	Rear 2nd sensor failure	Signal error
B2616	Rear 3rd sensor failure	Signal error
B2617	Rear 4th sensor failure	Signal error

DTC	Description	DTC type
B2618	Front 1st sensor data failure	Signal error
B2619	Front 2nd sensor data failure	Signal error
B261A	Front 3rd sensor data failure	Signal error
B261B	Front 4th sensor data failure	Signal error
B261C	Rear 1st sensor data failure	Signal error
B261D	Rear 2nd sensor data failure	Signal error
B261E	Rear 3rd sensor data failure	Signal error
B261F	Rear 4th sensor data failure	Signal error
B2646	Front sensor power failure	Signal error
B2647	Rear sensor power failure	Signal error
B2648	Front sensor signal short to ground	Signal error
B2649	Rear sensor signal short to ground	Signal error
B264A	Indicator circuit short to power	Signal error
B264B	Indicator circuit short to ground	Signal error
B264D	Front sensor combination error	Signal error
U0155	Lost communication with Gauge Control Module	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Lost communication with MICU	Loss of communication

POWER SEAT CONTROL DTCS

DTC	Description	DTC type
B1802	Power seat control unit internal (EEPROM) error	Internal error
B1825	Slide pulse error (no change in pulse for 1 second)	Signal error
B1826	Front height pulse error (no change in pulse for 1 second)	Signal error
B1827	Rear height pulse error (no change in pulse for 1 second)	Signal error
B1828	Driver seat recline motor pulse error	Signal error
B1829	AT-P signal and VSP or ESL_WHEEL signal mismatch	Signal error

DTC	Description	DTC type
B1836	Power Seat Position Sensor circuit short	Signal error
B1837	Memory position calling timeout	Signal error
B1844	Power Seat Slide switch circuit malfunction	Signal error
B1845	Power Seat Recline switch circuit malfunction	Signal error
B1846	Power Seat Front Up-Down switch circuit malfunction	Signal error
B1847	Power Seat Rear Up-Down switch circuit malfunction	Signal error
U0199	Power seat control unit lost communication with PW master SW	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Power seat control unit lost communication with MICU (body control module) (MICU frame)	Loss of communication
U128D	Lost Communication With Gauge Control Module (VSP/NE or ESL_WHEEL frame)	Loss of communication

POWER WINDOW MASTER SWITCH DTCS

DTC	Description	DTC type
B1125	Driver's power window motor A pulse malfunction	Signal error
B1126	Driver's power window motor B pulse malfunction	Signal error
B1127	Driver's door lock key cylinder switch malfunction	Signal error
B1128	Driver's door lock switch malfunction	Signal error
B1129	Driver's door lock knob switch malfunction	Signal error
B1130	Front Passenger's power window motor A-phase pulse signal input error	Signal error
B1131	Front Passenger's power window motor B-phase pulse signal input error	Signal error
B1140	Driver's power window position detect circuit malfunction	Signal error
B1142	Power window master switch lost communication with the other units (UART communication Error)	Loss of communication
B1145	Front passenger's window position detect circuit malfunction	Signal error
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1281	Power Window Master Switch lost communication with MICU (body control module)	Loss of communication
U128D	Power Window Master Switch lost communication with gauge control module	Loss of communication
U1299	Power Window Master Switch lost communication with climate control unit	Loss of communication

POWER TAILGATE CONTROL UNIT DTCS

DTC	Description	DTC type
B1352	Power Tailgate Control Unit Internal error (EEPROM error)	Internal error
B1375	Driver's side PTG switch circuit malfunction	Signal error
B1376	Tailgate Outer Handle switch circuit malfunction	Signal error
B1377	Power Tailgate Inner switch circuit malfunction	Signal error
B1378	Power Tailgate Right Touch/Pinch sensor circuit malfunction	Signal error

DTC	Description	DTC type
B1379	Power Tailgate Left Touch/Pinch sensor circuit malfunction	Signal error
B1380	Tailgate Closer Unit Neutral switch circuit malfunction	Signal error

DTC	Description	DTC type
B1382	Tailgate Closer Unit Full Latch switch circuit malfunction	Signal error
B1383	Tailgate Closer Unit Ratchet switch circuit malfunction	Signal error
B1384	Tailgate Closer Unit Half Latch switch circuit malfunction	Signal error
B1385	Power Tailgate temperature sensor malfunction	Signal error
B1386	Power Tailgate sensor Pulse A circuit malfunction	Signal error
B1387	Power Tailgate sensor Pulse B circuit malfunction	Signal error
B1388	Power Tailgate Drive Motor circuit malfunction	Signal error
B1390	Power Tailgate Closer Motor circuit malfunction	Signal error
U0199	Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)	Loss of communication
U1280	Communication Bus line Error (a bus OFF state is detected by Power Tail Gate ECU)	Loss of communication
U1281	Lost communication with MICU (MICU frame)	Loss of communication
U128D	Power Tailgate Control Unit lost communication with GAUGE Control Module	Loss of communication

SEAT HEATER CONTROL UNIT DTCS

DTC	Description	DTC type
B1C55	Driver's heater thermistor circuit open	Signal error
B1C56	Driver's heater thermistor circuit short	Signal error
B1C57	Passenger's heater thermistor circuit open	Signal error
B1C58	Passenger's heater thermistor circuit short	Signal error
B1C60	Driver's heater current abnormal high	Signal error
B1C61	Driver's heater current abnormal low	Signal error
B1C62	Passenger's heater current abnormal high	Signal error
B1C63	Passenger's heater current abnormal low	Signal error
B1C68	Driver's heater not heating	Signal error
B1C69	Passenger's heater not heating	Signal error
B1C70	Driver's main heater switch failure	Signal error
B1C71	Passenger's main heater switch failure	Signal error
U1064	Seat heater control unit lost communication with climate control unit	Loss of communication
U1280	Seat heater control unit communication bus line error (BUS-OFF)	Loss of communication

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DTCS

DTC	Detection Item
B0001-11	Short to ground in the driver's airbag first inflator
B0001-12	Short to power in the driver's airbag first inflator
B0001-13	Open or increased resistance in the driver's airbag first inflator
B0001-1A	Decreased resistance in the driver's airbag first inflator
B0001-2B	Short to another wire harness in the driver's airbag first inflator
B0002-11	Short to ground in the driver's airbag second inflator
B0002-12	Short to power in the driver's airbag second inflator
B0002-13	Open or increased resistance in the driver's airbag second inflator
B0002-1A	Decreased resistance in the driver's airbag second inflator
B0002-2B	Short to another wire harness in the driver's airbag second inflator
B0010-11	Short to ground in the front passenger's airbag first inflator
B0010-12	Short to power in the front passenger's airbag first inflator
B0010-13	Open or increased resistance in the front passenger's airbag first inflator
B0010-1A	Decreased resistance in the front passenger's airbag first inflator
B0010-2B	Short to another wire harness in the front passenger's airbag first inflator
B0011-11	Short to ground in the front passenger's airbag second inflator
B0011-12	Short to power in the front passenger's airbag second inflator

DTC	Detection Item
B0011-13	Open or increased resistance in the front passenger's airbag second inflator
B0011-1A	Decreased resistance in the front passenger's airbag second inflator
B0011-2B	Short to another wire harness in the front passenger's airbag second inflator
B0020-11	Short to ground in the driver's side airbag inflator
B0020-12	Short to power in the driver's side airbag inflator
B0020-13	Open or increased resistance in the driver's side airbag inflator
B0020-1A	Decreased resistance in the driver's side airbag inflator
B0020-2B	Short to another wire harness in the driver's side airbag inflator
B0021-11	Short to ground in the left side curtain airbag first inflator
B0021-12	Short to power in the left side curtain airbag first inflator
B0021-13	Open or increased resistance in the left side curtain airbag first inflator
B0021-1A	Decreased resistance in the left side curtain airbag first inflator
B0021-2B	Short to another wire harness in the left side curtain airbag first inflator
B0028-11	Short to ground in the front passenger's side airbag inflator
B0028-12	Short to power in the front passenger's side airbag inflator
B0028-13	Open or increased resistance in the front passenger's side airbag inflator
B0028-1A	Decreased resistance in the front passenger's side airbag inflator
B0028-2B	Short to another wire harness in the front passenger's side airbag inflator
B0029-11	Short to ground in the right side curtain airbag first inflator
B0029-12	Short to power in the right side curtain airbag first inflator
B0029-13	Open or increased resistance in the right side curtain airbag first inflator
B0029-1A	Decreased resistance in the right side curtain airbag first inflator
B0029-2B	Short to another wire harness in the right side curtain airbag first inflator
B0050-11	Short or decreased resistance in the driver's seat belt buckle switch
B0050-13	Open or increased resistance in the driver's seat belt buckle switch
B0050-2B	Short to another wire harness in the driver's seat belt buckle switch
B0052-11	Short or decreased resistance in the front passenger's seat belt buckle switch
B0052-13	Open or increased resistance in the front passenger's seat belt buckle switch
B0052-2B	Short to another wire harness in the front passenger's seat belt buckle switch
B0070-11	Short to ground in the driver's seat belt tensioner

DTC	Detection Item
B0070-12	Short to power in the driver's seat belt tensioner
B0070-13	Open or increased resistance in the driver's seat belt tensioner
B0070-1A	Decreased resistance in the driver's seat belt tensioner
B0070-2B	Short to another wire harness in the driver's seat belt tensioner
B0072-11	Short to ground in the front passenger's seat belt tensioner
B0072-12	Short to power in the front passenger's seat belt tensioner
B0072-13	Open or increased resistance in the front passenger's seat belt tensioner
B0072-1A	Decreased resistance in the front passenger's seat belt tensioner
B0072-2B	Short to another wire harness in the front passenger's seat belt tensioner
B0079-11	Short to ground in the driver's seat belt outer lap tensioner
B0079-12	Short to power in the driver's seat belt outer lap tensioner
B0079-13	Open or increased resistance in the driver's seat belt outer lap tensioner
B0079-1A	Decreased resistance in the driver's seat belt outer lap tensioner
B0079-2B	Short to another wire harness in the driver's seat belt outer lap tensioner
B007A-11	Short to ground in the front passenger's seat belt outer lap tensioner
B007A-12	Short to power in the front passenger's seat belt outer lap tensioner

DTC	Detection Item
B007A-13	Open or increased resistance in the front passenger's seat belt outer lap tensioner
B007A-1A	Decreased resistance in the front passenger's seat belt outer lap tensioner
B007A-2B	Short to another wire harness in the front passenger's seat belt outer lap tensioner
B0082-11	Short to ground in the selectable energy absorption device of the front passenger's seat belt tensioner
B0082-12	Short to power in the selectable energy absorption device of the front passenger's seat belt tensioner
B0082-13	Open or increased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner
B0082-1A	Decreased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner
B0082-2B	Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner
B0090-4A	Internal failure of the left front impact sensor
B0090-87	No signal from the left front impact sensor
B0090-92	Internal failure of the left front impact sensor
B0091-4A	Internal failure of the left side impact sensor (first)
B0091-87	No signal from the left side impact sensor (first)
B0091-92	Internal failure of the left side impact sensor (first)
B0092-4A	Internal failure of the left side impact sensor (second)
B0092-87	No signal from the left side impact sensor (second)
B0092-92	Internal failure of the left side impact sensor (second)
B0095-4A	Internal failure of the right front impact sensor
B0095-87	No signal from the right front impact sensor
B0095-92	Internal failure of the right front impact sensor
B0096-4A	Internal failure of the right side impact sensor (first)
B0096-87	No signal from the right side impact sensor (first)
B0096-92	Internal failure of the right side impact sensor (first)
B0097-4A	Internal failure of the right side impact sensor (second)
B0097-87	No signal from the right side impact sensor (second)
B0097-92	Internal failure of the right side impact sensor (second)
B00A0-54	Front passenger's weight sensor not calibrated
B00B5-11	Short or decreased resistance in the driver's seat position sensor

DTC	Detection Item
B00B5-13	Open or increased resistance in the driver's seat position sensor
B00B5-2B	Short to another wire harness in the driver's seat position sensor
B00C0-16	Internal failure of the front passenger's weight sensor (front inner side)
B00C0-4A	Different supplier ID/function ID of the front passenger's weight sensor (front inner side)
B00C0-54	Different serial ID of the front passenger's weight sensor (front inner side)
B00C0-87	No signal from the front passenger's weight sensor (front inner side)
B00C0-96	Internal failure of the front passenger's weight sensor (front inner side)
B00C2-16	Internal failure of the front passenger's weight sensor (rear inner side)
B00C2-4A	Different supplier ID/function ID of the front passenger's weight sensor (rear inner side)
B00C2-54	Different Serial ID of the front passenger's weight sensor (rear inner side)
B00C2-87	No signal from the front passenger's weight sensor (rear inner side)
B00C2-96	Internal failure of the front passenger's weight sensor (rear inner side)
B00D5-14	Open or short to ground in the front passenger's airbag cutoff indicator
B00D5-17	Short to power in the front passenger's airbag cutoff indicator

DTC	Detection Item
B2800-49	Internal failure of the SRS unit
B2801-49	Internal failure of the SRS unit
B2802-49	Internal failure of the SRS unit
B2840-13	SRS unit connector A not properly installed
B2841-13	SRS unit connector B not properly installed
C0061-96	Internal failure of the SRS unit
C0063-96	Internal failure of the SRS unit
U0122-00	Lost communication with the VSA modulator-control unit (wheel speed sensor signal error)
U3000-49	Internal failure of the SRS unit
U3000-51	SRS unit programming error

VSA SYSTEM DTCS

	-17	Power Source Failure for ECU (High Voltage)

WIRELESS CHARGER DTCS

DTC	Description	DTC Type
B22A0	Wireless charger unit failure	Internal error
B22A1	Wireless charger unit ACC input circuit failure	Signal error
U1280	Communication bus line Error (BUS-OFF)	Loss of communication
U1281	Wireless charger unit lost communication with MICU	Loss of communication
U1286	Wireless charger unit lost communication with Keyless Access Control Unit	Loss of communication
U128D	Wireless charger unit lost communication with Gauge control module	Loss of communication
U128E	Wireless charger unit lost communication with Audio-Navigation Unit	Loss of communication

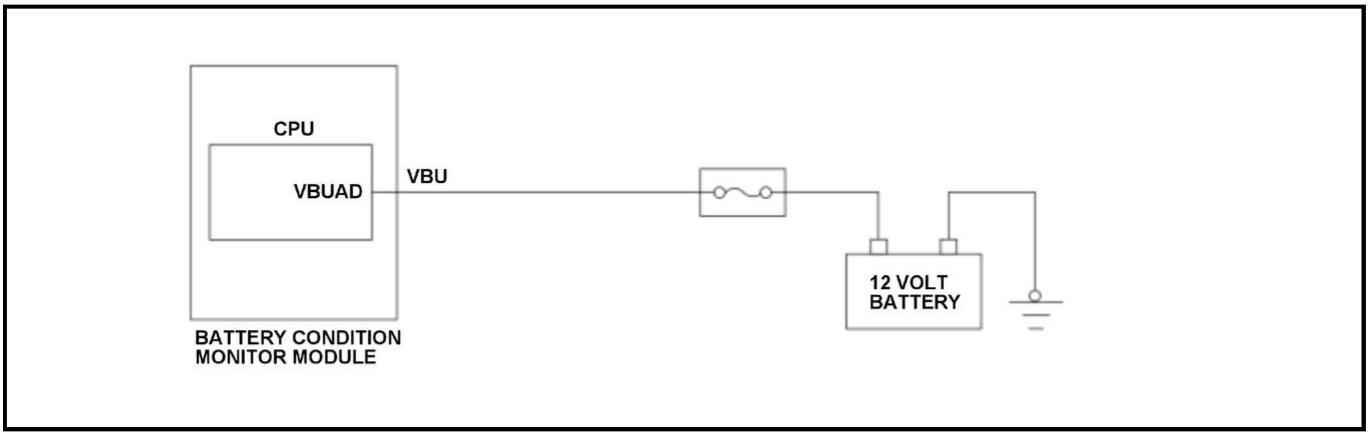
---

ADVANCED DIAGNOSTICS

DTC P0562 (BATTERY CONDITION MONITOR MODULE)

DTC P0562: Battery Condition Monitor Module System Voltage Low

General Description



The battery condition monitor module monitors the voltage of back-up power supply. When the back-up power supply voltage is a specified voltage for a set time, a malfunction is detected and a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The back-up power supply voltage is 2.0 V or less for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery condition monitor module VBU line open (includes fuse blown)
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

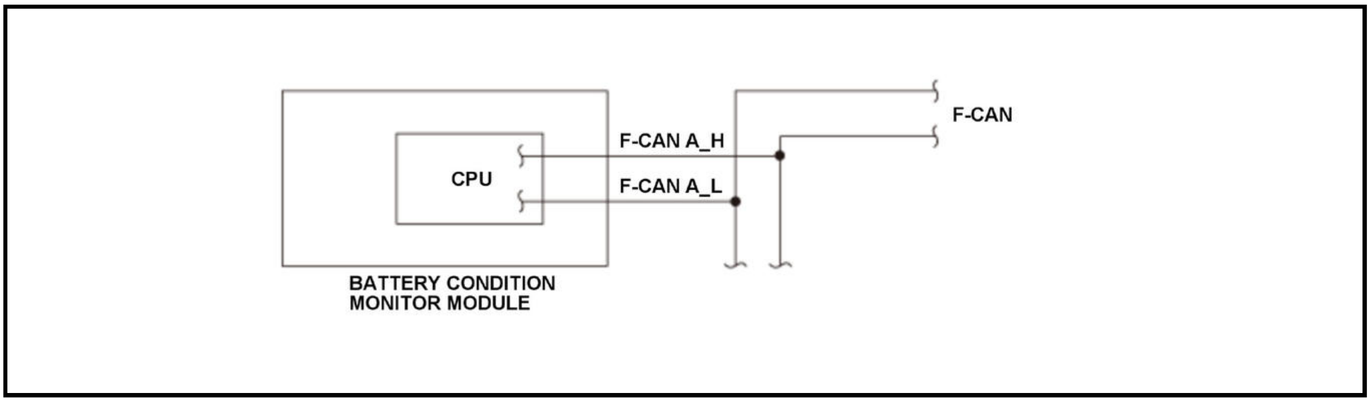
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P0602 (BATTERY CONDITION MONITOR MODULE)

DTC P0602: Battery Condition Monitor Module Programming Error

General Description



The CPU in the battery condition monitor module can be reprogrammed with updated software. The CPU confirms if the control program update is completed normally. When the power is interrupted during reprogramming, the CPU detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	When the power is turned on after updating is executed and it failed
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The power is interrupted during reprogramming, and the CPU is not updated and programmed normally.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CPU program unwritten

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P062F (BATTERY CONDITION MONITOR MODULE)

DTC P062F: Battery Condition Monitor Module EEPROM Error

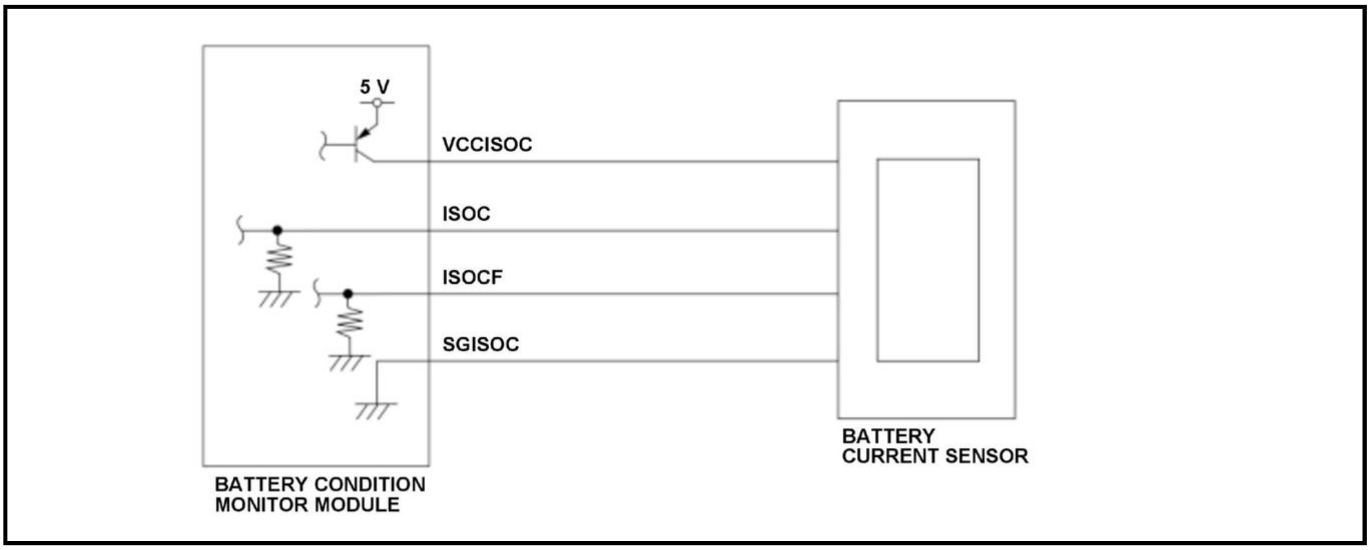
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the following DTC codes (P1D3A, P1D3B) are detected.

DTC P06B1 (BATTERY CONDITION MONITOR MODULE)

DTC P06B1: HV Battery Current Sensor Power Supply Circuit Low

General Description



The battery condition monitor module applies 5 V to the battery current sensor and monitors the voltage. When the battery current sensor voltage is a specified voltage for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the	50 milliseconds	-

Condition	Minimum	Maximum
vehicle condition is turned to the ON mode		
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The battery current sensor voltage is 4.75 V or less for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor VCCISOC line short to ground
- Battery current sensor failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

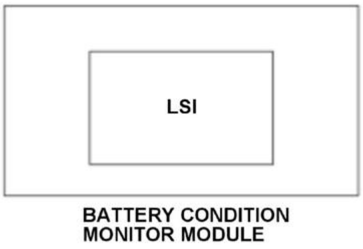
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P0A1F

DTC P0A1F: Battery Condition Monitor Module

General Description



The large-scale integration (LSI) is built into the battery condition monitor module. If the battery condition monitor module detects an abnormal in the LSI, a malfunction is detected and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-

DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The battery condition monitor module detects an abnormal in the LSI.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

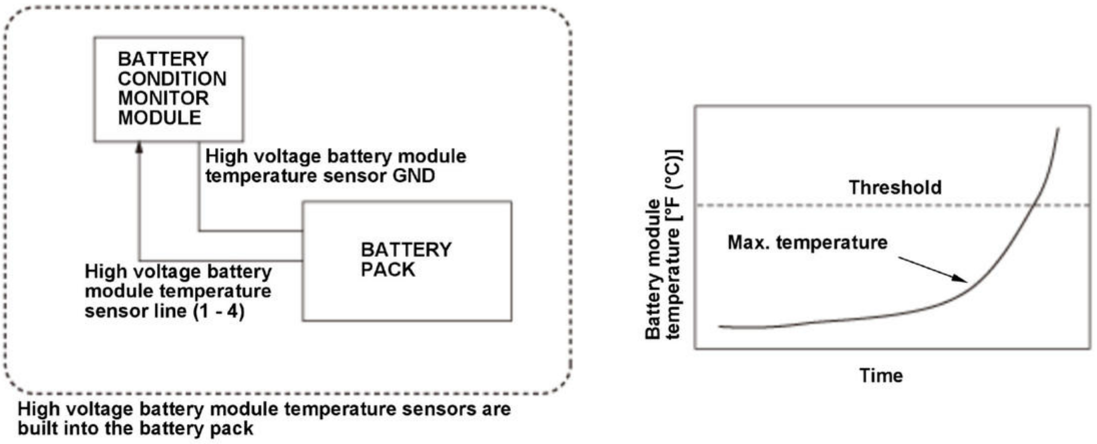
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P0A7E

DTC P0A7E: HV Battery Pack Over Temperature

General Description



BATTERY CONDITION MONITOR MODULE
High voltage battery module temperature sensor GND
BATTERY PACK
High voltage battery module temperature sensor line (1 - 4)
High voltage battery module temperature sensors are built into the battery pack
Battery module temperature [°F (°C)]
Threshold
Max. temperature
Time

High voltage battery module temperature sensors are built into the battery module in the battery pack to detect a battery module temperature. If the battery module temperature is a specified temperature for a set time, the battery condition monitor module detects a malfunction in the battery module and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The battery module temperature is 167 deg.F (75 deg.C) or more for at least 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P0A7F

DTC P0A7F: HV Battery Pack Deterioration

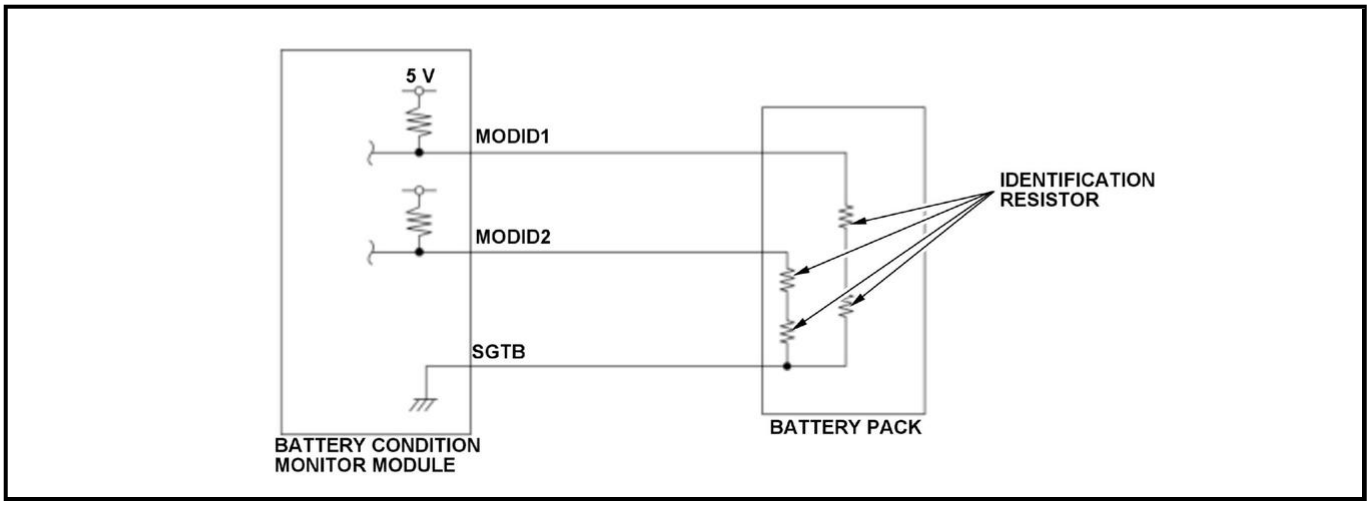
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the following DTC codes (P144A, P1DC7) are detected.

DTC P0A80

DTC P0A80: Replace HV Battery Pack

General Description



The battery pack built in resistance for battery module identifications are used for the battery condition monitor module to monitor whether an appropriate battery module is connected. If the battery pack resistance voltage for battery module identifications are out of specified value for a set time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage	8.0 V	-
Other	During initial start-up of the battery condition monitor module, after disconnecting the 12 volt battery	

Malfunction Threshold

One of these conditions is met:

- The resistance voltage is 4.98 V or more for at least 2.0 seconds.
- The resistance voltage is 0.03 V or less for at least 2.0 seconds.
- The average voltage of resistance voltage acquired for 19 times is 2.61 V or less, or 3.84 V or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack MODID1 line open
- Battery pack MODID1 line short to ground
- Battery pack MODID2 line open
- Battery pack MODID2 line short to ground
- Battery pack internal circuit failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

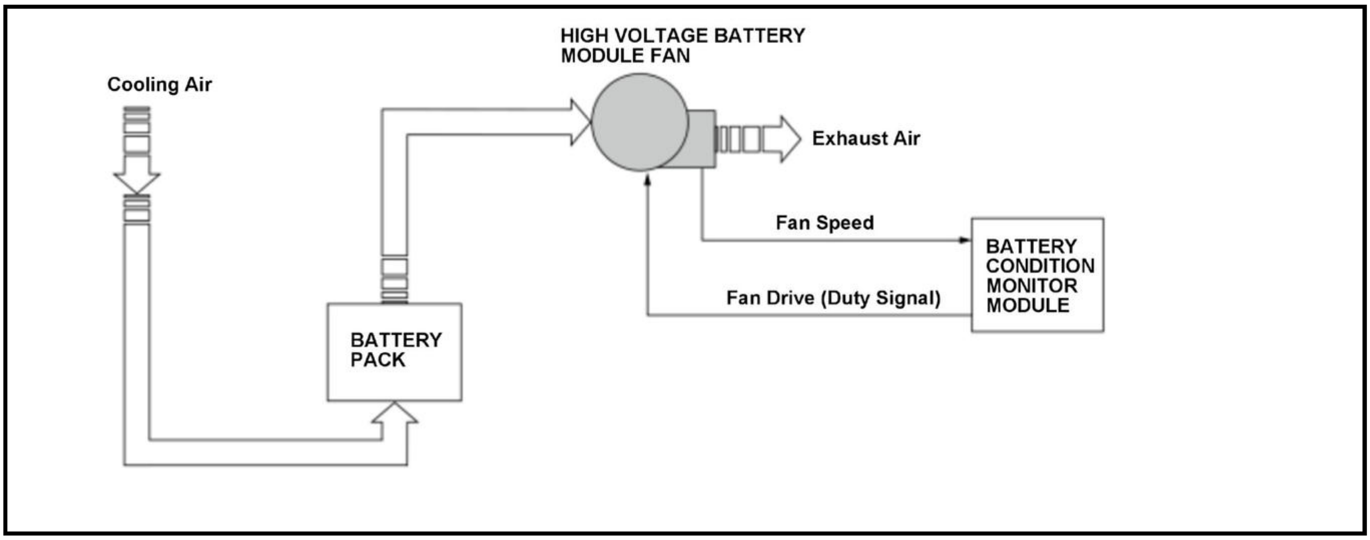
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P0A82

DTC P0A82: HV Battery Pack Cooling Fan Performance/Stuck Off

General Description



To manage the temperature of the battery pack, the electric powertrain system is equipped with a high voltage battery module fan. When a malfunction occurs in the high voltage battery module fan, charging and power supplying to the 12 volt battery is disabled due to temperature increase. A malfunction in the high voltage battery module fan is detected to avoid problems caused by overheating. If the high voltage battery module fan is functioning normally, when the battery condition monitor module operates the high voltage battery module fan, it should be operated within a specified speed range. The battery condition monitor module compares the actual high voltage battery module fan speed to the high voltage battery module fan duty cycle, and if the difference exceeds a specified value, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	19 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Target high voltage battery module fan speed	880 rpm	-
Battery condition monitor module power-supply voltage	11.4 V	-

Condition	Minimum	Maximum
Vehicle	ON mode	

Malfunction Threshold

The difference between the target high voltage battery module fan speed and actual speed is equal to or more than the value in the table below continuously for 19 seconds.

Target high voltage battery module fan speed (rpm)	1, 649	1, 650	2, 000	2, 700	3, 400	4, 100	4, 520	4, 800	5, 500
Actual high voltage battery module fan speed (rpm)	0	550	900	1, 600	2, 300	3, 000	3, 000	3, 000	3, 000

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage battery module fan line failure
- High voltage battery module fan failure
- Battery condition monitor module failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode.

With the HDS

Select the BATTERY FAN TEST in the FUNCTION TEST with the HDS, then select START.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

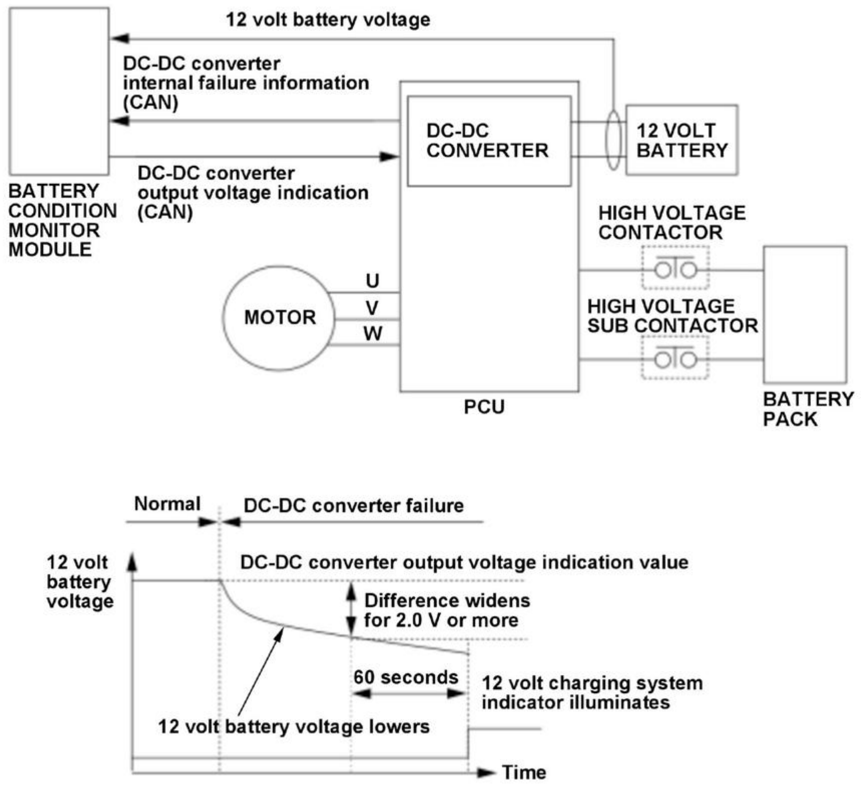
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P0A94

DTC P0A94: DC-DC Converter Performance

General Description



12 volt battery voltage
DC-DC converter internal failure information (CAN)
DC-DC converter output voltage indication (CAN)
BATTERY CONDITION MONITOR MODULE
DC-DC CONVERTER
12 VOLT BATTERY
HIGH VOLTAGE CONTACTOR
HIGH VOLTAGE SUB CONTACTOR

12 volt battery voltage lowers
Time

The 12 volt battery voltage and the output voltage measured by the battery condition monitor module become within a prescribed value if the DC-DC converter is normally operating. In the event of malfunction of the DC-DC converter or if the DC-DC converter protection is activated (output is stopped) due to overheating, the 12 volt battery voltage is decreased. Malfunction of the DC-DC converter is detected and a DTC is stored when any one of the following conditions is met:

- Malfunction judgment 1

  The value of the DC-DC converter output power instructed by the battery condition monitor module and the 12 volt battery voltage measured by the battery condition monitor module are compared and when the difference in the voltage is equal to or more than the prescribed value continuously for the prescribed time or more or when the battery condition monitor module has received internal failure information similarly determined within the DC-DC converter.

- Malfunction judgment 2

  When the DC-DC converter output voltage is equal to or less than the voltage instructed by the battery condition monitor module continuously for the prescribed time or more.

- Malfunction judgment 3

  When the 12 volt battery voltage is equal to or less than the prescribed value continuously for the prescribed time.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

*: Malfunction judgment 1

**: Malfunction judgment 2

***: Malfunction judgment 3

Duration	60 seconds or more*, ***2 seconds or more**
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator off, 12 VOLT CHARGING SYSTEM indicator on

*: Malfunction judgment 1

**: Malfunction judgment 2

***: Malfunction judgment 3

Enable Conditions

Condition	Minimum	Maximum
Battery condition monitor module power-supply voltage	10.2 V	-
Motor power inverter (MPI) module voltage	187.6 V	300.75 V
Vehicle	ON mode	

Malfunction Threshold

- Malfunction judgment 1

  The difference between the commanded DC-DC converter voltage and the battery condition monitor module voltage is 2.0 V or more for at least 60 seconds.

- Malfunction judgment 2

  The battery condition monitor module receives the internal malfunction information from the DC-DC converter for at least 2 seconds.

- Malfunction judgment 3

  When the 12 volt battery voltage detected by the battery condition monitor module is less than 11 V continuously for 60 seconds or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- DC-DC converter output line open
- DC-DC converter internal circuit failure
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the READY TO DRIVE mode, and wait 100 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

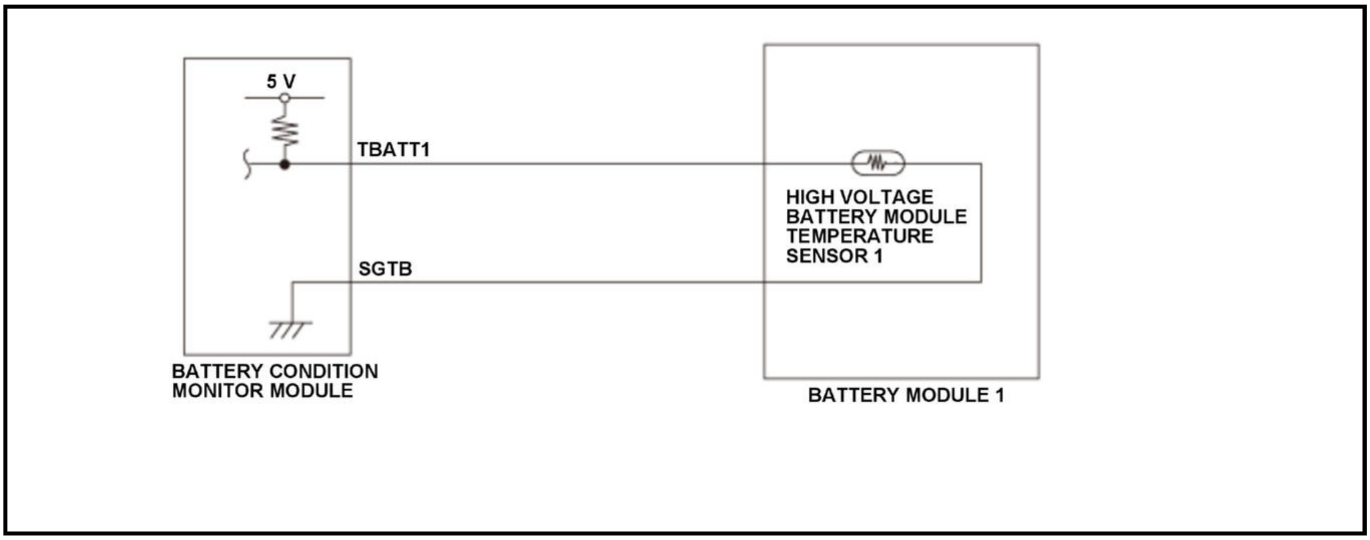
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P0A9B

DTC P0A9B: HV Battery Temperature Sensor 1 Circuit

General Description



5 V
TBATT1
SGTB
HIGH VOLTAGE BATTERY MODULE TEMPERATURE SENSOR 1
BATTERY CONDITION MONITOR MODULE
BATTERY MODULE 1

Four high voltage battery module temperature sensors are attached to the battery module in the battery pack, and the battery condition monitor module continuously monitors the battery module temperature. If the battery condition monitor module input voltage from high voltage battery module temperature sensor 1 is out of the specified voltage for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3.0 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	8.0 V	-

Malfunction Threshold

The high voltage battery module temperature sensor 1 output voltage [HV Battery Module Temperature Sensor 1 Voltage] is 0.72 V or less, or 4.83 V or more for at least 3.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage battery module temperature sensor 1 failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

In electric powertrain system, if the vehicle condition is turned to the OFF (LOCK) mode when the vehicle is in a stationary condition, or when electric powertrain system is stopped due to a fail safe action, the high voltage contactor turns OFF which was ON during the electric powertrain system was activated. If either the high voltage contactor or the high voltage sub contactor is turned OFF, the electric charge charged in the power drive unit (PDU) capacitor of the inverter is discharged by the DC-DC converter and the bypass resistor, and the inverter voltage drops. In case of an ON malfunction of the high voltage contactor, the voltage is not discharged so the inverter voltage does not drop. The battery condition monitor module monitors the voltage of the inverter voltage when vehicle condition is turned to the OFF (LOCK) mode, and if the voltage difference between the inverter voltage and the high voltage contactor voltage before and after turning OFF continues to be within a specified value for a certain period of time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	After the vehicle condition is turned to the OFF (LOCK) mode
Sequence	None
Duration	140 seconds or more

DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Battery condition monitor module power-supply voltage	10.2 V	-
MPI module voltage	84.9 V	323.1 V
Inverter voltage variability	-	23.0 V
Vehicle	OFF (LOCK) mode	

Malfunction Threshold

The voltage difference between the inverter voltage before and after turning the high voltage contactor OFF is 48 V or less for at least 140 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage contactor CNTP line short
- High voltage contactor stuck on
- Bypass contactor stuck on
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

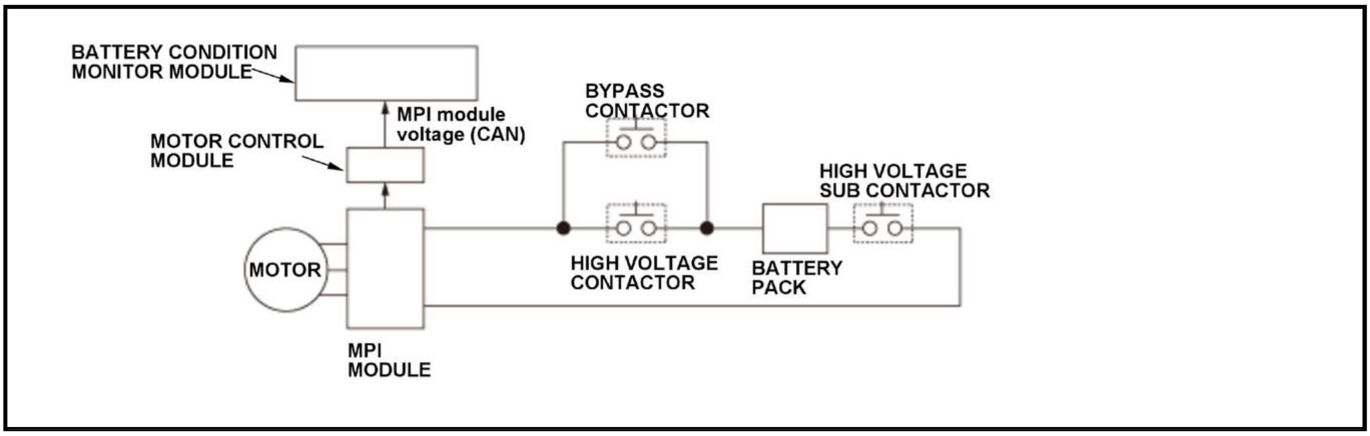
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

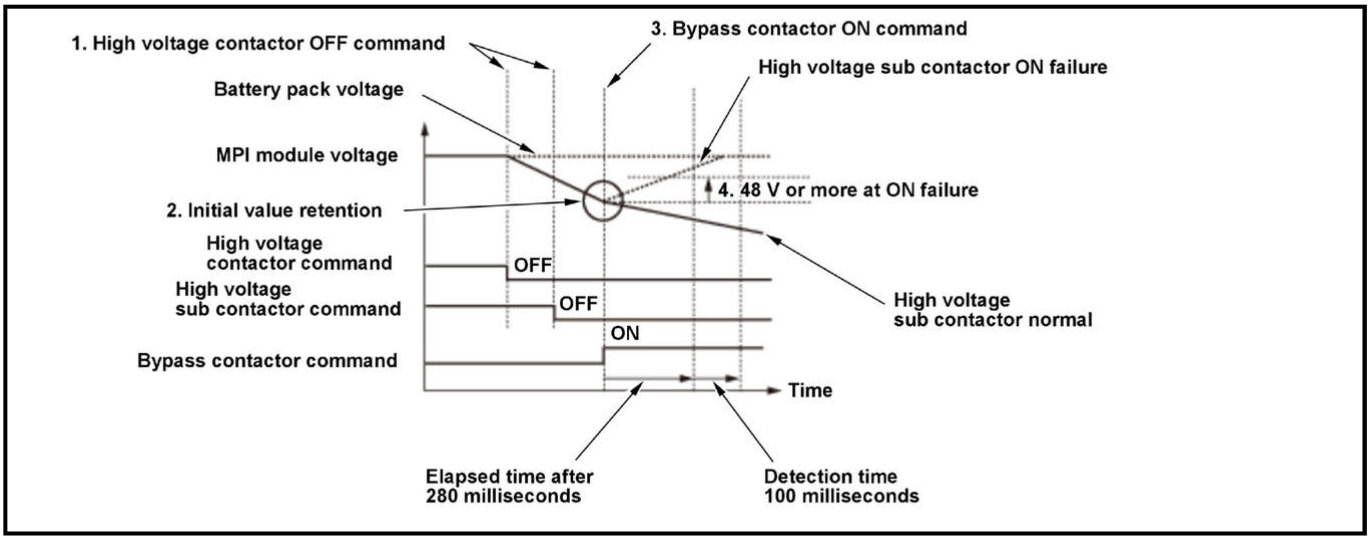
DTC P0AA3

DTC P0AA3: HV Battery Sub Contactor Circuit

General Description



BATTERY CONDITION MONITOR MODULE
MPI module voltage (CAN)
MOTOR CONTROL MODULE
BYPASS CONTACTOR
HIGH VOLTAGE SUB CONTACTOR
MOTOR
HIGH VOLTAGE CONTACTOR
BATTERY PACK
MPI MODULE



In electric powertrain system, if the vehicle condition is turned to the OFF (LOCK) mode when the vehicle is in a stationary condition, or when electric powertrain system is stopped due to a fail safe action, the high voltage sub contactor turns OFF which was ON during the electric powertrain system was activated. Under an ON malfunction condition of the high voltage sub contactor, the power drive unit (PDU) capacitor is gradually charged by the battery pack, and the inverter voltage rises if the battery condition monitor module sends an ON command of the bypass contactor. The battery condition monitor module monitors the voltage value through the inverter voltage sensor. If the voltage difference of the inverter voltage before and after turning the bypass contactor ON continues to be at a specified value for a certain period of time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	After the vehicle condition is turned to the OFF (LOCK) mode
Sequence	None
Duration	380 milliseconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the bypass contactor is ON	280 milliseconds	-

[ ]: HDS Parameter

Condition	Minimum	Maximum
Bypass contactor power-supply voltage	8.7 V	-
Traction motor speed	-	441 rpm
Generator motor speed [Motor Speed (GEN)]	-	740 rpm
Vehicle	OFF (LOCK) mode	

[ ]: HDS Parameter

Malfunction Threshold

The voltage difference between the MPI module voltage before and after turning the bypass contactor ON is more than 48 V and continues for 100 milliseconds or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage sub contactor CNTN line short
- High voltage sub contactor stuck on
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the ON mode.
- Turn the vehicle to the OFF (LOCK) mode, and wait 120 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

SHORT CIRCUIT RESISTANCE
Body Ground

There are high voltage parts including the battery pack in the electric powertrain system. The high voltage parts are insulated from the body on both positive and negative circuits. The battery condition monitor module detects decreases in the insulation resistance (short circuit resistance), and if the resistance drops to a specified resistance, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
High voltage contactor	ON
Vehicle	ON mode

Malfunction Threshold

The short circuit resistance value is 592 kΩ or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric A/C compressor internal failure
- Power control unit (PCU) internal circuit failure
- DC-DC converter internal failure
- Battery pack internal failure
- Battery power cable failure
- Traction motor failure
- Generator motor failure

- Subjunction board internal failure
- Junction board internal failure
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the READY TO DRIVE mode, and wait for at least 60 seconds.

Be sure to operate the following:

- Generator motor
- Traction motor
- Electric A/C compressor

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

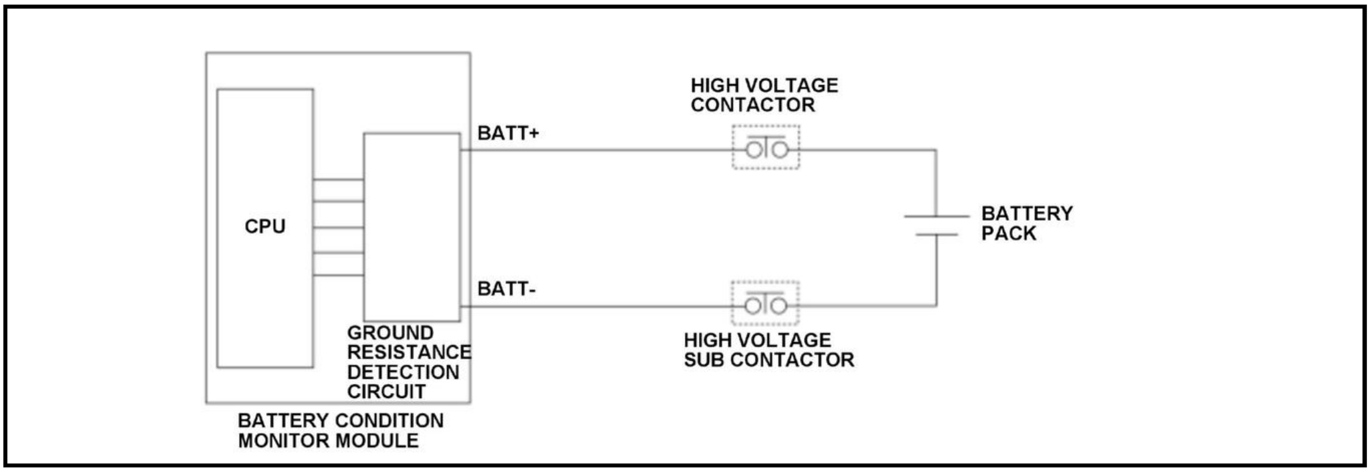
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P0AA7

DTC P0AA7: HV Battery Voltage Isolation Sensor Circuit

General Description



HIGH VOLTAGE CONTACTOR
BATT+
CPU
BATTERY PACK
BATT-
GROUND RESISTANCE DETECTION CIRCUIT
HIGH VOLTAGE SUB CONTACTOR
BATTERY CONDITION MONITOR MODULE

The battery condition monitor module monitors the ground resistance value of the high voltage circuit by the BATT+ line and the BATT- line. When an abnormality is detected on the ground resistance detection circuit, the BATT lines, or the contactors for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle (After the vehicle condition is turned to the ON mode) or during the vehicle condition is turned to the ON mode
Sequence	None
Duration	12 seconds or more

DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The ground resistance detection circuit, the BATT lines, or the contactors is abnormal for at least 12 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack BATT+ line open
- Battery pack BATT- line open
- High voltage contactor internal failure
- High voltage sub contactor internal failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the POWER SYSTEM indicator comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P0ABF

DTC P0ABF: HV Battery Pack Current Sensor Circuit

General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the following DTC codes (P1586, P158A) are detected.

DTC P0AC0

DTC P0AC0: HV Battery Pack Current Sensor Circuit Range/Performance

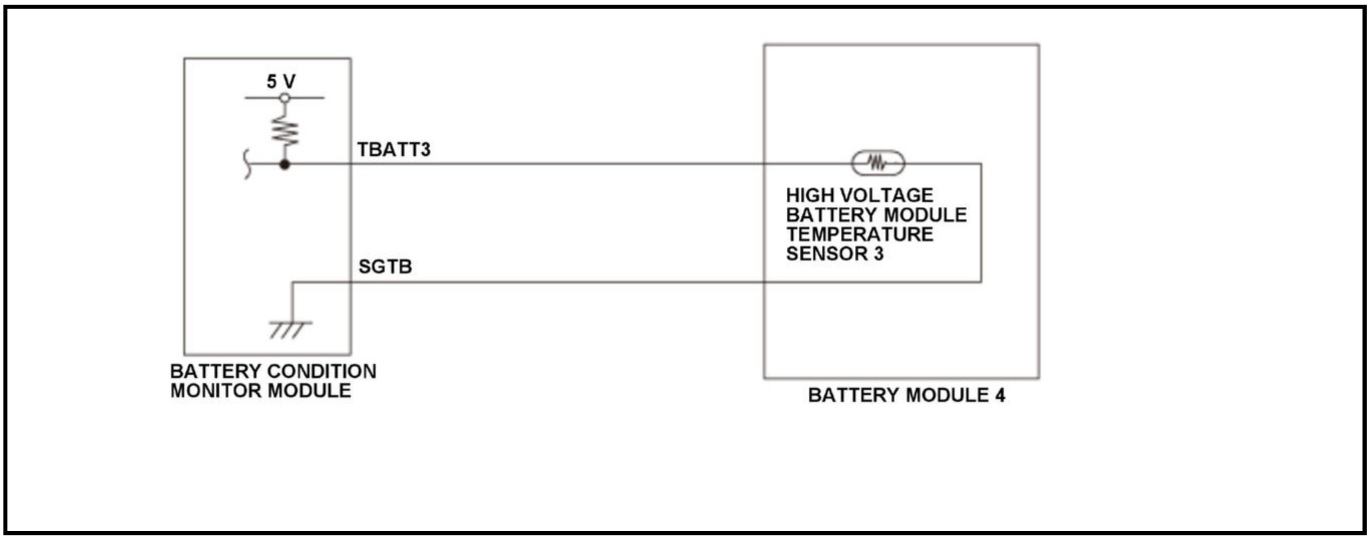
DTC P0ACA: HV Battery Temperature Sensor 3 Circuit

General Description



5 V
TBATT3
SGTB
HIGH VOLTAGE BATTERY MODULE TEMPERATURE SENSOR 3
BATTERY CONDITION MONITOR MODULE
BATTERY MODULE 4

Four high voltage battery module temperature sensors are attached to the battery module in the battery pack, and the battery condition monitor module continuously monitors the battery module temperature. If the battery condition monitor module input voltage from high voltage battery module temperature sensor 3 is out of the specified voltage for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3.0 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the	50 milliseconds	-

Condition	Minimum	Maximum
vehicle condition is turned to the ON mode		
12 volt battery voltage	8.0 V	-

Malfunction Threshold

The high voltage battery module temperature sensor 3 output voltage [HV Battery Module Temperature Sensor 3 Voltage] is 0.72 V or less, or 4.83 V or more for at least 3.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage battery module temperature sensor 3 failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

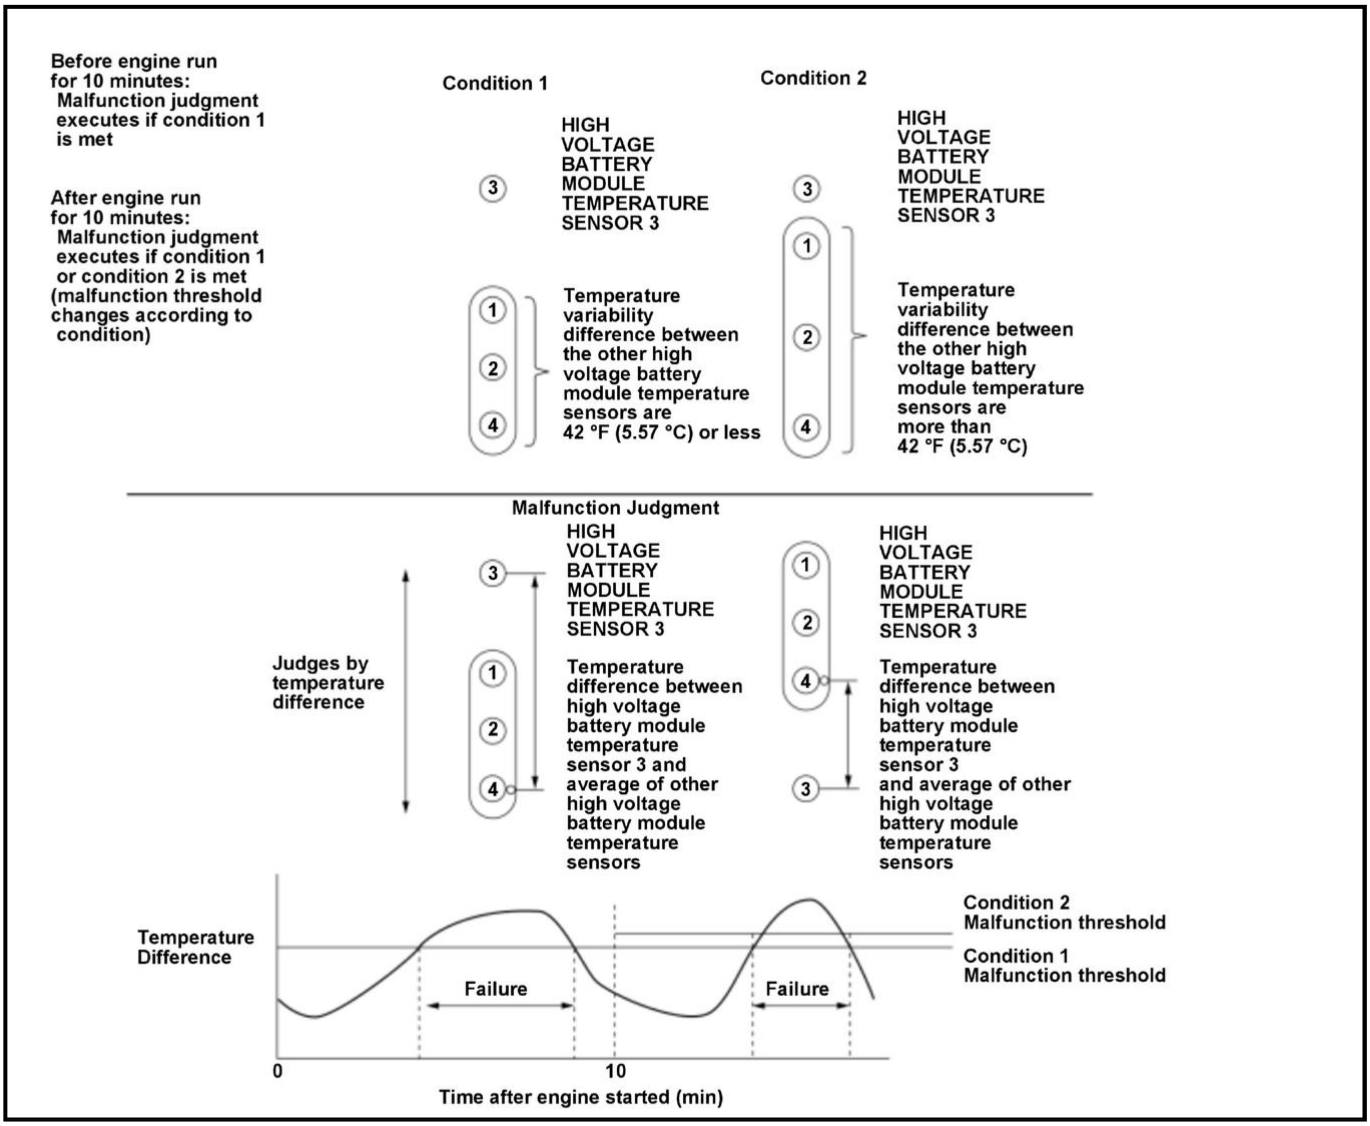
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P0ACB

DTC P0ACB: HV Battery Temperature Sensor 3 Circuit Range/Performance

General Description



Before engine run for 10 minutes: Malfunction judgment executes if condition 1 is met
After engine run for 10 minutes: Malfunction judgment executes if condition 1 or condition 2 is met (malfunction threshold changes according to condition)
Condition 1
HIGH VOLTAGE BATTERY MODULE TEMPERATURE SENSOR 3
Temperature variability difference between the other high voltage battery module temperature sensors are 42 °F (5.57 °C) or less
Condition 2
HIGH VOLTAGE BATTERY MODULE TEMPERATURE SENSOR 3
Temperature variability difference between the other high voltage battery module temperature sensors are more than 42 °F (5.57 °C)
Malfunction Judgment
Judges by temperature difference
HIGH VOLTAGE BATTERY MODULE TEMPERATURE SENSOR 3
Temperature difference between high voltage battery module temperature sensor 3 and average of other high voltage battery module temperature sensors
Temperature Difference
Failure
Condition 2 Malfunction threshold
Condition 1 Malfunction threshold
0
10
Time after engine started (min)
1
2
3
4

The temperatures between the battery modules are kept approximately equal if the high voltage battery module fan, the high voltage battery module temperature sensors, the battery pack, and the inverter, etc. are operating normal. The high voltage battery module temperature sensors are compared to detect characteristic abnormality of themselves. If the temperature difference between high voltage battery module temperature sensor 3 and the average of other high voltage battery module temperature sensors is a specified value, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode**	10 minutes	-
Temperature variability between the battery module temperature (high voltage	-	42 deg.F (5.57 deg.C)

Condition	Minimum	Maximum
battery module temperature sensor 1, 2, 4)*		
Temperature variability between the battery module temperature (high voltage battery module temperature sensor 1, 2, 4)**	42 deg.F (5.57 deg.C)	-
Vehicle	ON mode	
Other	High voltage battery module fan must be operating normal	

*: Condition 1

**: Condition 2

Malfunction Threshold

- If the vehicle is in Condition 1

  The temperature difference between high voltage battery module temperature sensor 3 and the average of other high voltage battery module temperature sensors is 61 deg.F (16 deg.C) or more.

- If the vehicle is in Condition 2

  The temperature difference between high voltage battery module temperature sensor 3 and the average of other high voltage battery module temperature sensors is 65 deg.F (18 deg.C) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Cooling fan air duct blocked or fell off
- Battery pack internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

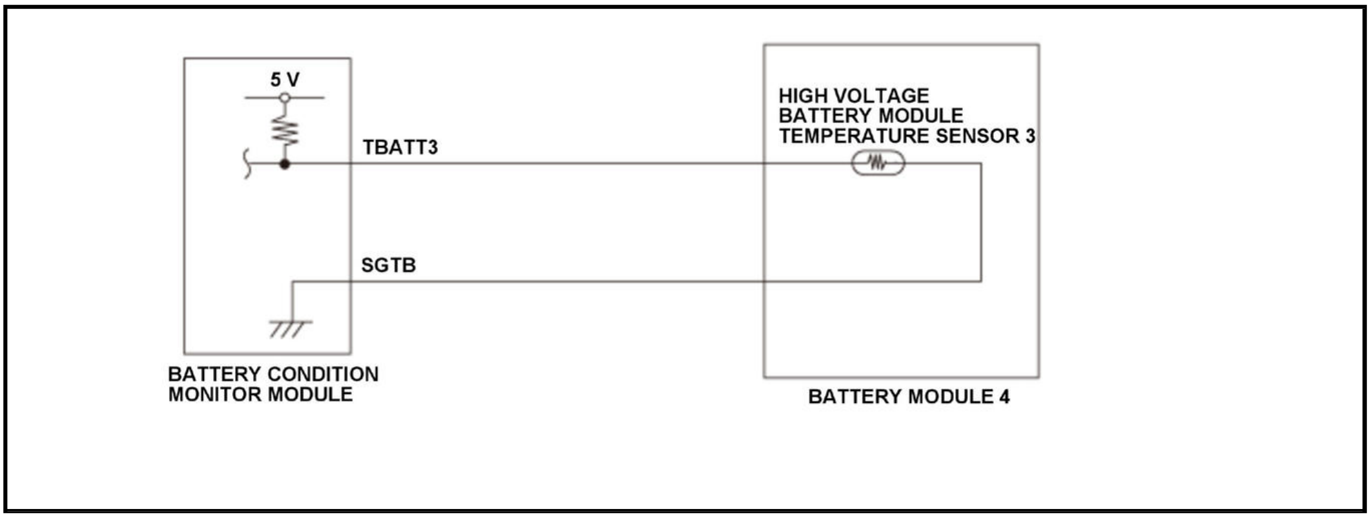
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P0ACC

DTC P0ACC: HV Battery Temperature Sensor 3 Circuit Low

General Description



5 V
TBATT3
SGTB
BATTERY CONDITION MONITOR MODULE
HIGH VOLTAGE BATTERY MODULE TEMPERATURE SENSOR 3
BATTERY MODULE 4

Four high voltage battery module temperature sensors are attached to the battery module in the battery pack, and the battery condition monitor module continuously monitors the battery module temperature. If the battery condition monitor module input voltage from high voltage battery module temperature sensor 3 is a specified voltage for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The high voltage battery module temperature sensor 3 output voltage [HV Battery Module Temperature Sensor 3 Voltage] is 0.07 V or less for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage battery module temperature sensor 3 TBATT3 line short to ground
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

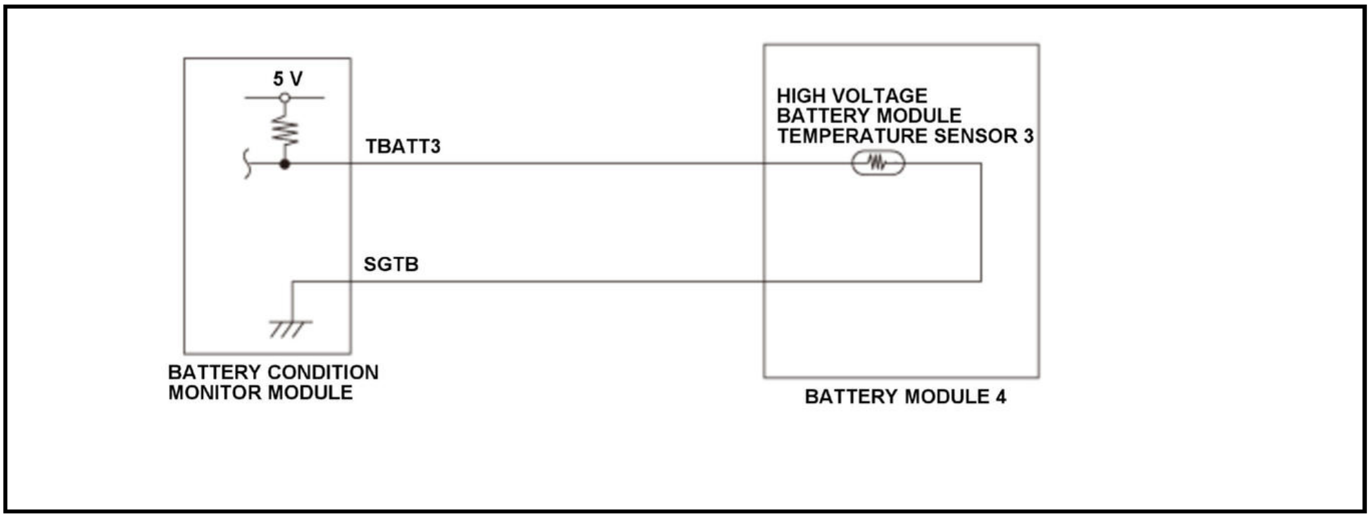
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P0ACD

DTC P0ACD: HV Battery Temperature Sensor 3 Circuit High

General Description



5 V
TBATT3
SGTB
BATTERY CONDITION MONITOR MODULE
HIGH VOLTAGE BATTERY MODULE TEMPERATURE SENSOR 3
BATTERY MODULE 4

Four high voltage battery module temperature sensors are attached to the battery module in the battery pack, and the battery condition monitor module continuously monitors the battery module temperature. If the battery condition monitor module input voltage from high voltage battery module temperature sensor 3 is a specified voltage for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The high voltage battery module temperature sensor 3 output voltage [HV Battery Module Temperature Sensor 3 Voltage] is 4.93 V or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage battery module temperature sensor 3 TBATT3 line open
- High voltage battery module temperature sensor 3 SGTB line open

- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

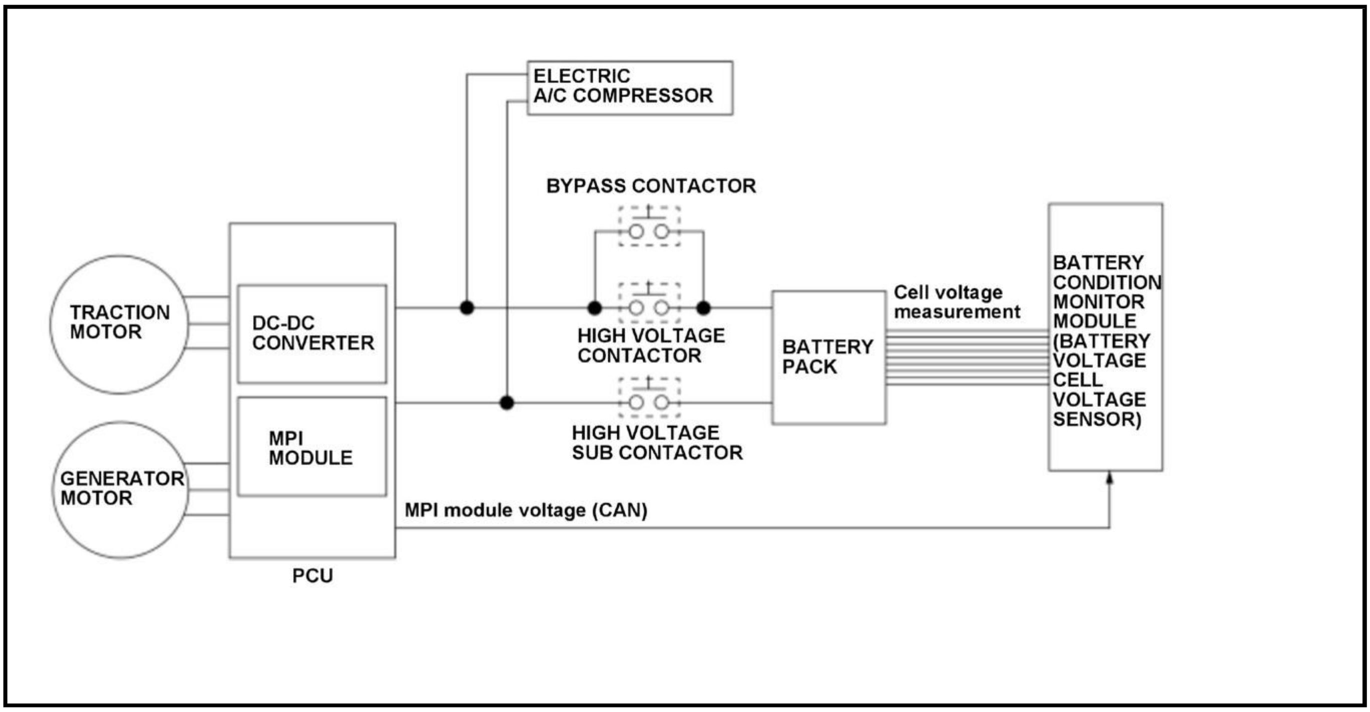
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

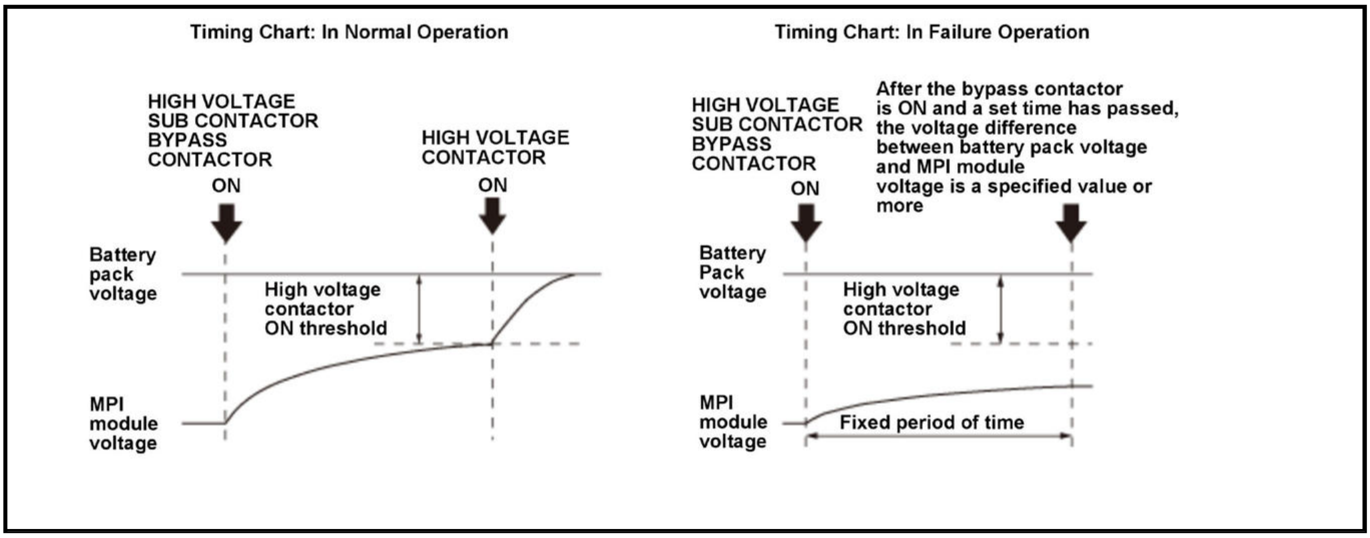
DTC P0AE1

DTC P0AE1: HV Battery Precharge Contactor Circuit

General Description



ELECTRIC A/C COMPRESSOR
BYPASS CONTACTOR
TRACTION MOTOR
DC-DC CONVERTER
HIGH VOLTAGE CONTACTOR
BATTERY PACK
Cell voltage measurement
BATTERY CONDITION MONITOR MODULE (BATTERY VOLTAGE CELL VOLTAGE SENSOR)
MPI MODULE
HIGH VOLTAGE SUB CONTACTOR
GENERATOR MOTOR
MPI module voltage (CAN)
PCU



In electric powertrain system, the high voltage contactor between the battery pack and the inverter is turned ON to operate the electric powertrain system after vehicle condition is turned to the ON mode. At this time, the high voltage sub contactor and the bypass contactor are turned ON before the high voltage contactor is turned ON, and the power drive unit (PDU) capacitor is gradually charged by the controlled current of the bypass resistor. When the difference of the voltage between the inverter and the battery pack is within the specified value, the high voltage contactor is turned ON and the bypass contactor is turned OFF. If the difference of the voltage between the inverter and the battery pack does not become a specified value for a set time after the bypass contactor is turned ON, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None

Duration	660 milliseconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the bypass contactor on	340 milliseconds	-
Battery condition monitor module power-supply voltage	10.2 V	-
Vehicle	ON mode	
Other	MPI module voltage must be lower than battery pack voltage	

Malfunction Threshold

The difference between the MPI module voltage and the battery pack voltage is more than 9.3 V after 660 milliseconds past from the bypass contactor is turned ON.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage sub contactor CNTN line open
- Bypass contactor PRE line open
- High voltage contactor CNTP line open
- High voltage contactor/High voltage sub contactor/Bypass contactor CNTPSIN line open
- Busbar poor connection
- Busbar failure
- Service plug poor connection
- Service plug failure
- Main fuse failure
- Bypass contactor stuck off
- High voltage contactor stuck off
- High voltage sub contactor stuck off
- Battery pack internal circuit failure
- Bypass resistor poor connection
- Bypass resistor failure

- Junction board poor connection
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating condition

Turn the vehicle to the ON mode, and wait for at least 2 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

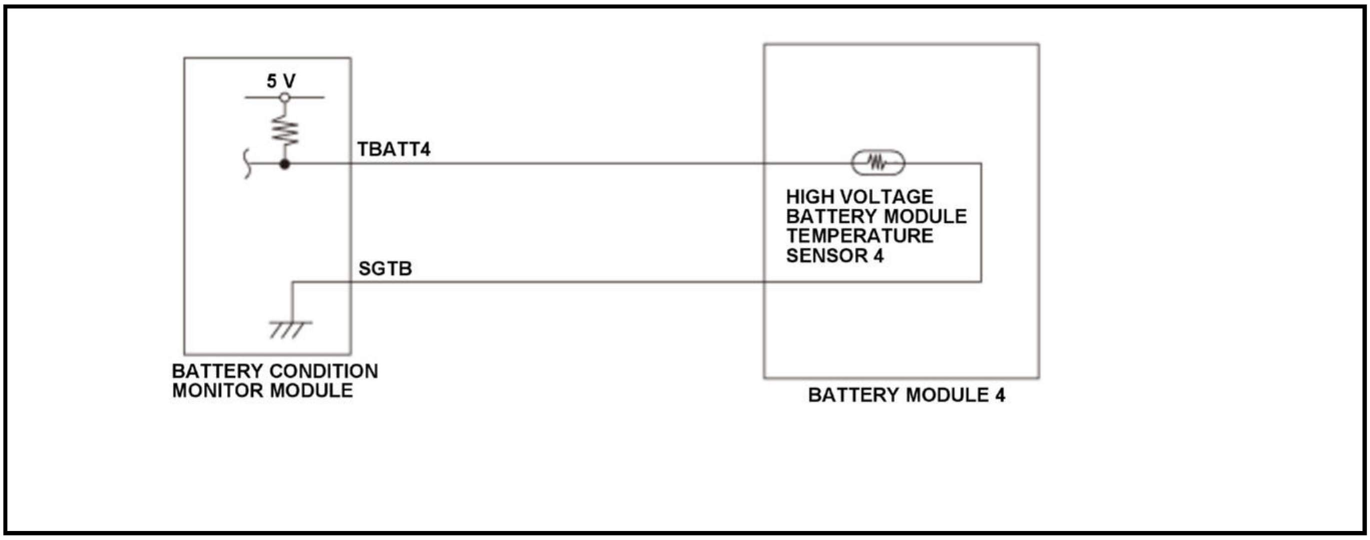
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P0AE8

DTC P0AE8: HV Battery Temperature Sensor 4 Circuit

General Description



5 V
TBATT4
SGTB
HIGH VOLTAGE BATTERY MODULE TEMPERATURE SENSOR 4
BATTERY CONDITION MONITOR MODULE
BATTERY MODULE 4

Four high voltage battery module temperature sensors are attached to the battery module in the battery pack, and the battery condition monitor module continuously monitors the battery module temperature. If the battery condition monitor module input voltage from high voltage battery module temperature sensor 4 is a specified voltage for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3.0 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	8.0 V	-

Malfunction Threshold

The high voltage battery module temperature sensor 4 output voltage [HV Battery Module Temperature Sensor 4 Voltage] is 0.72 V or less, or 4.83 V or more for at least 3.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage battery module temperature sensor 4 failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0AE9

DTC P0AE9: HV Battery Temperature Sensor 4 Circuit Range/Performance

General Description

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The high voltage battery module temperature sensor 4 output voltage [HV Battery Module Temperature Sensor 4 Voltage] is 4.93 V or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage battery module temperature sensor 4 TBATT4 line open
- High voltage battery module temperature sensor 4 SGTB line open

- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

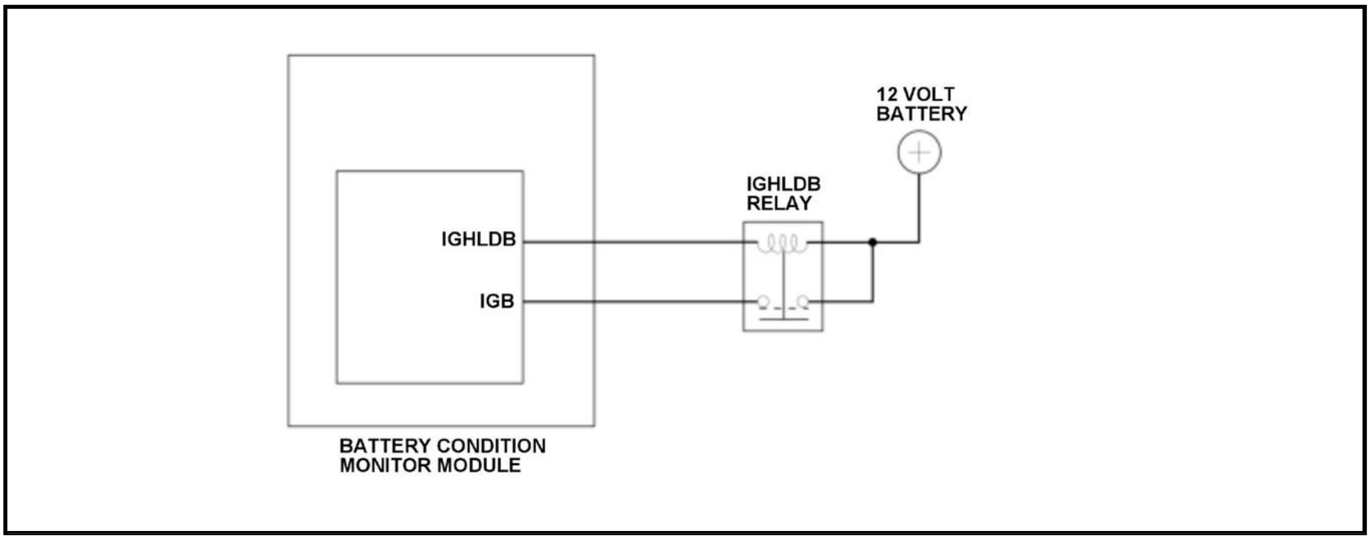
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P0AFA

DTC P0AFA: HV Battery System Voltage Low

General Description



The battery condition monitor module drives the IGHLDB relay and monitors output voltage. If the IGB voltage decreases even though there is a certain voltage to the IG1MONI, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The IGB voltage is 1.0 V or less for at least 0.5 seconds when the IG1 voltage is 9.2 V or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- IGHLDB relay IGHLDB line failure
- IGHLDB relay IGB line failure
- IGHLDB relay failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

The CPU transmits/receives information to/from the LIB-IC by using communication line. When the CPU detects the failures of the LIB-IC or the battery pack for a set time, a malfunction is detected and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	8 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

Any of the condition is met for at least 8 seconds:

- Clock monitor of CPU in the battery condition monitor module failure
- CRC monitor of CPU in the battery condition monitor module failure
- Timer monitor of CPU in the battery condition monitor module failure
- Battery pack voltage monitor failure

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack line failure
- Battery pack internal failure

- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

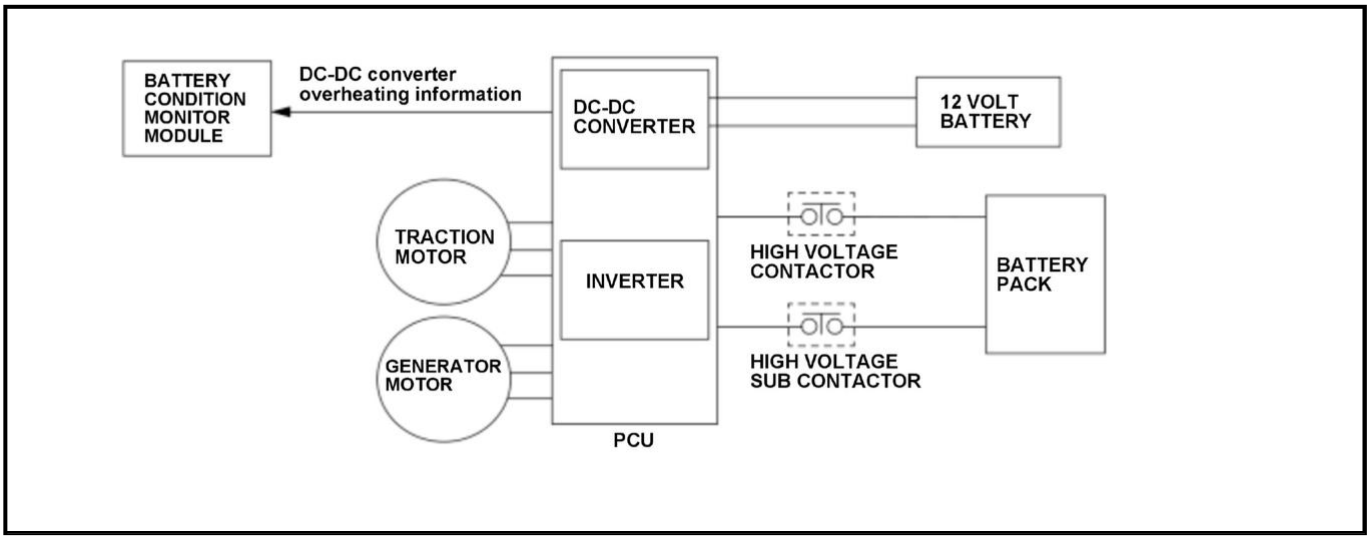
DTC P0D32 (BATTERY CONDITION MONITOR MODULE)

DTC P0D32: DC-DC Converter Over Temperature (Battery Condition Monitor Module Detected)

General Description



BATTERY CONDITION MONITOR MODULE
DC-DC converter overheating information
DC-DC CONVERTER
12 VOLT BATTERY
TRACTION MOTOR
INVERTER
HIGH VOLTAGE CONTACTOR
BATTERY PACK
GENERATOR MOTOR
HIGH VOLTAGE SUB CONTACTOR
PCU

The DC-DC converter stops output if the DC-DC converter temperature exceeds a specified temperature for overheat protection. When the battery condition monitor module receives information of DC-DC converter stop due to overheat from the DC-DC converter for a specified duration, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator off, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Battery condition monitor module power-supply voltage	10.2 V	-
Vehicle	ON mode	

Malfunction Threshold

The battery condition monitor module receives information of DC-DC converter stop due to overheat from the DC-DC converter for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric motor control module coolant pump line open
- Radiator fan control (RFC) unit line open
- Water pipe leak
- Water pipe clogged
- Electric motor control module coolant pump failure
- Power control unit (PCU) internal circuit failure
- RFC unit failure
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating condition

Turn the vehicle to READY TO DRIVE mode, and wait 750 seconds under these conditions.

- Headlights on high beam
- Hazard warning lights on
- Blower fan at maximum speed
- Rear window defogger on
- Seat heater on, max hot
- A/C switch ON, heater on, max hot

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

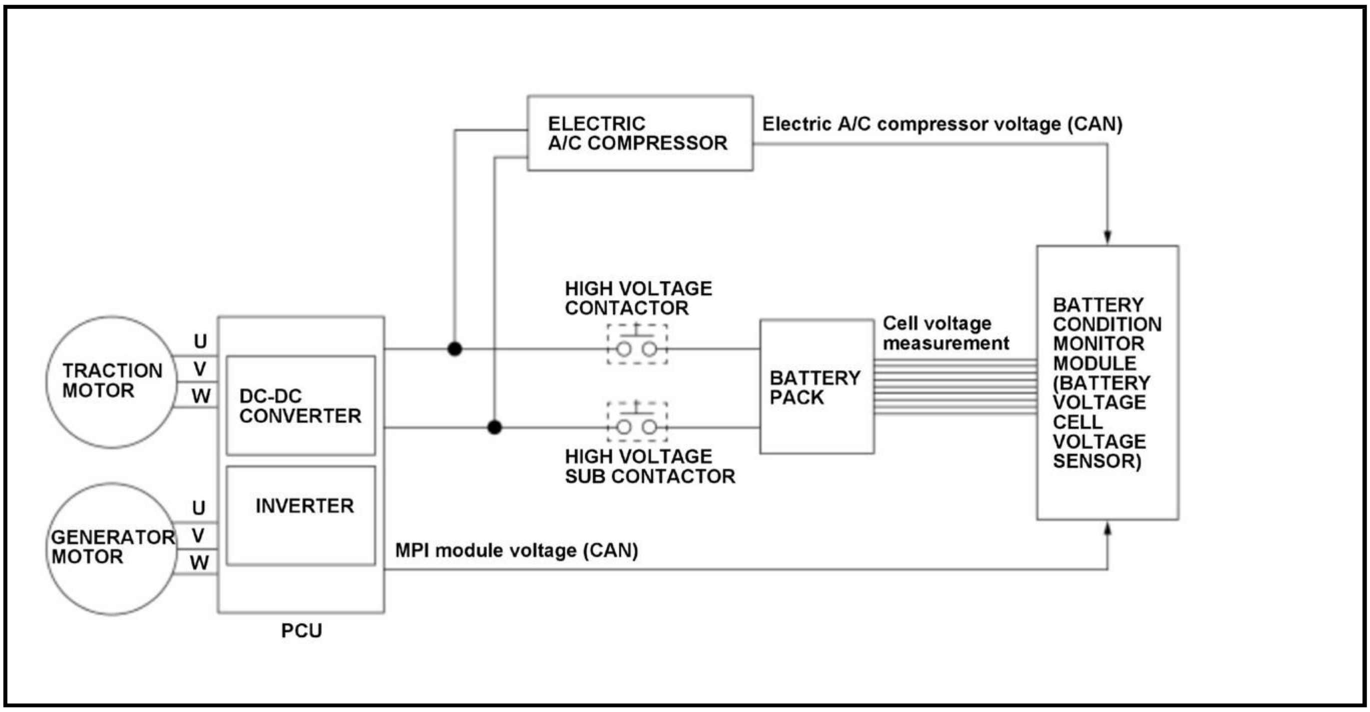
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P0DA8

DTC P0DA8: HV Battery Voltage/Motor Inverter Voltage Correlation

General Description



ELECTRIC A/C COMPRESSOR
Electric A/C compressor voltage (CAN)
HIGH VOLTAGE CONTACTOR
Cell voltage measurement
BATTERY CONDITION MONITOR MODULE (BATTERY VOLTAGE CELL VOLTAGE SENSOR)
TRACTION MOTOR
U
V
W
DC-DC CONVERTER
BATTERY PACK
HIGH VOLTAGE SUB CONTACTOR
GENERATOR MOTOR
U
V
W
INVERTER
MPI module voltage (CAN)
PCU

The battery condition monitor module compares inverter voltage information and battery pack voltage information obtained from the battery voltage cell voltage sensor. If the difference between the battery pack voltage and the inverter voltage is a specified value and continues for a specified duration, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Battery condition monitor module power-supply voltage	10.2 V	-
Difference between inverter voltage and electric A/C compressor voltage	26 V	-
Vehicle	ON mode	

Malfunction Threshold

The difference between the battery pack voltage and the MPI module voltage is more than 50 V and continues for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High voltage contactor CNTP line open
- High voltage contactor CNTPSIN line open
- High voltage contactor CNTP line short

- High voltage contactor CNTPSIN line short
- Battery power cable open
- Electric A/C compressor internal circuit failure
- High voltage contactor stuck off
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

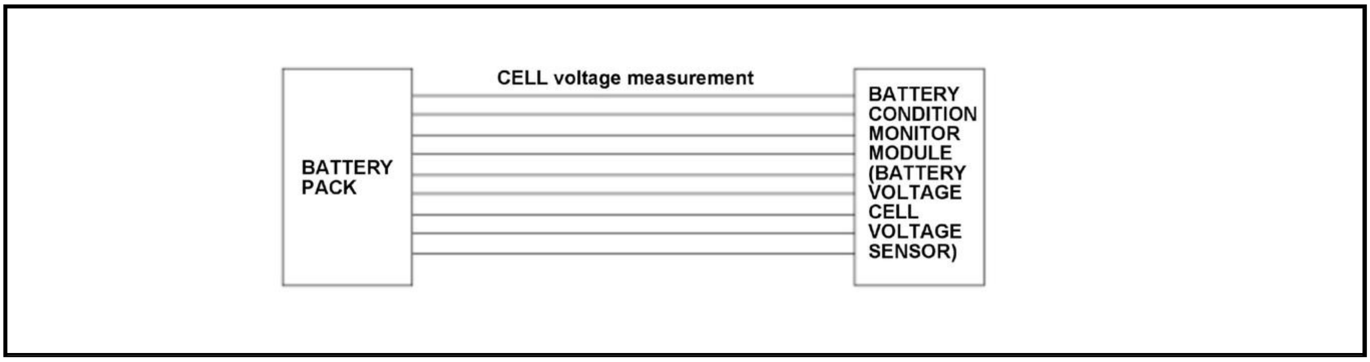
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

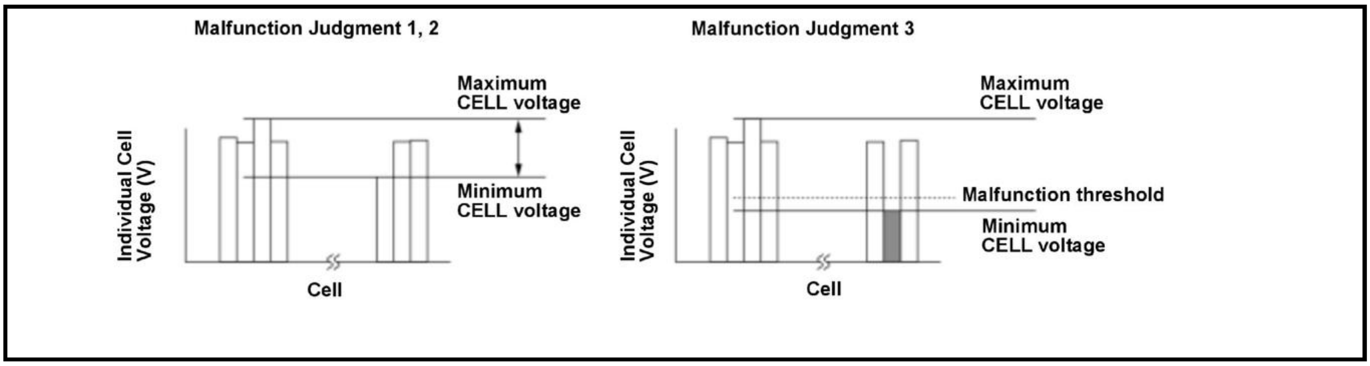
DTC P0DE6

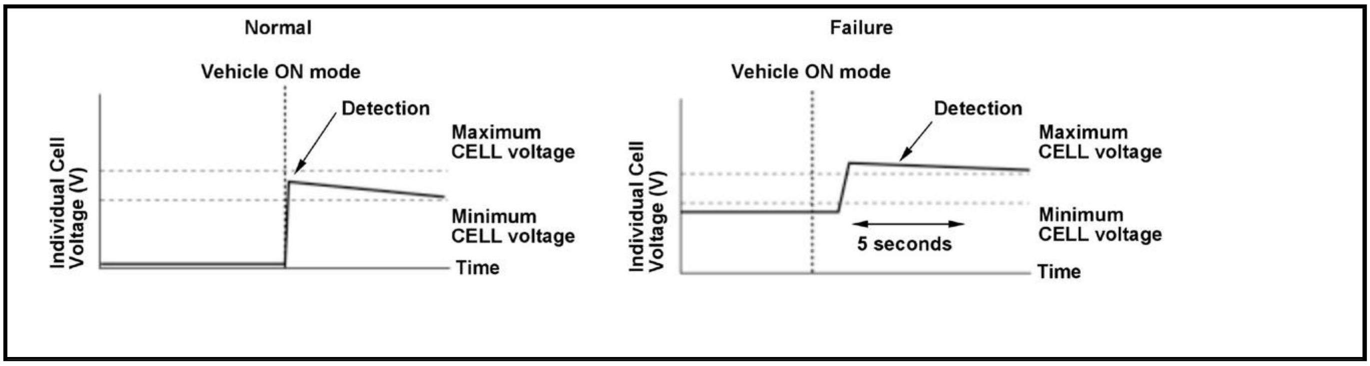
DTC P0DE6: HV Battery Pack Voltage Low

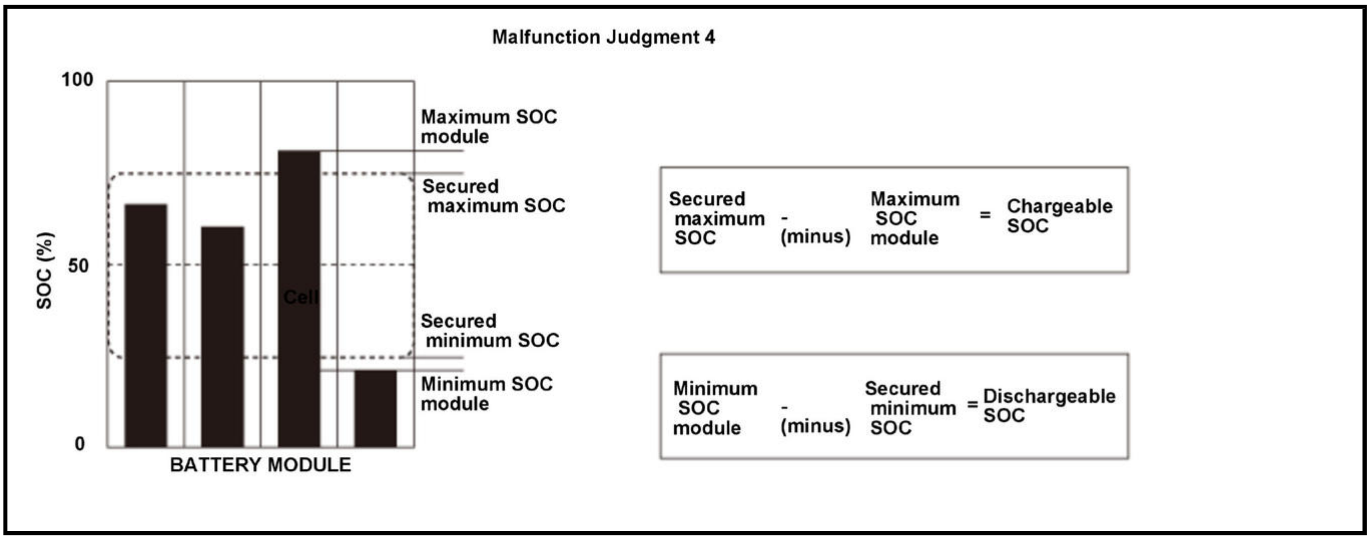
General Description



CELL voltage measurement
BATTERY PACK
BATTERY CONDITION MONITOR MODULE (BATTERY VOLTAGE CELL VOLTAGE SENSOR)







Malfunction Judgment 4
100
50
0
SOC (%)
Cell
BATTERY MODULE
Maximum SOC module
Secured maximum SOC
Secured minimum SOC
Minimum SOC module
Secured maximum SOC - (minus) Maximum SOC module = Chargeable SOC
Minimum SOC module - (minus) Secured minimum SOC = Dischargeable SOC

If one of the following conditions occurs, the battery condition monitor module detects a malfunction and stores a DTC:

- Malfunction judgment 1

  The voltage difference between the maximum cell voltage and the minimum cell voltage exceeds a specified voltage immediately after the vehicle condition is turned to the ON mode.

- Malfunction judgment 2

  The voltage difference between the maximum cell voltage and the minimum cell voltage exceeds a specified voltage for a specified duration.

- Malfunction judgment 3

  The individual cell voltage falls below a minimum voltage for a set duration.

- Malfunction judgment 4

  The SOC variability occurs between the battery modules of the battery pack for a specified duration.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-* 5 seconds or more**, **** 10 seconds or more***
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

*: Malfunction judgment 1

**: Malfunction judgment 2

***: Malfunction judgment 3

****: Malfunction judgment 4

Enable Conditions

Condition	Minimum	Maximum
Battery pack temperature	50 deg.F (10 deg.C)	-
Battery pack current	-3 A	3 A

Condition	Minimum	Maximum
Vehicle	ON mode	

Malfunction Threshold

One of the conditions is met:

- Malfunction judgment 1

  The voltage difference between the maximum cell voltage and the minimum cell voltage is more than 0.45 V immediately after the vehicle condition is turned to the ON mode.

- Malfunction judgment 2

  The voltage difference between the maximum cell voltage and the minimum cell voltage is more than 0.75 V for at least 5 seconds.

- Malfunction judgment 3

  The individual cell voltage is 1.5 V or less for at least 10 seconds.

- Malfunction judgment 4

  There is a battery module that the chargeable SOC is less than 0 %, and a battery module that the dischargeable SOC is less than 0 %. These conditions continue for at least 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

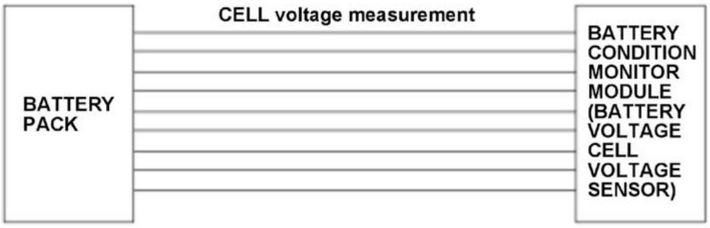
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

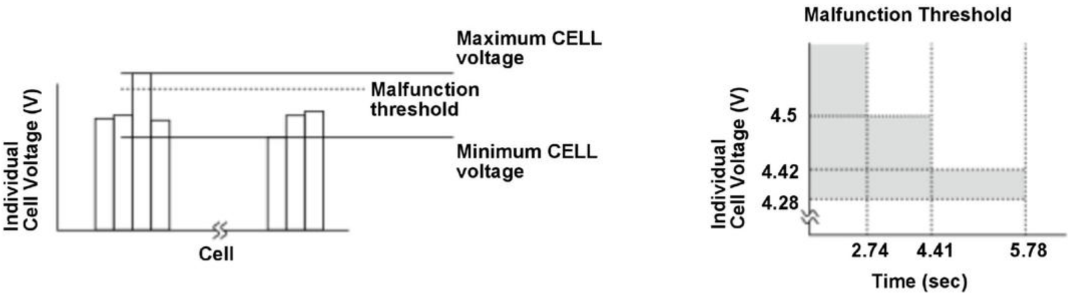
DTC P0DE7

DTC P0DE7: HV Battery Pack Voltage High

General Description



BATTERY PACK
CELL voltage measurement
BATTERY CONDITION MONITOR MODULE (BATTERY VOLTAGE CELL VOLTAGE SENSOR)



If the individual cell maximum voltage received from the battery voltage cell voltage sensor exceeds a specified value for a specified duration, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Depending on the cell voltage
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

One of the following conditions is occurs:

- Maximum cell voltage is 4.5 V or more for at least 2.74 seconds.
- Maximum cell voltage is 4.42 V or more for at least 4.41 seconds.
- Maximum cell voltage is 4.28 V or more for at least 5.78 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack internal failure
- Powertrain control module (PCM) internal circuit failure
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

LIB-IC
LIB-IC
LIB-IC
LIB-IC
LIB-IC
BATTERY MODULE
BATTERY MODULE
BATTERY MODULE
BATTERY MODULE
CPU
Communication line
Communication IC
BATTERY CONDITION MONITOR MODULE
BATTERY PACK

The CPU and LIB-ICs are built into the battery condition monitor module and the CPU detects various malfunctions. The CPU transmits/receives information to/from the LIB-IC by using communication line. When the CPU detects the failures of communication line, the LIB-IC, or the battery pack for a set time, a malfunction is detected and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

One of these conditions is met for at least 2 seconds:

- Clock monitor of CPU in the battery condition monitor module failure
- CRC monitor of CPU in the battery condition monitor module failure
- Timer monitor of CPU in the battery condition monitor module failure
- Battery pack voltage monitor failure

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

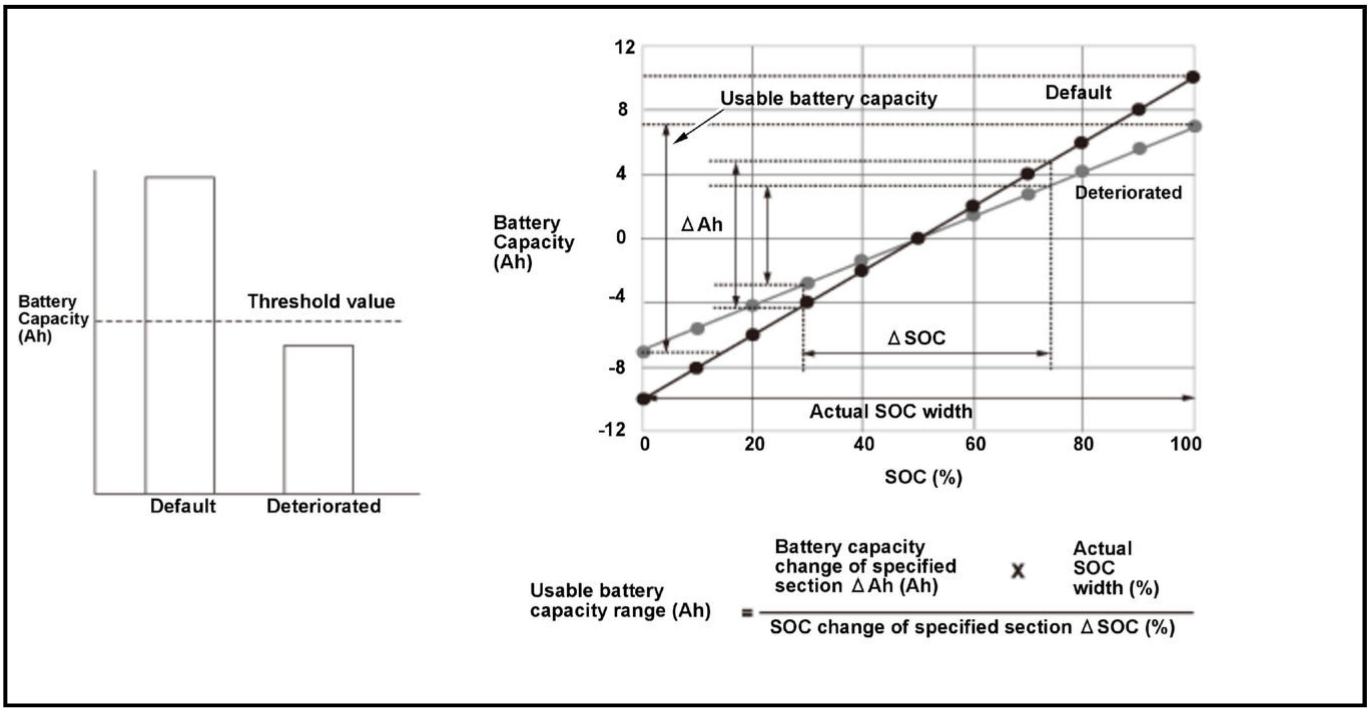
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P1447

DTC P1447: HV Battery Pack Deterioration (Middle Severity)

General Description



Usable battery capacity range of the battery pack is calculated from the battery capacity (ΔAh) and SOC (state of charge) change width (ΔSOC) of a specified section. If the usable battery capacity lowers to a specified value, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Battery pack temperature	56 deg.F (13 deg.C)	130 deg.F (54.5 deg.C)
Vehicle	ON mode	

Malfunction Threshold

The battery pack capacity is 18.34 % or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the READY TO DRIVE mode.
- Test-drive the vehicle; accelerate to 31 mph (50 km/h) and decelerate to 0 mph (0 km/h), repeat that for 10 minutes.

- Drive the vehicle in this manner only if the traffic regulations and ambient condition allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

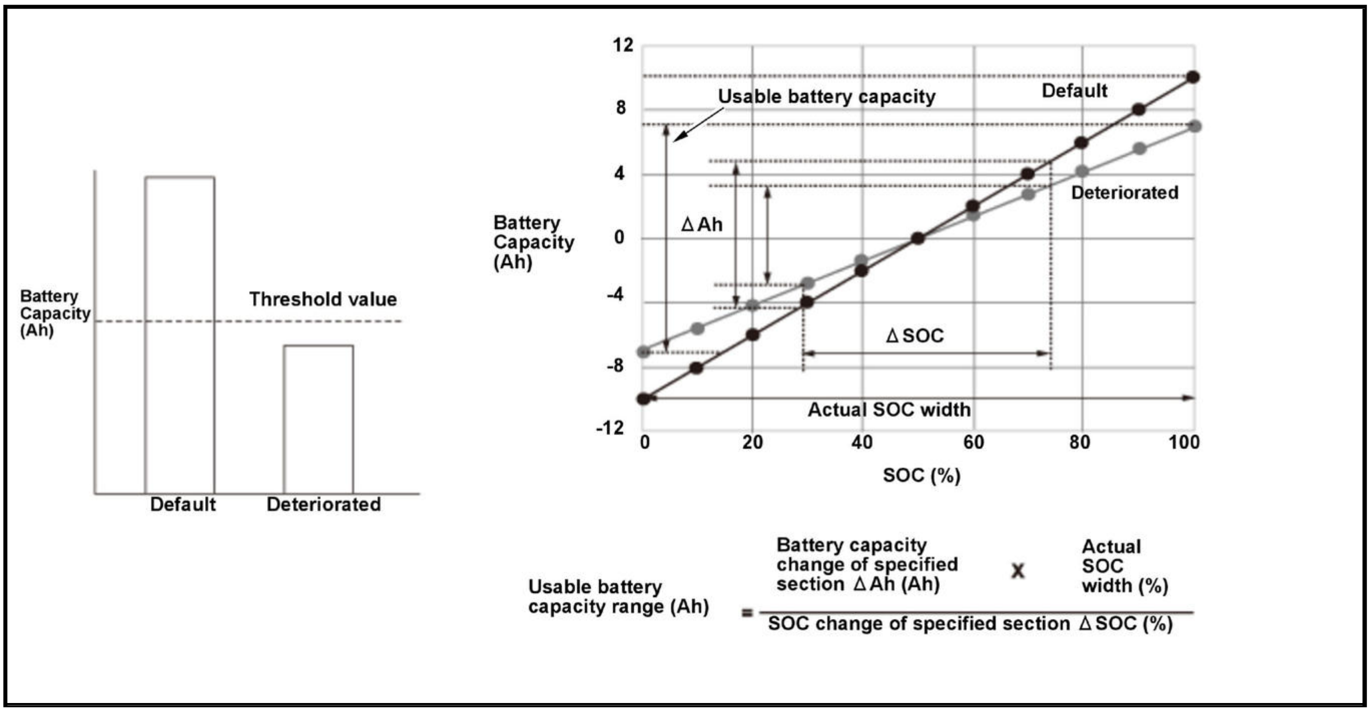
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P144A

DTC P144A: HV Battery Pack Deterioration (High Severity)

General Description



Usable battery capacity range of the battery pack is calculated from the battery capacity (ΔAh) and SOC (state of charge) change width (ΔSOC) of a specified section. If the usable battery capacity lowers to a specified value, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Battery pack temperature	56 deg.F (13 deg.C)	130 deg.F (54.5 deg.C)

Condition	Minimum	Maximum
Vehicle	ON mode	

Malfunction Threshold

The battery pack capacity is 13.33 % or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the READY TO DRIVE mode.
- Test-drive the vehicle; accelerate to 31 mph (50 km/h) and decelerate to 0 mph (0 km/h), repeat that for 10 minutes.

- Drive the vehicle in this manner only if the traffic regulations and ambient condition allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

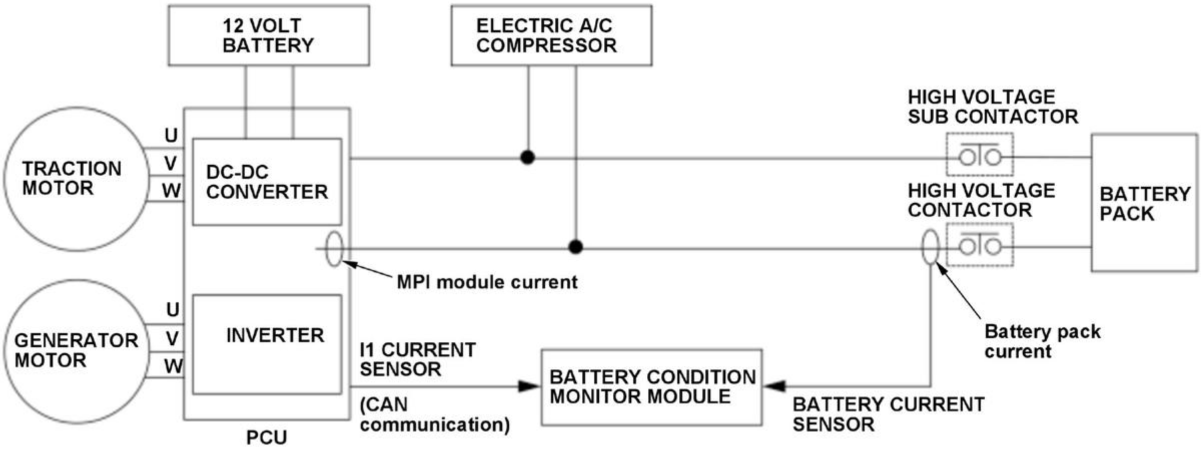
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P1586

DTC P1586: HV Battery Current Sensor

General Description



12 VOLT BATTERY
ELECTRIC A/C COMPRESSOR
HIGH VOLTAGE SUB CONTACTOR
TRACTION MOTOR
U
V
W
DC-DC CONVERTER
HIGH VOLTAGE CONTACTOR
BATTERY PACK
MPI module current
GENERATOR MOTOR
U
V
W
INVERTER
I1 CURRENT SENSOR
(CAN communication)
BATTERY CONDITION MONITOR MODULE
Battery pack current
BATTERY CURRENT SENSOR
PCU

When the high voltage contactor is on, the inverter current and the battery pack current is monitored on the same line across the electric A/C compressor by the battery condition monitor module. Therefore, the estimated inverter current (estimate current is calculated by the battery condition monitor module from the motor phase current information) and the battery pack current values are compared and if the difference exceeds of a specified valued for a specified time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Battery condition monitor module power-supply voltage	10.2 V	-
Vehicle	ON mode	

Malfunction Threshold

The difference between the estimated MPI module current and the battery pack current is more than 94.76 A, or less than -36.33 A for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor internal circuit failure
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the READY TO DRIVE mode, and drive the vehicle at vehicle speed 31 mph (50 km/h) or more.
- Keep the vehicle speed 31 mph (50 km/h) or more with the brake pedal pressed to switch ON the brake pedal position switch for at least 2 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

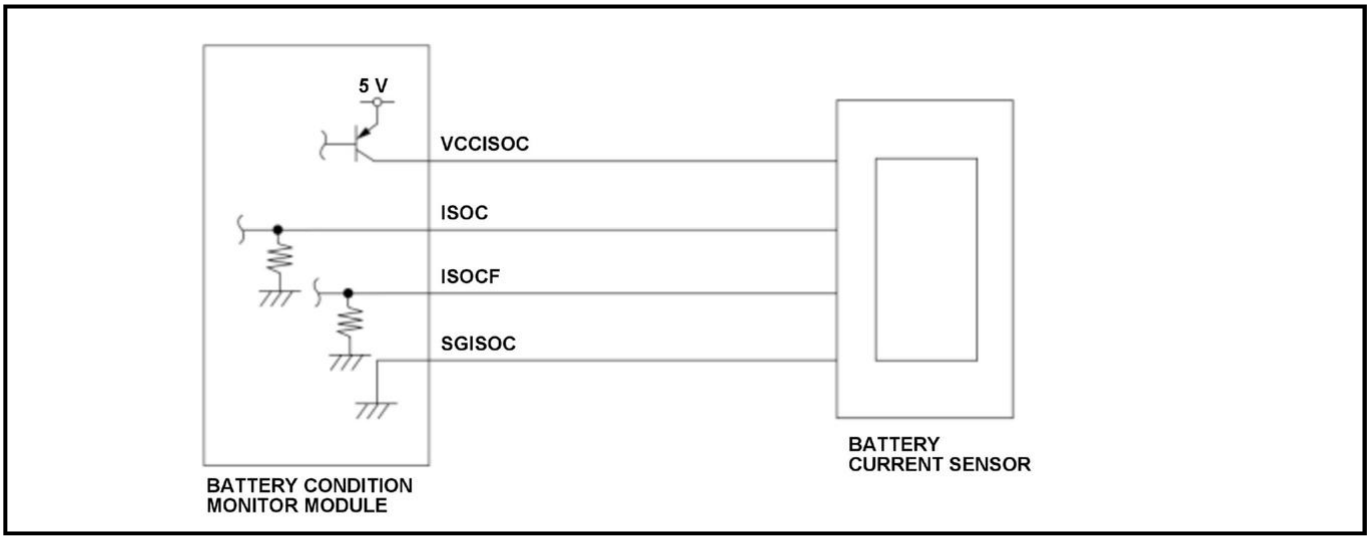
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P158A

DTC P158A: HV Battery Current Sensor Correlation

General Description



If the difference between the current value calculated from the ISOC signal and that from the ISOCF signal compared by battery condition monitor module is out of a specified range, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The absolute current value difference between the ISOC signal and the ISOCF signal is 10 A or more for at least 2.0 seconds when the ISOC value is in the range of -30 A to 30 A.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor SGISOC line open
- Battery current sensor failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

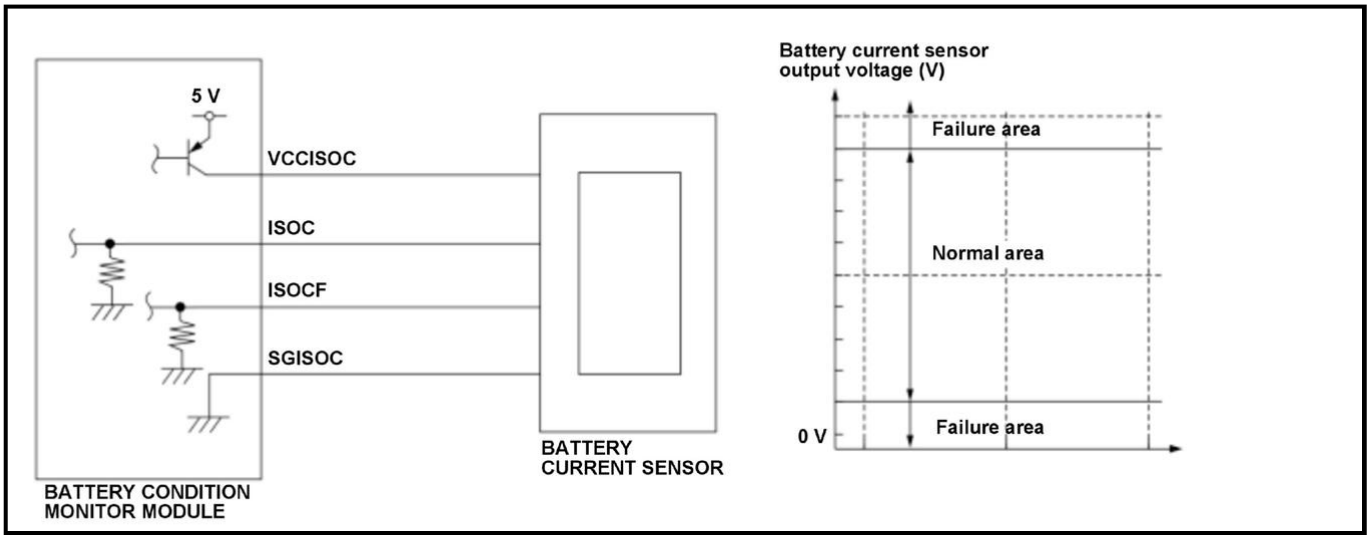
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P158B

DTC P158B: HV Battery Current Sensor 1 Circuit

General Description



5 V
VCCISOC
ISOC
ISOCF
SGISOC
BATTERY CONDITION MONITOR MODULE
BATTERY CURRENT SENSOR
Battery current sensor output voltage (V)
Failure area
Normal area
Failure area
0 V

Battery condition monitor module controls the charging/discharging of the high-voltage battery, based on the signal of battery current sensor. If the ISOC signal voltage output by battery current sensor deviates from the normal range and does not reach the failure level triggered by the upper and lower limits for the specified amount of time or longer, it is judged that battery condition monitor module has failed and the DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.0 second or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The battery current sensor ISOC signal voltage is 1.27 V or less, or 4.30 V or more for at least 1.0 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

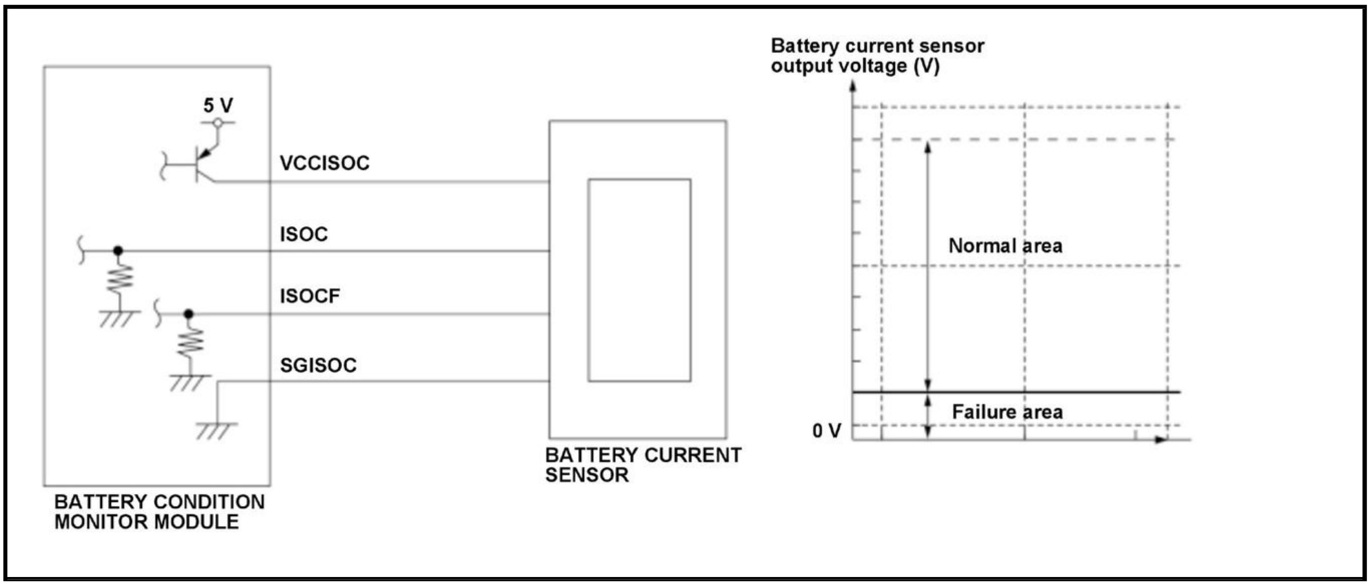
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P158D

DTC P158D: HV Battery Current Sensor 1 Circuit Low

General Description



Battery current sensor output voltage (V)
5 V
VCCISOC
ISOC
ISOCF
SGISOC
Normal area
Failure area
0 V
BATTERY CURRENT SENSOR
BATTERY CONDITION MONITOR MODULE

The battery condition monitor module controls charge/discharge of the battery pack based on the battery current sensor signal. When the battery current sensor ISOC signal voltage is a specified voltage for a set time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	500 milliseconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The battery current sensor ISOC signal voltage is less than 0.16 V for at least 500 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor VCCISOC line open
- Battery current sensor ISOC line short to ground
- Battery current sensor failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

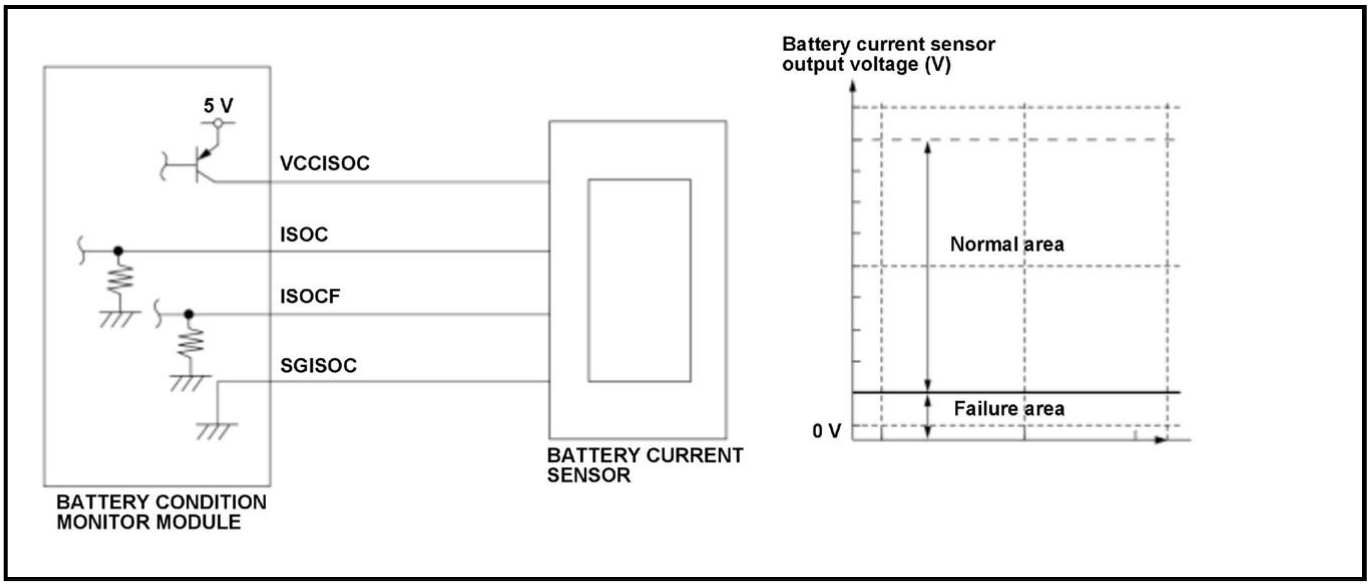
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P158E

DTC P158E: HV Battery Current Sensor 2 Circuit Low

General Description



5 V
VCCISOC
ISOC
ISOCF
SGISOC
BATTERY CONDITION MONITOR MODULE
BATTERY CURRENT SENSOR
Battery current sensor output voltage (V)
Normal area
Failure area
0 V

The battery condition monitor module controls charge/discharge of the battery pack based on the battery current sensor signal. When the battery current sensor ISOCF signal voltage is a specified voltage for a set time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	500 milliseconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The ISOCF signal voltage from battery current sensor is less than 0.22 V for at least 500 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor VCCISOC line open
- Battery current sensor ISOCF line short to ground
- Battery current sensor failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

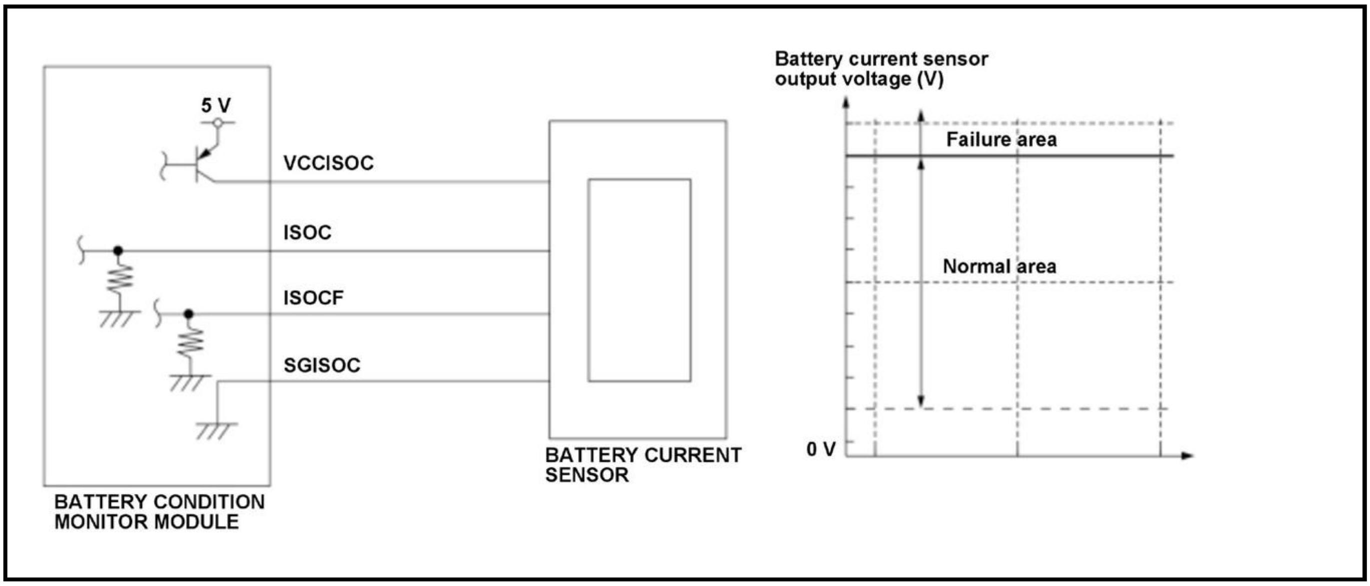
General Description



5 V
VCCISOC
ISOC
ISOCF
SGISOC
BATTERY CONDITION MONITOR MODULE
BATTERY CURRENT SENSOR
Battery current sensor output voltage (V)
Failure area
Normal area
0 V

The battery condition monitor module controls charge/discharge of the battery pack based on the battery current sensor signal. When the battery current sensor ISOCF signal voltage is a specified voltage for a set time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	500 milliseconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The battery current sensor ISOCF signal voltage is more than 4.74 V for at least 500 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor SGISOC line open
- Battery current sensor failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

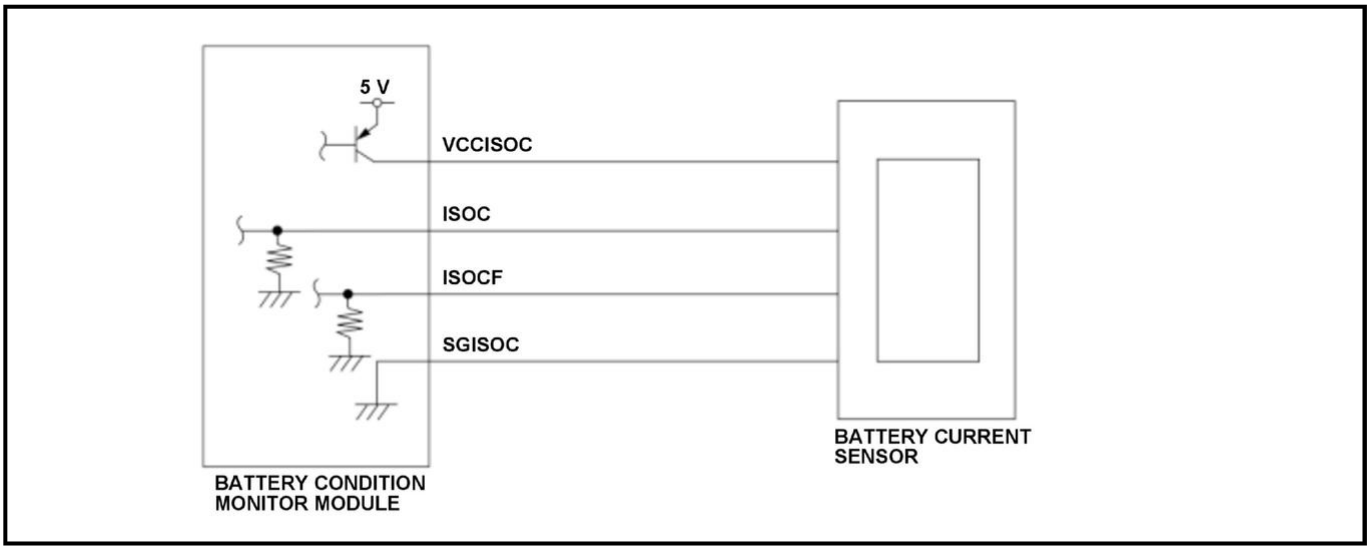
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P1597

DTC P1597: HV Battery Current Sensor 1 Circuit Range/Performance

General Description



The battery condition monitor module calculates the offset value of the battery current sensor during no voltage condition of the battery pack immediately after the vehicle condition is turned to the ON mode. The battery condition monitor module converts (A/D conversion) the ISOC signal input voltage and when the difference between the maximum value and the minimum value of eight continuous inputs are within 0.04 V, the average value of eight battery current sensor inputs are calculated. When the battery current sensor average value is out of a specified range, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Immediately after the vehicle condition is turned to the ON mode
Sequence	None
Duration	200 milliseconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The average signal voltage of 8 time acquired are within 0.04 V and the average value of the battery current sensor input deviates from the range of 2.24 V to 2.76 V.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

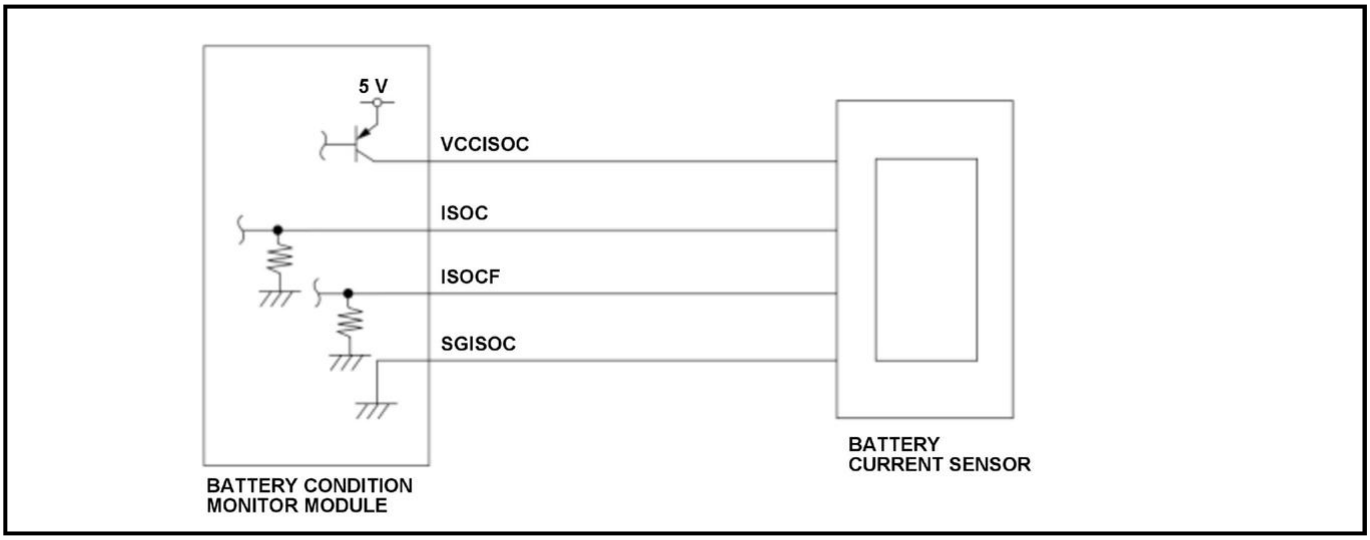
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P1598

DTC P1598: HV Battery Current Sensor 2 Circuit Range/Performance

General Description



The battery condition monitor module calculates the offset value of the battery current sensor during no voltage condition of the battery pack immediately after the vehicle condition is turned to the ON mode. The battery condition monitor module converts (A/D conversion) the ISOCF signal input voltage and when the difference between the maximum value and the minimum value of eight continuous inputs are within 0.04 V, the average value of eight battery current sensor inputs are calculated. When the battery current sensor average value is out of a specified range or the calculated current difference between ISOC signal and ISOCF signal deviates from a specified range for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Immediately after the vehicle condition is turned to the ON mode
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	7.7 V	-

Malfunction Threshold

The average signal voltage of 8 time acquired are within 0.04 V and the average value of the battery current sensor input deviates from the range of 2.24 V to 2.76 V.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery current sensor SGISOC line open
- Battery current sensor failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

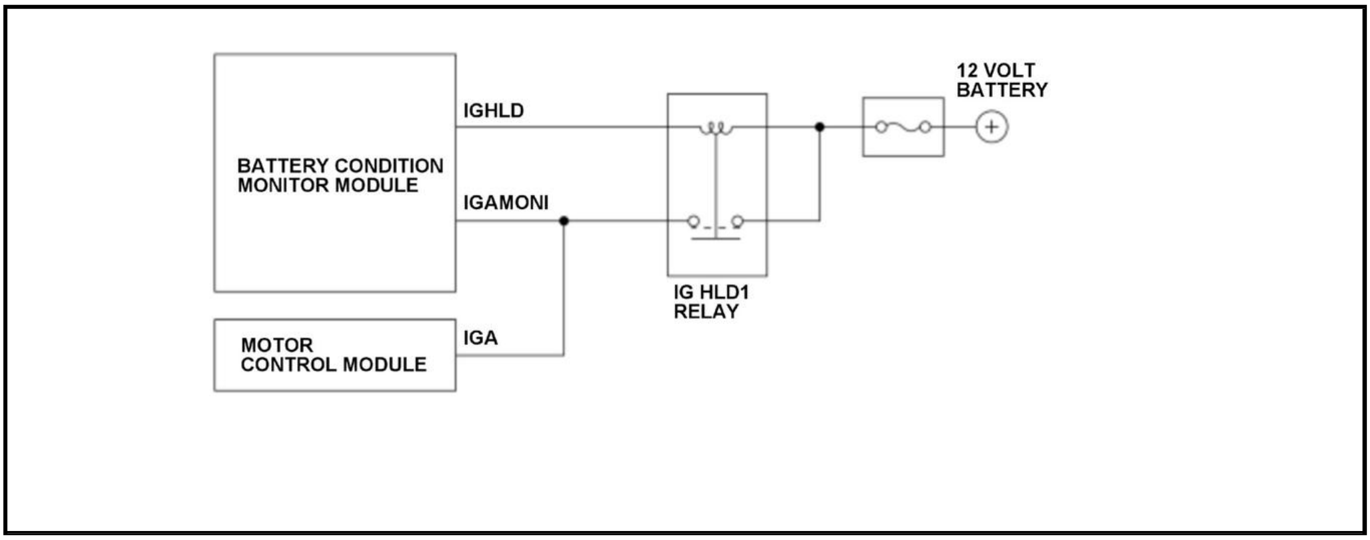
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P1673

DTC P1673: IGHLD Relay Circuit

General Description



The battery condition monitor module commands IGHLD1 relay to turn ON or permit it to turn OFF to the motor control module. The battery condition monitor module monitors IGHLD1 relay voltage at all times. When the IGHLD1 relay output and the voltage does not match a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage	8.2 V	-

Malfunction Threshold

One of these conditions is met for at least 5.0 seconds:

- The IGA voltage is 2.0 V or less when the IG HLD1 relay ON request is issued.
- The IGA voltage is 2.0 V or more when the IG HLD1 relay OFF request is issued.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- IG HLD1 relay IGHLD line short to ground
- IG HLD1 relay failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the POWER SYSTEM indicator comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

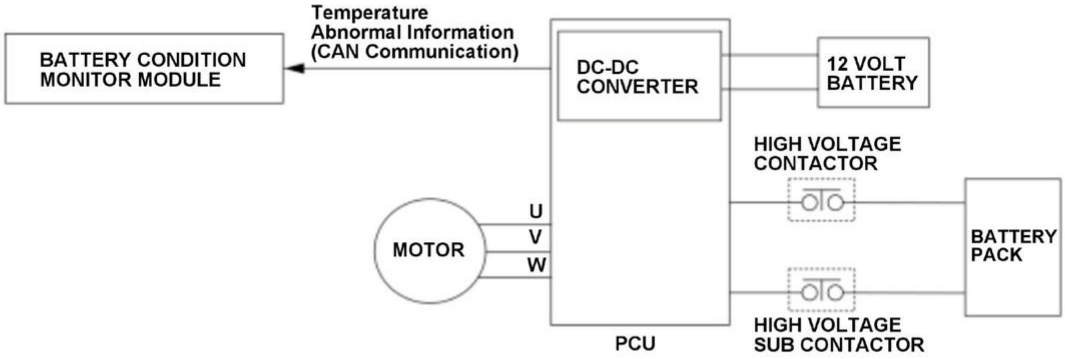
Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P16C3

DTC P16C3: DC-DC Converter Temperature Sensor Circuit

General Description



Temperature
Abnormal Information
(CAN Communication)
BATTERY CONDITION
MONITOR MODULE
DC-DC
CONVERTER
12 VOLT
BATTERY
HIGH VOLTAGE
CONTACTOR
U
V
W
MOTOR
BATTERY
PACK
PCU
HIGH VOLTAGE
SUB CONTACTOR

Temperature abnormalities are detected by the CPU in the DC-DC converter, and this information is sent to the battery condition monitor module via CAN communication. When the DC-DC converter temperature sensor abnormal information continues for a set time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Battery condition monitor module power-supply voltage	10.2 V	-
Vehicle	ON mode	

Malfunction Threshold

The DC-DC converter temperature sensor abnormal information continues for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Power control unit (PCU) internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

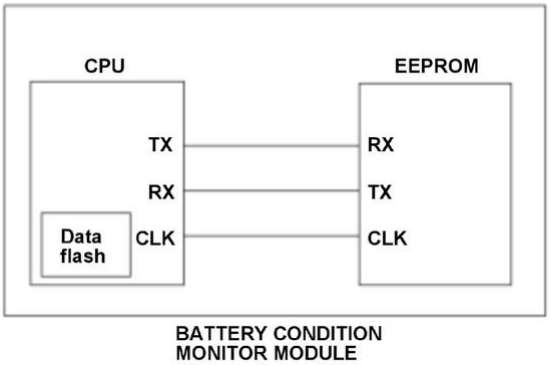
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P1D3A

DTC P1D3A: Battery Condition Monitor Module EEPROM Error (FSA Operated)

General Description



The CPU in the battery condition monitor module stores control data to the electrically erasable programmable read-only memory (EEPROM) or the data flash in the CPU. The CPU compares input and read data of the EEPROM or the data flash. When the data does not match, a malfunction is detected and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The battery condition monitor module fails to input to or read out from the EEPROM or the data flash.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

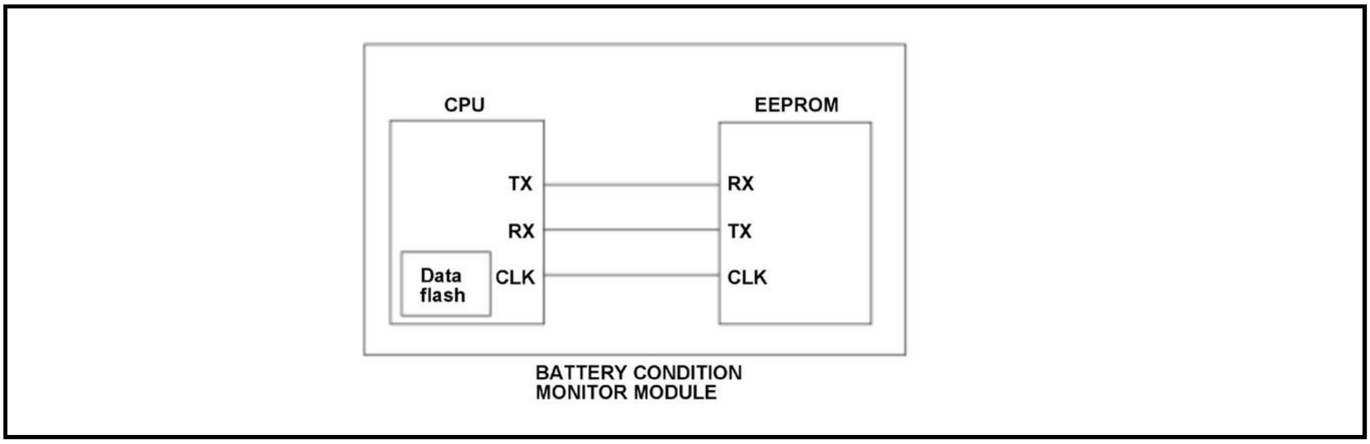
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P1D3B

DTC P1D3B: Battery Condition Monitor Module EEPROM Error (FSA Not-Operated)

General Description



The CPU in the battery condition monitor module stores control data to the electrically erasable programmable read-only memory (EEPROM) or the data flash in the CPU. The CPU compares input and read data of the EEPROM or the data flash. When the data does not match, a malfunction is detected and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The battery condition monitor module fails to input to or read out from the EEPROM or the data flash.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

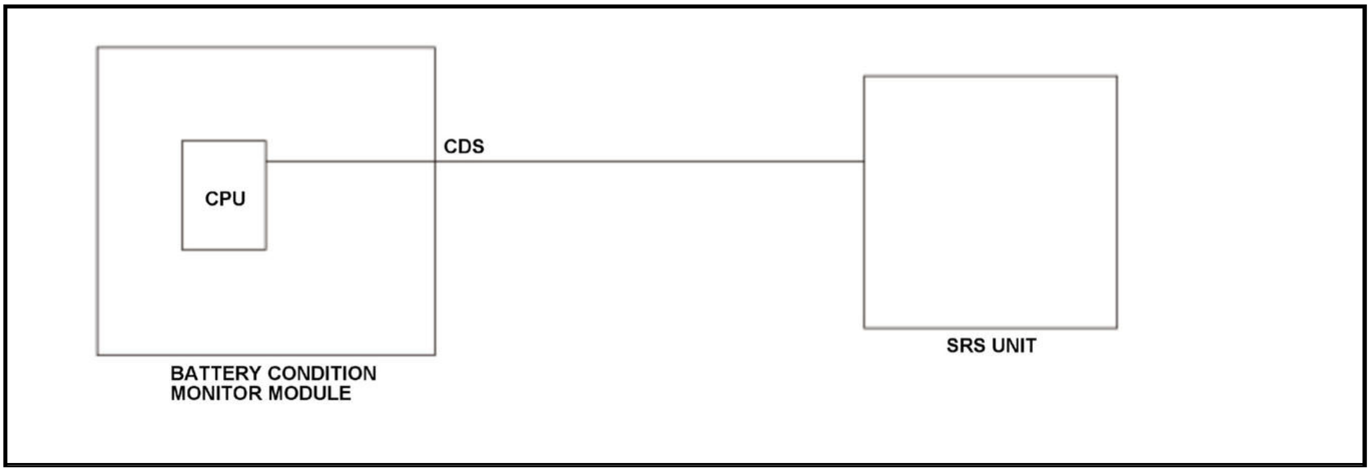
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P1D64

DTC P1D64: Collision Detection Signal Circuit

General Description



The battery condition monitor module receives pulse signals of crash cutoff information from the SRS unit. If the battery condition monitor module does not receive pulse signals from the SRS unit, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.5 seconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a	50 milliseconds	-

Condition	Minimum	Maximum
specified value after the vehicle condition is turned to the ON mode		
12 volt battery voltage	9.7 V	-

Malfunction Threshold

The battery condition monitor module does not receive pulse signals from the SRS unit for at least 5.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- SRS unit CDS line open
- SRS unit CDS line short
- SRS unit failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the POWER SYSTEM indicator comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

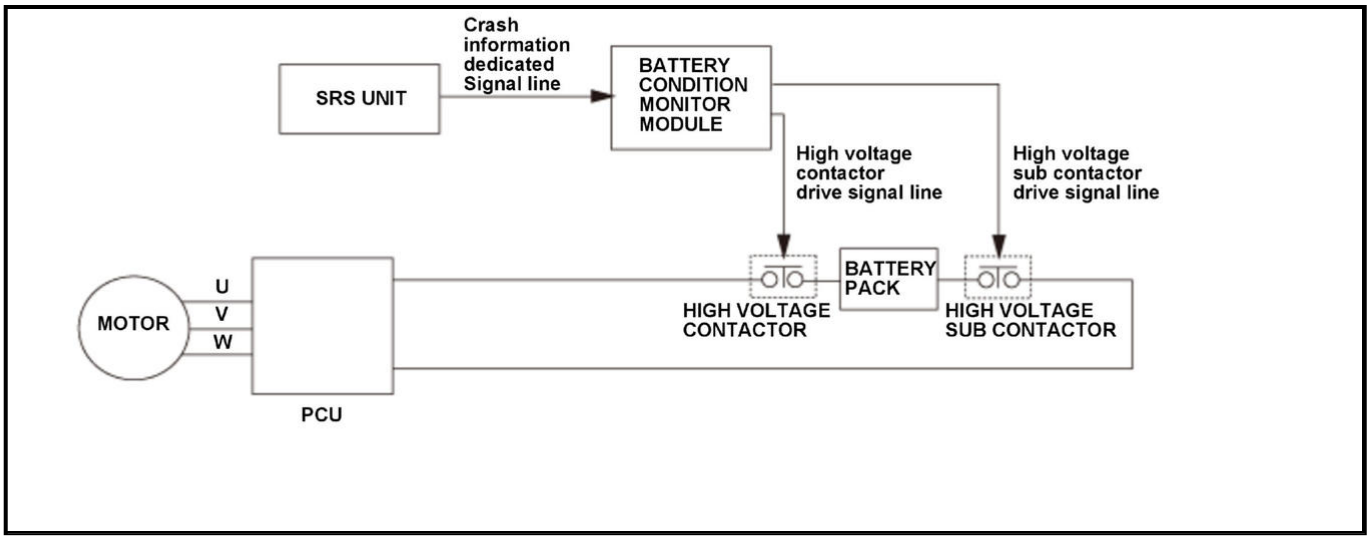
Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P1D65

DTC P1D65: HV System Shutdown (Collision Detection Signal Detected)

General Description



Crash information dedicated Signal line
SRS UNIT
BATTERY CONDITION MONITOR MODULE
High voltage contactor drive signal line
High voltage sub contactor drive signal line
MOTOR
U
V
W
PCU
HIGH VOLTAGE CONTACTOR
BATTERY PACK
HIGH VOLTAGE SUB CONTACTOR

The electric powertrain system contains a system that shuts down the high voltage line when the vehicle crashes. The SRS unit sends vehicle crash information to the battery condition monitor module via a dedicated signal line when the SRS unit detects that the vehicle has crashed. When the battery condition monitor module keeps receiving vehicle crash information from the SRS unit for a set time, the battery condition monitor module judges that the crash shut down condition has been met, and shuts down the high voltage contactor and the high voltage sub contactor.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	240 milliseconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Battery condition monitor module power-supply voltage	10.2 V	-
Vehicle	ON mode	

Malfunction Threshold

The battery condition monitor module receives the vehicle crash information for at least 240 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Failure of the vehicle by the collision
- SRS unit internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

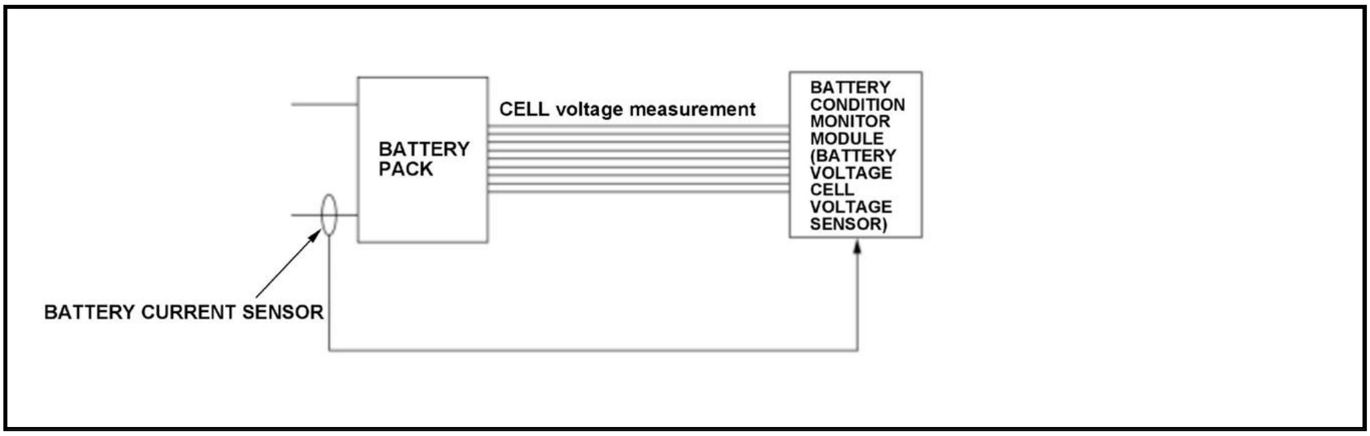
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

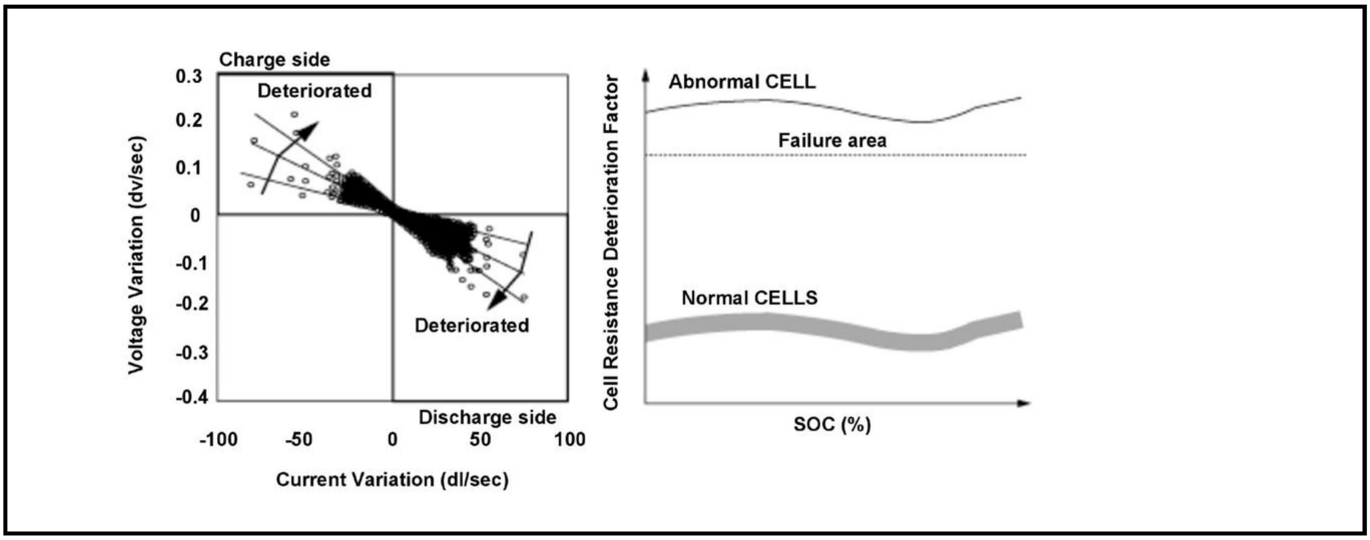
DTC P1DC7

DTC P1DC7: HV Battery Pack Deterioration of Power

General Description



CELL voltage measurement
BATTERY PACK
BATTERY CONDITION MONITOR MODULE (BATTERY VOLTAGE CELL VOLTAGE SENSOR)
BATTERY CURRENT SENSOR



Cell resistance deterioration factor in the discharged state is calculated based on the individual cell voltage from the battery voltage cell voltage sensor connected to the battery pack and the differentiated current and voltage when inputting and outputting electric power from the battery current sensor and the battery condition monitor module. If the cell resistance deterioration factor exceeds a specified value for a specified duration, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Battery pack temperature	56 deg.F (13 deg.C)	130 deg.F (54.5 deg.C)
Vehicle	ON mode	

Malfunction Threshold

The cell resistance deterioration factor ratio when discharging is 2.75 times or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack internal failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the READY TO DRIVE mode.
- Test-drive the vehicle; accelerate to 31 mph (50 km/h) and decelerate to 0 mph (0 km/h), repeat that for 10 minutes.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

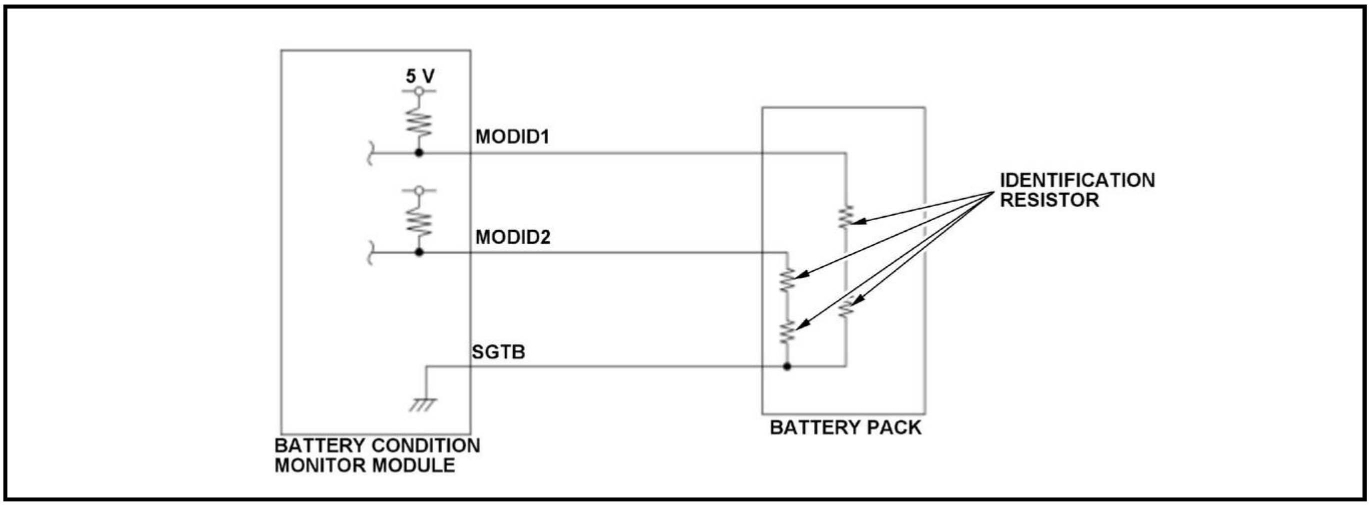
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P1DCB

DTC P1DCB: HV Battery Identification Circuit (System Running)

General Description



The battery pack built in resistance for battery module identifications are used for the battery condition monitor module to monitor whether an appropriate battery module is connected. If the battery pack resistance voltage for battery module identifications are out of specified value for a set time, the battery condition monitor module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more

DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage	8.0 V	-
Other	After the electric powertrain system operated	

Malfunction Threshold

One of the conditions is met:

- The resistance voltage is 4.98 V or more for at least 2.0 seconds.
- The resistance voltage is 0.03 V or less for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery pack MODID1 line open
- Battery pack MODID1 line short to ground
- Battery pack MODID2 line open
- Battery pack MODID2 line short to ground
- Battery pack internal circuit failure
- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

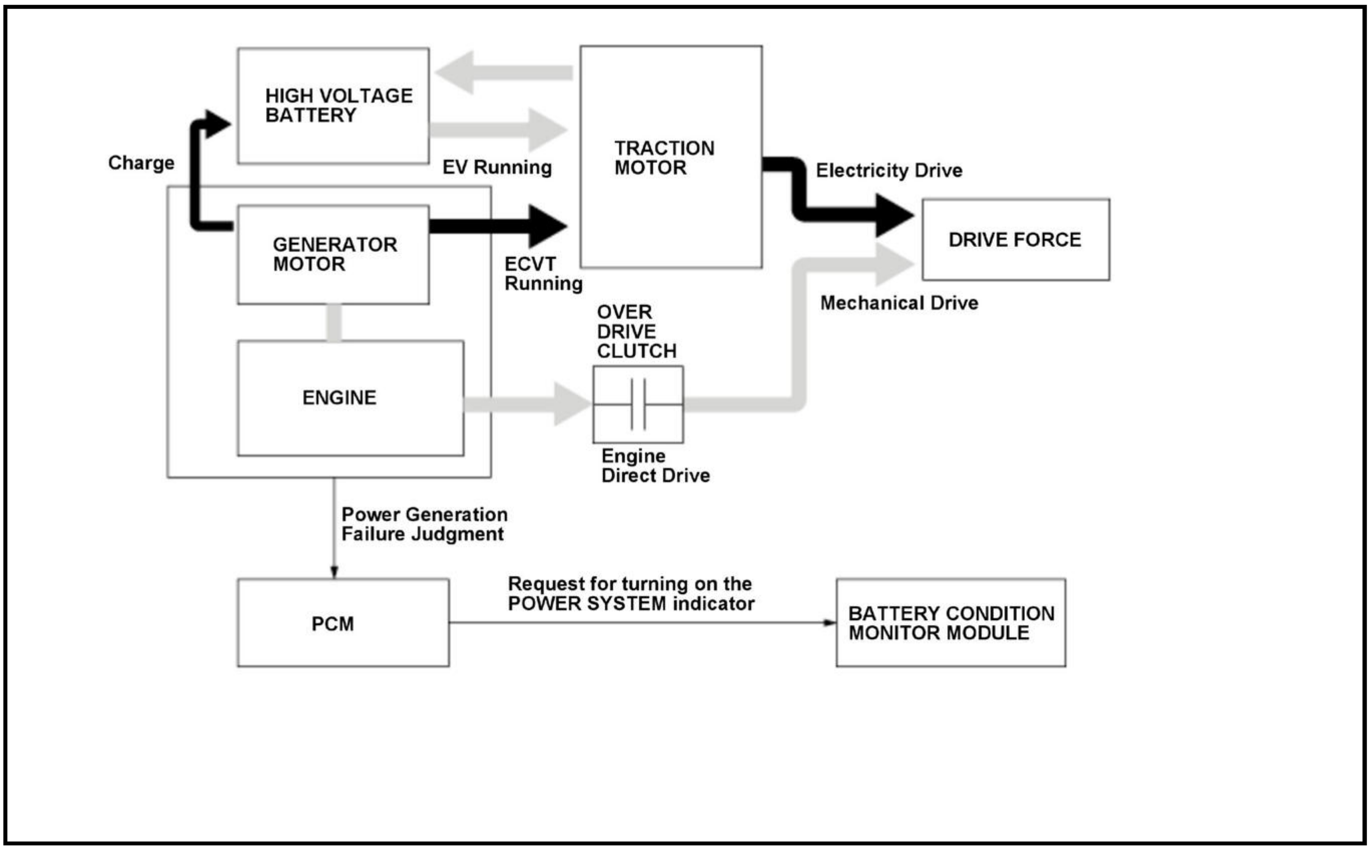
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P1DFD

DTC P1DFD: Power System Indicator Lighting Request From PCM

General Description



HIGH VOLTAGE BATTERY
Charge
EV Running
TRACTION MOTOR
Electricity Drive
DRIVE FORCE
GENERATOR MOTOR
ECVT Running
Mechanical Drive
OVER DRIVE CLUTCH
ENGINE
Engine Direct Drive
Power Generation Failure Judgment
PCM
Request for turning on the POWER SYSTEM indicator
BATTERY CONDITION MONITOR MODULE

The powertrain control module (PCM) monitors the power generation state of the generator motor and requests the battery condition monitor module to illuminate the POWER SYSTEM indicator when there is an abnormality.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3 seconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Motor control module power-supply voltage	10.2 V	-
Vehicle	ON mode	

Malfunction Threshold

When abnormality information is received from the generator motor for 3 seconds or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Out of fuel
- Poor fuel
- Misfire

Confirmation Procedure

Operating Condition

Enter the maintenance mode and wait for 3 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

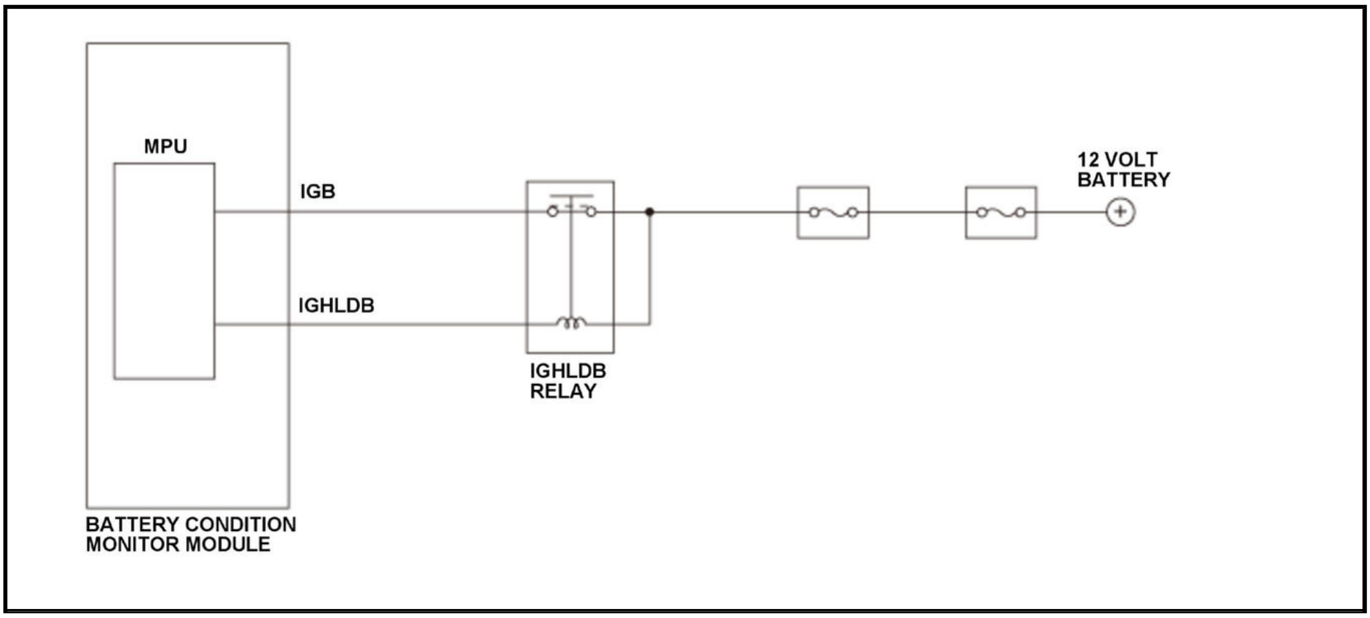
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC P1DFF

DTC P1DFF: IGHLDB Relay Circuit

General Description



The battery condition monitor module commands IGHLDB relay to turn ON or permit it to turn OFF. Normally, when the IGHLDB relay is OFF, the MPU in the battery condition monitor module is in sleep mode. The MPU counts elapsed time since the battery condition monitor module commanded IGHLDB relay to turn OFF. When the MPU remain powered even when the battery condition monitor module commands IGHLDB relay to turn OFF for a specified duration, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	After the vehicle is turned to the OFF (LOCK) mode for at least 150 seconds
Sequence	None
Duration	5.0 seconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle	OFF (LOCK) mode

Malfunction Threshold

The battery condition monitor module is not in sleep mode for at least 5.0 seconds after the battery condition monitor module sent the IGHLDB relay off signal for at least 135 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- IGHLDB relay IGHLDB line short to ground
- IGHLDB relay failure
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the ON mode.
- Turn the vehicle to the OFF (LOCK) mode, and leave the vehicle for at least 150 seconds.
- Turn the vehicle to the ON mode.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the POWER SYSTEM indicator comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

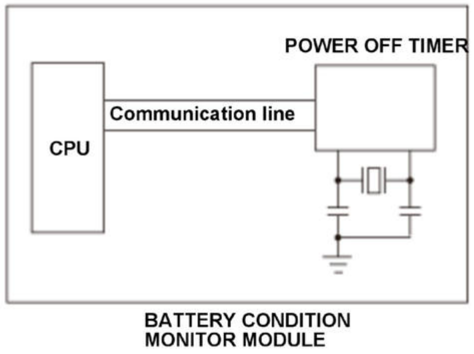
Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC P262B

DTC P262B: Battery Condition Monitor Module Timer

General Description



The CPU in the battery condition monitor module has built in power off timer that measures the duration from electric powertrain system off to the next vehicle ON mode. The CPU accesses to the power off timer when reading the measured duration. If the access process fails or an abnormality is found in the read data, the battery condition monitor module detects a malfunction and stores a DTC. Even if the access is normally performed, the battery condition monitor module stores a DTC when the measured duration accuracy of the power off timer is out of normal range.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3 minutes or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	B
Vehicle*	ON mode

*: Excludes after the 12 volt battery is reconnected

Malfunction Threshold

One of these conditions is occurs:

- The access process to the power off timer fails.
- The malfunction is found in the read data.
- When the difference between the CPU and the power off timer measurement time is 50 % or more continuously for three times.*

*: Power off timer measurement updates once per minute.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Battery condition monitor module internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

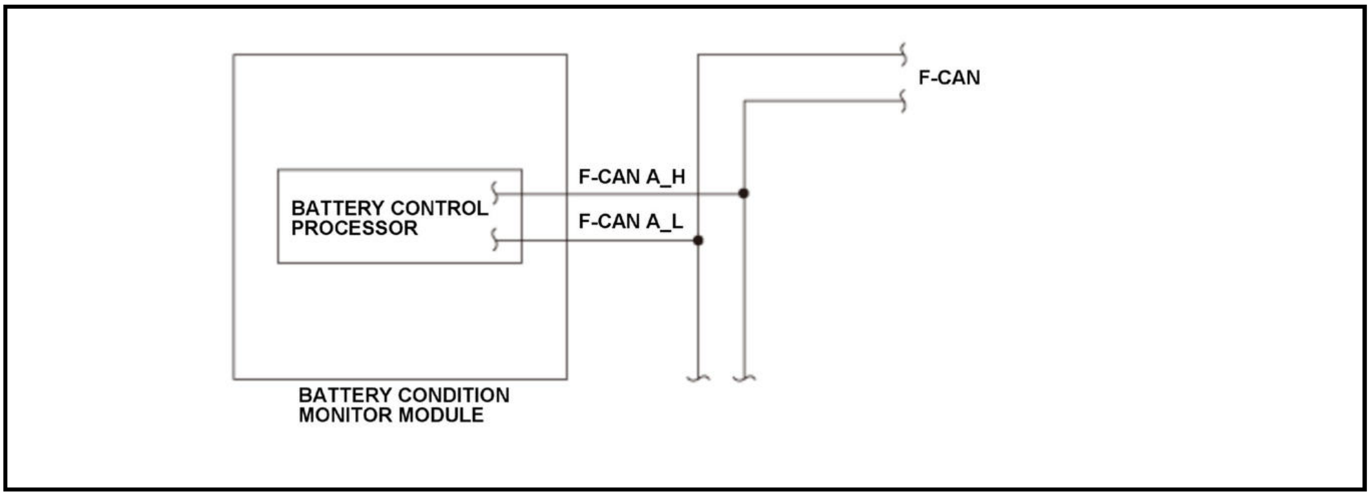
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U0029 (BATTERY CONDITION MONITOR MODULE)

DTC U0029: F-CAN Malfunction (Battery Condition Monitor Module Bus-Off)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). If the bus-off occurs due to an open or a short circuit in the F-CAN line is detected for a prescribed time, the battery control processor in the battery condition monitor module detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	500 milliseconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

The F-CAN line bus-off continues for at least 500 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short
- F-CAN circuit F-CAN A_L line short
- Unit communicating on F-CAN internal circuit failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

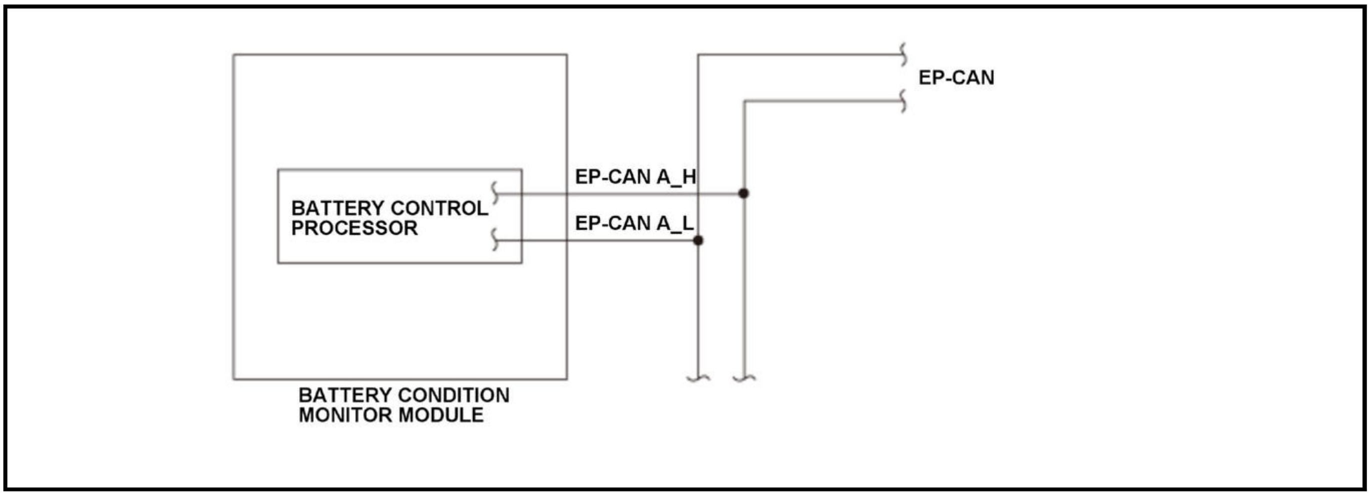
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U0038 (BATTERY CONDITION MONITOR MODULE)

DTC U0038: EP-CAN Malfunction (Battery Condition Monitor Module Bus-Off)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). If the bus-off occurs due to an open or a short circuit in the EP-CAN line is detected for a prescribed time, the battery control processor in the battery condition monitor module detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	500 milliseconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	50 milliseconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

The EP-CAN line bus-off continues for at least 500 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short
- EP-CAN circuit EP-CAN A_L line short
- Unit communicating on EP-CAN internal circuit failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U0100 (BATTERY CONDITION MONITOR MODULE)

DTC U0100: CAN Malfunction (Battery Condition Monitor Module - PCM)

General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the following DTC codes (U1204, U1600) are detected.

DTC U0110 (BATTERY CONDITION MONITOR MODULE)

DTC U0110: F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)

General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the DTC code U1205 is detected.

DTC U012D (BATTERY CONDITION MONITOR MODULE)

DTC U012D: F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)

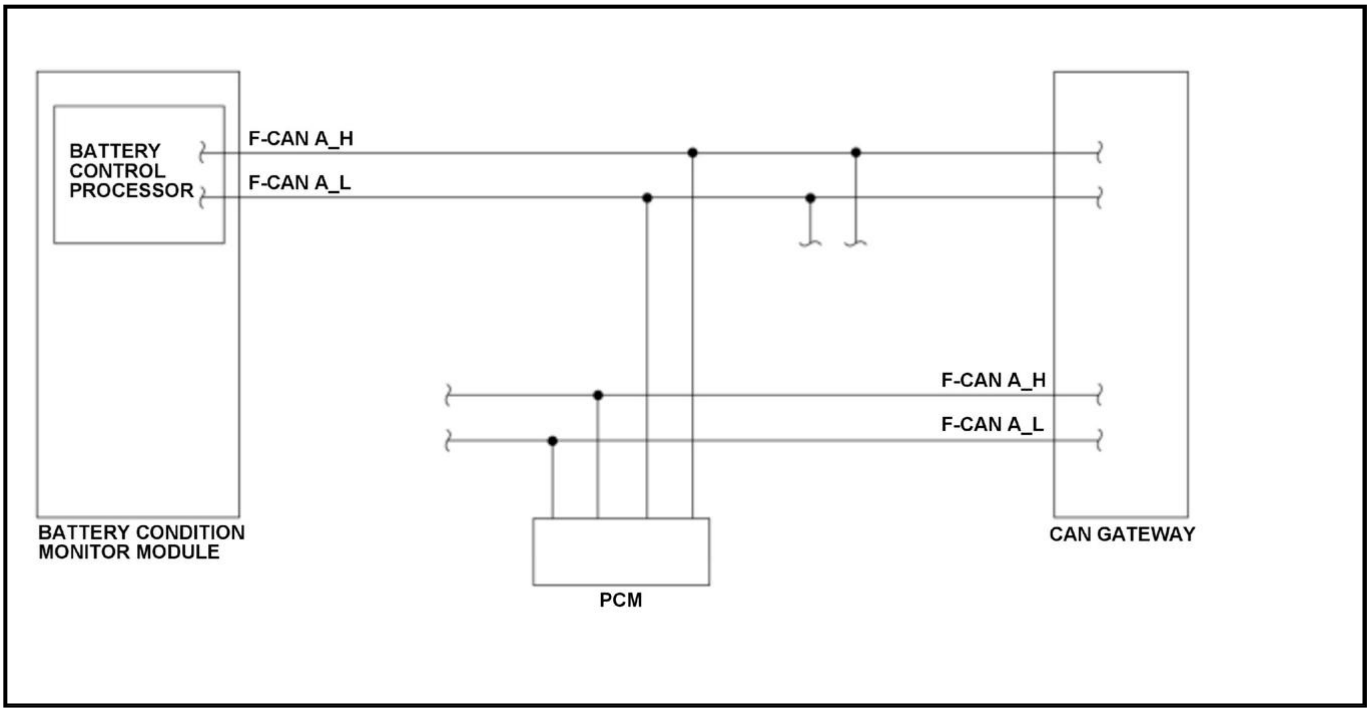
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the DTC code U12A5 is detected.

DTC U0146 (BATTERY CONDITION MONITOR MODULE)

DTC U0146: F-CAN Malfunction (Battery Condition Monitor Module - CAN Gateway)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the CAN gateway via the F-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the CAN gateway via the F-CAN lines for at least 2.0 seconds.
- The information sent from the CAN gateway is abnormal for at least 10 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short
- F-CAN circuit F-CAN A_L line short
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short
- F-CAN circuit F-CAN B_L line short
- CAN gateway failure
- Powertrain control module (PCM) failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

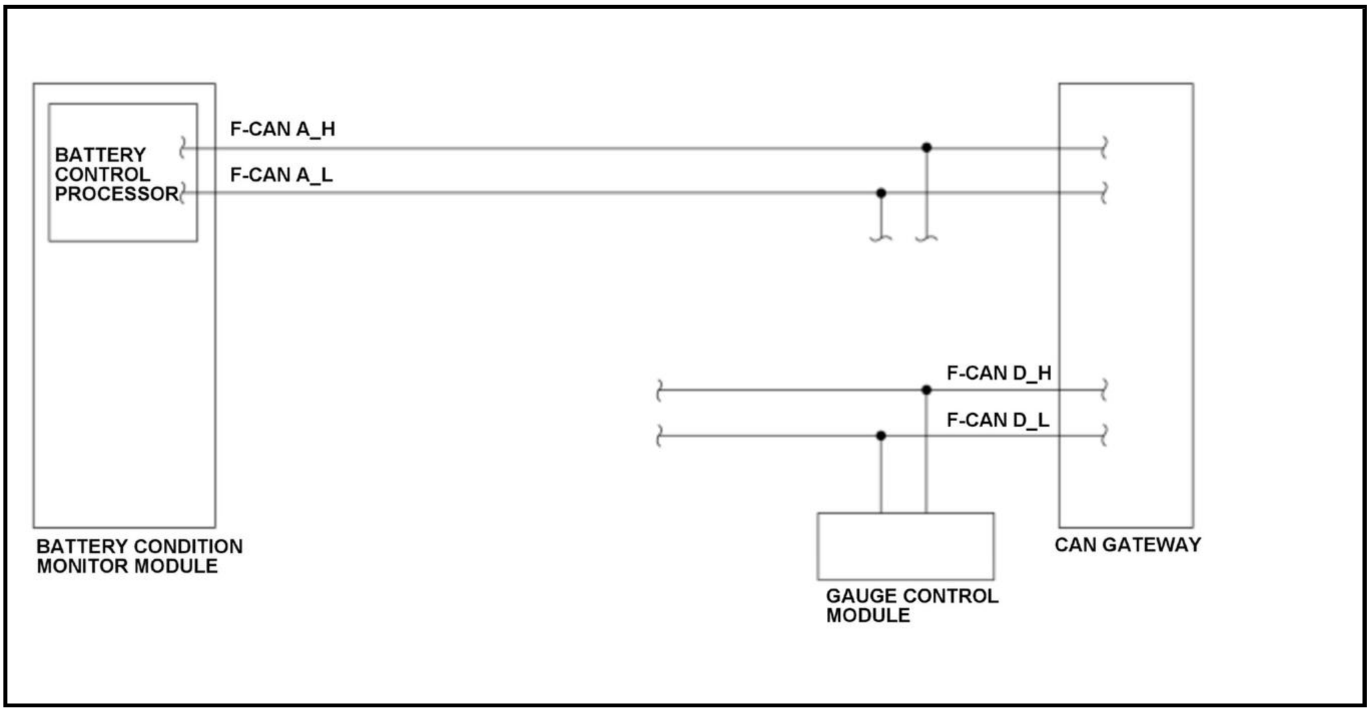
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U0155 (BATTERY CONDITION MONITOR MODULE)

DTC U0155: F-CAN Malfunction (Battery Condition Monitor Module - Gauge Control Module)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the gauge control module via the F-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	25 seconds or more
DTC Type	Two drive cycles, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the gauge control module via the F-CAN lines for at least 2.0 seconds.
- The information sent from the gauge control module is abnormal for at least 25 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open

- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short
- F-CAN circuit F-CAN A_L line short
- F-CAN circuit F-CAN D_H line open
- F-CAN circuit F-CAN D_L line open
- F-CAN circuit F-CAN D_H line short
- F-CAN circuit F-CAN A_L line short
- Gauge control module failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the POWER SYSTEM indicator comes on and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U0298 (BATTERY CONDITION MONITOR MODULE)

DTC U0298: DC-DC Converter Communication Error

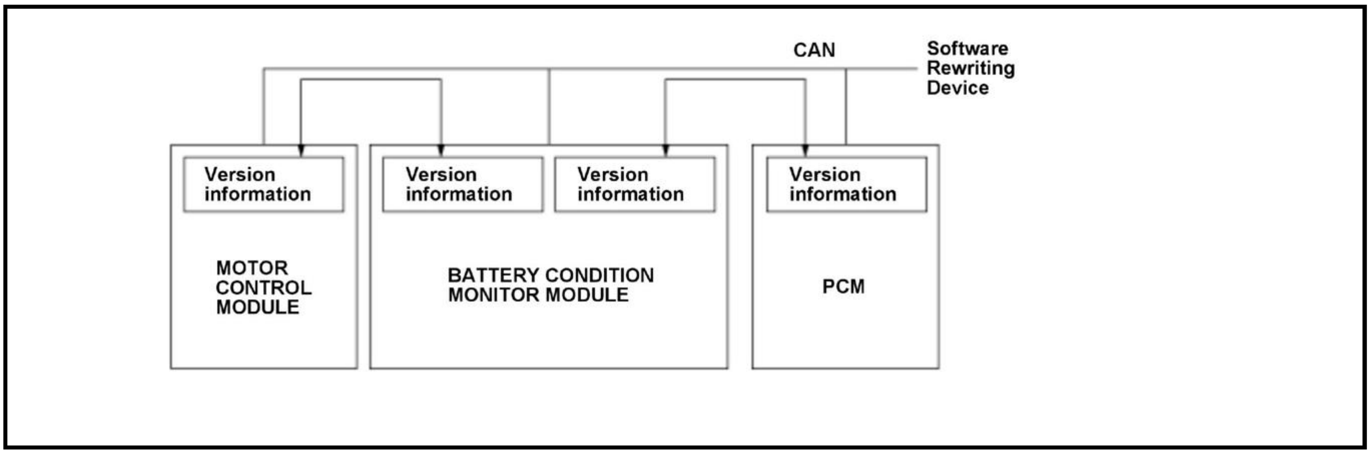
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the DTC code U1220 is detected.

DTC U0312 (BATTERY CONDITION MONITOR MODULE)

DTC U0312: Battery Condition Monitor Module Programming Error (Version Mismatch)

General Description



The motor control module, battery condition monitor module, and the powertrain control module (PCM) can be updated by software rewriting device communicated via the CAN lines. When the motor control module, battery condition monitor module, or the PCM needs to be updated but either CPU fails rewriting, the indicator comes on and stores a DTC. Each CPU stores software version information, and compare their versions each other by transmitting/receiving via the CAN lines. If the battery condition monitor module judges that its own software version is old, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.0 second or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator on

Enable Conditions

Condition	B
Other	The normal status of communication by CAN line between the PCM or the motor control module and the battery condition monitor module

Malfunction Threshold

The battery condition monitor module judges that its own software version is old for at least 1.0 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Software version mismatch between the battery condition monitor module and the motor control module
- Software version mismatch between the battery condition monitor module and the PCM

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

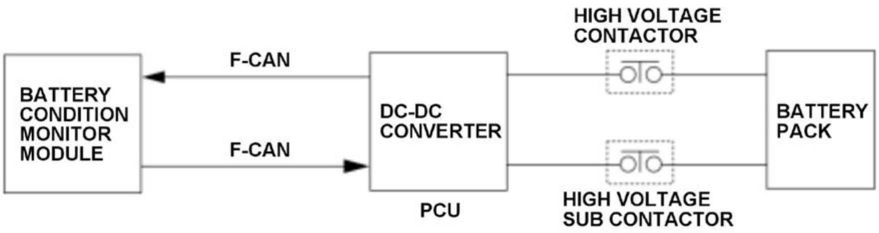
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U0599 (BATTERY CONDITION MONITOR MODULE)

DTC U0599: DC-DC Converter Serial Communication Receive Error

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module does not receive the signal from the DC-DC converter via the F-CAN line for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL off, POWER SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met for at least 2.0 seconds:

- The battery condition monitor module does not receive any signals via the F-CAN lines.
- The information sent from the DC-DC converter is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN D_H line open
- F-CAN circuit F-CAN D_L line open
- F-CAN circuit F-CAN D_H line short
- F-CAN circuit F-CAN D_L line short
- DC-DC converter failure
- DC-DC converter does not work
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored is the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the POWER SYSTEM indicator comes on and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

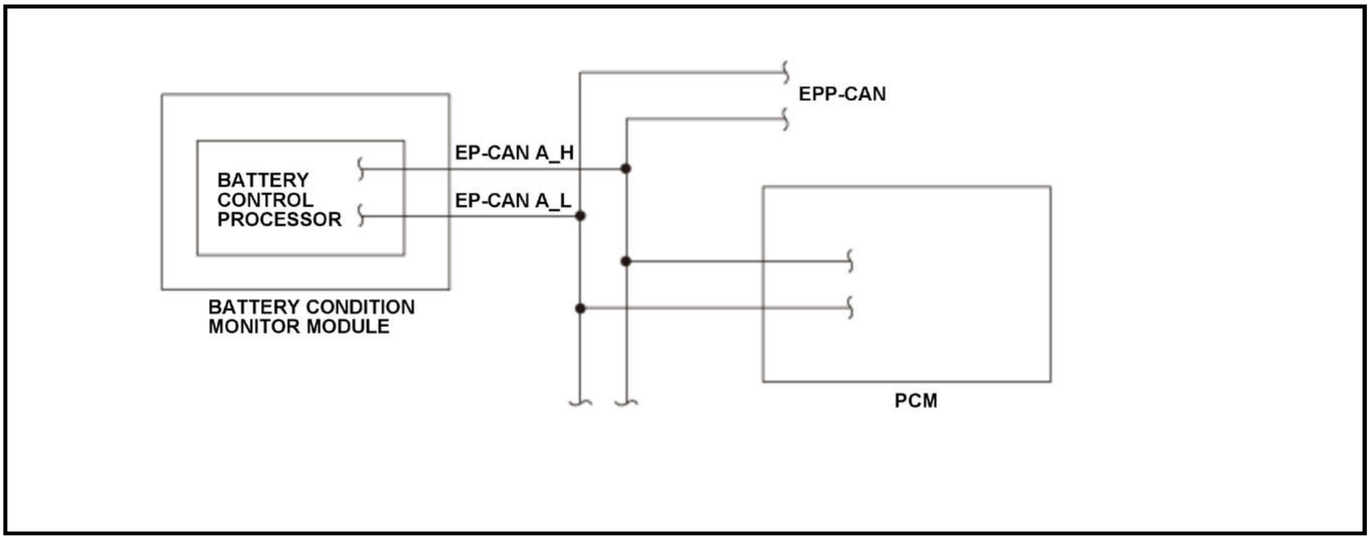
Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U1204 (BATTERY CONDITION MONITOR MODULE)

DTC U1204: EP-CAN Malfunction (Battery Condition Monitor Module - PCM)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the powertrain control module (PCM) via the EP-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	25 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the PCM via the EP-CAN lines for at least 2.0 seconds.
- The information sent from the PCM is abnormal for at least 25 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short
- EP-CAN circuit EP-CAN A_L line short
- PCM failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

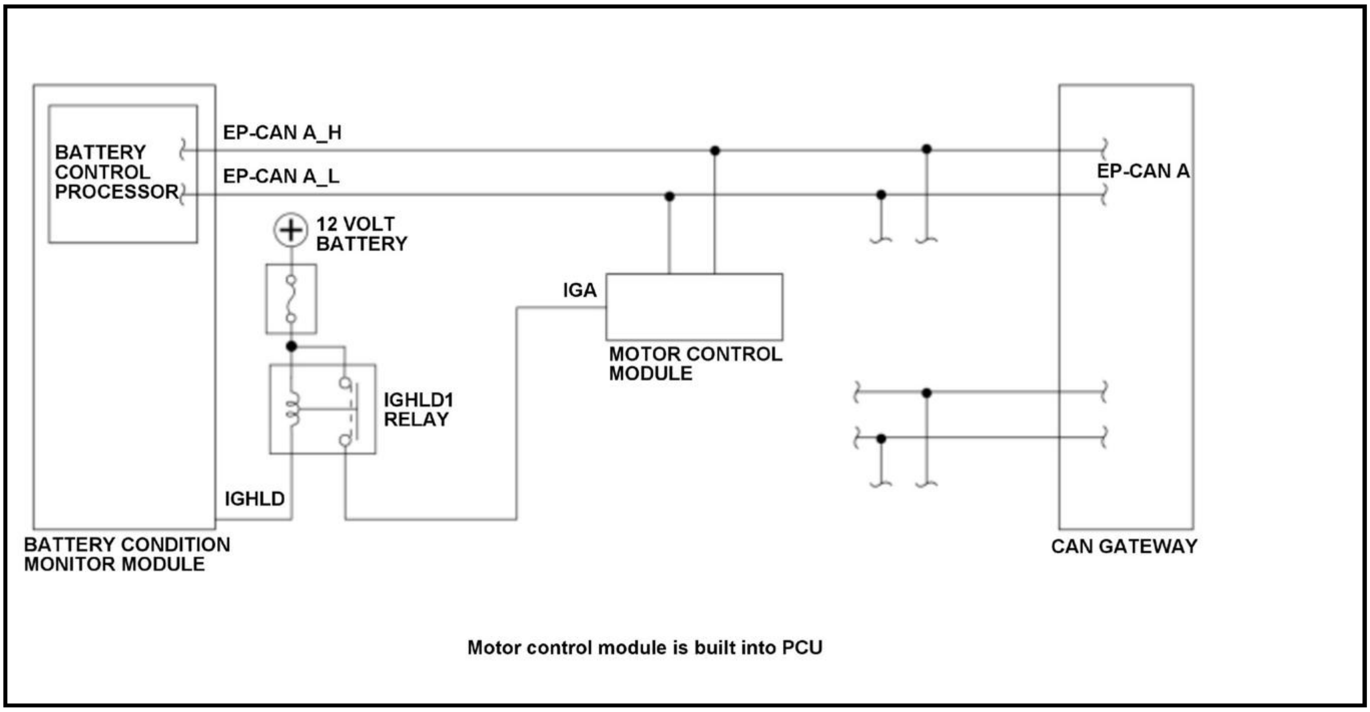
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U1205 (BATTERY CONDITION MONITOR MODULE)

DTC U1205: EP-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)

General Description



BATTERY CONTROL PROCESSOR
EP-CAN A_H
EP-CAN A_L
12 VOLT BATTERY
IGA
MOTOR CONTROL MODULE
IGHLD1 RELAY
IGHLD
BATTERY CONDITION MONITOR MODULE
EP-CAN A
CAN GATEWAY
Motor control module is built into PCU

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the motor control module via the EP-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	25 seconds or more

DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the motor control module via the EP-CAN lines for at least 2.0 seconds.
- The information sent from the motor control module is abnormal for at least 25 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short
- EP-CAN circuit EP-CAN A_L line short
- IGHLD1 relay IGHLD line open
- IGHLD1 relay stuck off
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

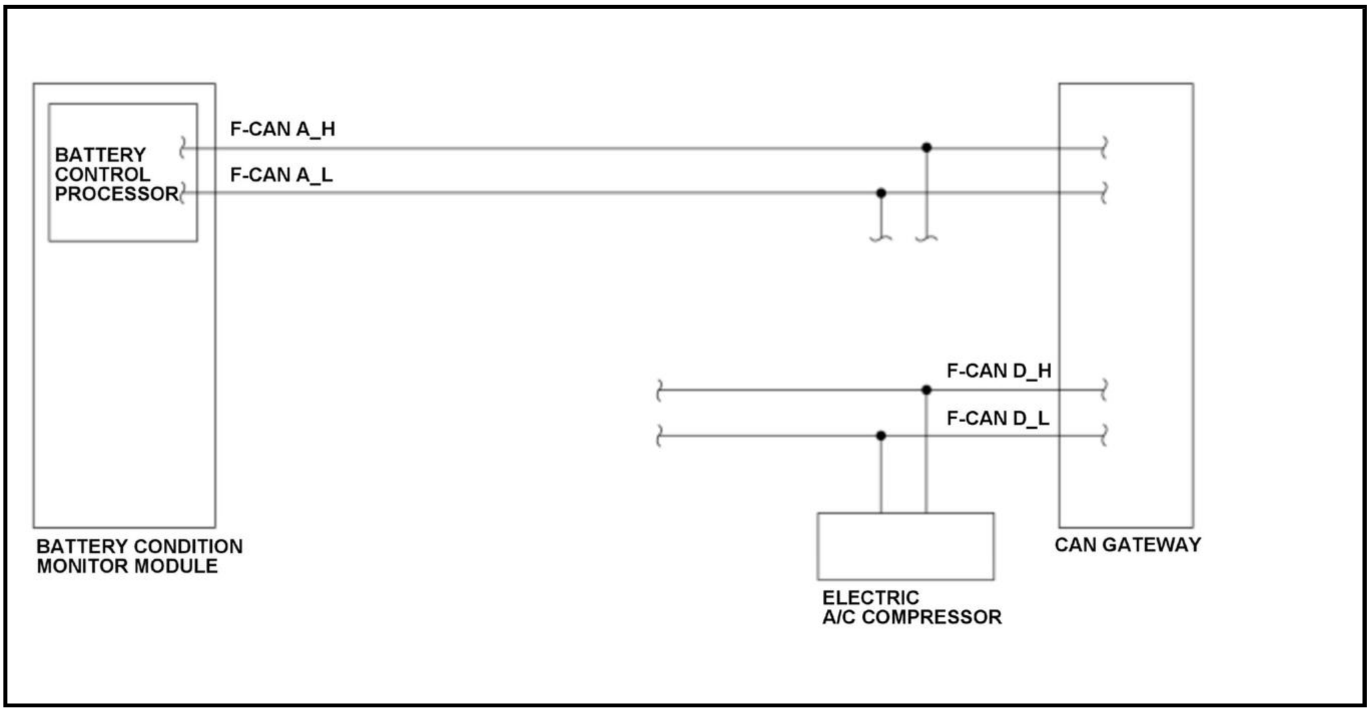
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U1207 (BATTERY CONDITION MONITOR MODULE)

DTC U1207: F-CAN Malfunction (Battery Condition Monitor Module - Electric A/C Compressor)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the electric A/C compressor via the F-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the electric A/C compressor via the F-CAN lines for at least 2.0 seconds.
- The information sent from the electric A/C compressor is abnormal for at least 10 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open

- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short
- F-CAN circuit F-CAN A_L line short
- F-CAN circuit F-CAN D_H line open
- F-CAN circuit F-CAN D_L line open
- F-CAN circuit F-CAN D_H line short
- F-CAN circuit F-CAN D_L line short
- Electric A/C compressor failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the POWER SYSTEM indicator comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory. The MIL does not come on.

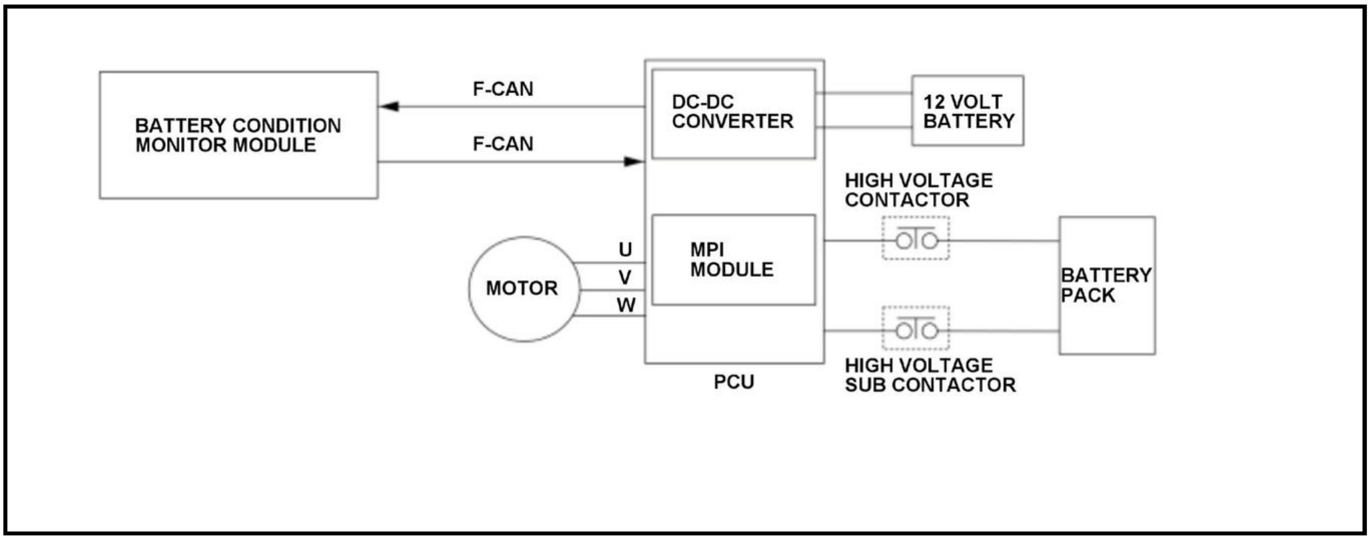
Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U1220 (BATTERY CONDITION MONITOR MODULE)

DTC U1220: DC-DC Converter Serial Communication Transmit Error

General Description



BATTERY CONDITION MONITOR MODULE
F-CAN
F-CAN
DC-DC CONVERTER
12 VOLT BATTERY
HIGH VOLTAGE CONTACTOR
MOTOR
U
V
W
MPI MODULE
BATTERY PACK
PCU
HIGH VOLTAGE SUB CONTACTOR

The DC-DC converter uses an internal timer to measure the intervals between CAN communication data updates. When an update is not received for a specified time, the battery condition monitor module detects a CAN communication reception malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more

DTC Type	Two drive cycles, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Battery condition monitor module power-supply voltage	10.2 V	-
Vehicle	ON mode	

Malfunction Threshold

The CAN communication data is not updated for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short
- F-CAN circuit F-CAN A_L line short
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

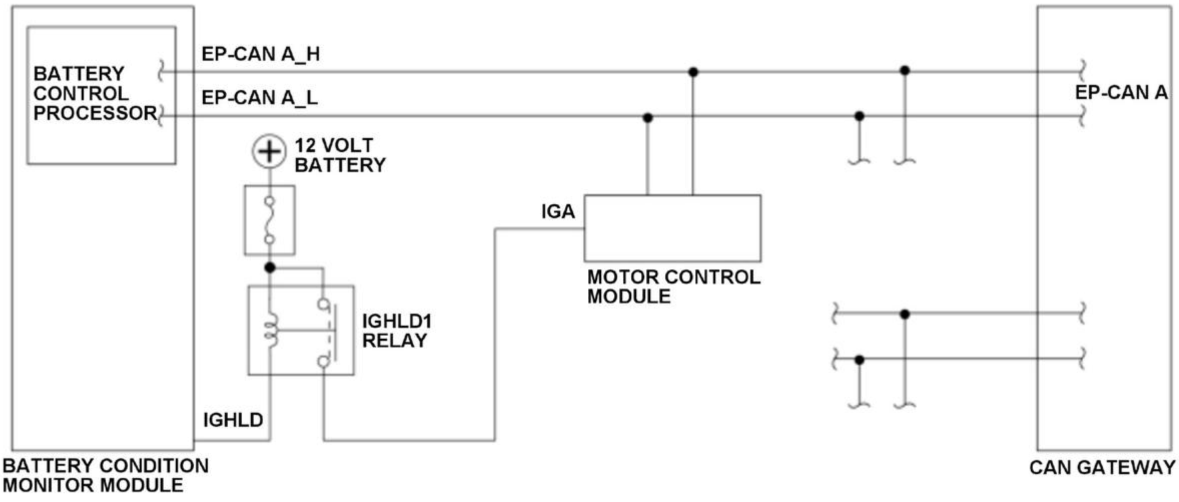
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or the battery condition monitor module reset.

DTC U12A5 (BATTERY CONDITION MONITOR MODULE)

DTC U12A5: EP-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)

General Description



BATTERY CONTROL PROCESSOR
EP-CAN A_H
EP-CAN A_L
12 VOLT BATTERY
IGA
MOTOR CONTROL MODULE
IGHLD1 RELAY
IGHLD
EP-CAN A
BATTERY CONDITION MONITOR MODULE
CAN GATEWAY

Motor control module is built into PCU

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the motor control module via the EP-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	25 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the motor control module via the EP-CAN lines for at least 2.0 seconds.
- The information sent from the motor control module is abnormal at least 25 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open

- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short
- EP-CAN circuit EP-CAN A_L line short
- IGHLD1 relay IGHLD line open
- IGHLD1 relay stuck off
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the battery condition monitor module memory.

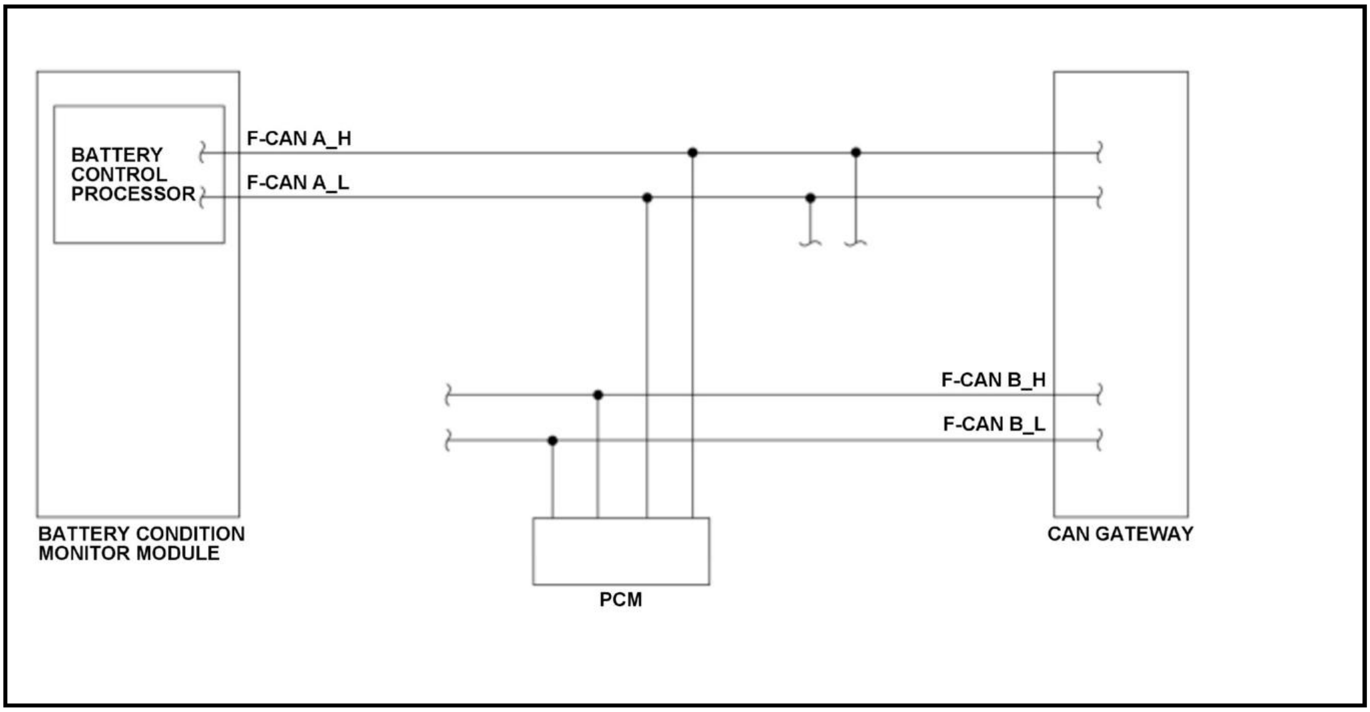
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U1600 (BATTERY CONDITION MONITOR MODULE)

DTC U1600: F-CAN Malfunction (Battery Condition Monitor Module - PCM)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the powertrain control module (PCM) via the F-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	25 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	5 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the PCM via the F-CAN lines for at least 2.0 seconds.
- The information sent from the PCM is abnormal for at least 25 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short
- F-CAN circuit F-CAN A_L line short
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short
- F-CAN circuit F-CAN B_L line short
- PCM failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

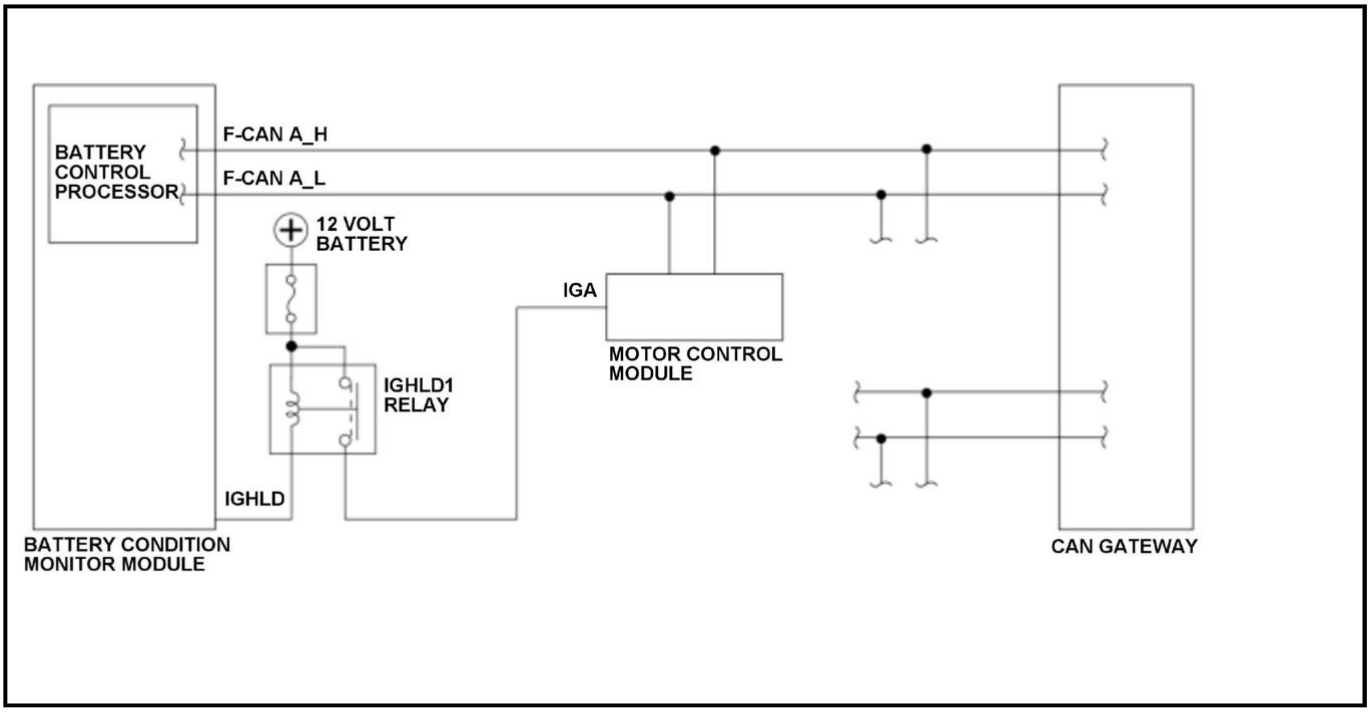
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U1604 (BATTERY CONDITION MONITOR MODULE)

DTC U1604: F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)

General Description



BATTERY CONTROL PROCESSOR
F-CAN A_H
F-CAN A_L
12 VOLT BATTERY
IGA
MOTOR CONTROL MODULE
IGHLD1 RELAY
IGHLD
BATTERY CONDITION MONITOR MODULE
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the motor control module via the F-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	25 seconds or more
DTC Type	Two drive cycles, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the motor control module via the F-CAN lines for at least 2.0 seconds.
- The information sent from the motor control module is abnormal for at least 25 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short
- F-CAN circuit F-CAN A_L line short
- IGHLD1 relay IGHLD line open
- IGHLD1 relay stuck off
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the POWER SYSTEM indicator comes on and a Confirmed DTC and the freeze data are stored.

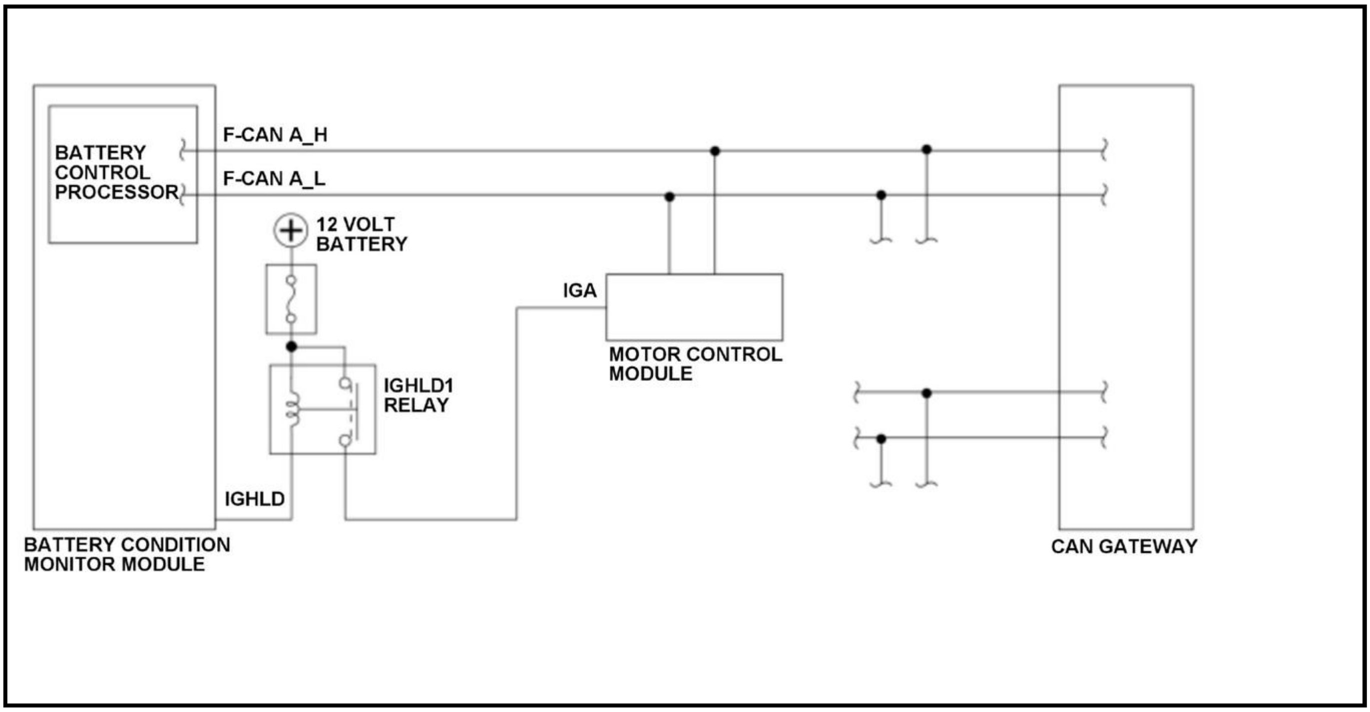
Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

DTC U1605 (BATTERY CONDITION MONITOR MODULE)

DTC U1605: F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the battery condition monitor module cannot receive the signals from the motor control module via the F-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	25 seconds or more
DTC Type	Two drive cycles, MIL off, POWER SYSTEM indicator on, 12 VOLT CHARGING SYSTEM indicator off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10.2 V	-

Malfunction Threshold

One of these conditions is met:

- The battery condition monitor module cannot receive any signals from the motor control module via the F-CAN lines for at least 2.0 seconds.
- The information sent from the motor control module is abnormal for at least 25 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short
- F-CAN circuit F-CAN A_L line short
- IGHLD1 relay IGHLD line open
- IGHLD1 relay stuck off
- Power control unit (PCU) internal circuit failure
- Battery condition monitor module failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the battery condition monitor module memory. If the malfunction returns in the next (second) drive cycle, the POWER SYSTEM indicator comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command.

*2: This DTC code does not store individually. Details depend on other DTC codes stored at the same time.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE ELECTRIC POWERTRAIN

Intermittent Failures

The term intermittent failure means a system may have had a failure, but it checks OK now. If the POWER SYSTEM indicator on the dash does not come on, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting. If the POWER SYSTEM indicator was on but then went off, the original problem may have been intermittent.

Service Information

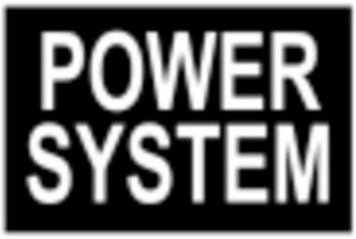
Periodically new software or new service procedures may become available for the motor control module and/or battery condition module. Always check online for the latest software or service information related to the DTCs or symptoms you are troubleshooting.

Opens and Shorts

Open and shorts are common electrical terms. An open is a break in a wire or at a connection. A short is an accidental connection of a wire to ground or to another wire. In simple electronics, this usually means something won't work at all. With complex electronics (such as motor control modules or battery condition monitor modules) this can sometimes mean something works, but not the way it's supposed to.

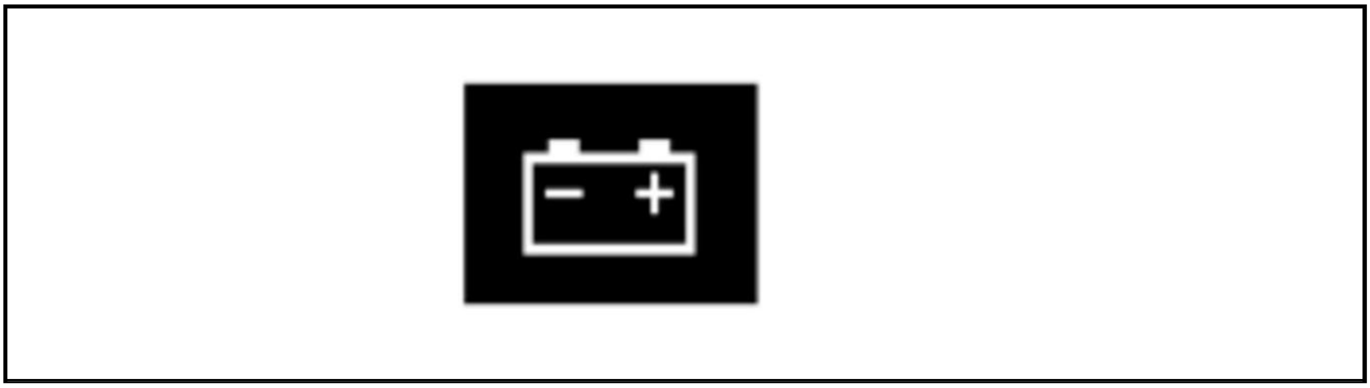
POWER SYSTEM Indicator

1. If the POWER SYSTEM indicator in the gauge comes on, go to How to Use the HDS (Honda Diagnostic System) to check for DTCs.



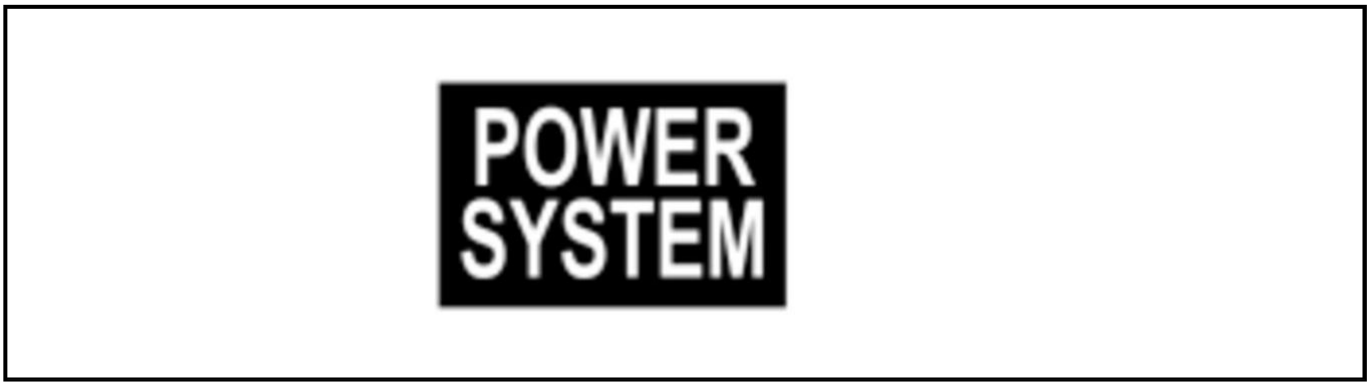
12 Volt Charging System Indicator

1. If the 12 volt charging system indicator in the gauge comes on, go to How to Use the HDS (Honda Diagnostic System) to check for DTCs.



How to Use the HDS (Honda Diagnostic System) to Check for DTCs

1. Turn the vehicle to the READY TO DRIVE mode, and check the POWER SYSTEM indicator in the gauge control module.



2. **Connect the HDS to the data link connector (DLC)** .

3. Check the diagnostic trouble code (DTC) and note it. Also check the freeze data and/or on-board snapshot data, and download any data found. Then refer to the indicated DTC's troubleshooting, and begin the appropriate troubleshooting procedure.

NOTE: For specific operations, refer to the user's manual that came with the HDS.

4. If no DTCs are found, **go to the POWER SYSTEM indicator circuit troubleshooting**

.

If you cannot duplicate the DTC

Some of the troubleshooting requires you to clear the DTC and try to duplicate the DTC. If the problem is intermittent and you can't duplicate the DTC, do not continue through the DTC troubleshooting procedure. The troubleshooting procedure is to be used only when the DTC can be duplicated. Using them otherwise will only result in confusion and possibly, needlessly replaced parts.

On-Board Snapshot

When a DTC troubleshooting results in intermittent failure, try to reproduce the failure under the same conditions with the on-board snapshot if the on-board snapshot has been recorded.

DTC Clear

1. **Connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Clear the DTC with the HDS.

4. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the DLC.

NOTE: For specific operations, refer to the user's manual that comes with the HDS.

How to End a Troubleshooting Session (required after any troubleshooting)

1. **Connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the READY TO DRIVE mode.

3. Clear the DTC with the HDS.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Wait for 60 seconds.

6. Turn the vehicle to the READY TO DRIVE mode.

7. Check for DTCs with the HDS.

NOTE: Test-drive the vehicle if necessary.

8. Make sure there is no DTC found and no warning indication on the gauge.

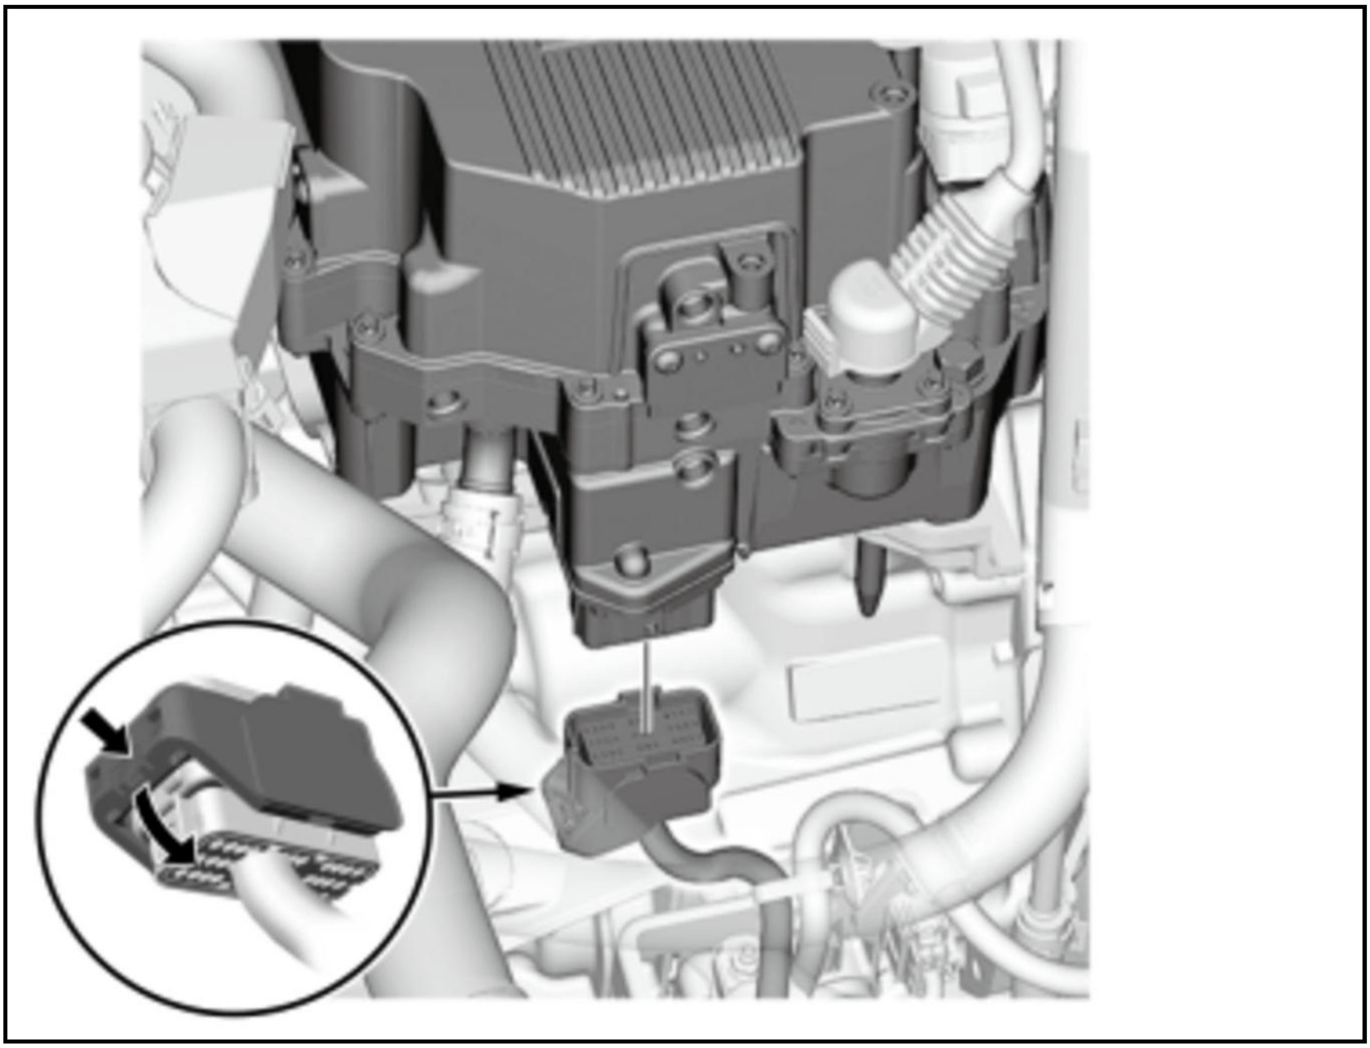
9. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS.

How to Troubleshoot Circuits at the Power Control Unit (PCU) Connector

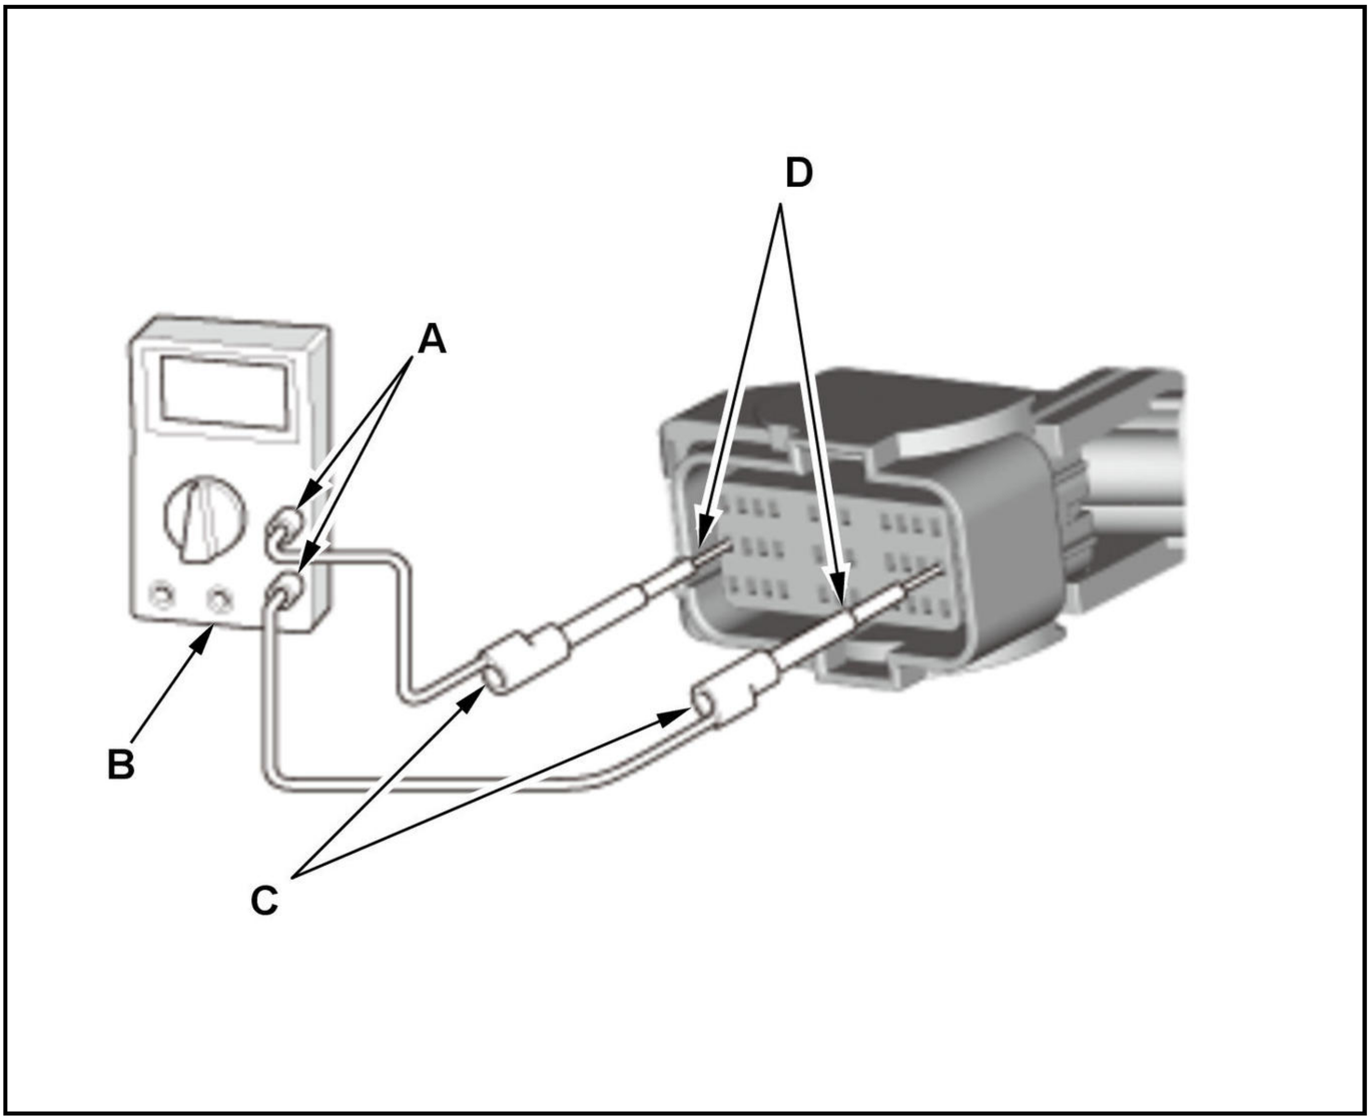
1. Turn the vehicle to the OFF (LOCK) mode

2. **Do the 12 volt battery terminal disconnection procedure** .

3. **Disconnect the PCU connector** .



4. Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminal (C) to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (D).



Gently insert the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

WARNING:

- **For accurate results, always use the pin probe (male).**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause or eventually lead to poor or intermittent electrical connections.**

Troubleshooting Circuits at the Battery Condition Monitor Module Connectors

1. Turn the vehicle to the OFF (LOCK) mode.

2. Remove the service plug .

3. Remove the IPU cover .

NOTE: When you troubleshoot the IPU on the vehicle, check for the ground cable (E) connection. If the cable was removed, you need to install it.

4. Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminal (C) to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (D).

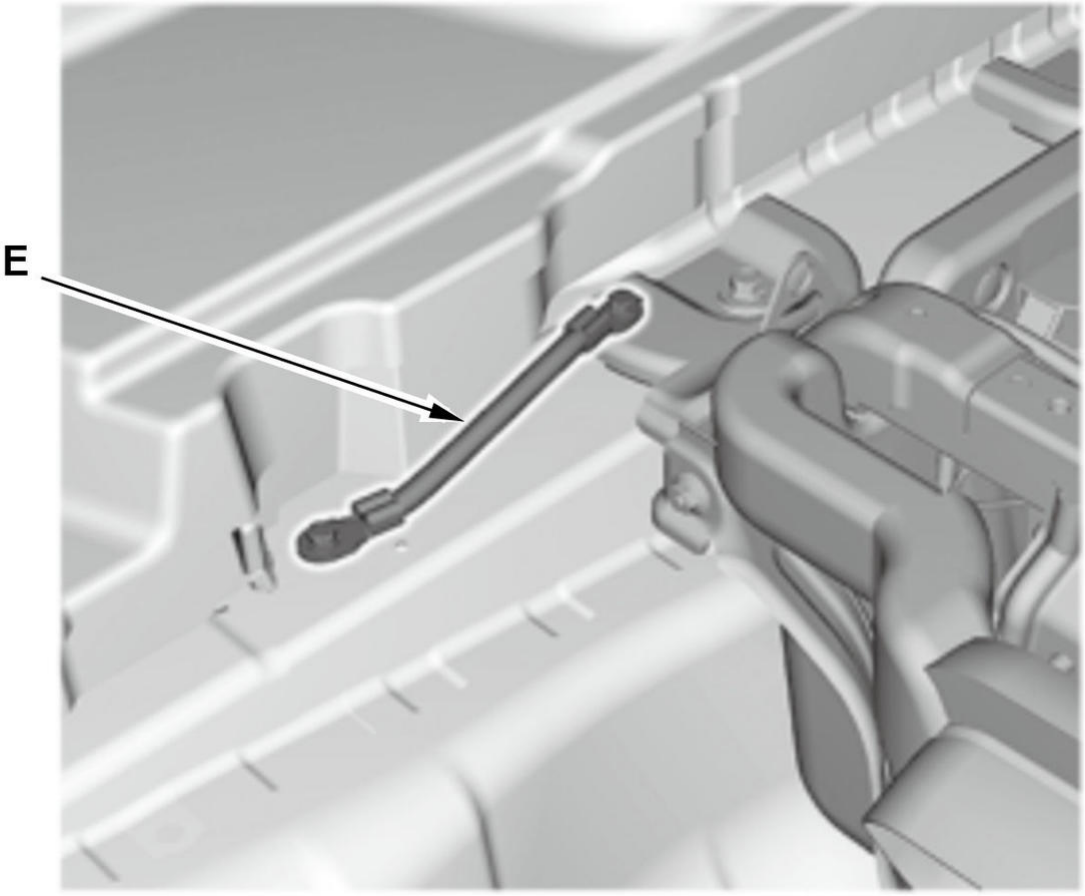
C
D
B
A



OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully finished. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on-board diagnosis is successfully finished.
- FAILED: The on-board diagnosis has finished but failed.
- NOT COMPLETED: The on-board diagnosis was running, but it is out of the enable conditions of the DTC.

DTC TROUBLESHOOTING

DTC P0562 (15) (BATTERY CONDITION MONITOR MODULE)

DTC P0562 : Battery Condition Monitor Module System Voltage Low

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0562 Battery Condition Monitor Module System Voltage Low	B	B	B

DTC (Electric Powertrain)

1. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. E5**

Is the fuse OK?

YES

Go to step 2.

NO

Go to step 4.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0562 Battery Condition Monitor Module System Voltage Low	B	B	B

Is DTC P0562 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the **No. E5** fuse and the battery condition monitor module.

3. Open wire check (VBU/+B_IMA1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-4. **Do the 12 volt battery terminal reconnection procedure** .

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the battery condition monitor module .

NO

Repair an open in the VBU/+B_IMA1 wire between the **No. E5** fuse and the battery condition monitor module (E1).

4. Shorted wire check (VBU/+B_IMA1 line)

-1. Remove the **service plug** and the **IPU cover** .

-2. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 1**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the battery condition monitor module .

NO

Repair a short in the VBU/+B_IMA1 wire between the battery condition monitor module (E1) and the **No. E5** fuse. Also replace the No. E5 fuse.

DTC P0602 (92) (BATTERY CONDITION MONITOR MODULE)

DTC P0602 : Battery Condition Monitor Module Programming Error

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0602 Battery Condition Monitor Module Programming Error	B	B	B

DTC (Electric Powertrain)

1. Problem verification (update)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. **Do the battery condition monitor module update procedure** .

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0602 Battery Condition Monitor Module Programming Error	B	B	B

Is DTC P0602 indicated?

YES

Replace the battery condition monitor module .

NO

The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P062F (BATTERY CONDITION MONITOR MODULE)

DTC P062F : Battery Condition Monitor Module EEPROM Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If any of the DTCs listed below are indicated at the same time as DTC P062F, troubleshoot those DTCs first, then recheck for P062F.
-
    - -

      P1D3A, P1D3B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P062F Battery Condition Monitor Module EEPROM Error	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC P062F and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the battery condition monitor module if it does not have the latest software .

DTC P06B1 (79) (BATTERY CONDITION MONITOR MODULE)

DTC P06B1 : HV Battery Current Sensor Power Supply Circuit Low

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06B1 HV Battery Current Sensor Power Supply Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06B1 HV Battery Current Sensor Power Supply Circuit Low	B	B	B

   Is DTC P06B1 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (battery current sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the service plug and the IPU cover .

   -3. Remove the IPU and the IPU case .

   -4. Disconnect the following connector.

Battery current sensor 4P connector

   -5. Reinstall the IPU .

   -6. Do the 12 volt battery terminal reconnection procedure .

   -7. Turn the vehicle to the ON mode.

-8. Clear the DTC with the HDS.

-9. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06B1 HV Battery Current Sensor Power Supply Circuit Low	B	B	B

Is DTC P06B1 indicated?

YES

Go to step 3.

NO

Replace the battery current sensor .

3. Shorted wire check (VCCISOC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery current sensor 4P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 28**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the battery condition monitor module .

NO

Repair a short in the VCCISOC wire between the battery current sensor and the battery condition monitor module (E28).

DTC P0A1F (112)

DTC P0A1F : Battery Condition Monitor Module

NOTE: Before you troubleshoot, **review the general troubleshooting information**.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A1F Battery Condition Monitor Module	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A1F Battery Condition Monitor Module	B	B	B

Is DTC P0A1F indicated?

YES

Replace the battery condition monitor module .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0A7E (72)

DTC P0A7E : HV Battery Pack Over Temperature

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the battery condition monitor module detects this DTC, the battery cannot be reused because it is damaged by overheating. Even if this failure does not duplicate, the battery must be replaced.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A7E HV Battery Pack Over Temperature	B	B	B

DTC (Electric Powertrain)

1. Battery cooling system visual check

   -1. Check the cause of overheating (the IPU air duct and the high voltage battery module fan for disconnections, damage, or obstructions).

   Is there any abnormality?

   YES

   After solving the problem, **replace the battery pack** .

   NO

   The battery cooling system is OK, **replace the battery pack** .

DTC P0A7F

DTC P0A7F : HV Battery Pack Deterioration

NOTE:

- Before you troubleshoot, review the general troubleshooting information.
- If any of the DTCs listed below are indicated at the same time as DTC P0A7F, troubleshoot those DTCs first, then recheck for P0A7F.
-
    - -

      P144A, P1DC7

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A7F HV Battery Pack Deterioration	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0A7F and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the battery condition monitor module if it does not have the latest software .

DTC P0A80 (566), P1DCB (567)

DTC P0A80 : Replace HV Battery Pack

DTC P1DCB : HV Battery Identification Circuit (System Running)

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A80 Replace HV Battery Pack	B	B	B
P1DCB HV Battery Identification Circuit (System Running)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait 30 seconds.

   -4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A80 Replace HV Battery Pack	B	B	B
P1DCB HV Battery Identification Circuit (System Running)	B	B	B

Is DTC P0A80 and/or DTC P1DCB indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Identification resistance check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connector.

Battery condition monitor module connector F (12P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
Test point 1	**Battery condition monitor module connector F (12P) No. 5**
Test point 2	**Battery condition monitor module connector F (12P) No. 6**

Is there about 24 kΩ?

YES

Go to step 3.

NO

Go to step 4.

3. Identification resistance check 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
Test point 1	**Battery condition monitor module connector F (12P) No. 11**
Test point 2	**Battery condition monitor module connector F (12P) No. 6**

Is there about 24 kΩ?

YES

Replace the battery condition monitor module .

NO

Go to step 8.

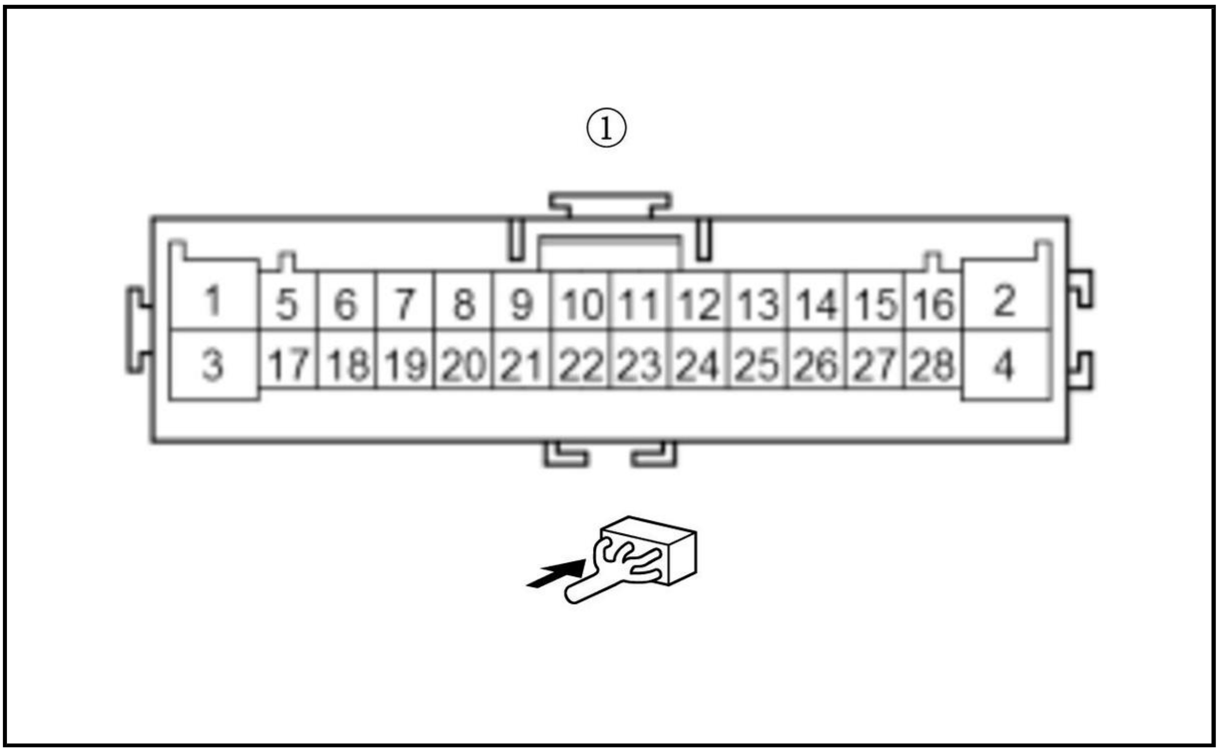
4. Open wire check (MODID1 line)

-1. Disconnect the following connector.

Battery module 1 28P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
B	Battery module 1 28P connector: disconnected
Test point 1	Battery condition monitor module connector F (12P) No. 5
Test point 2	Battery module 1 28P connector (male terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Go to step 5.

NO

Repair an open in the MODID1 wire between the battery condition monitor module (F5) and battery module 1.

5. Open wire check (MODID1-M line)

-1. Disconnect the following connector.

Battery module 2 28P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
B	Battery module 1 28P connector: disconnected
B	Battery module 2 28P connector: disconnected

Test point 1	Battery module 1 28P connector (male terminals) No. 4: ①
Test point 2	Battery module 2 28P connector (male terminals) No. 2: ②

Is there 1.0 Ω or less?

YES

Go to step 6.

NO

Repair an open in the MODID1-M wire between battery module 1 and battery module 2.

6. Shorted wire check (MODID1 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
B	Battery module 1 28P connector: disconnected
B	Battery module 2 28P connector: disconnected
Test point 1	**Battery condition monitor module connector F (12P) No. 5**
Test point 2	Body ground (G701)

Is there 1 MΩ or more?

YES

Go to step 7.

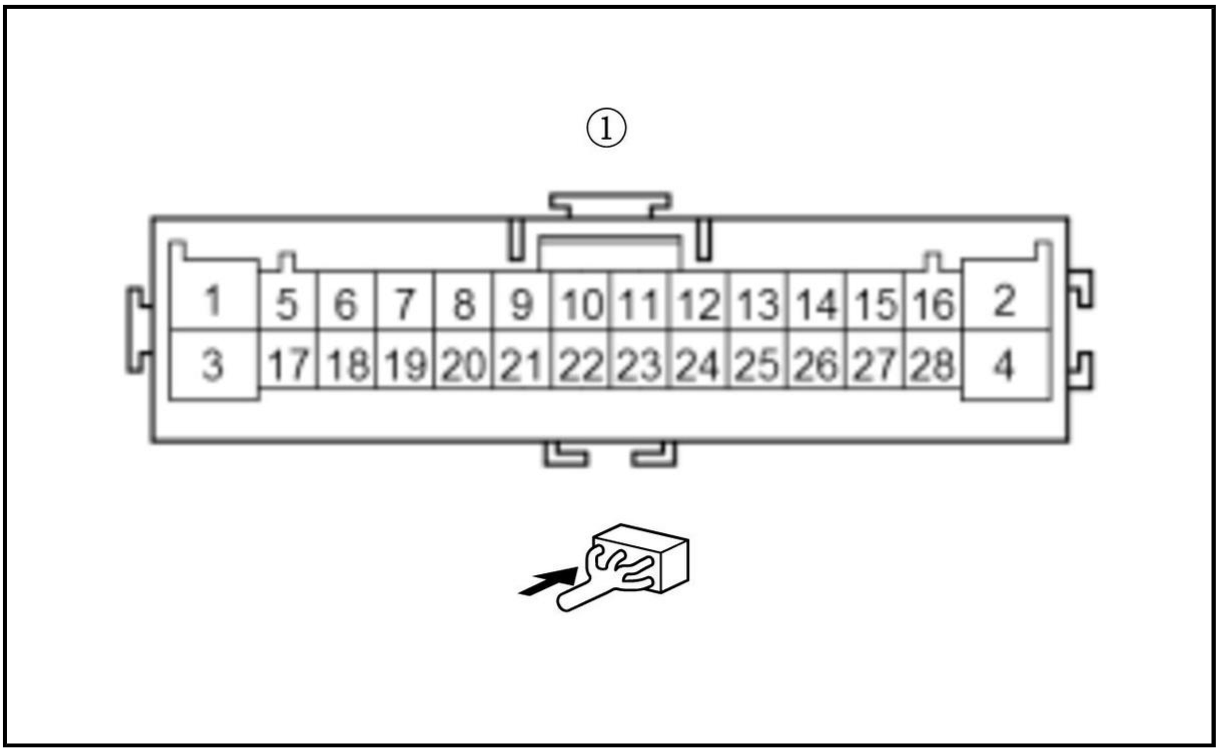
NO

Repair a short in the MODID1 wire between the battery condition monitor module (F5) and battery module 1.

7. Open wire check (SGTB/MODID1-SG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
B	Battery module 1 28P connector: disconnected
B	Battery module 2 28P connector: disconnected
Test point 1	**Battery condition monitor module connector F (12P) No. 6**
Test point 2	Battery module 2 28P connector (male terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

There is a failure in the battery module identification resistor. **Replace the battery pack** .

NO

Repair an open in the SGTB/MODID1-SG wire between the battery condition monitor module (F6) and battery module 2.

8. Open wire check (MODID2 line)

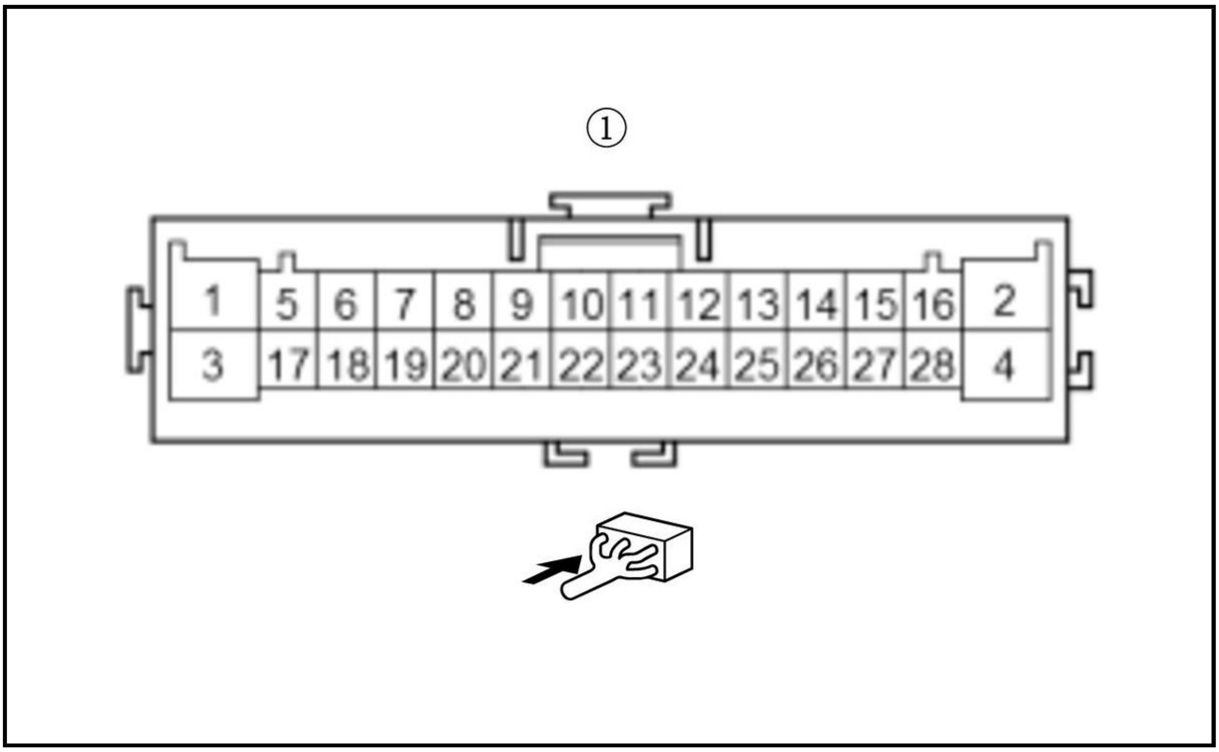
-1. **Remove the IPU and the IPU case** .

-2. Disconnect the following connector.

Battery module 3 28P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
B	Battery module 3 28P connector: disconnected
Test point 1	**Battery condition monitor module connector F (12P) No. 11**
Test point 2	Battery module 3 28P connector (male terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Go to step 9.

NO

Repair an open in the MODID2 wire between the battery condition monitor module (F11) and battery module 3.

9. Open wire check (MODID2-M line)

-1. Disconnect the following connector.

Battery module 4 28P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
B	Battery module 3 28P connector: disconnected
B	Battery module 4 28P connector: disconnected

Is there 1.0 Ω or less?

YES

Go to step 10.

NO

Repair an open in the MODID2-M wire between battery module 3 and battery module 4.

10. Shorted wire check (MODID2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected

B	Battery module 3 28P connector: disconnected
B	Battery module 4 28P connector: disconnected
Test point 1	**Battery condition monitor module connector F (12P) No. 11**
Test point 2	Body ground (G701)

Is there 1 MΩ or more?

YES

Go to step 11.

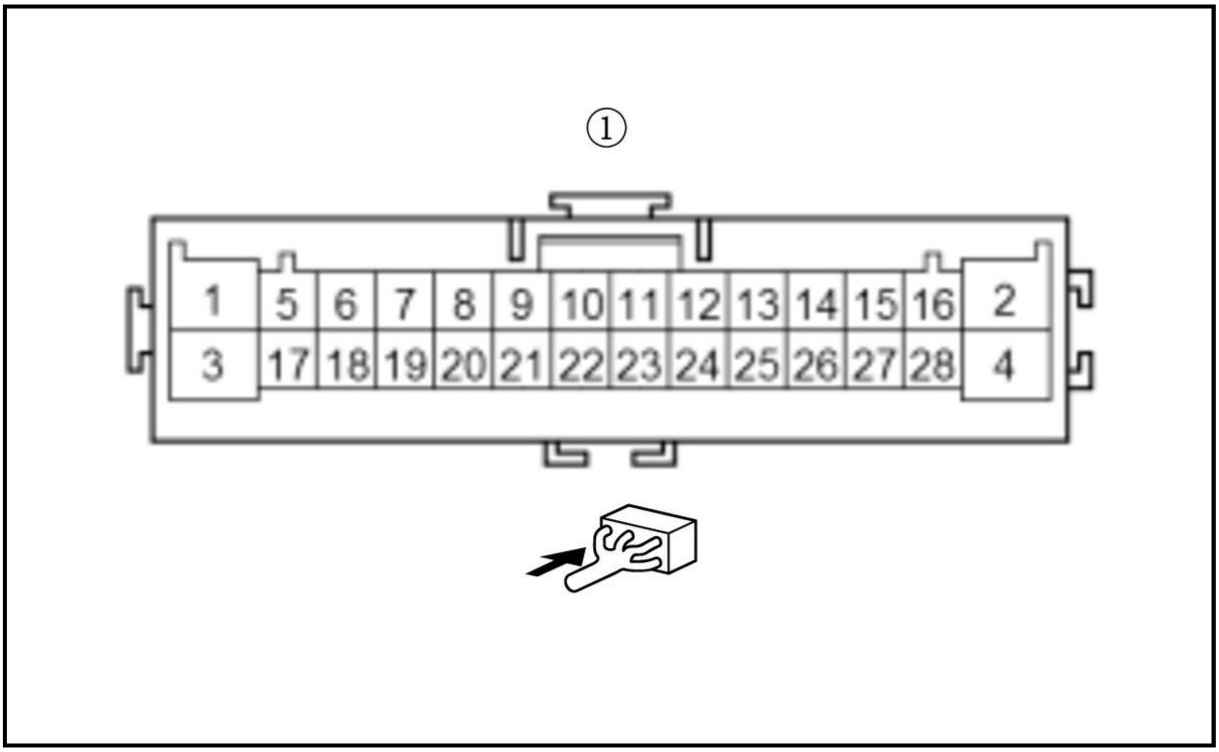
NO

Repair a short in the MODID2 wire between the battery condition monitor module (F11) and battery module 3.

11. Open wire check (SGTB/MODID2-SG line)

    -1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected
B	Battery module 3 28P connector: disconnected
B	Battery module 4 28P connector: disconnected
Test point 1	**Battery condition monitor module connector F (12P) No. 6**
Test point 2	Battery module 4 28P connector (male terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

There is a failure in the battery module identification resistor. **Replace the battery pack** .

NO

Repair an open in the SGTB/MODID2-SG wire between the battery condition monitor module (F6) and battery module 4.

DTC TROUBLESHOOTING

DTC P0A82 (63)

DTC P0A82 : HV Battery Pack Cooling Fan Performance/Stuck Off

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A82 HV Battery Pack Cooling Fan Performance/Stuck Off	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the BATTERY FAN TEST in the Electric Powertrain FUNCTION TEST with the HDS, then select START.

   Battery Fan Test

   Is the high voltage battery module fan OK?

   YES

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   NO

   Go to step 2.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A4-4

   Is the fuse OK?

   YES

   Go to step 3.

   NO

Replace the No. A4-4 fuse. Also check for a short to ground on the No. A4-4 fuse circuit if needed.

3. Relay check

-1. Remove the **service plug** and the **IPU cover** .

-2. **Remove the battery fan relay** .

-3. **Test the battery fan relay** .

Is the relay OK?

YES

Go to step 4.

NO

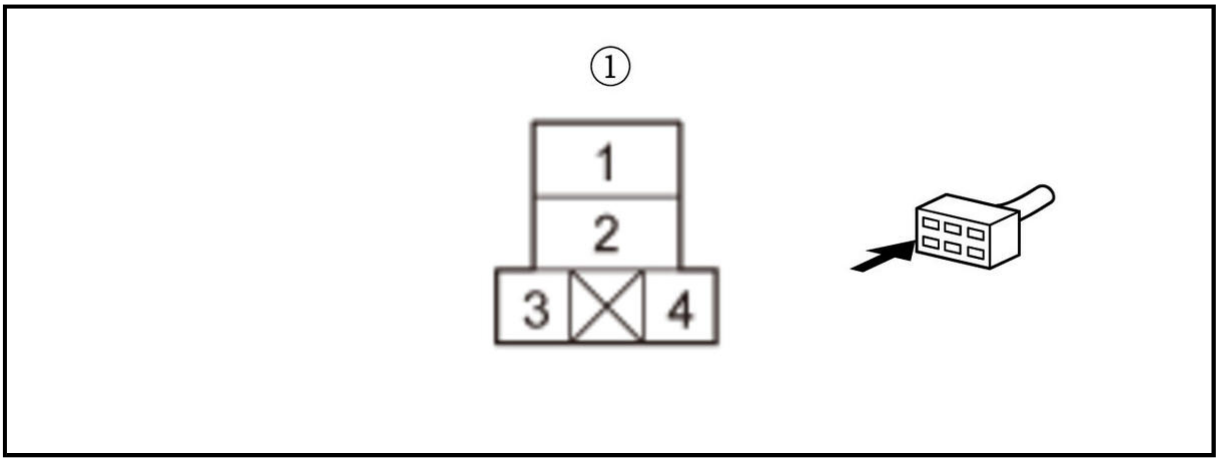
Replace the battery fan relay.

4. Open wire check (+B_IGA2 line)

-1. **Do the 12 volt battery terminal reconnection procedure** .

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery fan relay: disconnected
Test point 1	Battery fan relay 4P socket (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5

NO

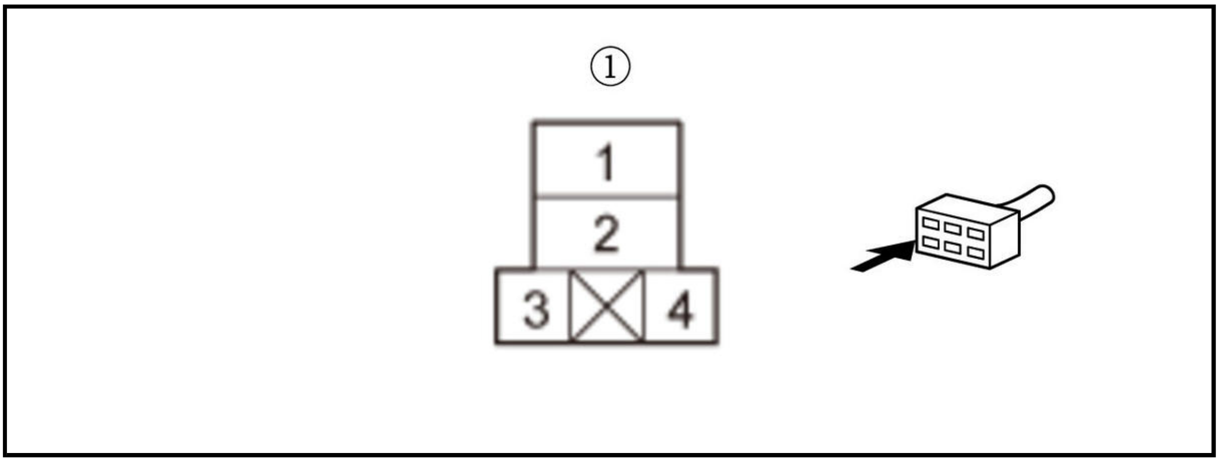
Repair an open in the +B_IGA2 wire between the **No. A4-4** fuse and the battery fan relay.

5. Open wire check (IGB line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Battery fan relay: disconnected
Test point 1	Battery fan relay 4P socket (female terminal) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 6.

NO

Repair an open in the IGB wire between the IGHLDB relay and the battery fan relay.

6. Open wire check (NFAN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

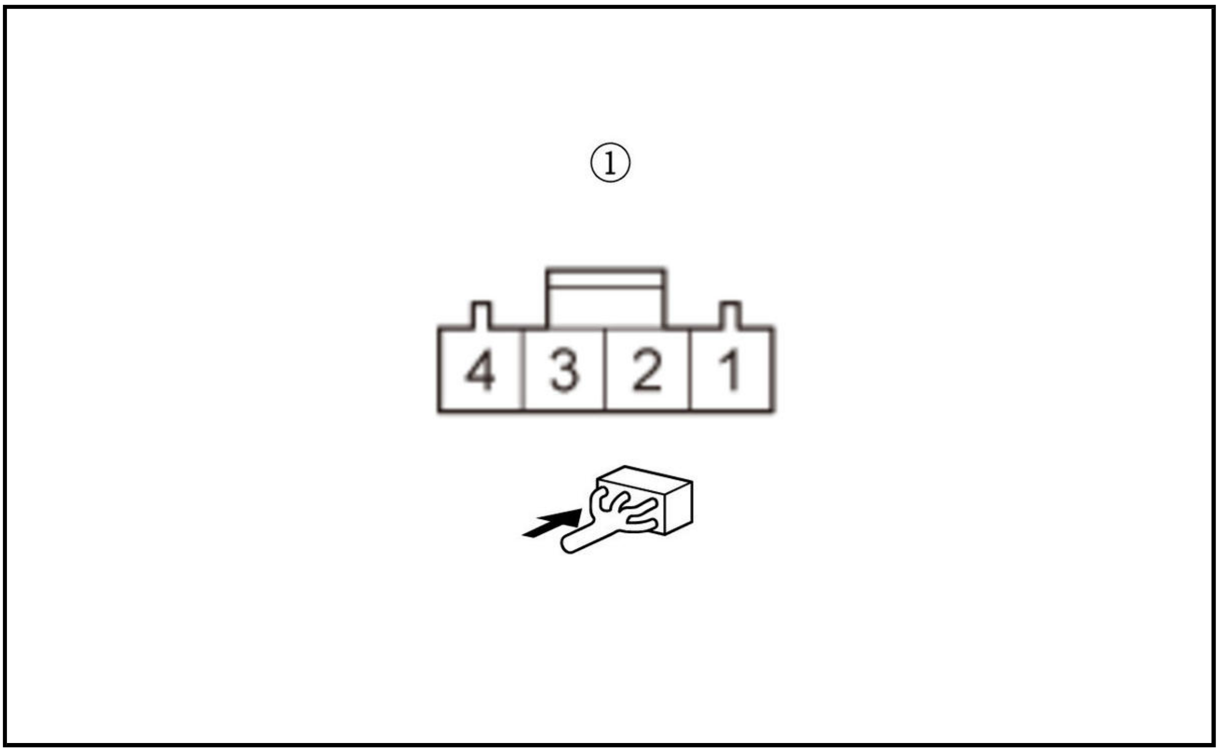
-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connectors.

High voltage battery module fan 4P connector	
Battery condition monitor module connector E (32P)	

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery fan relay: disconnected
B	High voltage battery module fan 4P connector: disconnected
Test point 1	High voltage battery module fan 4P connector (female terminals) No. 3: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 14**



Is there 1.0 Ω or less?

YES

Go to step 7.

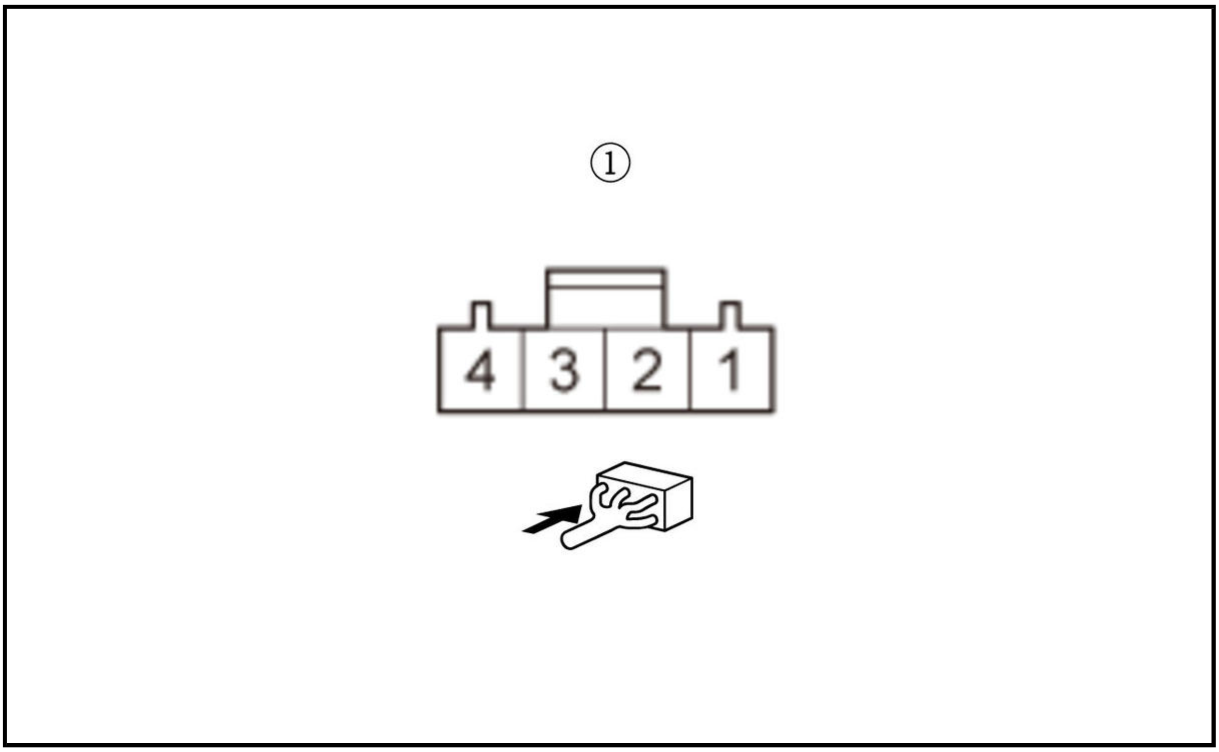
NO

Repair an open in the NFAN wire between the high voltage battery module fan and the battery condition monitor module (E14).

7. Shorted wire check (NFAN line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery fan relay: disconnected
B	High voltage battery module fan 4P connector: disconnected
Test point 1	High voltage battery module fan 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 8.

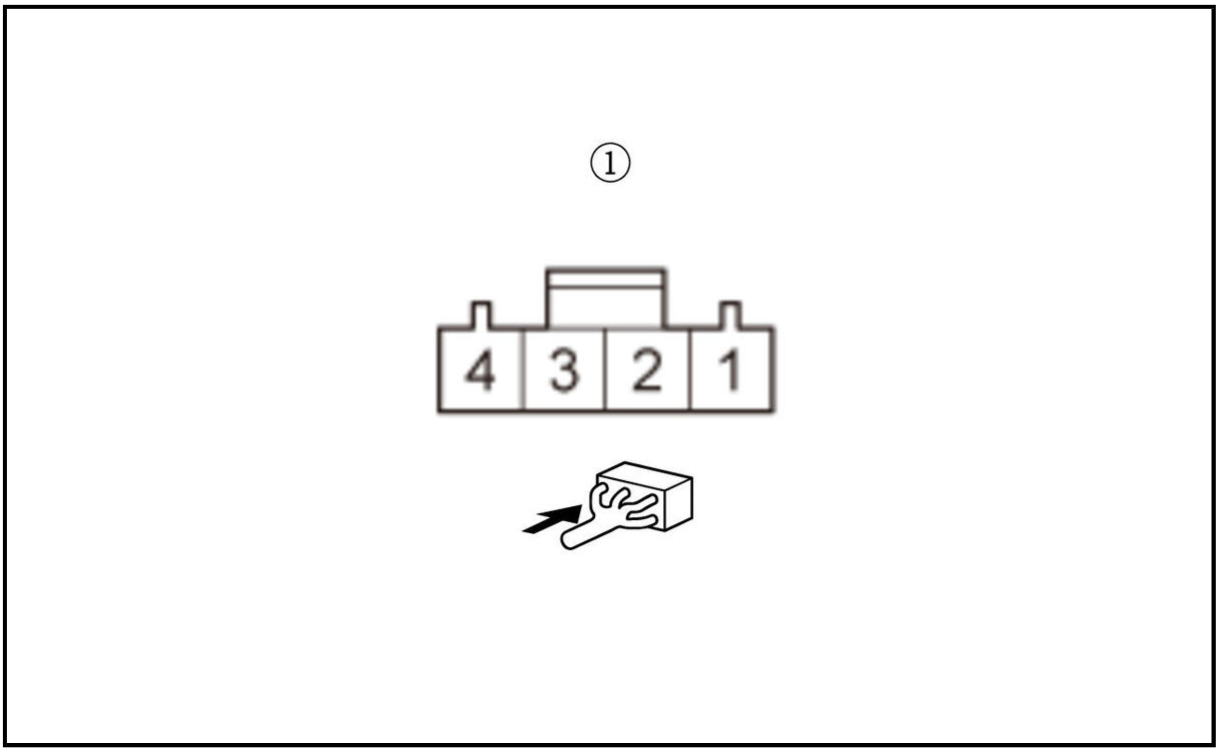
NO

Repair a short in the NFAN wire between the high voltage battery module fan and the battery condition monitor module (E14).

8. Open wire check (FANCTL line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery fan relay: disconnected
B	High voltage battery module fan 4P connector: disconnected
Test point 1	High voltage battery module fan 4P connector (female terminals) No. 2: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 24**



Is there 1.0 Ω or less?

YES

Go to step 9.

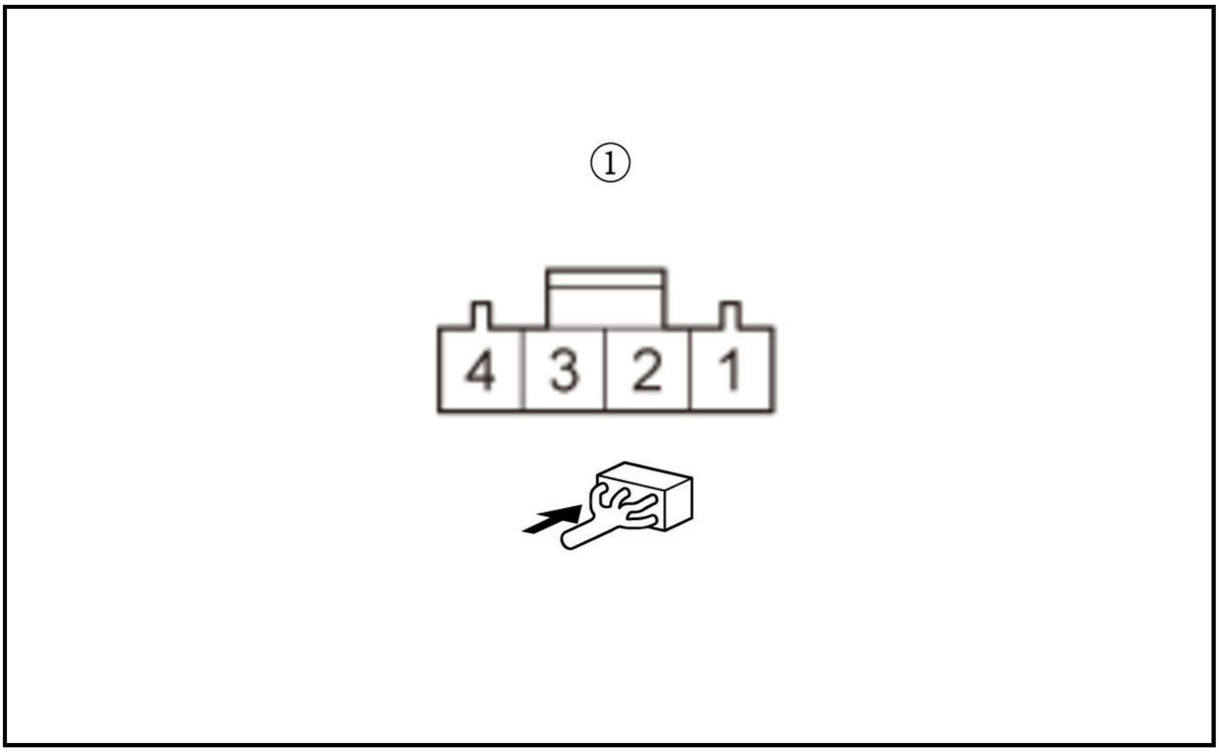
NO

Repair an open in the FANCTL wire between the high voltage battery module fan and the battery condition monitor module (E24).

9. Shorted wire check (FANCTL line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery fan relay: disconnected
B	High voltage battery module fan 4P connector: disconnected
Test point 1	High voltage battery module fan 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 10.

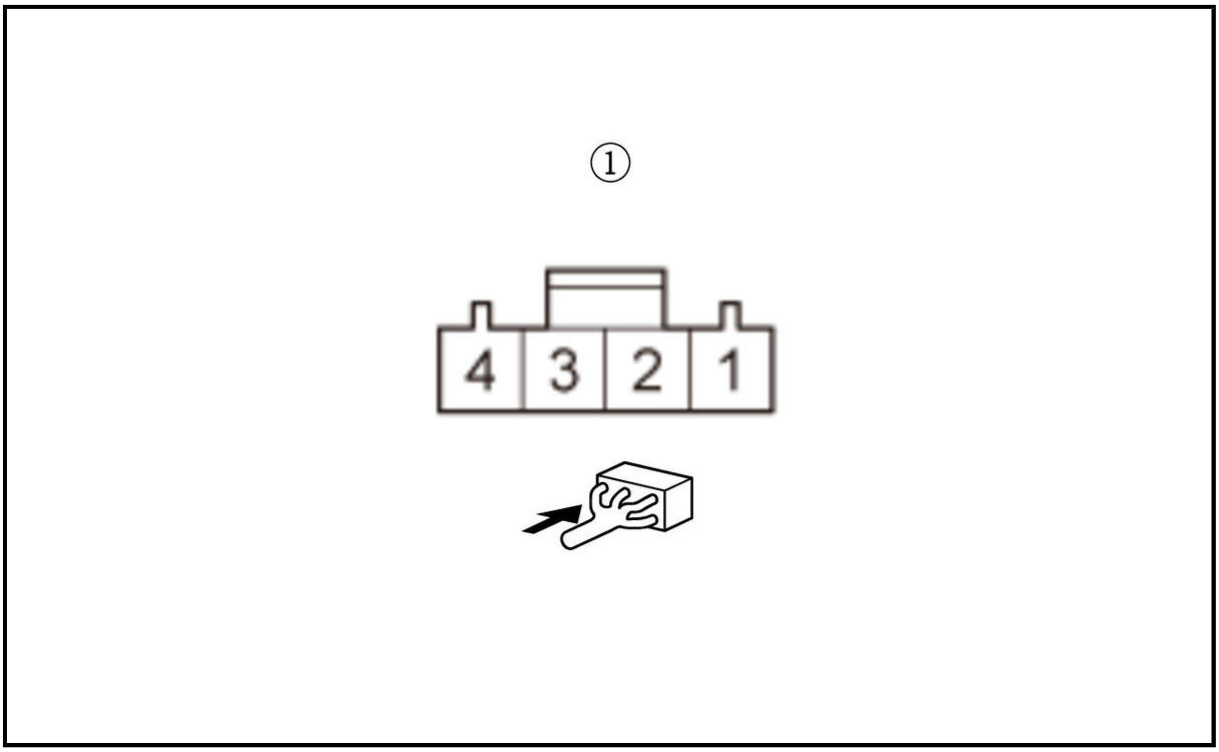
NO

Repair a short in the FANCTL wire between the high voltage battery module fan and the battery condition monitor module (E24).

10. Open wire check (FAN_GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery fan relay: disconnected
B	High voltage battery module fan 4P connector: disconnected
Test point 1	High voltage battery module fan 4P connector (female terminals) No. 1: ①
Test point 2	Body ground (G701)



Is there 1.0 Ω or less?

YES

Go to step 11

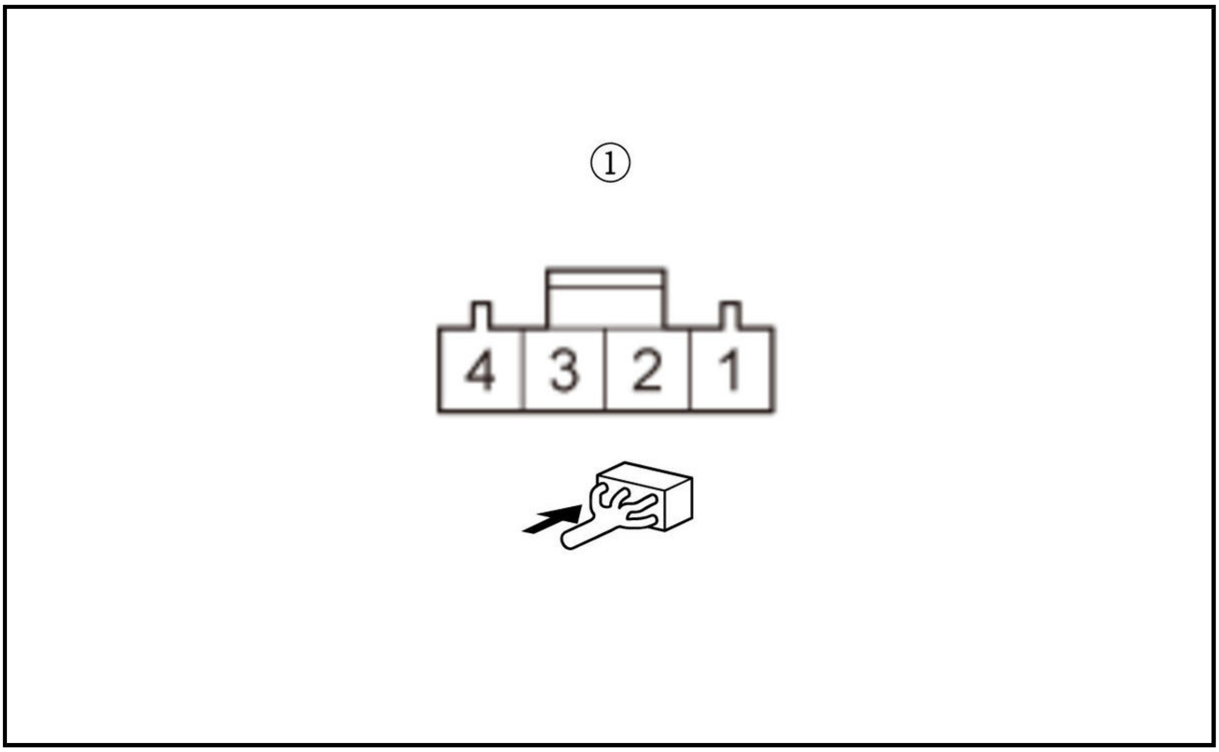
NO

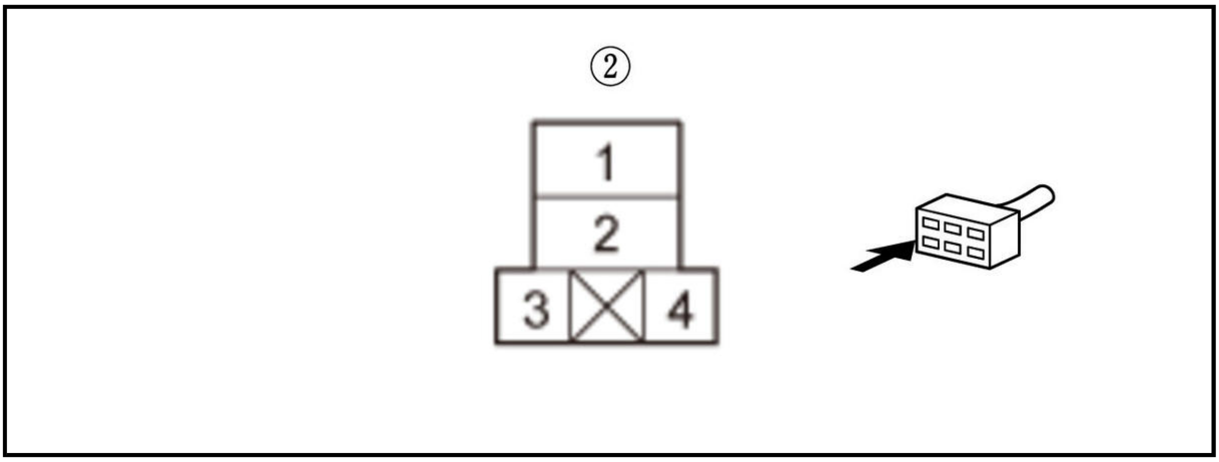
Repair an open in the FAN_GND wire between the high voltage battery module fan and G701.

11. Open wire check (IGA2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery fan relay: disconnected
B	High voltage battery module fan 4P connector: disconnected
Test point 1	High voltage battery module fan 4P connector (female terminals) No. 4: ①
Test point 2	Battery fan relay 4P socket (female terminal) No. 1: ②





Is there 1.0 Ω or less?

YES

Go to step 12

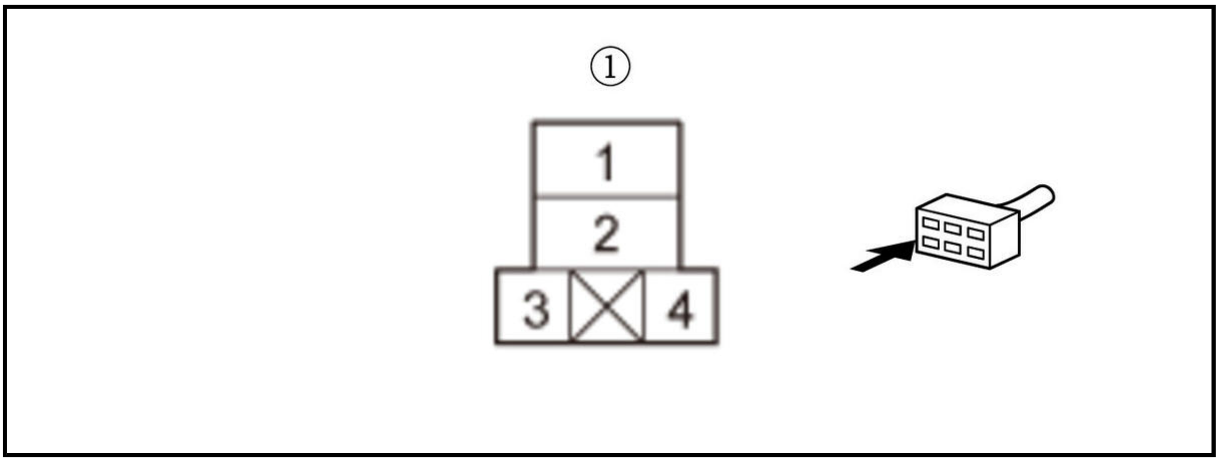
NO

Repair an open in the IGA2 wire between the high voltage battery module fan and the battery fan relay.

12. Open wire check (IGHLD2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery fan relay: disconnected
B	High voltage battery module fan 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 21**
Test point 2	Battery fan relay 4P socket (female terminal) No. 4: ①



Is there 1.0 Ω or less?

YES

Go to step 13

NO

Repair an open in the IGHLD2 wire between the battery fan relay and the battery condition monitor module (E21).

13. Shorted wire check (IGHLD2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery fan relay: disconnected
B	High voltage battery module fan 4P connector: disconnected

Test point 1	Battery condition monitor module connector E (32P) No. 21
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the high voltage module fan .

NO

Repair a short in the IGHLD2 wire between the battery condition monitor module (E21) and the battery fan relay. If the wire is OK, replace the battery condition monitor module .

DTC P0A94 (48)

DTC P0A94 : DC-DC Converter Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A94 DC-DC Converter Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to READY TO DRIVE mode, and wait 100 seconds.

-4. Monitor the OBD STATUS for DTC P0A94 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0A94 DC-DC Converter Performance	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, intermittent failure the system is OK at this time. If the HDS indicates NOT COMPLETED, keep the vehicle in READY TO DRIVE mode until a result comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0562 Battery Condition Monitor Module System Voltage Low	B	B	B
U0599 DC-DC Converter Serial Communication Receive Error	B	B	B

Is DTC P0562 or U0599 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 3.

3. DC-DC converter operation check

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
DC-DC Converter Information	Normal	B	B	B

Do the current condition(s) match the threshold?

YES

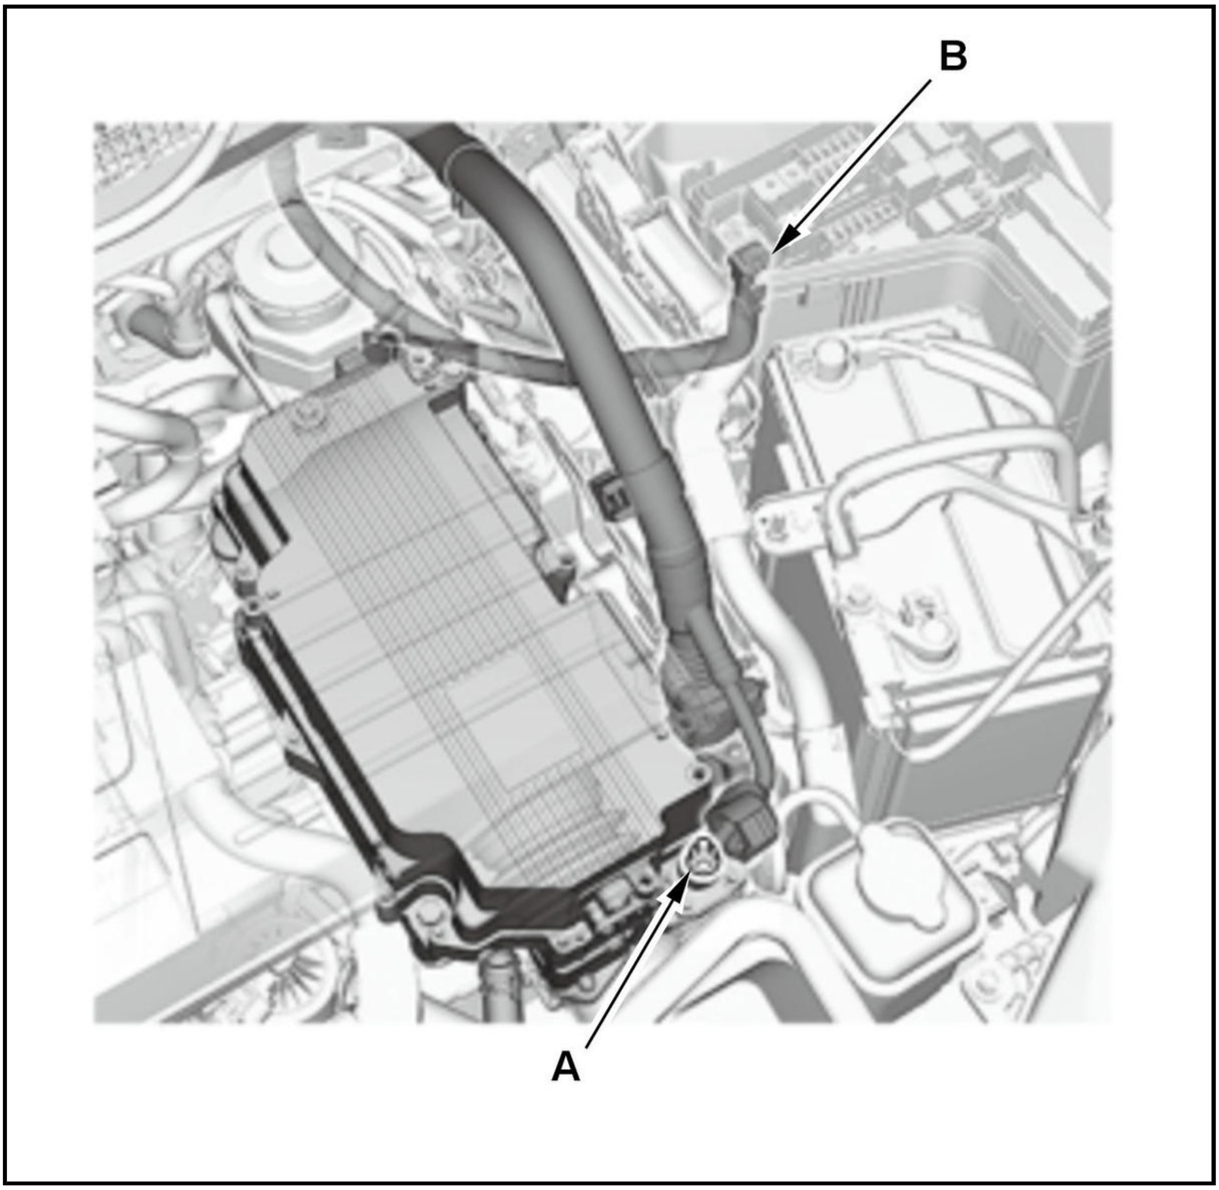
Go to step 4.

NO

Check for poor connections or loose terminals at the PCU. If the connections and the terminals are OK, replace the PCU .

4. +B terminals visual check

-1. Check the connections of the +B terminal (A) on the PCU and the under-hood fuse/relay box +B terminal (B).



Are the connection OK?

YES

Replace the PCU .

NO

Repair the +B terminal connection.

DTC P0A9B (972), P0AC5 (973), P0ACA (974), P0AE8 (975)

DTC P0A9B : HV Battery Temperature Sensor 1 Circuit

DTC P0AC5 : HV Battery Temperature Sensor 2 Circuit

DTC P0ACA : HV Battery Temperature Sensor 3 Circuit

DTC P0AE8 : HV Battery Temperature Sensor 4 Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A9B HV Battery Temperature Sensor 1 Circuit	B	B	B
P0AC5 HV Battery Temperature Sensor 2 Circuit	B	B	B
P0ACA HV Battery Temperature Sensor 3 Circuit	B	B	B
P0AE8 HV Battery Temperature Sensor 4 Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Test-drive the vehicle in the range of recorded freeze data parameters.

Freeze Data

NOTE: This DTC may take 10 minutes or more for detection.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A9B HV Battery Temperature Sensor 1 Circuit	B	B	B
P0AC5 HV Battery Temperature Sensor 2 Circuit	B	B	B
P0ACA HV Battery Temperature Sensor 3 Circuit	B	B	B
P0AE8 HV Battery Temperature Sensor 4 Circuit	B	B	B

Is DTC P0A9B, P0AC5, P0ACA, or P0AE8 indicated?

P0A9B is indicated

Go to step 2.

P0AC5 is indicated

Go to step 3.

P0ACA is indicated

Go to step 4.

P0AE8 is indicated

Go to step 5.

DTC is not indicated

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (High voltage battery module temperature sensor 1)

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A9C HV Battery Temperature Sensor 1 Circuit Range/Performance	B	B	B
P0A9D HV Battery Temperature Sensor 1 Circuit Low	B	B	B
P0A9E HV Battery Temperature Sensor 1 Circuit High	B	B	B

   Is DTC P0A9C, P0A9D, and/or P0A9E indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Replace the high voltage battery module temperature sensor 1 .

3. DTC check (High voltage battery module temperature sensor 2)

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AC6 HV Battery Temperature Sensor 2 Circuit Range/Performance	B	B	B
P0AC7 HV Battery Temperature Sensor 2 Circuit Low	B	B	B
P0AC8 HV Battery Temperature Sensor 2 Circuit High	B	B	B

   Is DTC P0AC6, P0AC7 and/or P0AC8 indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Replace the high voltage battery module temperature sensor 2 .

4. DTC check (High voltage battery module temperature sensor 3)

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0ACB HV Battery Temperature Sensor 3 Circuit Range/Performance	B	B	B
P0ACC HV Battery Temperature Sensor 3 Circuit Low	B	B	B
P0ACD HV Battery Temperature Sensor 3 Circuit High	B	B	B

Is DTC P0ACB, P0ACC and/or P0ACD indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Replace the high voltage battery module temperature sensor 3 .

5. DTC check (High voltage battery module temperature sensor 4)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE9 HV Battery Temperature Sensor 4 Circuit Range/Performance	B	B	B
P0AEA HV Battery Temperature Sensor 4 Circuit Low	B	B	B
P0AEB HV Battery Temperature Sensor 4 Circuit High	B	B	B

Is DTC P0AE9, P0AEA and/or P0AEB indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Replace the high voltage battery module temperature sensor 4 .

DTC P0A9C (67), P0AC6 (68), P0ACB (69), P0AE9 (71)

DTC P0A9C : HV Battery Temperature Sensor 1 Circuit Range/Performance

DTC P0AC6 : HV Battery Temperature Sensor 2 Circuit Range/Performance

DTC P0ACB : HV Battery Temperature Sensor 3 Circuit Range/Performance

DTC P0AE9 : HV Battery Temperature Sensor 4 Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A9C HV Battery Temperature Sensor 1 Circuit Range/Performance	B	B	B
P0AC6 HV Battery Temperature Sensor 2 Circuit Range/Performance	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0ACB HV Battery Temperature Sensor 3 Circuit Range/Performance	B	B	B
P0AE9 HV Battery Temperature Sensor 4 Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Battery cooling system visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the IPU air duct and the high voltage battery module fan for damages, obstructions or any disconnected connectors or ducts.

   Are the IPU air duct and the high voltage battery module fan OK?

   1. **YES**

      Replace the following high voltage battery module temperature sensor .

      - DTC P0A9C: High voltage battery module temperature sensor 1
      - DTC P0AC6: High voltage battery module temperature sensor 2
      - DTC P0ACB: High voltage battery module temperature sensor 3
      - DTC P0AE9: High voltage battery module temperature sensor 4

      NO

      Replace the IPU air duct as necessary and the high voltage battery module fan as needed.

DTC P0A9D (49), P0AC7 (51), P0ACC (53), P0AEA (121)

DTC P0A9D : HV Battery Temperature Sensor 1 Circuit Low

DTC P0AC7 : HV Battery Temperature Sensor 2 Circuit Low

DTC P0AEA : HV Battery Temperature Sensor 4 Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A9D HV Battery Temperature Sensor 1 Circuit Low	B	B	B
P0AC7 HV Battery Temperature Sensor 2 Circuit Low	B	B	B
P0ACC HV Battery Temperature Sensor 3 Circuit Low	B	B	B
P0AEA HV Battery Temperature Sensor 4 Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter(s) of the corresponding DTC below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HV Battery Module Temperature Sensor1 Voltage	Less than 0.07 V	V	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HV Battery Module Temperature Sensor2 Voltage	Less than 0.07 V	V	B	B
HV Battery Module Temperature Sensor3 Voltage	Less than 0.07 V	V	B	B
HV Battery Module Temperature Sensor4 Voltage	Less than 0.07 V	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (short in TBATT circuit, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the **service plug** and the **IPU cover** .

   -3. Disconnect the following connector.

Battery condition monitor module connector F (12P)

-4. Measure the resistance between appropriate DTC's test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector F (12P): disconnected

DTC	Test point 1	Test point 2
P0A9D (TBATT1)	**Battery condition monitor module connector F (12P) No. 1**	Body ground
P0AC7 (TBATT2)	**Battery condition monitor module connector F (12P) No. 7**	
P0ACC (TBATT3)	**Battery condition monitor module connector F (12P) No. 2**	
P0AEA (TBATT4)	**Battery condition monitor module connector F (12P) No. 8**	

Is there continuity?

YES

Go to step 3.

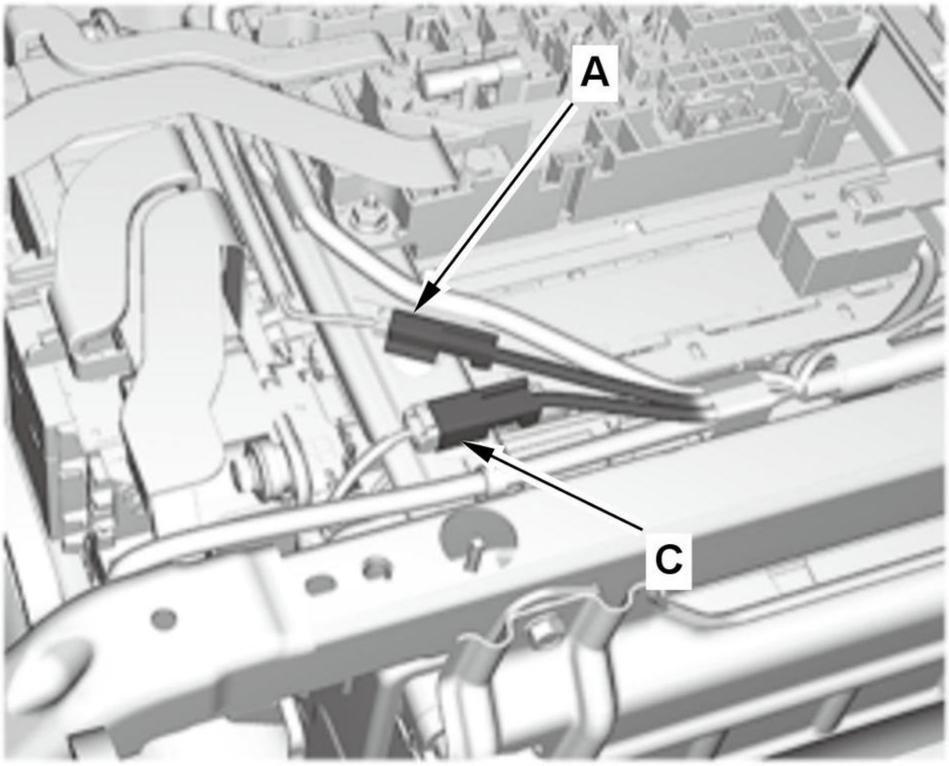
NO

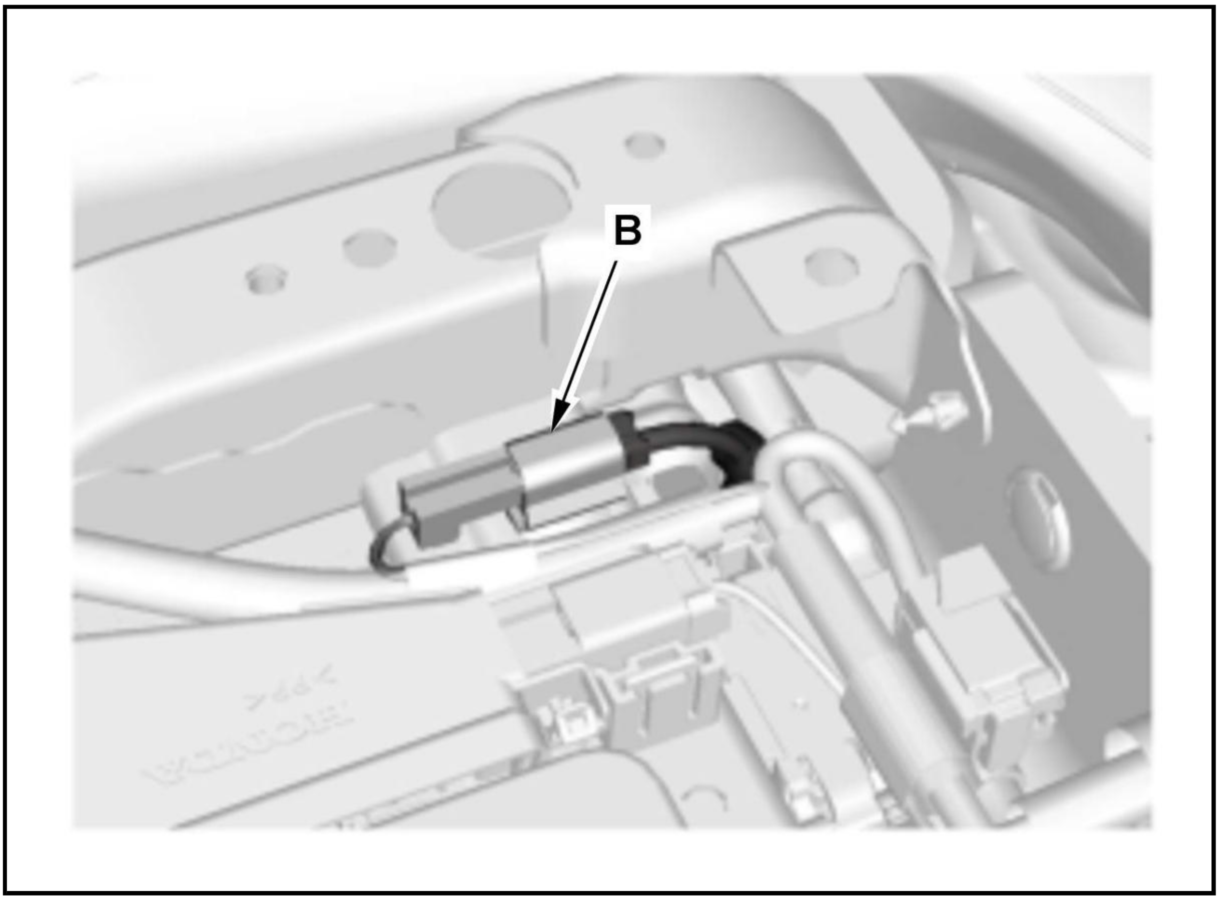
Replace the battery condition monitor module .

3. Shorted wire check (TBATT line)

-1. Disconnect the following connector.

DTC P0A9D: High voltage battery module temperature sensor connector A (2P)
DTC P0AC7: High voltage battery module temperature sensor connector B (2P)
DTC P0ACC, P0AEA: High voltage battery module temperature sensor connector C (4P)





-2. Measure the resistance between appropriate DTC's test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DTC P0A9D: High voltage battery module temperature sensor connector A (2P) : disconnected
B	DTC P0AC7: High voltage battery module temperature sensor connector B (2P) : disconnected
B	DTC P0ACC, P0AEA: High voltage battery module temperature sensor connector C (4P) : disconnected
B	Battery condition monitor module connector F (12P): disconnected

DTC	Test point 1	Test point 2
P0A9D (TBATT1)	Battery condition monitor module connector F (12P) No. 1	Body ground
P0AC7 (TBATT2)	Battery condition monitor module connector F (12P) No. 7	
P0ACC (TBATT3)	Battery condition monitor module connector F (12P) No. 2	
P0AEA (TBATT4)	Battery condition monitor module connector F (12P) No. 8	

Is there 1 MΩ or more?

1. **YES**

   Replace the following high voltage battery module temperature sensor .

   - DTC P0A9D: High voltage battery module temperature sensor 1
   - DTC P0AC7: High voltage battery module temperature sensor 2
   - DTC P0ACC: High voltage battery module temperature sensor 3

- DTC P0AEA: High voltage battery module temperature sensor 4

NO

Repair a short in the TBATT wire between the battery condition monitor module and the high voltage battery module temperature sensor.

DTC P0A9E (50), P0AC8 (52), P0ACD (54), P0AEB (120)

DTC P0A9E : HV Battery Temperature Sensor 1 Circuit High

DTC P0AC8 : HV Battery Temperature Sensor 2 Circuit High

DTC P0ACD : HV Battery Temperature Sensor 3 Circuit High

DTC P0AEB : HV Battery Temperature Sensor 4 Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A9E HV Battery Temperature Sensor 1 Circuit High	B	B	B
P0AC8 HV Battery Temperature Sensor 2 Circuit High	B	B	B
P0ACD HV Battery Temperature Sensor 3 Circuit High	B	B	B
P0AEB HV Battery Temperature Sensor 4 Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter(s) of the corresponding DTC below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HV Battery Module Temperature Sensor1 Voltage	More than 4.93	V	B	B
HV Battery Module Temperature Sensor2 Voltage	More than 4.93	V	B	B
HV Battery Module Temperature Sensor3 Voltage	More than 4.93	V	B	B
HV Battery Module Temperature Sensor4 Voltage	More than 4.93	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TBATT line, SGTB line)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A9E HV Battery Temperature Sensor 1 Circuit High	B	B	B
P0AC8 HV Battery Temperature Sensor 2 Circuit High	B	B	B
P0ACD HV Battery Temperature Sensor 3 Circuit High	B	B	B
P0AEB HV Battery Temperature Sensor 4 Circuit High	B	B	B

Are DTC P0A9E, P0AC8, P0ACD, P0AEB, and P0BC5 indicated at the same time?

YES

Go to step 4.

NO

Go to step 3.

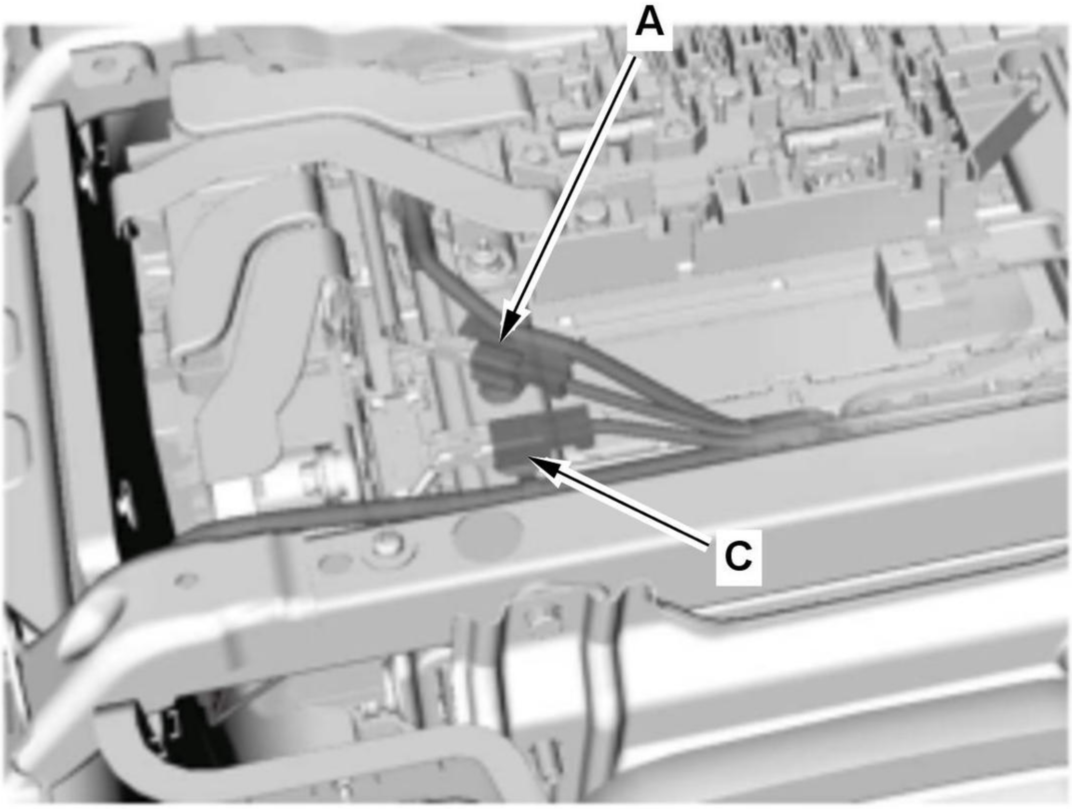
3. Open wire check (TBATT line)

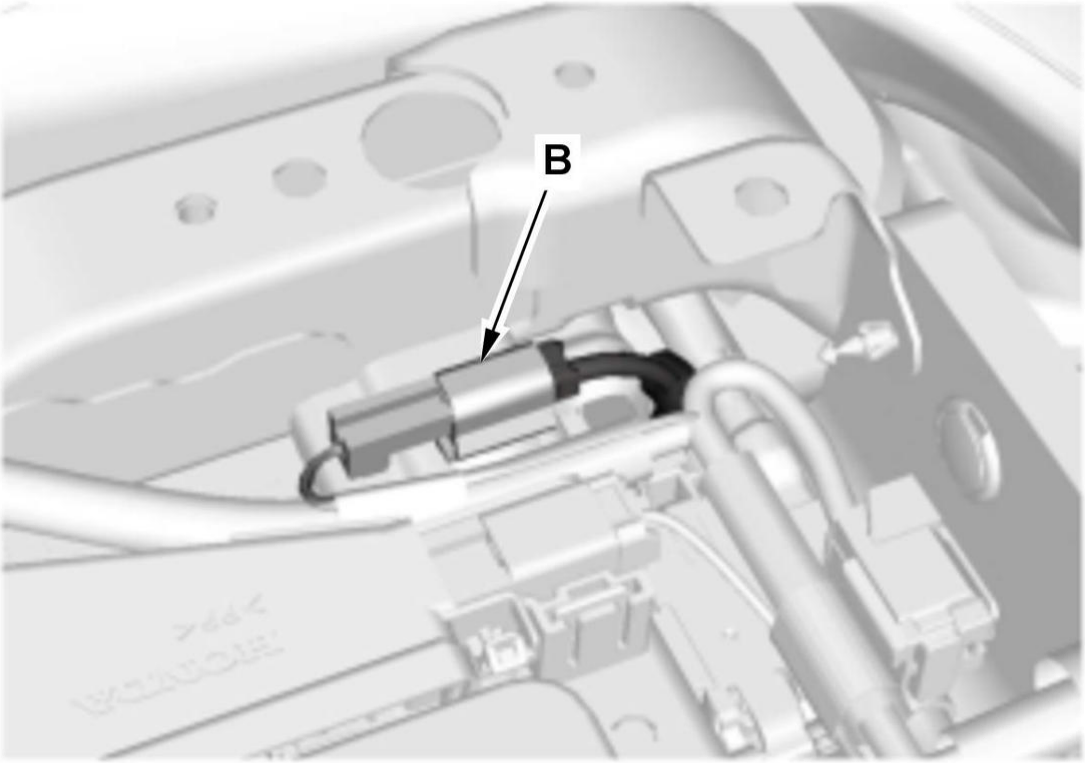
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connectors.

Battery condition monitor module connector F (12P)
DTC P0A9E: High voltage battery module temperature sensor connector A (2P)
DTC P0AC8: High voltage battery module temperature sensor connector B (2P)
DTC P0ACD, P0AEB: High voltage battery module temperature sensor connector C (4P)





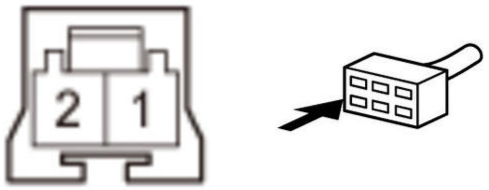
-4. Check for continuity between appropriate DTC's test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	DTC P0A9E: High voltage battery module temperature sensor connector A (2P) : disconnected

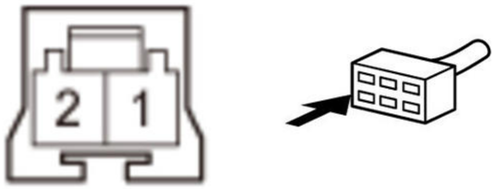
B	DTC P0AC8: High voltage battery module temperature sensor connector B (2P): disconnected
B	DTC P0ACD, P0AEB: High voltage battery module temperature sensor connector C (4P)
B	Battery condition monitor module connector F (12P): disconnected

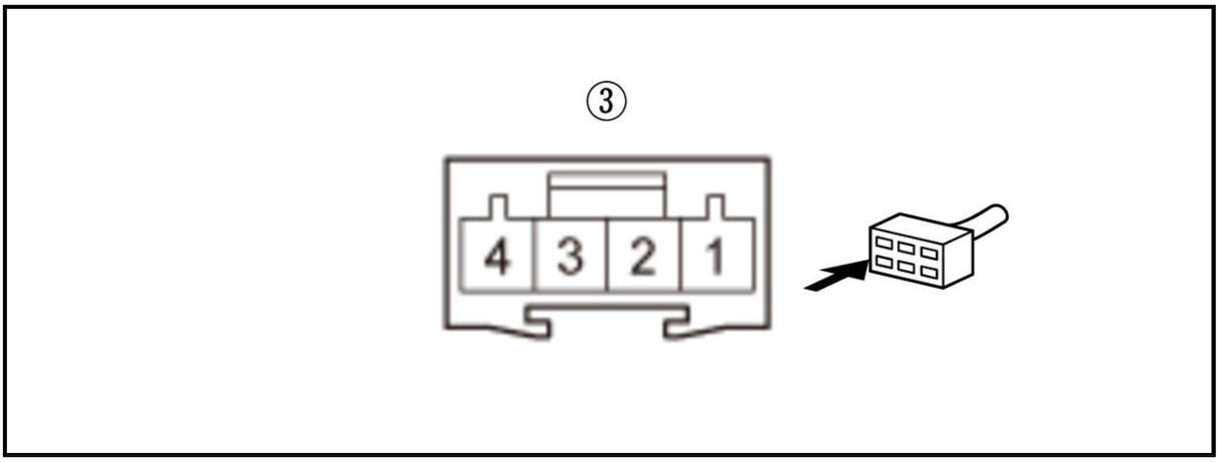
DTC	Test point 1	Test point 2
P0A9E (TBATT1)	Battery condition monitor module connector F (12P) No. 1	High voltage battery module temperature sensor connector A (2P) (male terminals) No. 1: ①
P0AC8 (TBATT2)	Battery condition monitor module connector F (12P) No. 7	High voltage battery module temperature sensor connector B (2P) (male terminals) No. 1: ②
P0ACD (TBATT3)	Battery condition monitor module connector F (12P) No. 2	High voltage battery module temperature sensor connector C (4P) (male terminals) No. 1: ③
P0AEB (TBATT4)	Battery condition monitor module connector F (12P) No. 8	High voltage battery module temperature sensor connector C (4P) (male terminals) No. 3: ③

①



②





Is there continuity?

YES

Go to step 5.

NO

Repair an open in the TBATT wire between the battery condition monitor module and the high voltage battery module temperature sensor.

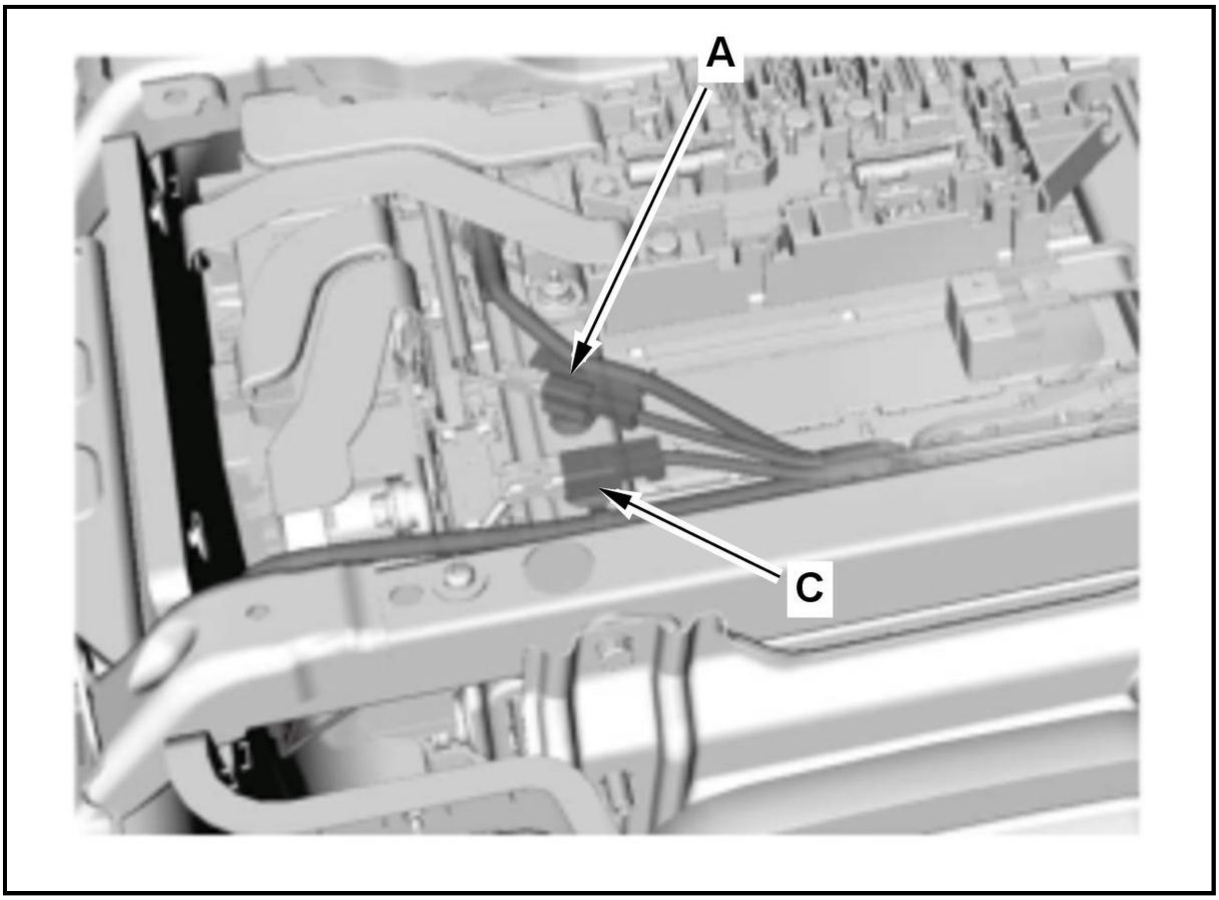
4. Open wire check (SGTB line)

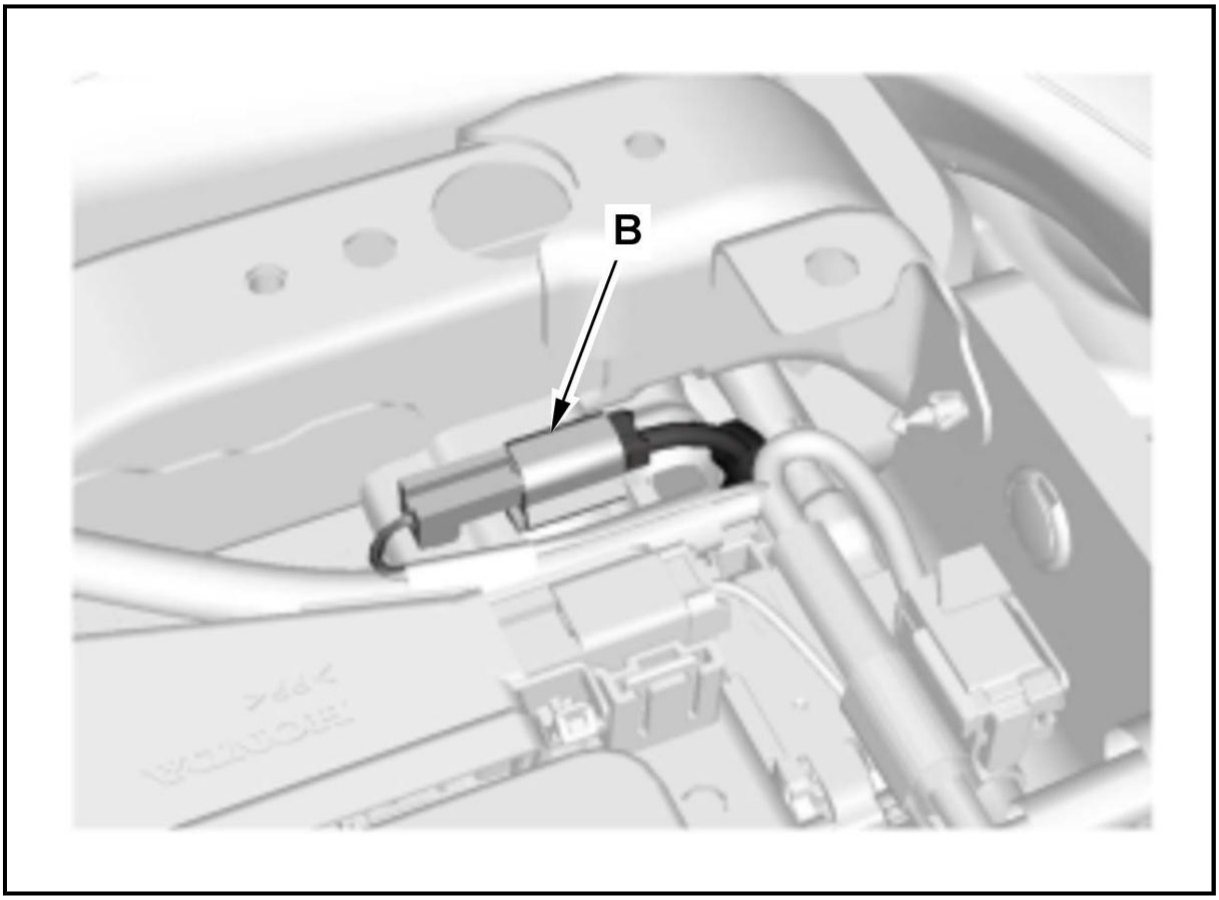
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the **service plug** and the **IPU cover** .

   -3. Disconnect the following connectors.

Battery condition monitor module connector F (12P)
DTC P0A9E: High voltage battery module temperature sensor connector A (2P)
DTC P0AC8: High voltage battery module temperature sensor connector B (2P)
DTC P0ACD, P0AEB: High voltage battery module temperature sensor connector C (4P)



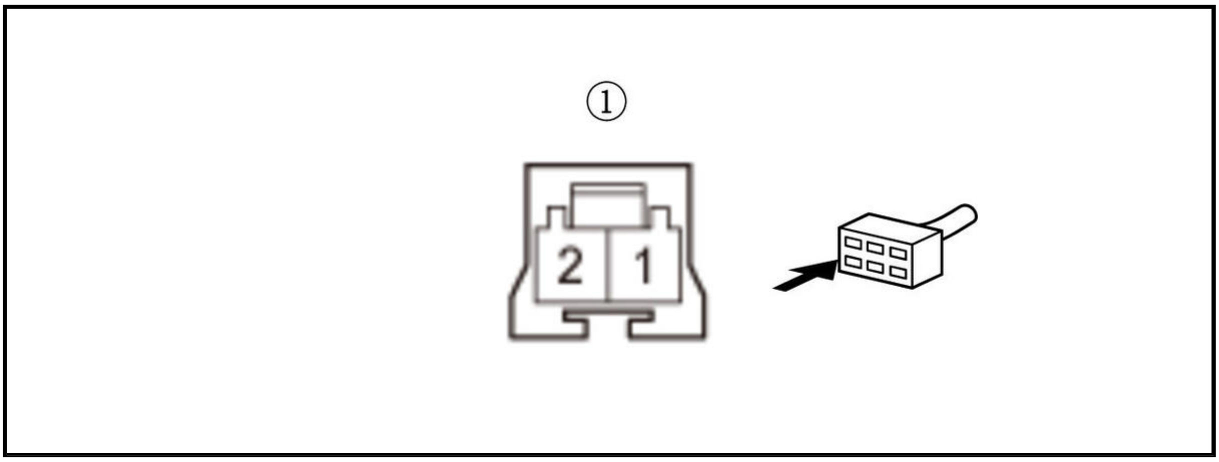


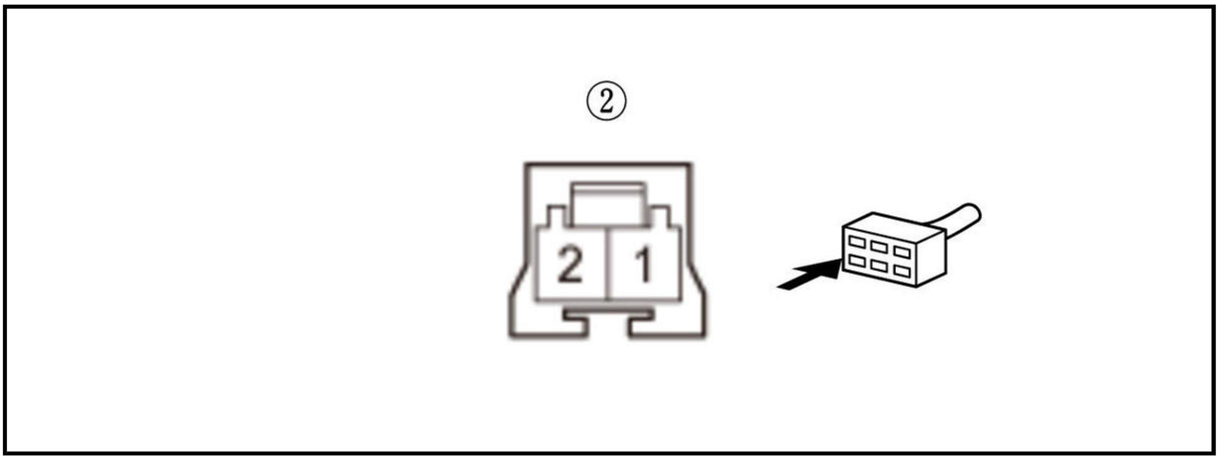
-4. Check for continuity between appropriate DTC's test points 1 and 2.

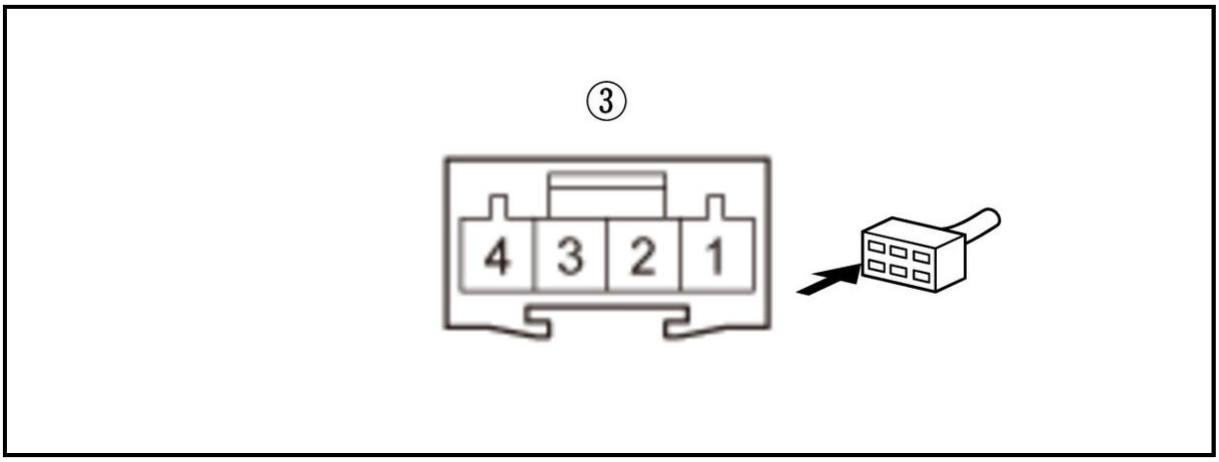
Test condition	Vehicle OFF (LOCK) mode
B	DTC P0A9E: High voltage battery module temperature sensor connector A (2P): disconnected

B	DTC P0AC8: High voltage battery module temperature sensor connector B (2P): disconnected
B	DTC P0ACD, P0AEB: High voltage battery module temperature sensor connector C (4P): disconnected
B	Battery condition monitor module connector F (12P): disconnected

DTC	Test point 1	Test point 2
P0A9E	Battery condition monitor module connector F (12P) No. 6	High voltage battery module temperature sensor connector A (2P) (male terminals) No. 2: ①
P0AC8		High voltage battery module temperature sensor connector B (2P) (male terminals) No. 2: ②
P0ACD		High voltage battery module temperature sensor connector C (4P) (male terminals) No. 2: ③
P0AEB		High voltage battery module temperature sensor connector C (4P) (male terminals) No. 4: ③







Is there continuity?

YES

Go to step 5.

NO

Repair an open in SGTB wire between the battery condition monitor module and the high voltage battery module temperature sensor.

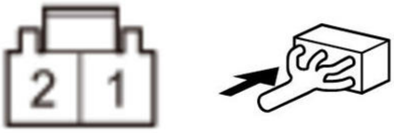
5. High voltage battery module temperature sensor check

-1. At the sensor side, measure the resistance between appropriate DTC's test points 1 and 2.

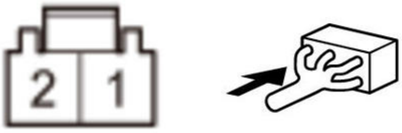
Test condition	Vehicle OFF (LOCK) mode
B	DTC P0A9E: High voltage battery module temperature sensor connector A (2P): disconnected
B	DTC P0AC8: High voltage battery module temperature sensor connector B (2P): disconnected
B	DTC P0ACD, P0AEB: High voltage battery module temperature sensor connector C (4P): disconnected
B	Battery condition monitor module connector F (12P): disconnected

DTC	High voltage battery module temperature sensor connector	Test point 1	Test point 2
P0A9E	A (2P) (female terminals)	No. 1: ①	No. 2: ①
P0AC8	B (2P) (female terminals)	No. 1: ②	No. 2: ②
P0ACD	C (4P) (female terminals)	No. 1: ③	No. 2: ③
P0AEB	C (4P) (female terminals)	No. 3: ③	No. 4: ③

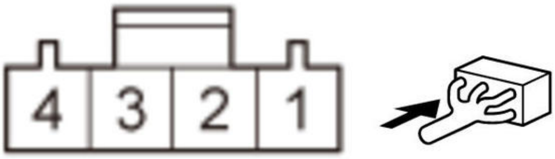
①

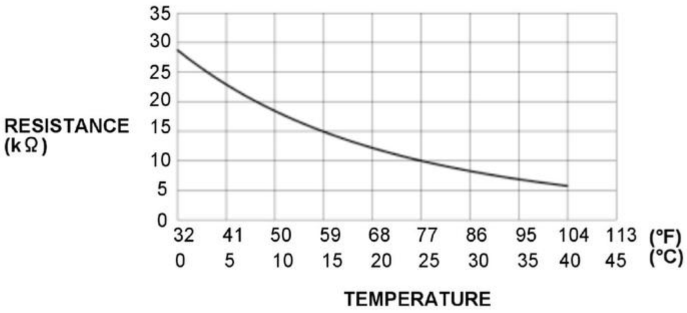


②



③





Is resistance value within the range?

YES

The high voltage battery module temperature sensor is OK. **Replace the battery condition monitor module** .

NO

Replace the following high voltage battery module temperature sensor .

- DTC P0A9E: High voltage battery module temperature sensor A
- DTC P0AC8: High voltage battery module temperature sensor B
- DTC P0ACD, P0AEB: High voltage battery module temperature sensor C

DTC P0AA1 (46)

DTC P0AA1 : HV Battery Main Contactor Circuit Stuck Closed

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Do not clear the DTC until the diagnosis has been completed. Otherwise, there is a possibility that the high-voltage sub contactor can get damaged if the DTC is cleared and the vehicle turned to the ON mode.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA1 HV Battery Main Contactor Circuit Stuck Closed	B	B	B

DTC (Electric Powertrain)

1. Determine possible failure area (short in PRE line, others)

-1. Remove the **service plug** and the **IPU cover** .

-2. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 6**

Test point 2	Body ground

Is there continuity?

YES

Go to step 2.

NO

Go to step 3.

2. Shorted wire check (PRE line)

-1. **Remove the IPU and the IPU case** .

-2. Disconnect the following connector.

Junction board 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Junction board 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 6**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The PRE wire is OK. **Replace the junction board** .

NO

Repair a short in the PRE wire between the battery condition monitor module (E6) and the junction board.

3. Determine possible failure area (short in CNTP line, others)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 4**
Test point 2	Body ground

Is there continuity?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (CNTP line)

-1. Disconnect the following connector.

Junction board 4P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Junction board 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 4**

Test point 2	Body ground

Is there 1 MΩ or more?

YES

The CNTP wire is OK. **Replace the junction board** .

NO

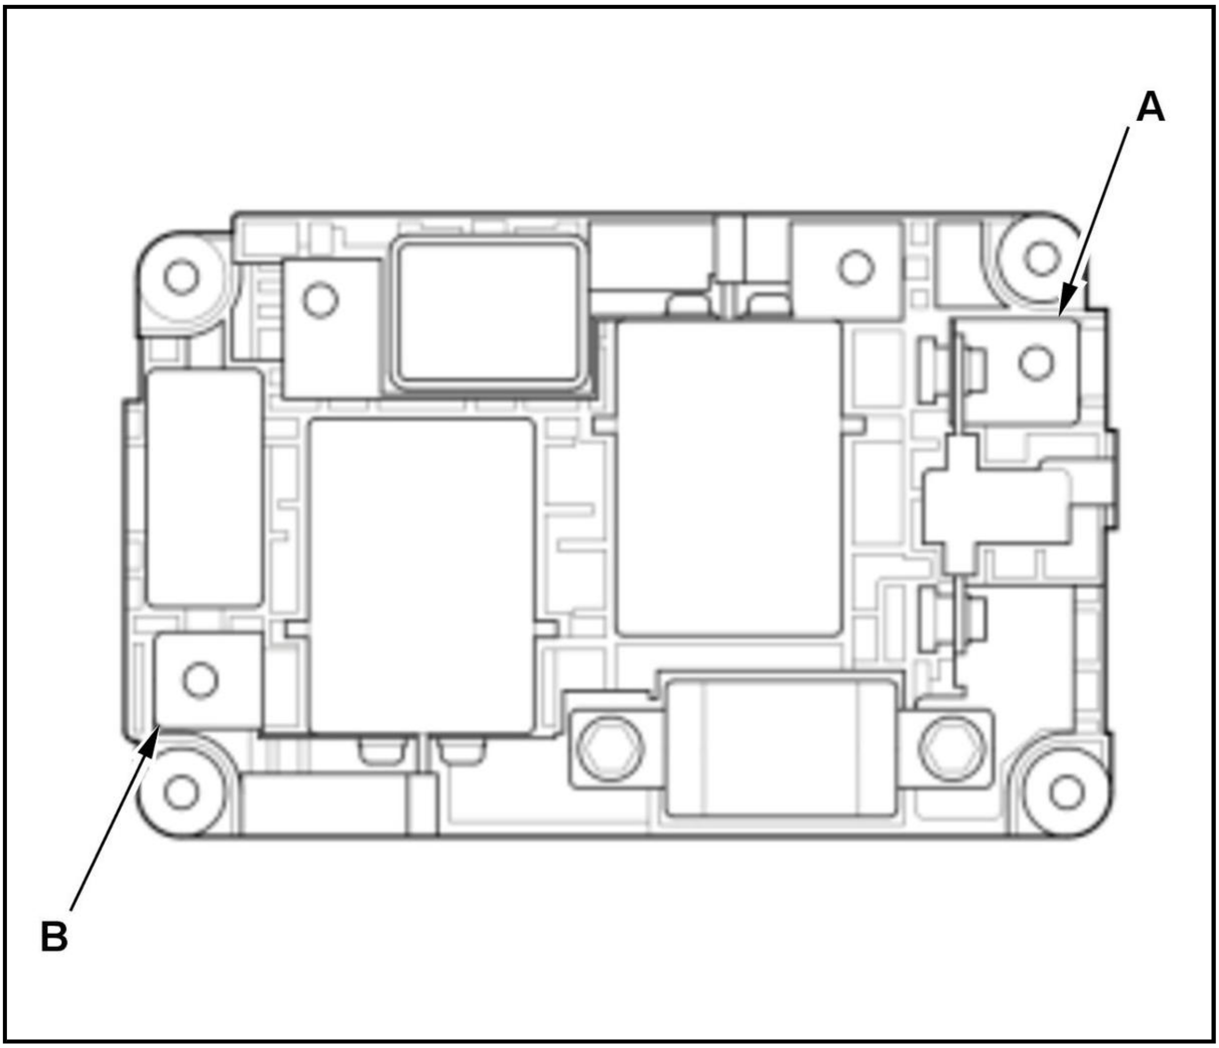
Repair a short in the CNTP wire between the battery condition monitor module (E4) and the junction board.

5. Junction board check

-1. **Remove the junction board** .

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Junction board terminal (A)
Test point 2	Junction board terminal (B)



Is there 45 Ω or less?

YES

There is a failure in the high voltage contactor or the bypass contactor. **Replace the junction board** .

NO

Replace the battery condition monitor module .

DTC P0AA3 (128)

DTC P0AA3 : HV Battery Sub Contactor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA3 HV Battery Sub Contactor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, and wait 120 seconds.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA3 HV Battery Sub Contactor Circuit	B	B	B

Is DTC P0AA3 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (short in CNTN line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 5**
Test point 2	Body ground

Is there continuity?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (CNTN line)

-1. Disconnect the following connector.

Junction board 4P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Junction board 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 5**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The CNTN wire is OK. **Replace the junction board** .

NO

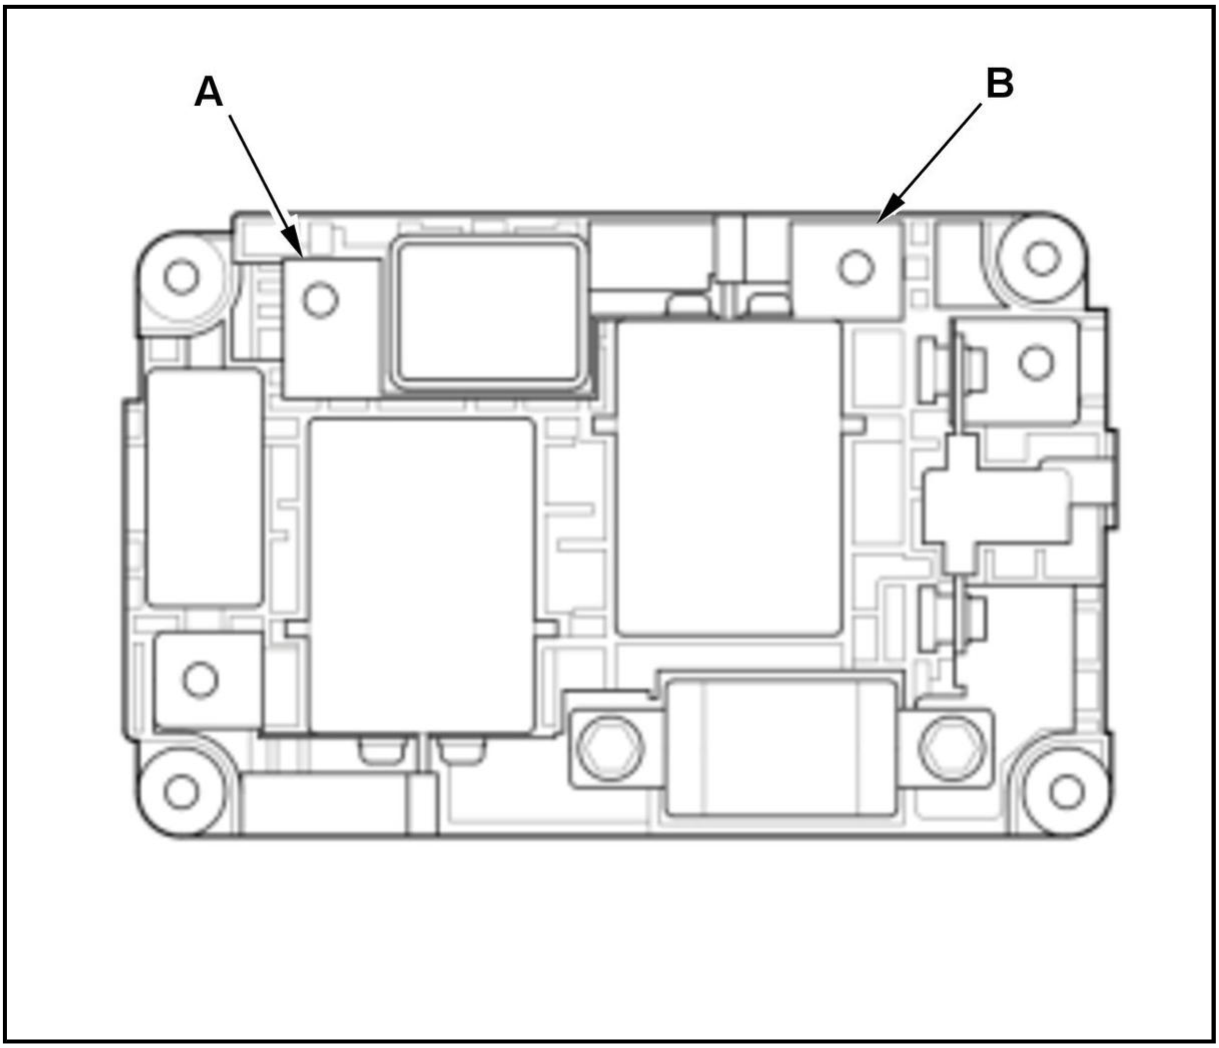
Repair a short in the CNTN wire between the junction board and the battery condition monitor module (E5).

4. Junction board check

-1. **Remove the junction board** .

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Junction board terminal (A)
Test point 2	Junction board terminal (B)



Is there continuity?

YES

There is a failure in the high voltage sub contactor. **Replace the junction board** .

NO

Replace the battery condition monitor module .

DTC P0AA6 (59)

DTC P0AA6 : HV Battery Voltage System Isolation Fault

WARNING: **This procedure includes high voltage measurements with the electric powertrain system turned on. To avoid serious injury from electrical shocks while testing the high voltage cable, use insulated gloves, select a DC range of 500 V or more on your digital multimeter, and be careful not to contact each tester probes and not to contact any metal parts while you measure the high voltage cable.**

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- Put on insulated gloves and use insulated tools to protect you from electrical shock.
- When you measure the insulation resistance, use a DC range of 500 V or more on your digital multimeter.
- When disassembling and assembling the battery pack, check for leaking electrolyte and take necessary precautions to handle it .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA6 HV Battery Voltage System Isolation Fault	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B3B HV Battery Cell Voltage Sense Circuit 1	B	B	B
P0B40 HV Battery Cell Voltage Sense Circuit 2	B	B	B
P0B45 HV Battery Cell Voltage Sense Circuit 3	B	B	B
P0B4A HV Battery Cell Voltage Sense Circuit 4	B	B	B
P0B4F HV Battery Cell Voltage Sense Circuit 5	B	B	B
P0B54 HV Battery Cell Voltage Sense Circuit 6	B	B	B

Are DTC P0B3B, P0B40, P0B45, P0B4A, P0B4F, and/or P0B54 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Problem verification 1:

   Check these items:

   - Transmission in P
   - A/C switch and heater fan switch OFF

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode.

   -5. Turn the vehicle to the ON mode.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA6 HV Battery Voltage System Isolation Fault	B	B	B

Is DTC P0AA6 indicated?

YES

Go to step 7.

NO

Go to step 3.

3. Problem verification 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Raise the vehicle on a lift** .

   -3. Turn the vehicle to the READY TO DRIVE mode.

   -4. Select the EV driving mode by EV switch.

   NOTE: If the vehicle cannot enter the EV driving mode because the high voltage battery SOC is low, charge the high voltage battery by the **No-Load Charging Procedure** .

   Test-drive the vehicle for 1 minute.

NOTE:

- **Do not apply the brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**
- **A/C switch and heater fan switch OFF**

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA6 HV Battery Voltage System Isolation Fault	B	B	B

Is DTC P0AA6 indicated?

YES

Go to step 6.

NO

Go to step 4.

4. Problem verification 3

-1. Turn the A/C switch to ON.

NOTE: Temperature set to MAX COOL.

-2. Wait for 1 minute.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA6 HV Battery Voltage System Isolation Fault	B	B	B

Is DTC P0AA6 indicated?

YES

Replace the electric A/C compressor .

NO

Go to step 5.

5. Problem verification 4

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

NOTE: A/C switch and heater fan switch is OFF

-3. **Enter the maintenance mode to start the engine** . Hold the engine speed between 2, 500 rpm and 3, 000 rpm for 1 minute.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA6 HV Battery Voltage System Isolation Fault	B	B	B

Is DTC P0AA6 indicated?

YES

Go to step 6.

NO

Intermittent failure. The system is OK at this time. Check for poor connections, loose terminals. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

6. Motor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the service plug** .

   -3. **Remove the PCU** .

   -4. Measure the resistance between body ground and traction motor and generator motor 3-phase terminals U, V, and W individually.

   Is there 305 kΩ or less?

   YES

   Faulty traction motor or generator motor, **replace the transmission (e-CVT) assembly** .

   NO

   Replace the PCU .

7. Battery module electrolyte leak check

   -1. Remove the **service plug** and the **IPU cover** .

   -2. Check the electrolyte leaks from each battery module.

Is there electrolyte leakage?

YES

Go to step 16.

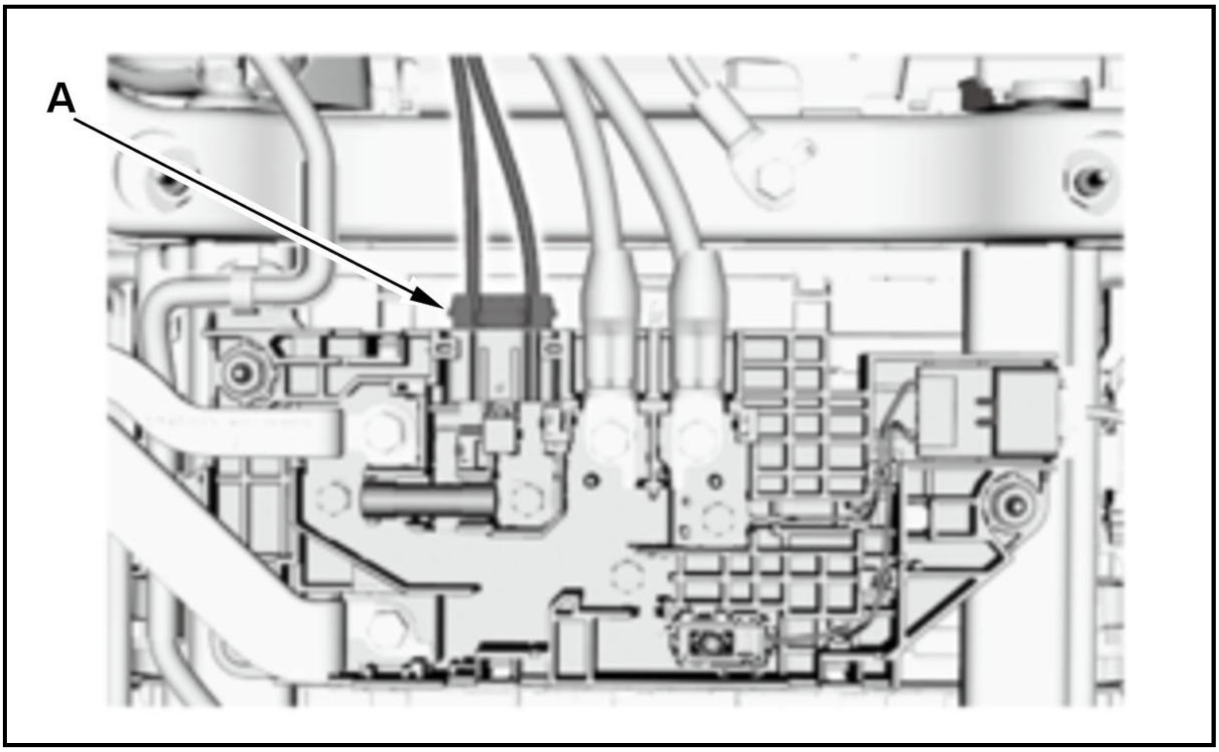
NO

Go to step 8.

8. Determine possible failure area (electric A/C compressor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the electric A/C compressor high voltage cable 2P connector (A) from the subjunction board.

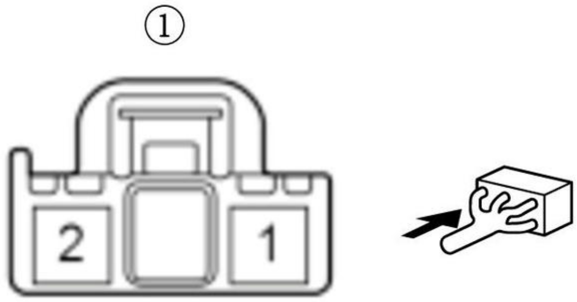


-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Electric A/C compressor high voltage cable 2P connector (subjunction board side): disconnected
Test point 1	Electric A/C compressor high voltage cable 2P connector (subjunction board side) (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	Electric A/C compressor high voltage cable 2P connector (subjunction board side) (female terminals) No. 2: ①
Test point 2	Body ground



Is there 305 kΩ or less?

YES

Go to step 9.

NO

Go to step 10.

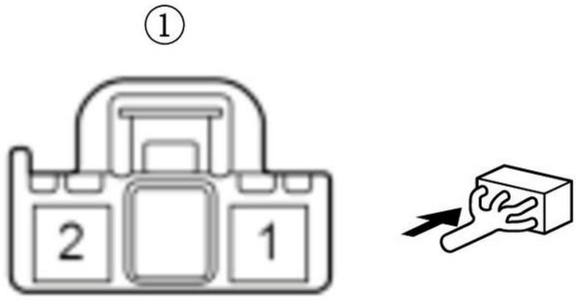
9. Electric A/C compressor high voltage cable check

-1. **Disconnect the electric A/C compressor connector A (2P) from the electric A/C compressor** .

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric A/C compressor high voltage cable 2P connector (subjunction board side): disconnected
B	Electric A/C compressor connector A (2P): disconnected
Test point 1	Electric A/C compressor high voltage cable 2P connector (subjunction board side) (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	Electric A/C compressor high voltage cable 2P connector (subjunction board side) (female terminals) No. 2: ①
Test point 2	Body ground



Is there 305 kΩ or less?

YES

Failure in the electric A/C compressor high voltage cable. **Replace the battery power cable** .

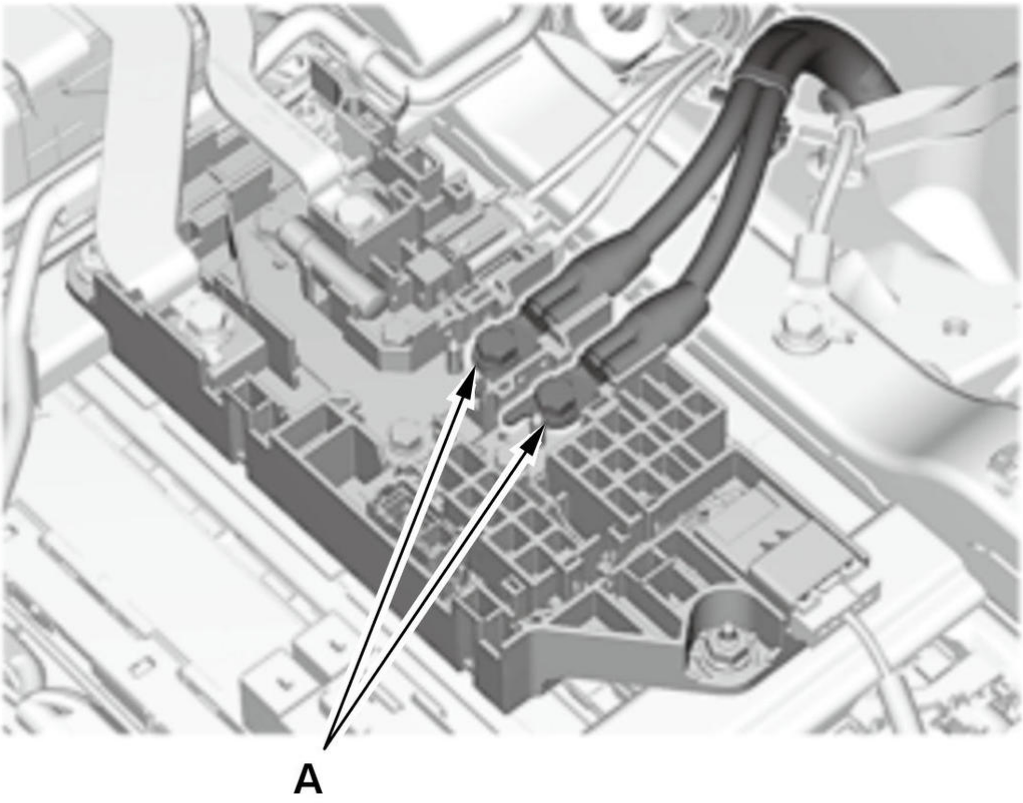
NO

Replace the electric A/C compressor .

10. Determine possible failure area (PCU or battery power cable, others)

-1. **Disconnect the battery power cable terminals (A) from the subjunction board** .

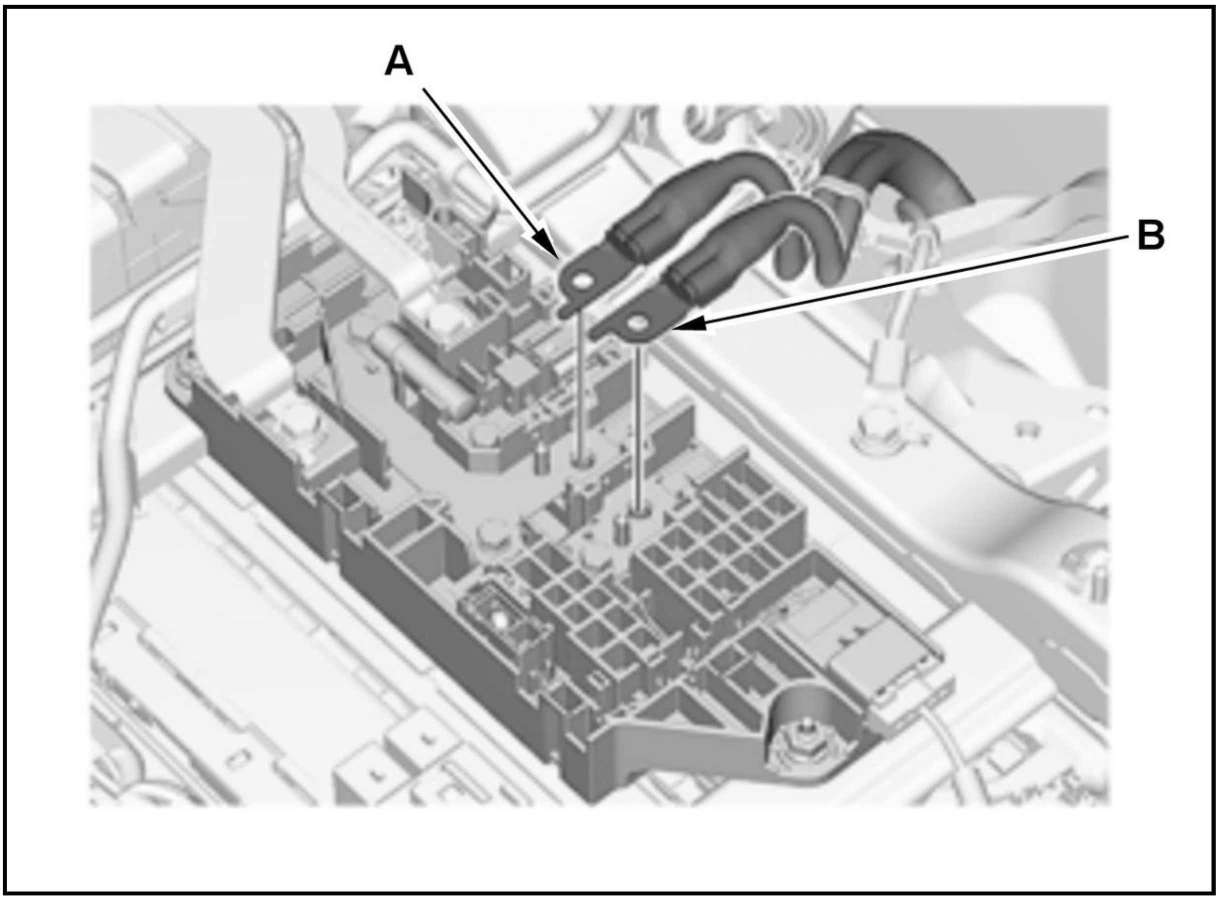
NOTE: Wrap the subjunction board terminals with insulating tape.



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery power cable terminals (subjunction board side): disconnected
Test point 1	Battery power cable terminal (subjunction board side) (+) (A)
Test point 2	Body ground

Test point 1	Battery power cable terminal (subjunction board side) (-) (B)
Test point 2	Body ground



Is there 305 kΩ or less?

YES

Go to step 11.

NO

Go to step 12.

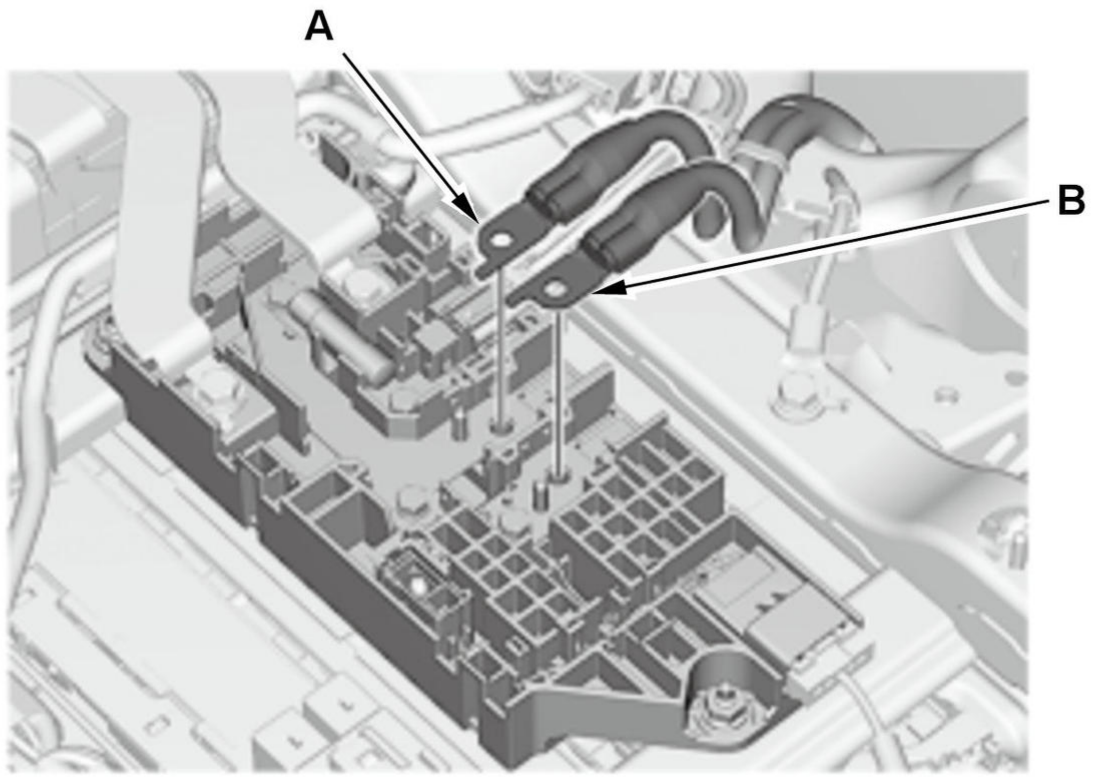
11. Battery power cable check

-1. **Disconnect the battery power cable connector from the PCU** .

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery power cable (PCU side): disconnected
B	Battery power cable terminals (subjunction board side): disconnected
Test point 1	Battery power cable terminal (subjunction board side) (+) (A)
Test point 2	Body ground

Test point 1	Battery power cable terminal (subjunction board side) (-) (B)
Test point 2	Body ground



Is there 305 kΩ or less?

YES

Replace the battery power cable .

NO

Replace the PCU .

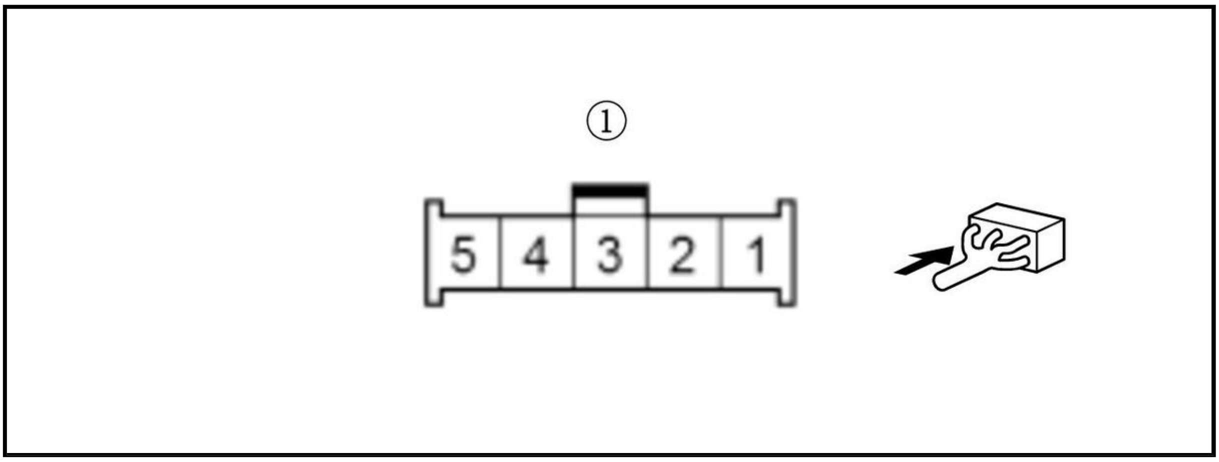
12. Determine possible failure area (leak sensor circuit, others)

-1. Disconnect the following connector.

Subjunction board connector A (5P)

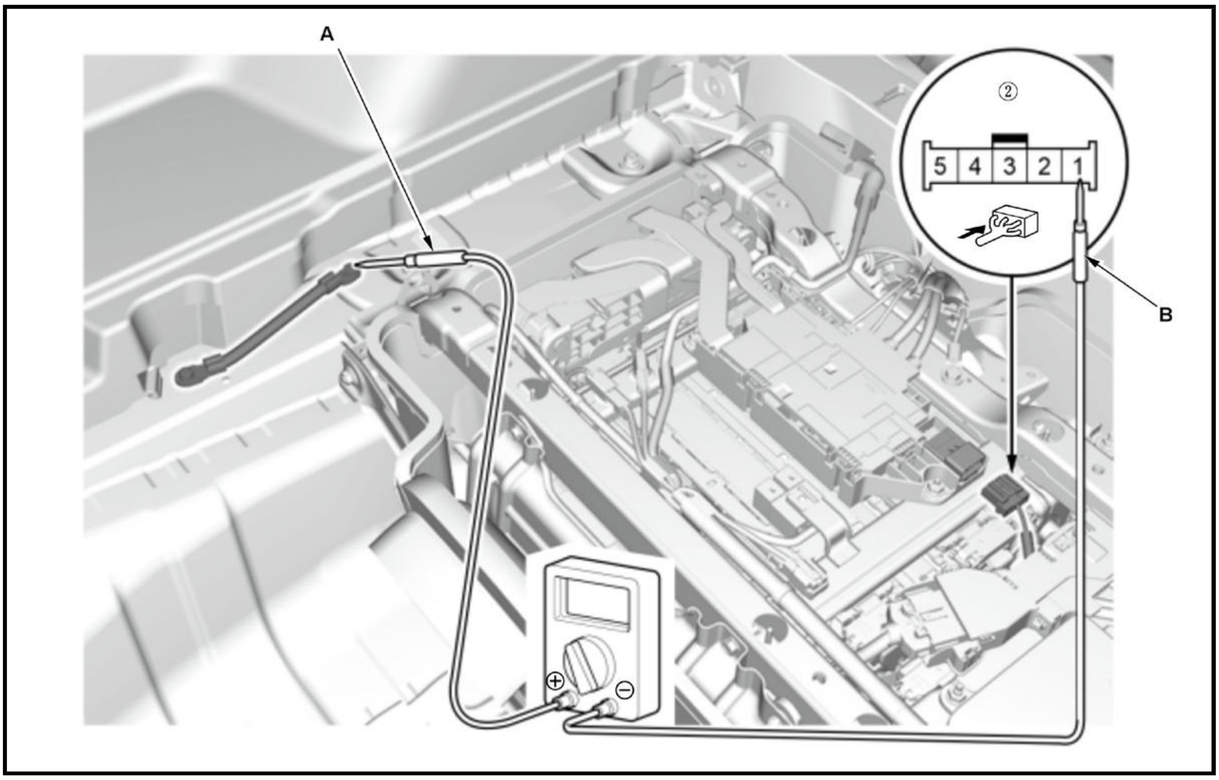
-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Subjunction board connector A (5P): disconnected
Test point 1	Subjunction board connector A (5P) (female terminals) No. 1: ①
Test point 2	Body ground (G701)



Test point 1	Subjunction board connector A (5P) (female terminals) No. 5: ②
Test point 2	Body ground (G701)

NOTE: When you measure the insulation resistance on the subjunction board connector A (5P) terminal No. 1, connect the positive pole side of the tester (A) to body ground (G701), and connect the negative pole side of the tester (B) to the subjunction board connector A (5P) terminal No. 1.



Is there 305 kΩ or less?

YES

Go to step 13.

NO

Go to step 14.

13. Shorted wire check (BATT+ line, BATT- line)

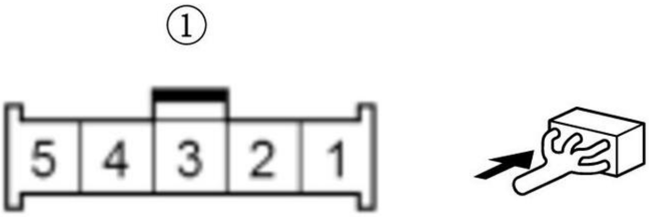
-1. Disconnect the following connector.

Battery condition monitor module connector A (28P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Subjunction board connector A (5P): disconnected
B	Battery condition monitor module connector A (28P): disconnected
Test point 1	Subjunction board connector A (5P) (female terminals) No. 1: ①
Test point 2	Body ground (G701)

Test point 1	Subjunction board connector A (5P) (female terminals) No. 5: ①
Test point 2	Body ground (G701)



Is there 305 kΩ or less?

YES

Repair a short in the BATT+ wire or the BATT- wire between the battery condition monitor module (A15, A4) and the subjunction board.

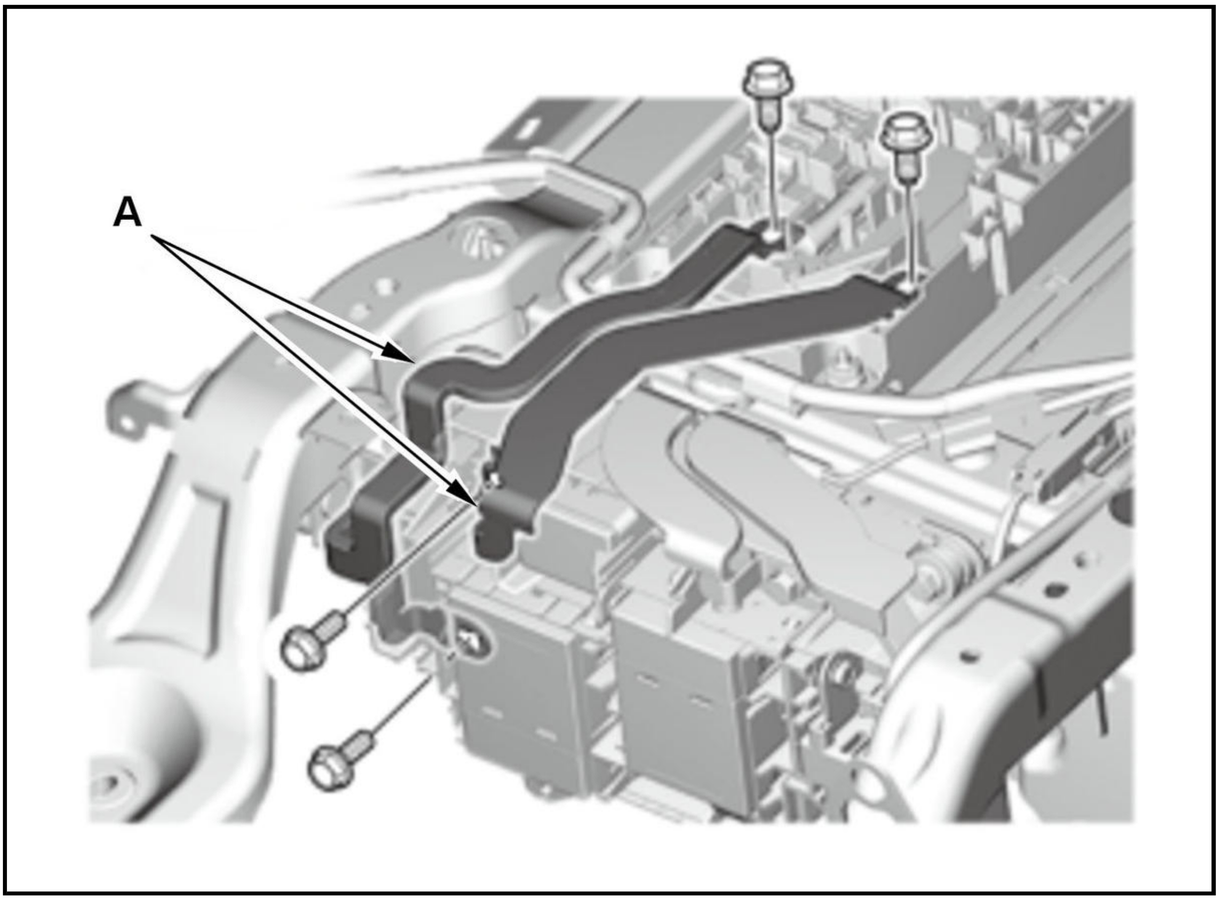
NO

Replace the battery condition monitor module .

14. Subjunction board check

-1. Remove the IPU and the IPU case .

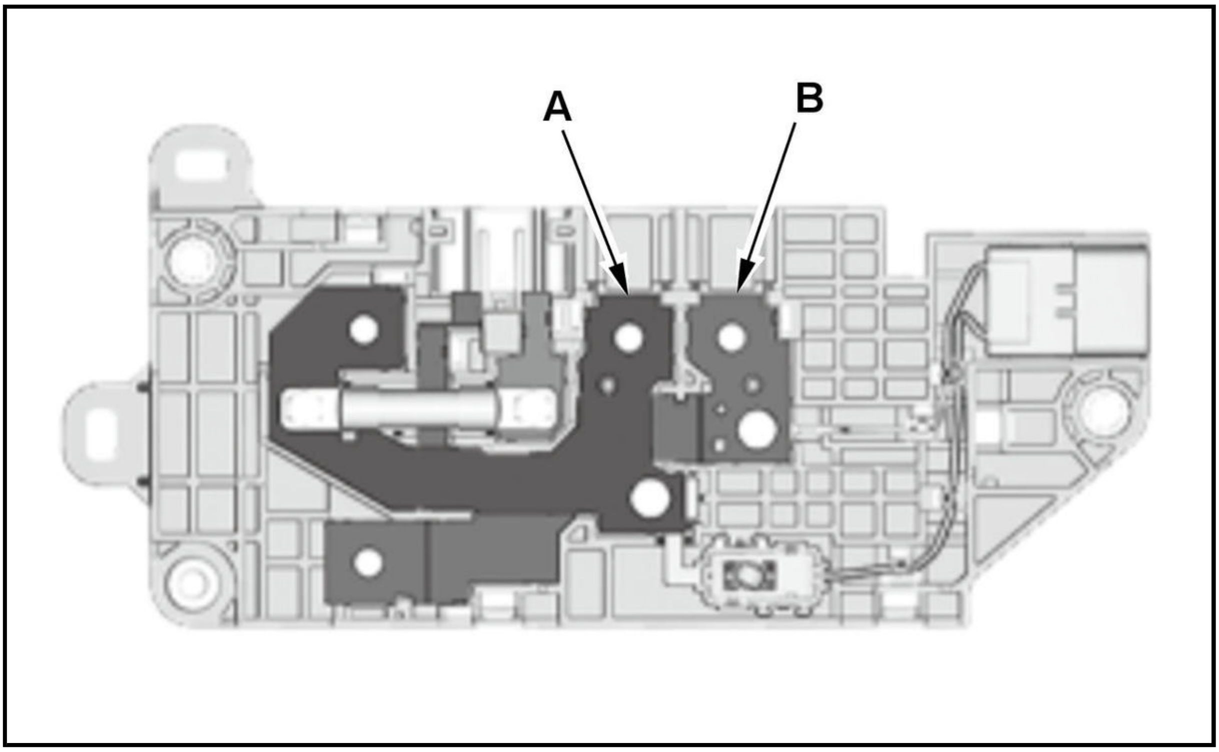
-2. Remove the busbars (A) from the subjunction board .



-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Subjunction board high voltage terminal (A)
Test point 2	Body ground

Test point 1	Subjunction board high voltage terminal (B)
Test point 2	Body ground



Is there 305 kΩ or less?

YES

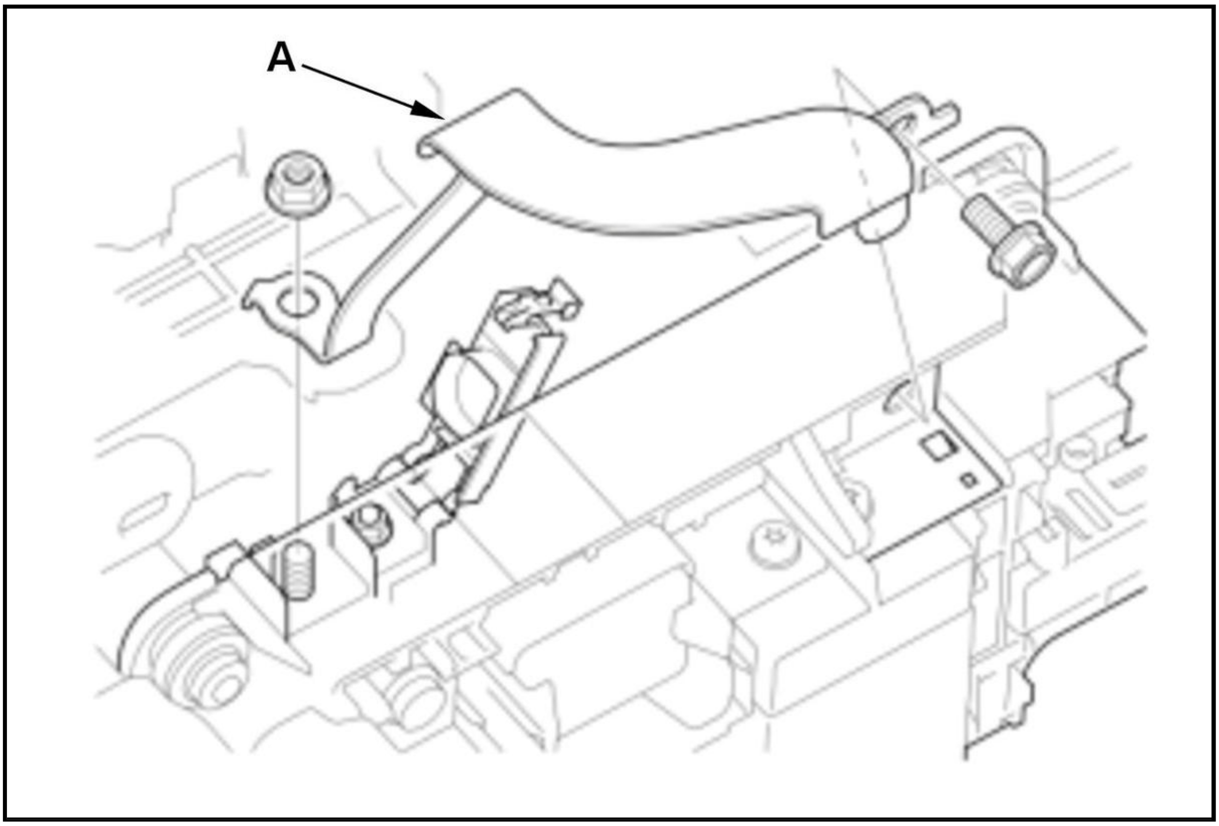
Replace the subjunction board .

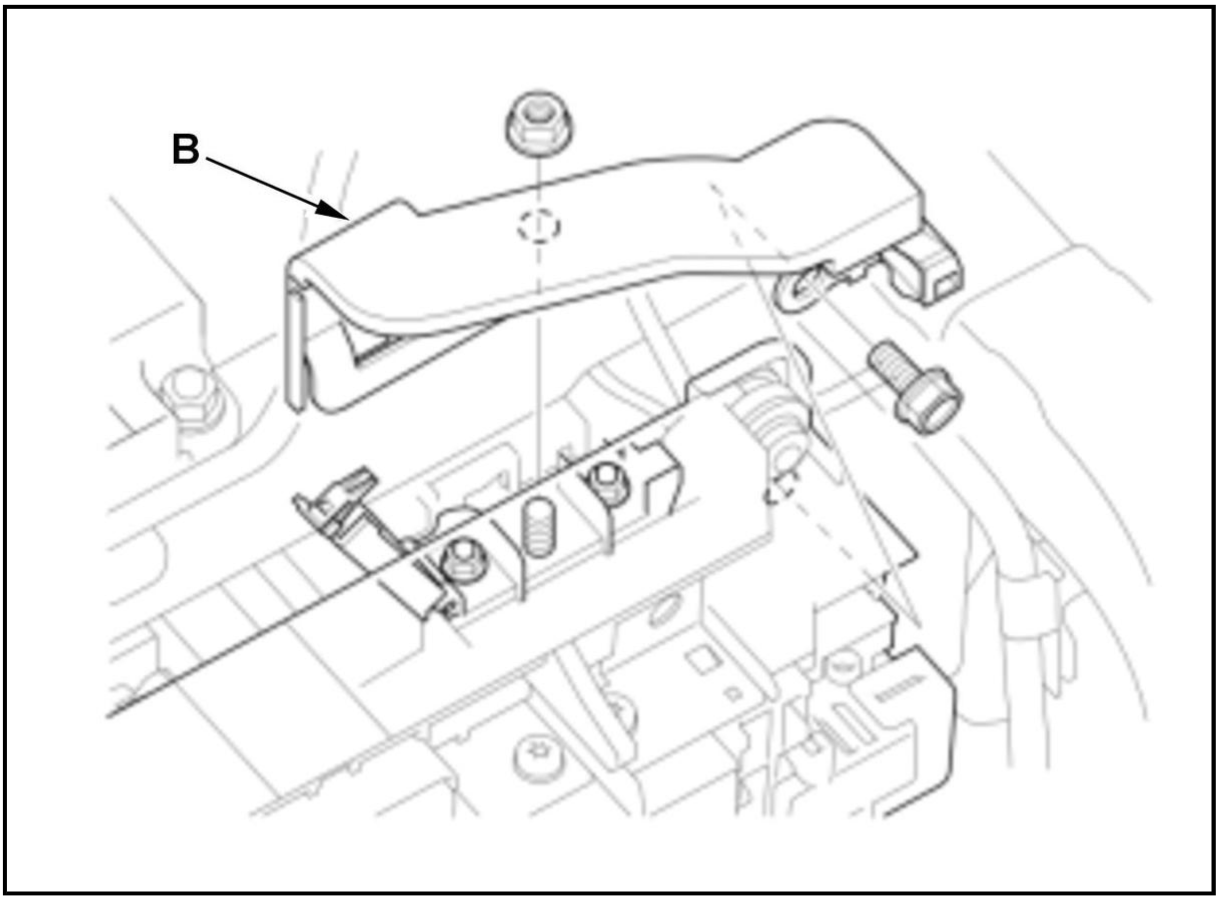
NO

Go to step 15.

15. Junction board check

    -1. **Remove the busbars (A) and (B) from the junction board** .





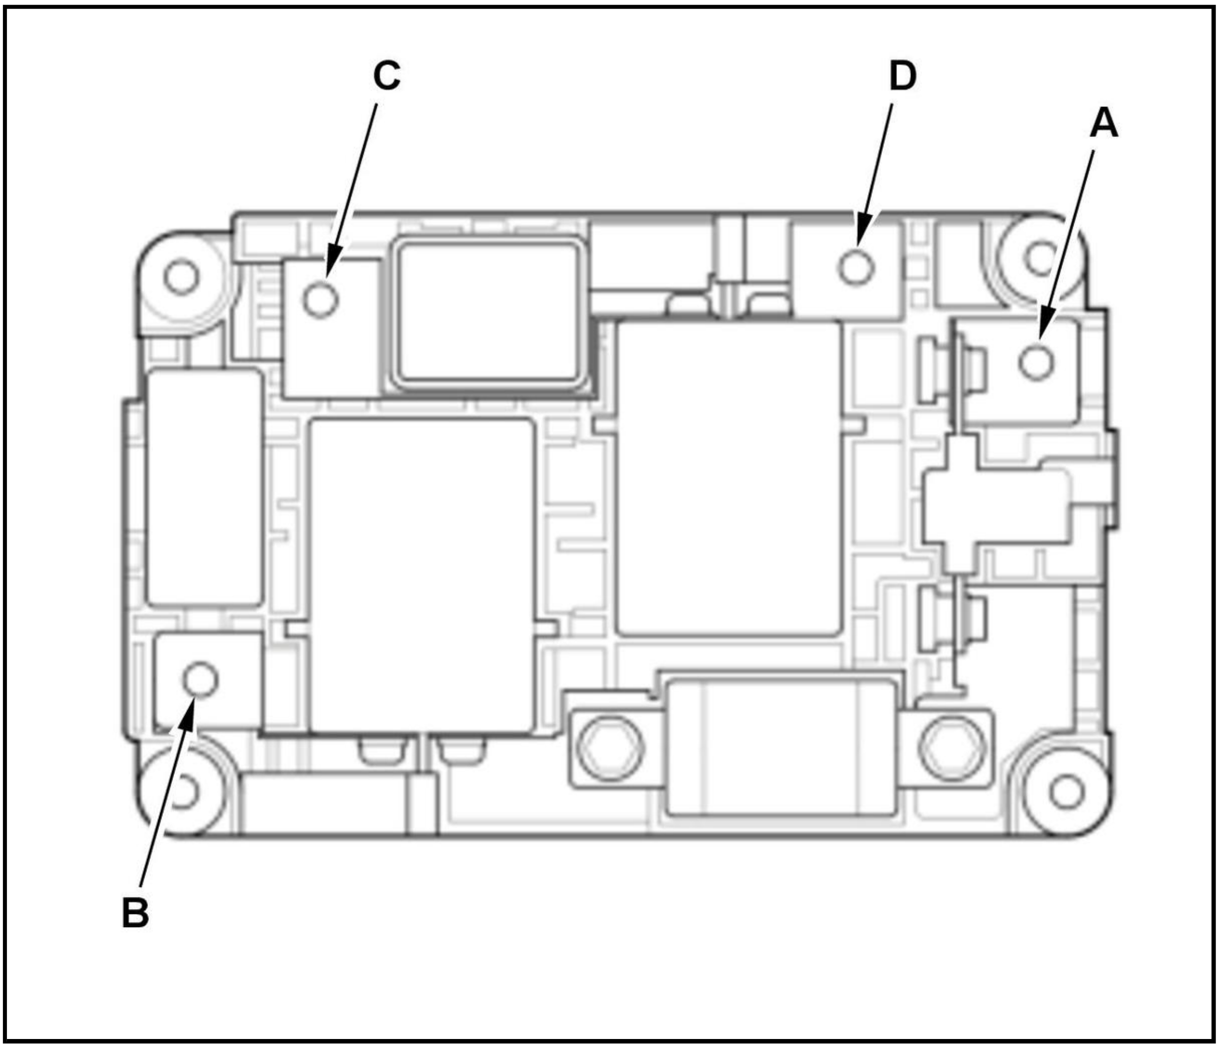
-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Junction board high voltage terminal (A)
Test point 2	Body ground

Test point 1	Junction board high voltage terminal (B)
Test point 2	Body ground

Test point 1	Junction board high voltage terminal (C)
Test point 2	Body ground

Test point 1	Junction board high voltage terminal (D)
Test point 2	Body ground



Is there 305 kΩ or less?

YES

Replace the junction board .

NO

Go to step 16.

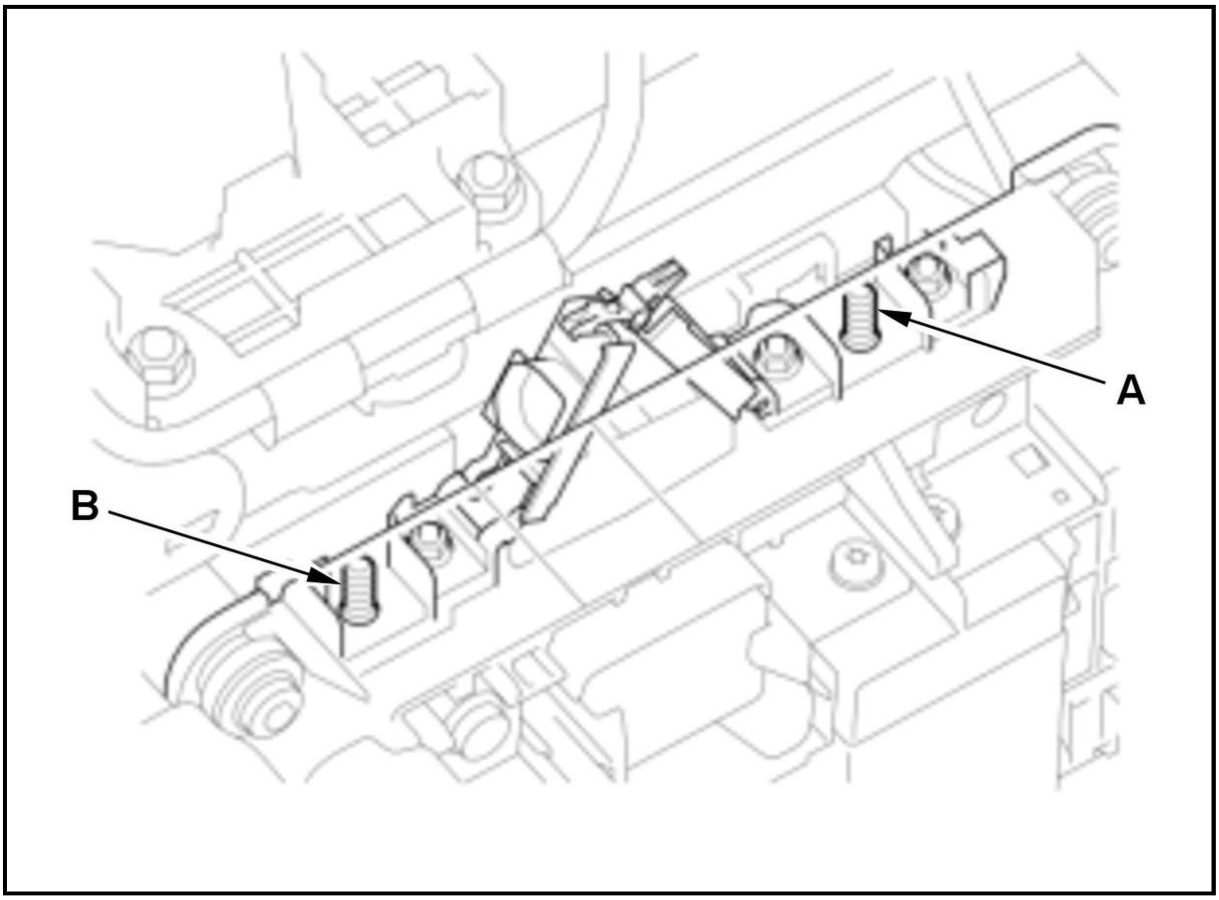
16. Battery pack check 1

    -1. **Remove the junction board** .

    -2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Battery pack high voltage terminal (A)
Test point 2	Body ground

Test point 1	Battery pack high voltage terminal (B)
Test point 2	Body ground



Is there 0V or less?

YES

Replace the junction board .

NO

Go to step 17.

17. Battery pack check 2

-1. Disconnect the following connectors.

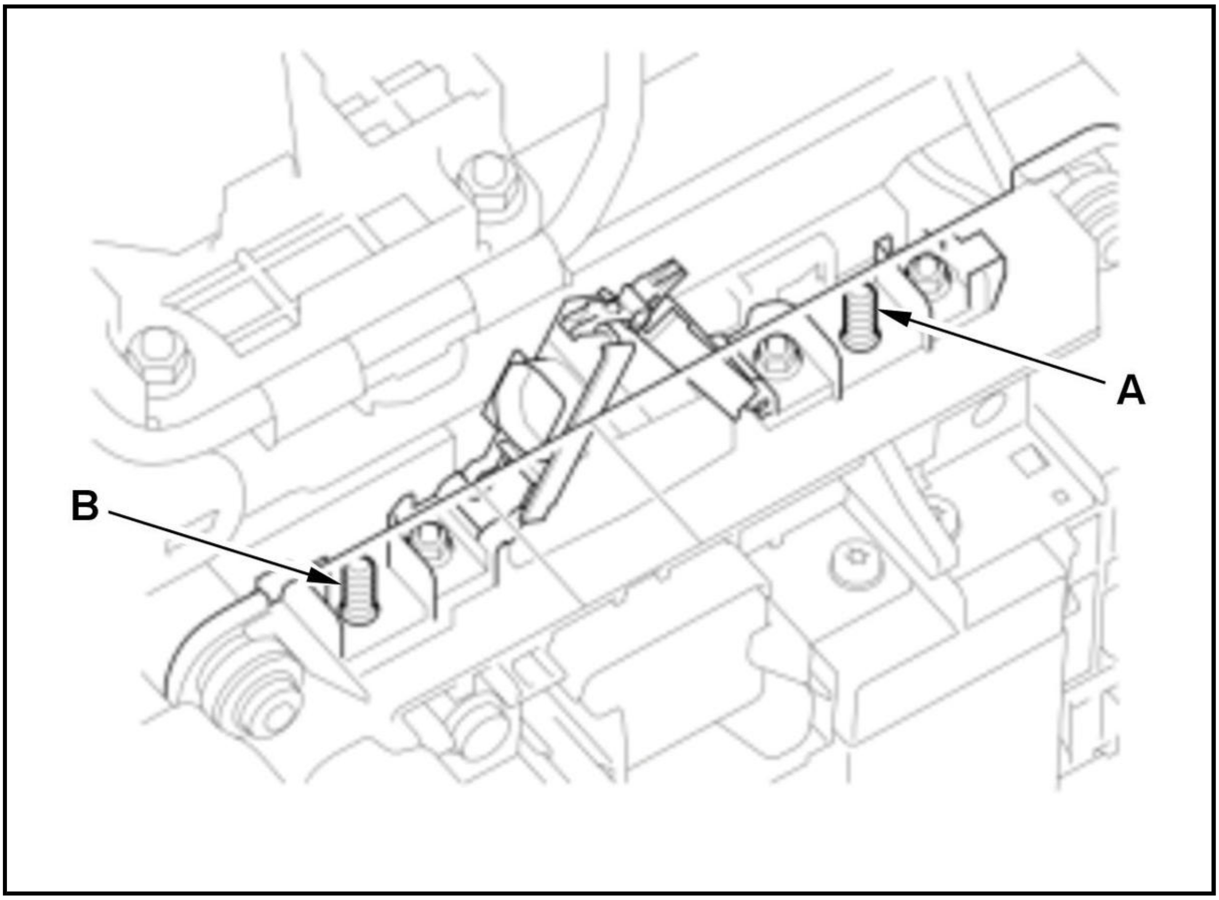
Battery condition monitor module connector A (28P)
Battery condition monitor module connector B (28P)
Battery condition monitor module connector C (28P)
Battery condition monitor module connector D (16P)
Battery condition monitor module connector E (32P)
Battery condition monitor module connector F (12P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector A (28P): disconnected
B	Battery condition monitor module connector B (28P): disconnected
B	Battery condition monitor module connector C (28P): disconnected
B	Battery condition monitor module connector D (16P): disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	Battery condition monitor module connector F (12P): disconnected
Test point 1	Battery pack high voltage terminal (A)

Test point 2	Body ground

Test point 1	Battery pack high voltage terminal (B)
Test point 2	Body ground



Is there 0V or less?

YES

Replace the battery condition monitor module .

NO

Go to step 18.

18. Battery pack check 3

-1. Disconnect the following connectors.

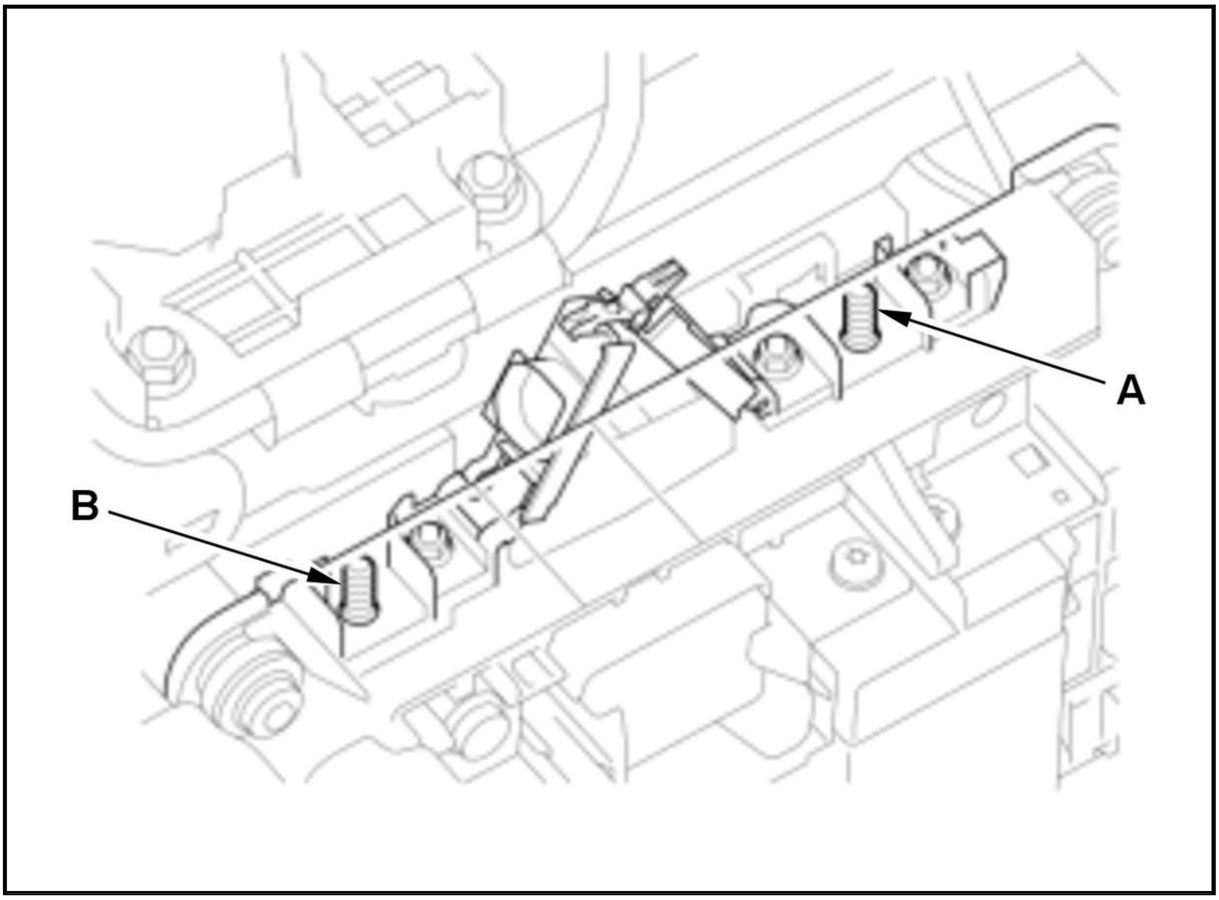
Battery module 1 28P connector
Battery module 2 28P connector
Battery module 3 28P connector
Battery module 4 28P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector A (28P): disconnected
B	Battery condition monitor module connector B (28P): disconnected
B	Battery condition monitor module connector C (28P): disconnected
B	Battery condition monitor module connector D (16P): disconnected

B	Battery condition monitor module connector E (32P): disconnected
B	Battery condition monitor module connector F (12P): disconnected
B	Battery module 1 28P connector: disconnected
B	Battery module 2 28P connector: disconnected
B	Battery module 3 28P connector: disconnected
B	Battery module 4 28P connector: disconnected
Test point 1	Battery pack high voltage terminal (A)
Test point 2	Body ground

Test point 1	Battery pack high voltage terminal (B)
Test point 2	Body ground



Is there 0V or less?

YES

Replace the IPU harness .

NO

Replace the battery pack .

DTC P0AA7 (76)

DTC P0AA7 : HV Battery Voltage Isolation Sensor Circuit

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AA7 HV Battery Voltage Isolation Sensor Circuit	B	B	B

1. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode, and wait 12 seconds.

   -3. Monitor the OBD STATUS for DTC P0AA7 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P0AA7 HV Battery Voltage Isolation Sensor Circuit	B

   Does the HDS indicate FAILED?

   YES

   Go to step 2.

   NO

   If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (BATT+ line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the **service plug** and the **IPU cover** .

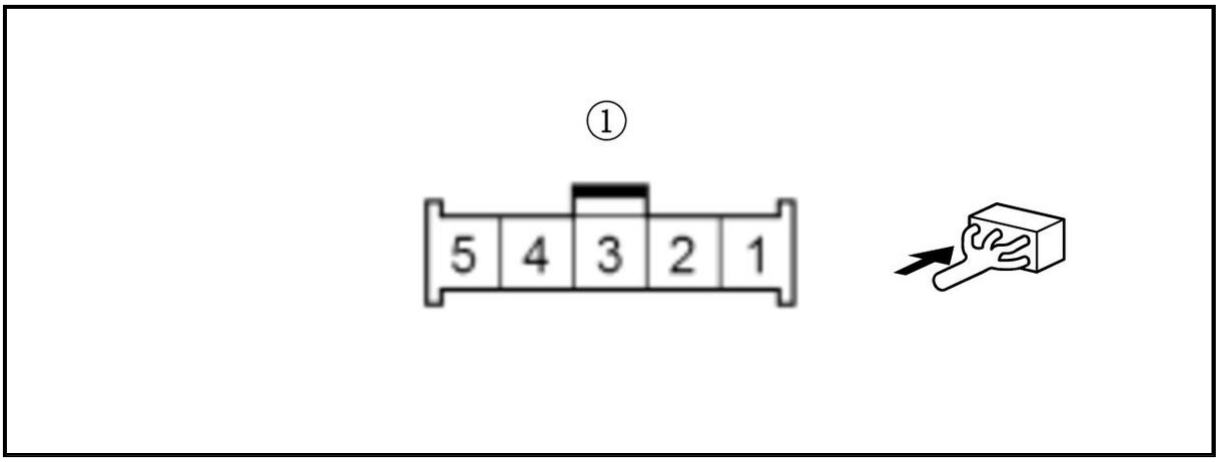
   -3. Disconnect the following connectors.

   Battery condition monitor module connector A (28P)

   Subjunction board connector A (5P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector A (28P): disconnected
B	Subjunction board connector A (5P): disconnected
Test point 1	**Battery condition monitor module connector A (28P) No. 15**
Test point 2	Subjunction board connector A (5P) (female terminals) No. 5: ①



Is there 1.0 Ω or less?

YES

Go to step 3.

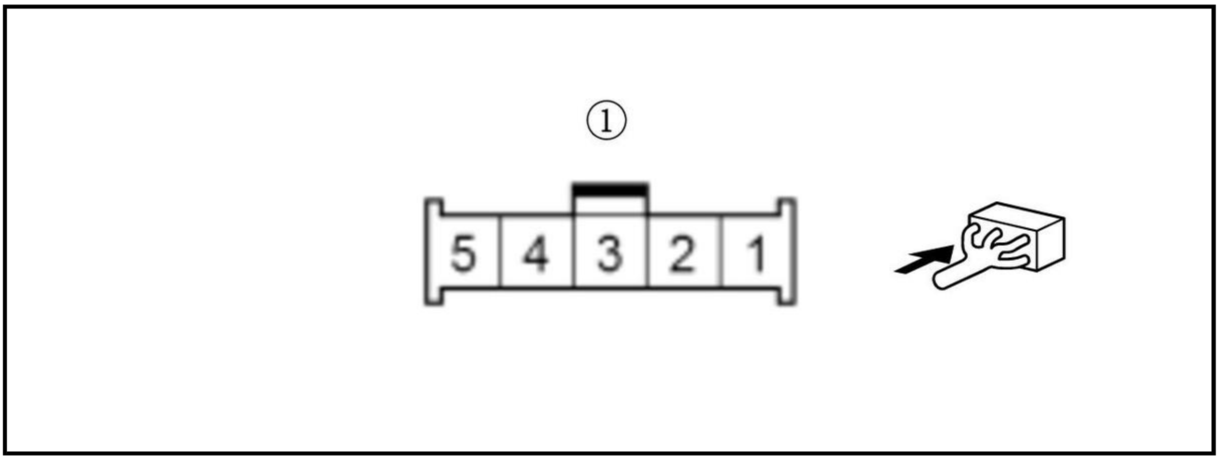
NO

Repair an open in the BATT+ wire between the battery condition monitor module (A15) and the subjunction board.

3. Open wire check (BATT- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector A (28P): disconnected
B	Subjunction board connector A (5P): disconnected
Test point 1	**Battery condition monitor module connector A (28P) No. 4**
Test point 2	Subjunction board connector A (5P) (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The BATT- wire is OK. **Replace the subjunction board** , then recheck. If DTC P0AA7 is still indicated, **replace the battery condition monitor module** .

NO

Repair an open in the BATT- wire between the battery condition monitor module (A4) and the subjunction board.

DTC P0ABF

DTC P0ABF : HV Battery Pack Current Sensor Circuit

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0ABF, troubleshoot those DTCs first, then recheck for P0ABF.
-
  - -

    P1586, P158A

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0ABF HV Battery Pack Current Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0ABF and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the battery condition monitor module if it does not have the latest software .

DTC P0AC0

DTC P0AC0 : HV Battery Pack Current Sensor Circuit Range/Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0AC0, troubleshoot those DTCs first, then recheck for P0AC0.
-
  - -

    P158B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AC0 HV Battery Pack Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0AC0 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the battery condition monitor module if it does not have the latest software .

DTC P0AC1

DTC P0AC1 : HV Battery Pack Current Sensor Circuit Low

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0AC1, troubleshoot those DTCs first, then recheck for P0AC1.
-
  - -

    P158D, P158E

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AC1 HV Battery Pack Current Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

Are DTC P0AC1 and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the battery condition monitor module if it does not have the latest software .

DTC P0AC2

DTC P0AC2 : HV Battery Pack Current Sensor Circuit High

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0AC2, troubleshoot those DTCs first, then recheck for P0AC2.
-
  - -

    P158F, P1596

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AC2 HV Battery Pack Current Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0AC2 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the battery condition monitor module if it does not have the latest software .

DTC P0AC3

DTC P0AC3 : HV Battery Pack Current Sensor Circuit Intermittent/Erratic

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .

- If any of the DTCs listed below are indicated at the same time as DTC P0AC3, troubleshoot those DTCs first, then recheck for P0AC3.
-
    - -

      P1597, P1598

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AC3 HV Battery Pack Current Sensor Circuit Intermittent/Erratic	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0AC3 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the battery condition monitor module if it does not have the latest software .

DTC P0AE1 (62)

DTC P0AE1 : HV Battery Precharge Contactor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE1 HV Battery Precharge Contactor Circuit	B	B	B

DTC (Electric Powertrain)

1. DTC (OBD STATUS) check

   -1. Turn the vehicle to the ON mode.

   -2. Monitor the OBD STATUS for DTC P0AFA, P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, U0110, U012D, U1205, U1220, U12A5, U1604 and U1605 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0AFA HV Battery System Voltage Low	B
P0B3B HV Battery Cell Voltage Sense Circuit 1	B
P0B40 HV Battery Cell Voltage Sense Circuit 2	B

DTC Description	OBD STATUS
P0B45 HV Battery Cell Voltage Sense Circuit 3	B
P0B4A HV Battery Cell Voltage Sense Circuit 4	B
P0B4F HV Battery Cell Voltage Sense Circuit 5	B
P0B54 HV Battery Cell Voltage Sense Circuit 6	B
U0110 F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B
U012D F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B
U1205 EP-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B
U1220 DC-DC Converter Serial Communication Transmit Error	B
U12A5 EP-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B
U1604 F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B
U1605 F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B

Does the HDS indicate FAILED?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Motor control system check

-1. Check for Pending or Confirmed DTCs with the HDS.

Traction motor control module

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

Generator motor control module

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are any motor control module DTC indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 3.

3. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE1 HV Battery Precharge Contactor Circuit	B	B	B

Is DTC P0AE1 indicated?

YES

The failure is duplicated. Go to step 4.

NO

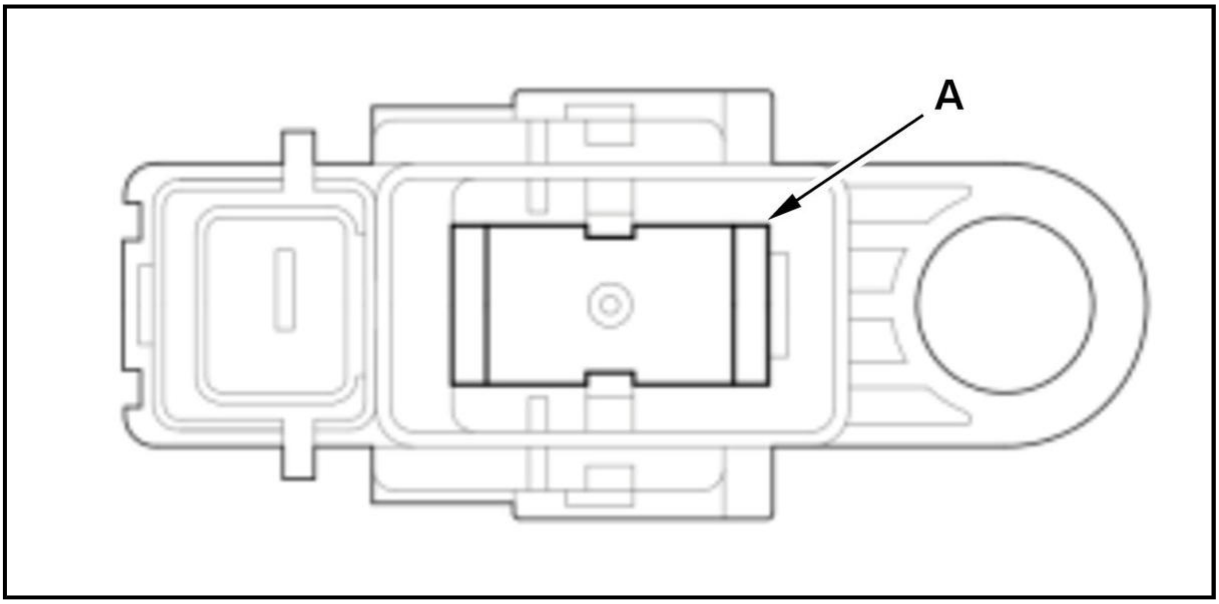
Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

4. Service plug check (high voltage circuit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the service plug** .

-3. Check the service plug terminal (A) for damage or corrosion.



Is the terminal OK?

YES

Go to step 5.

NO

Replace the service plug.

5. Electric A/C compressor check

-1. **Disconnect the electric A/C compressor connector A (2P) from the electric A/C compressor** .

-2. **Reinstall the service plug** .

-3. **Do the 12 volt battery terminal reconnection procedure** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE1 HV Battery Precharge Contactor Circuit	B	B	B

Is DTC P0AE1 indicated?

YES

Go to step 6.

NO

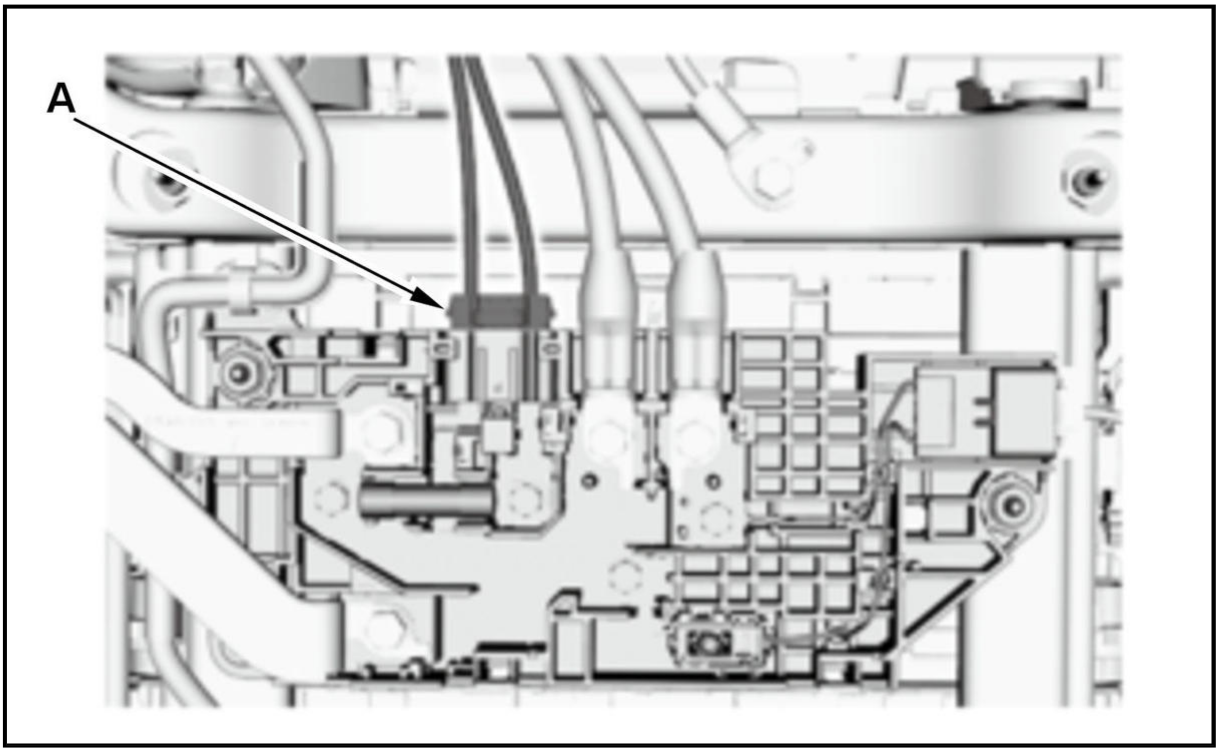
Replace the electric A/C compressor .

6. Electric A/C compressor power cable check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the service plug** .

-3. Disconnect the electric A/C compressor high voltage cable 2P connector (A) from the subjunction board.



-4. **Reinstall the service plug** .

-5. **Do the 12 volt battery terminal reconnection procedure** .

-6. Turn the vehicle to the ON mode.

-7. Clear the DTC with the HDS.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE1 HV Battery Precharge Contactor Circuit	B	B	B

Is DTC P0AE1 indicated?

YES

Go to step 7.

NO

There is a failure in the electric A/C compressor power cable. **Replace the battery power cable** .

7. Battery power cable check

-1. Turn the vehicle to the OFF (LOCK) mode.

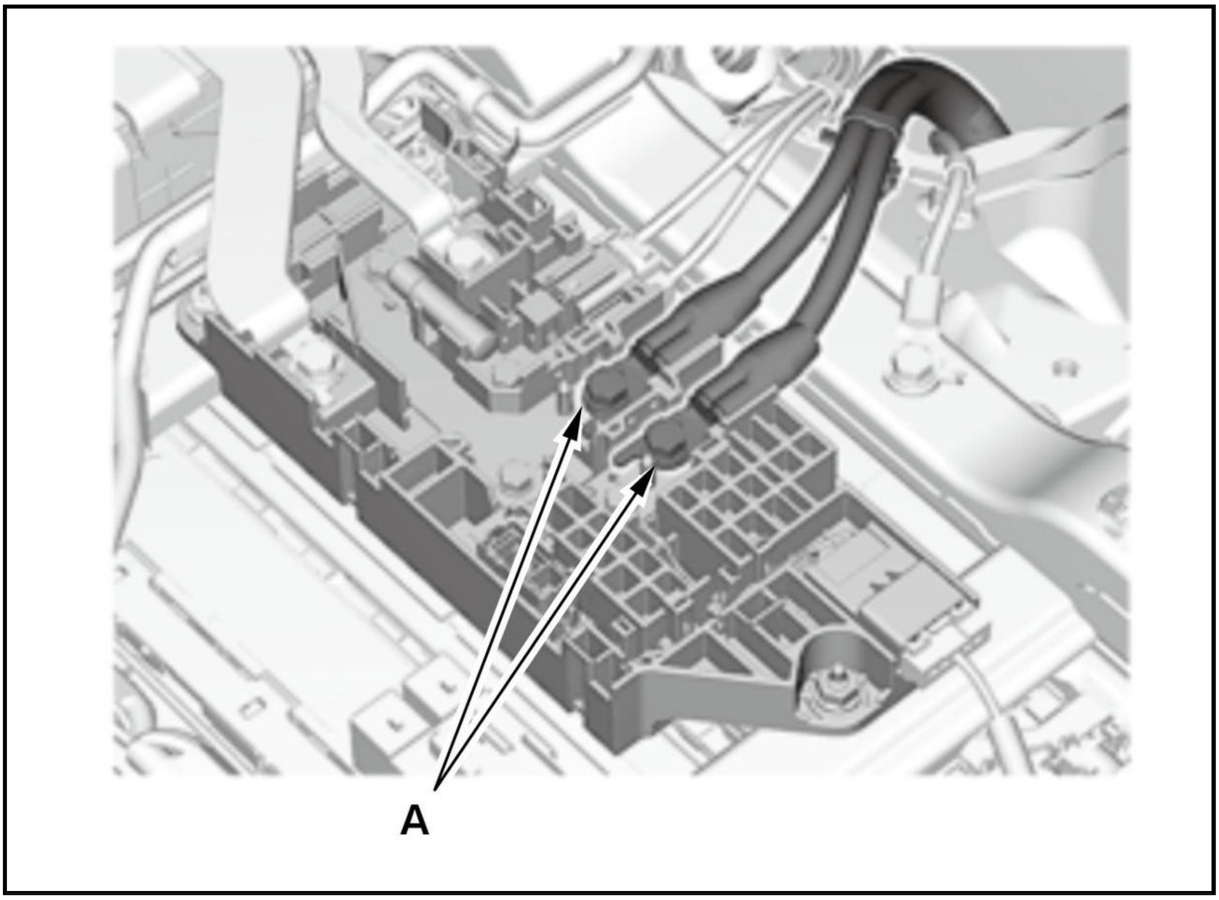
-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. **Remove the service plug** .

-4. **Disconnect the battery power cable connector from the PCU** .

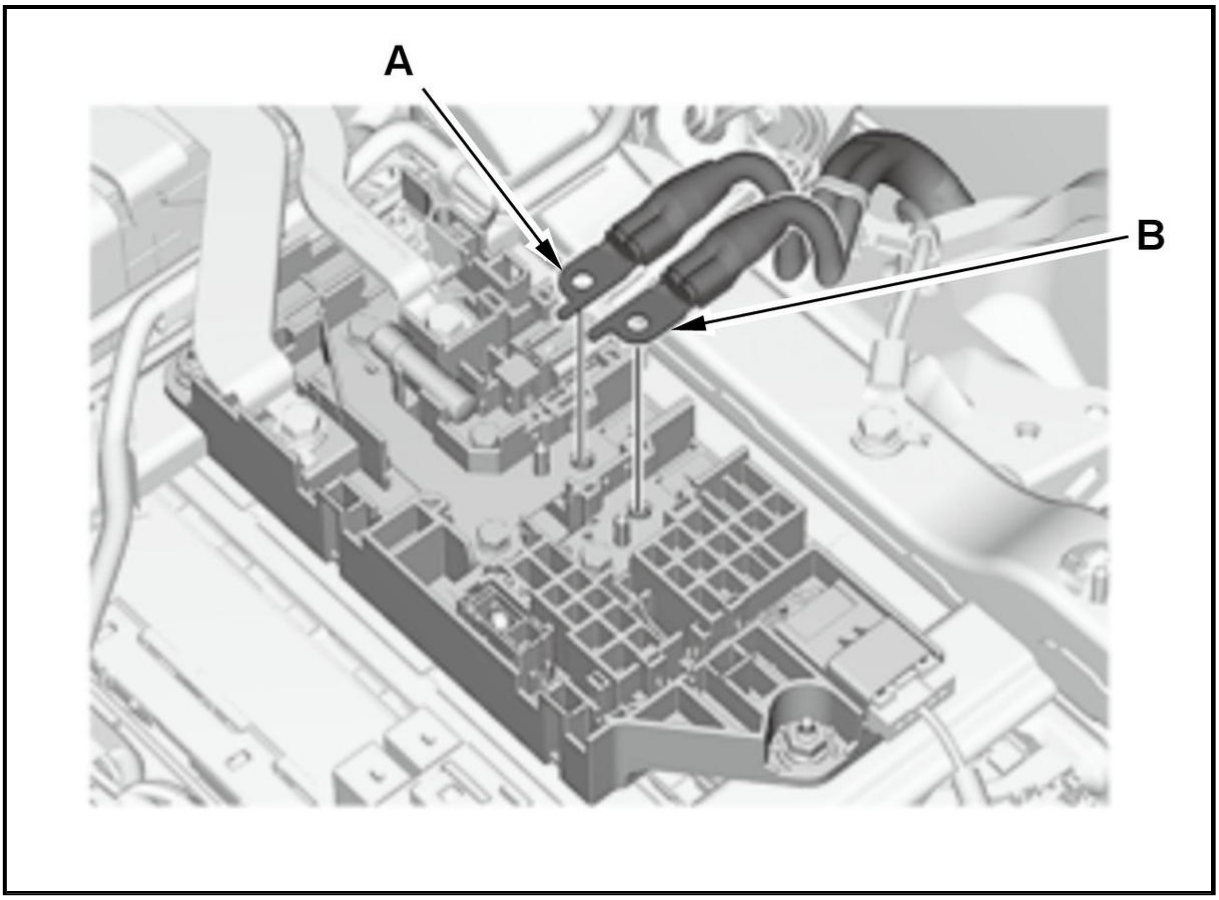
-5. **Disconnect the battery power cable terminals (A) from the subjunction board** .

NOTE: Wrap the subjunction board terminals with insulating tape.



-6. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery power cable (PCU side): disconnected
B	Battery power cable (subjunction board side): disconnected
Test point 1	Battery power cable (subjunction board side) (+) (A)
Test point 2	Battery power cable (subjunction board side) (-) (B)



Is there continuity?

YES

Replace the battery power cable .

NO

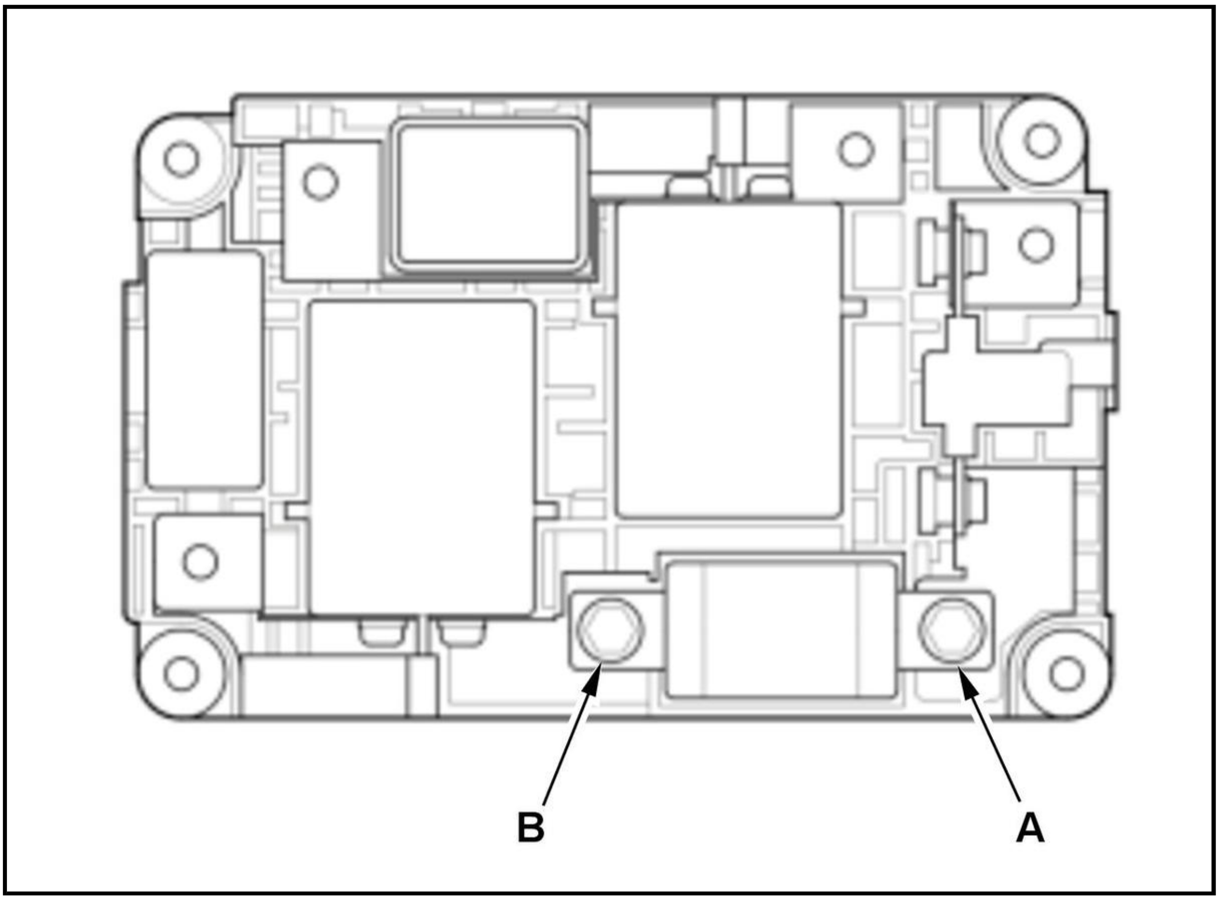
Go to step 8.

8. Main fuse check

-1. **Remove the IPU and the IPU case** .

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Main fuse terminal (A)
Test point 2	Main fuse terminal (B)



Is there continuity?

YES

Go to step 9.

NO

Faulty the main fuse. **Replace the junction board** .

9. High voltage contactor check (coil side)

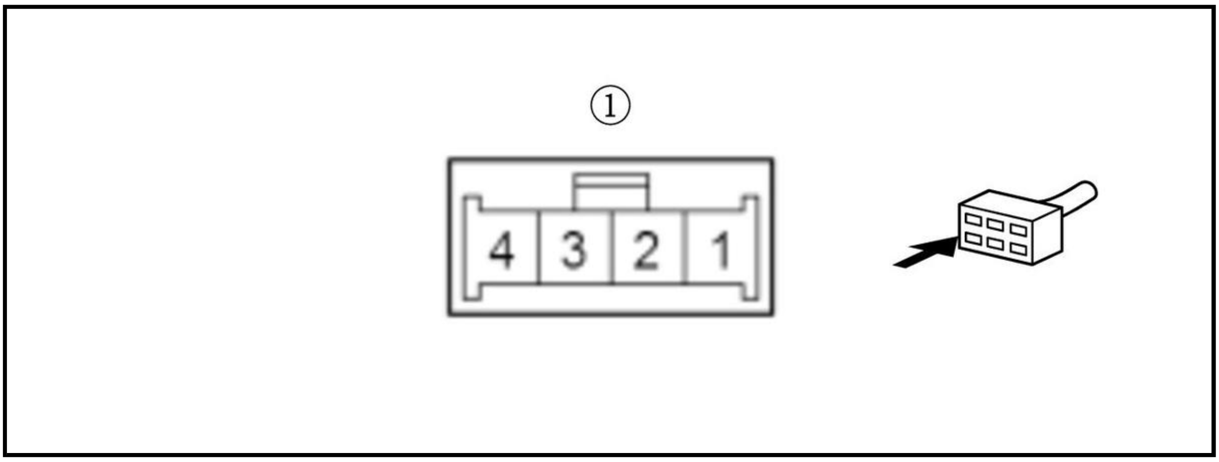
-1. **Remove the junction board** .

-2. Disconnect the following connector.

Junction board 4P connector

-3. At the junction board side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
Test point 1	Junction board 4P connector (male terminals) No. 3: ①
Test point 2	Junction board 4P connector (male terminals) No. 4: ①



Is there 31.1 - 38.0 Ω ?

YES

Go to step 10.

NO

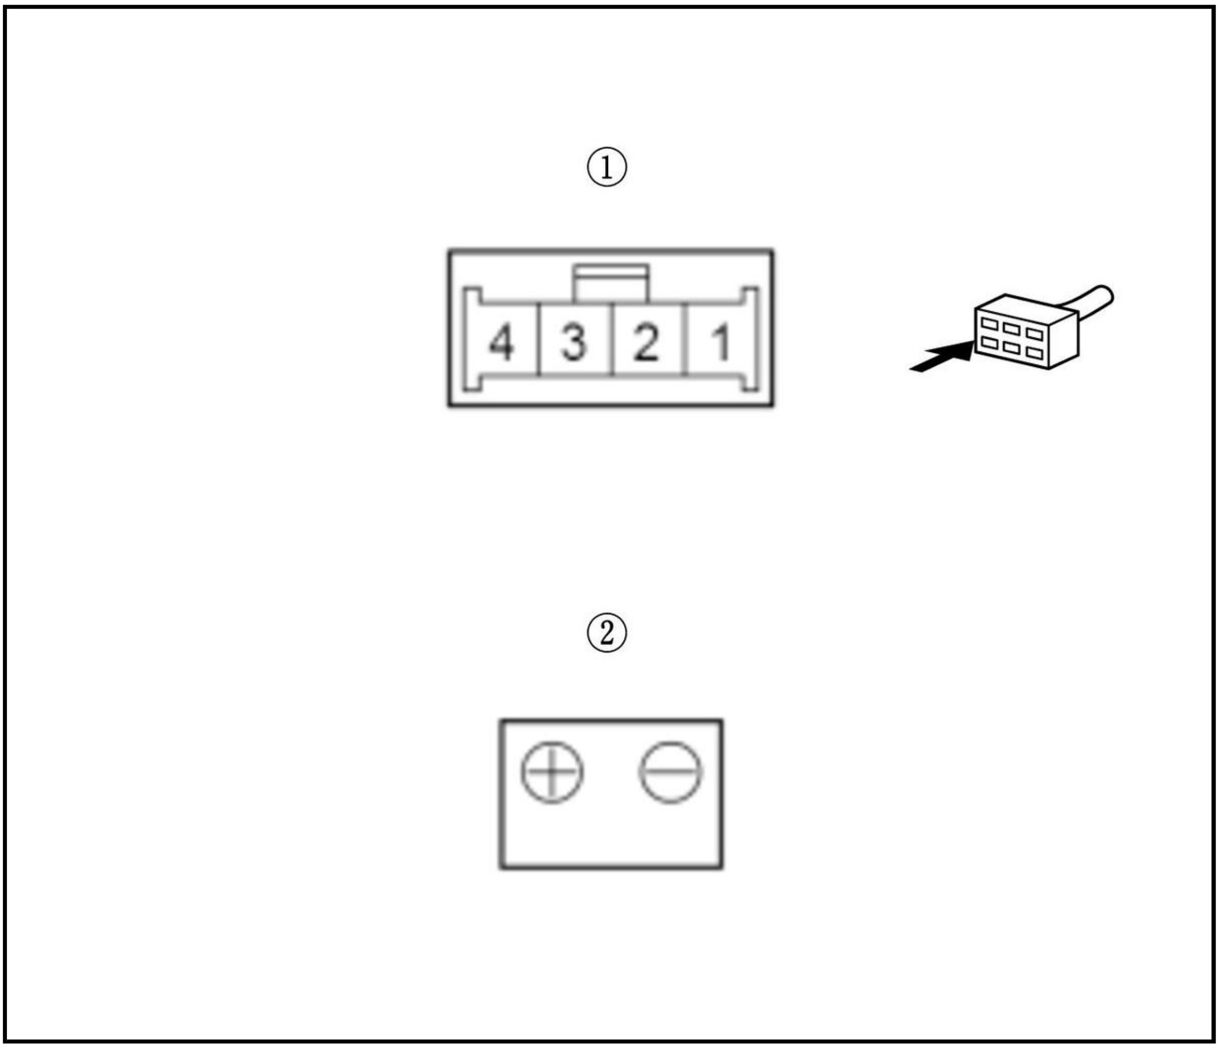
Faulty high voltage contactor. **Replace the junction board** .

10. High voltage contactor check (switch side)

-1. At the junction board side, connect terminals A and B to the 12 volt battery with jumper wires.

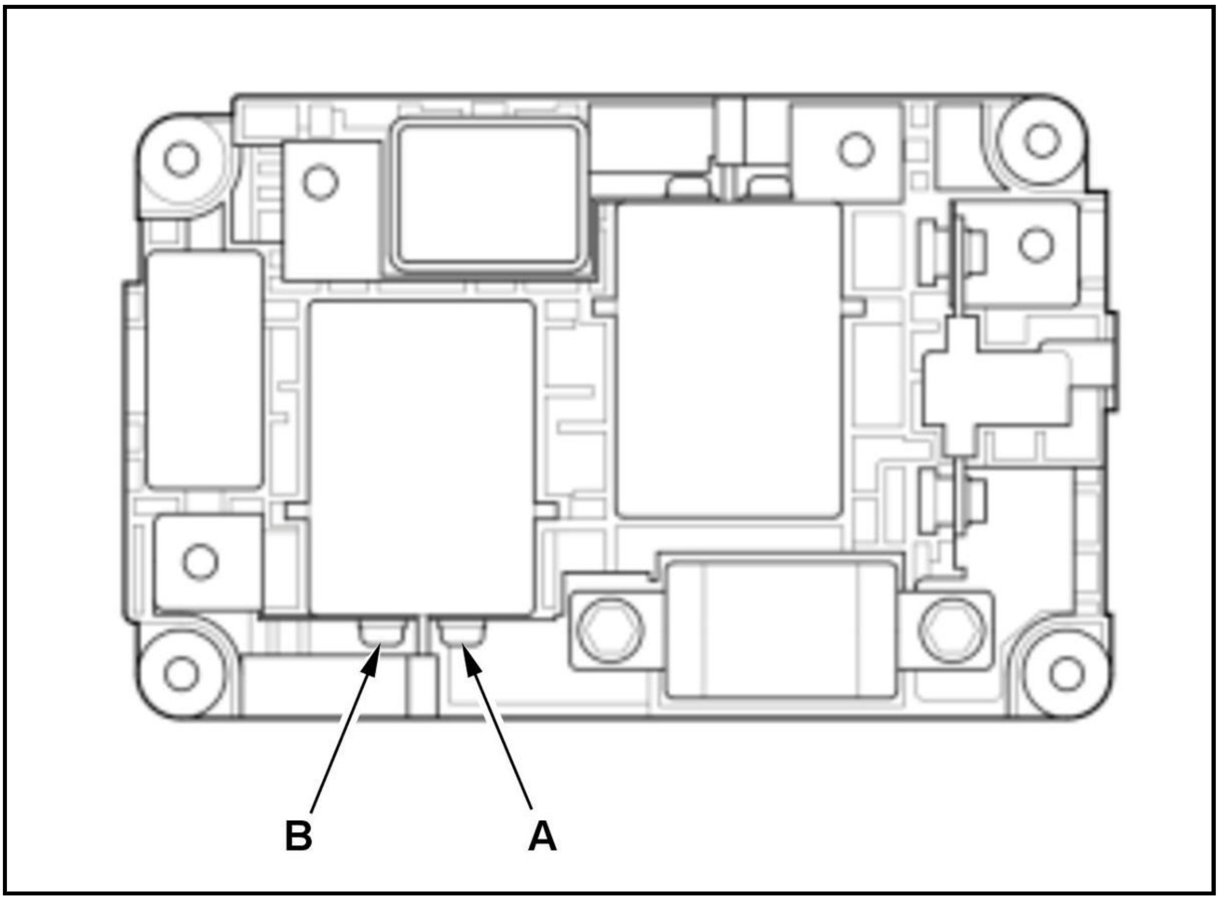
Terminal A	Junction board 4P connector (male terminals) No. 3: ①
Terminal B	12 volt battery positive terminal: ②

Terminal A	Junction board 4P connector (male terminals) No. 4: ①
Terminal B	12 volt battery negative terminal: ②



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
B	Junction board 4P connector terminals No. 3 and No. 4 (junction board side): jumped to 12 volt battery
Test point 1	High voltage contactor terminal (A)
Test point 2	High voltage contactor terminal (B)



Is there continuity?

YES

Go to step 11.

NO

Faulty high voltage contactor. Replace the junction board .

11. Open wire check (CNTP line)

-1. Remove the jumper wire from the junction board.

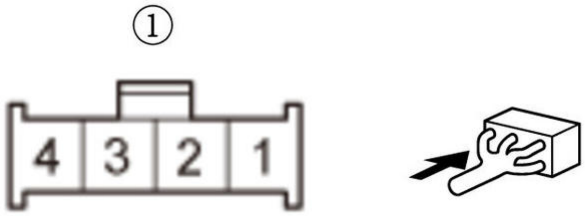
-2. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	Junction board 4P connector (female terminals) No. 4: ①

Test point 2	Battery condition monitor module connector E (32P) No. 4



Is there 1.0 Ω or less?

YES

Go to step 12.

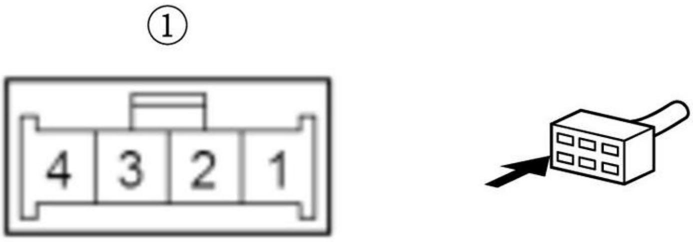
NO

Repair an open in the CNTP wire between the junction board and the battery condition monitor module (E4).

12. Bypass contactor check (coil side)

-1. At the junction board side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
Test point 1	Junction board 4P connector (male terminals) No. 2: ①
Test point 2	Junction board 4P connector (male terminals) No. 3: ①



Is there 92.7 - 113.3 Ω ?

YES

Go to step 13.

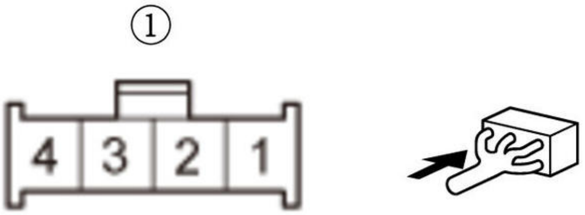
NO

Faulty bypass contactor. **Replace the junction board** .

13. Open wire check (PRE line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	Junction board 4P connector (female terminals) No. 2: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 6**



Is there 1.0 Ω or less?

YES

Go to step 14.

NO

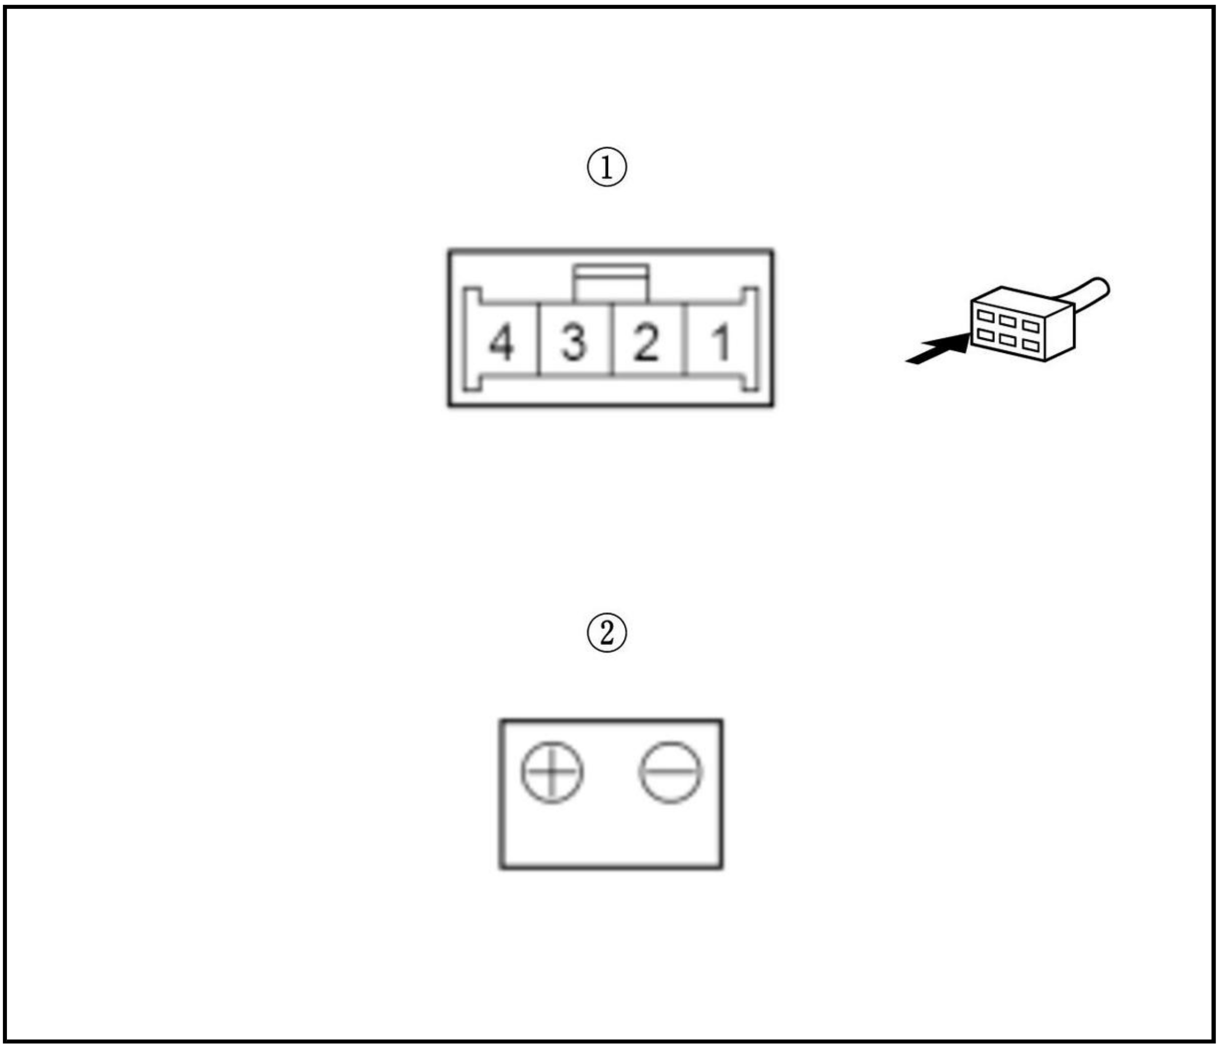
Repair an open in the PRE wire between the junction board and the battery condition monitor module (E6).

14. Bypass contactor check (switch side)

-1. At the junction board side, connect terminals A and B to the 12 volt battery with jumper wires.

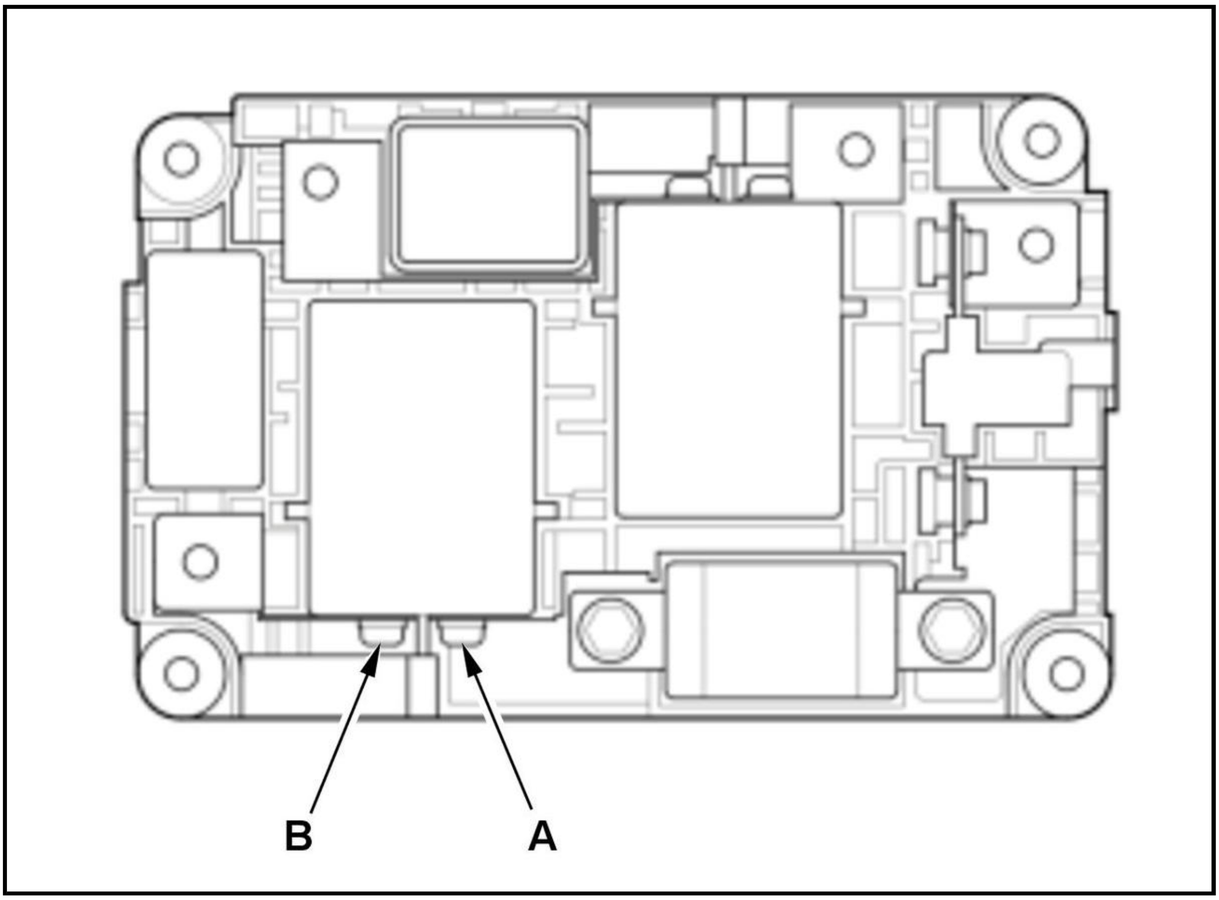
Terminal A	Junction board 4P connector (male terminals) No. 3: ①
Terminal B	12 volt battery positive terminal: ②

Terminal A	Junction board 4P connector (male terminals) No. 2: ①
Terminal B	12 volt battery negative terminal: ②



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
B	Junction board 4P connector terminals No. 3 and No. 2 (junction board side): jumped to 12 volt battery
Test point 1	High voltage contactor terminal (A)
Test point 2	High voltage contactor terminal (B)



Is there continuity?

YES

Go to step 15

NO

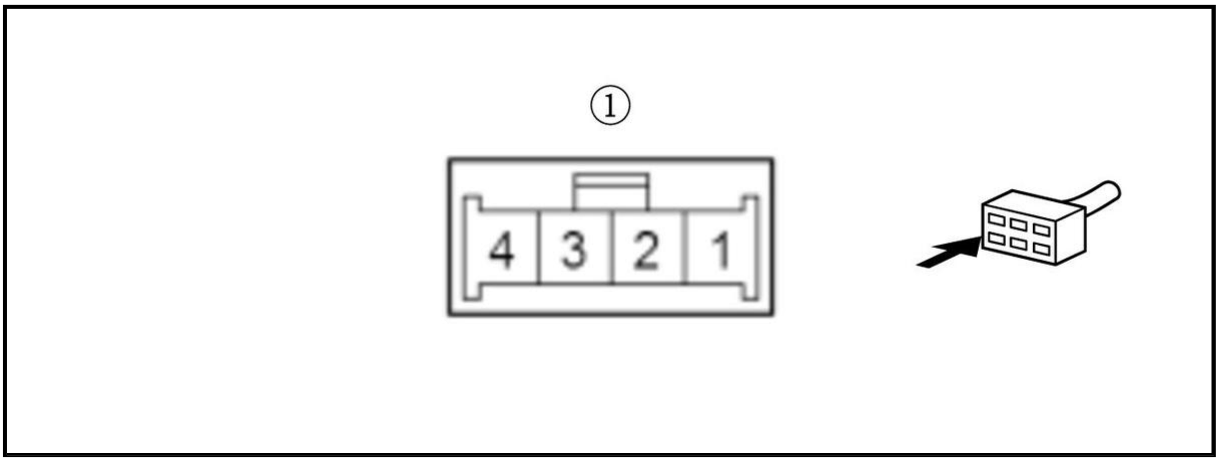
Faulty bypass contactor. **Replace the junction board** .

15. High voltage sub contactor check (coil side)

    -1. Remove the jumper wire from the junction board.

    -2. At the junction board side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
Test point 1	Junction board 4P connector (male terminals) No. 1: ①
Test point 2	Junction board 4P connector (male terminals) No. 3: ①



Is there 31.1 - 38.0 Ω ?

YES

Go to step 16.

NO

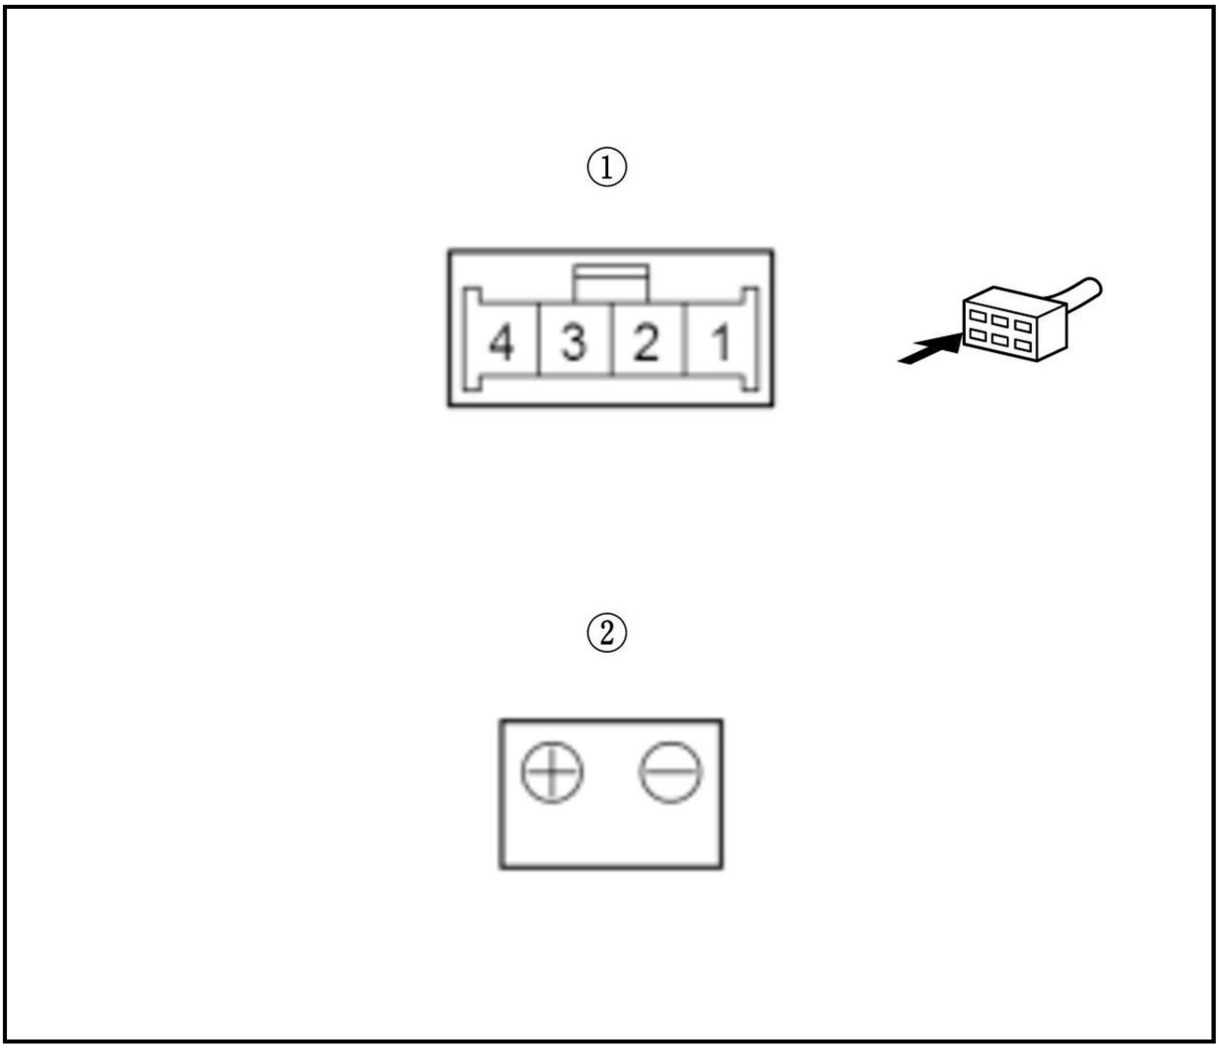
Faulty high voltage sub contactor. **Replace the junction board** .

16. High voltage sub contactor check (switch side)

-1. At the junction board side, connect terminals A and B to the 12 volt battery with jumper wires

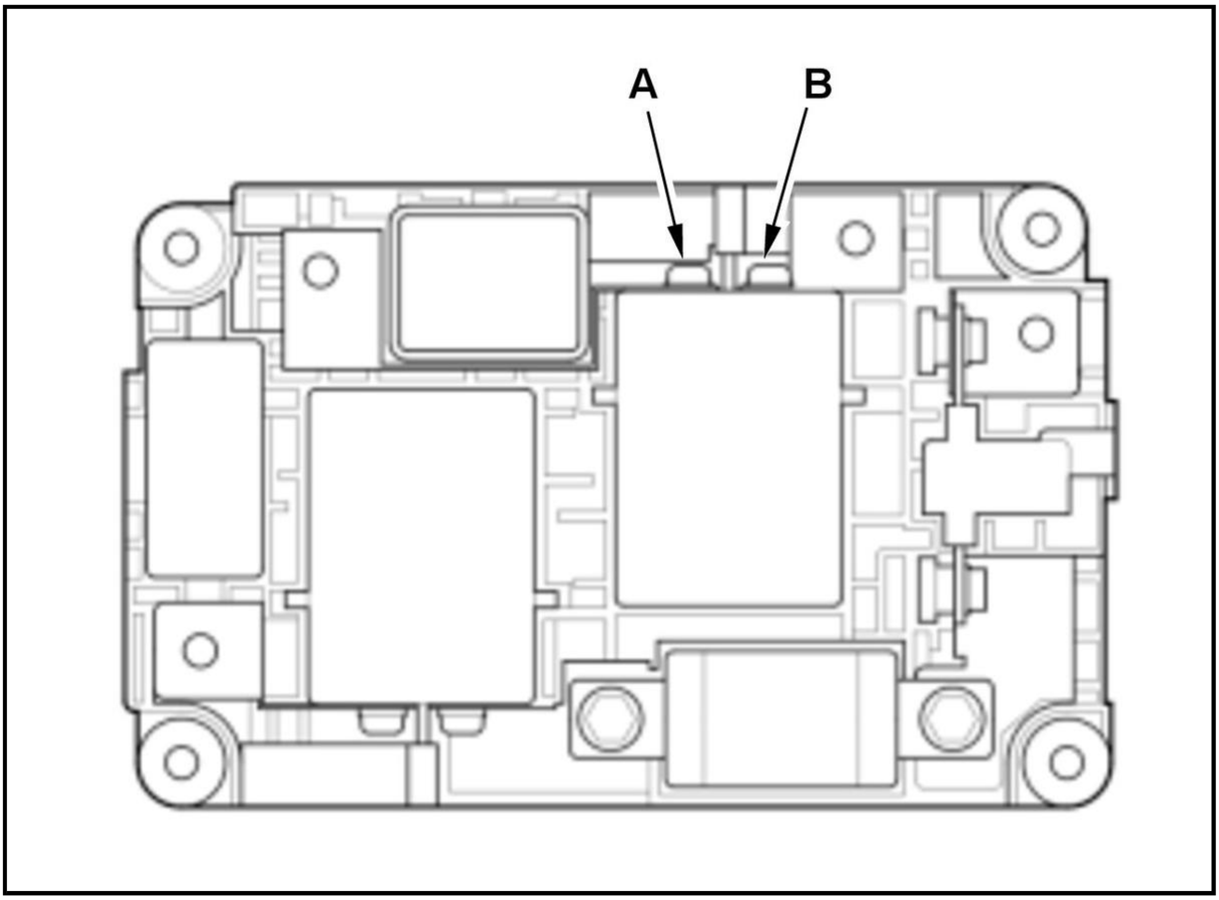
Terminal A	Junction board 4P connector (male terminals) No. 3: ①
Terminal B	12 volt battery positive terminal: ②

Terminal A	Junction board 4P connector (male terminals) No. 1: ①
Terminal B	12 volt battery negative terminal: ②



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
B	Junction board 4P connector terminals No. 3 and No. 1 (junction board side): jumped to 12 volt battery
Test point 1	High voltage sub contactor terminal (A)
Test point 2	High voltage sub contactor terminal (B)



Is there continuity?

YES

Go to step 17.

NO

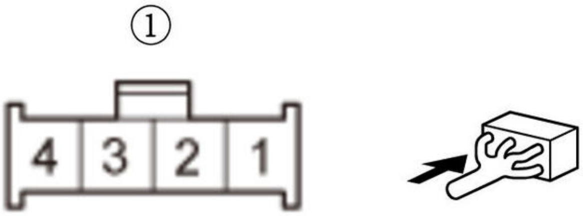
Faulty high voltage sub contactor. **Replace the junction board** .

17. Open wire check (CNTN line)

    -1. Remove the jumper wire from the junction board.

    -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Junction board 4P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	Junction board 4P connector (female terminals) No. 1: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 5**



Is there 1.0 Ω or less?

YES

Go to step 18.

NO

Repair an open in the CNTN wire between the junction board and the battery condition monitor module (E5).

18. Open wire check (CNTPS line)

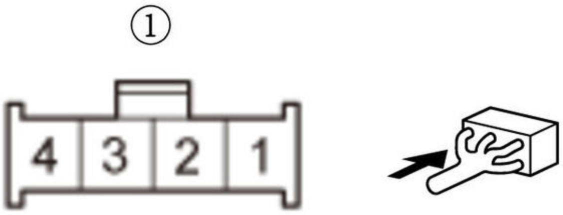
-1. Disconnect the following connector.

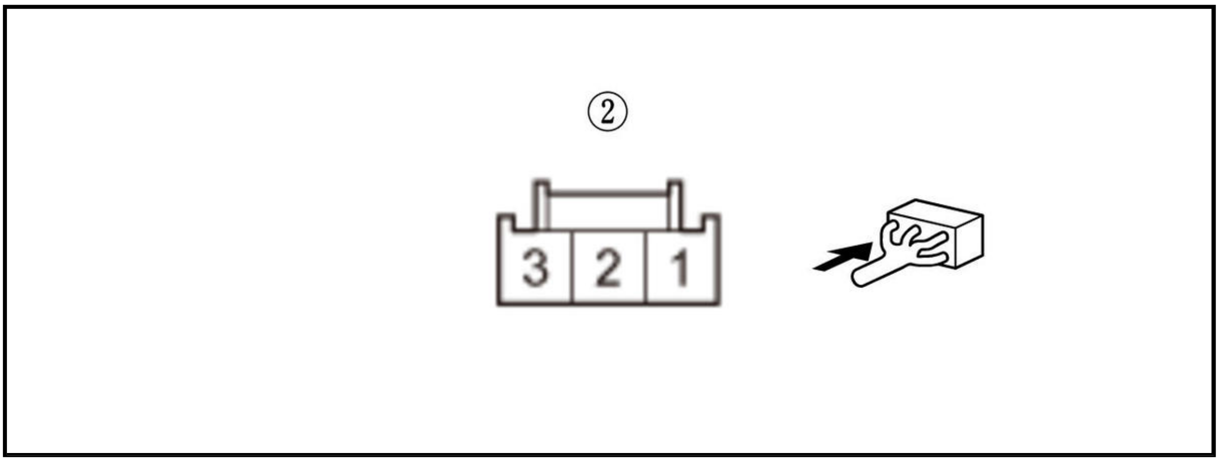
Service plug 3P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LCCK) mode
B	Junction board 4P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	Service plug 3P connector: disconnected
Test point 1	Junction board 4P connector (female terminals) No. 3: ①
Test point 2	Service plug 3P connector (female terminals) No. 1: ②

Test point 1	**Battery condition monitor module connector E (32P) No. 3**
Test point 2	Service plug 3P connector (female terminals) No. 2: ②





Is there 1.0 Ω or less?

YES

Go to step 19.

NO

Repair an open in the CNTPS wire between the junction board and the service plug, and/or the battery condition monitor module (E3) and the service plug.

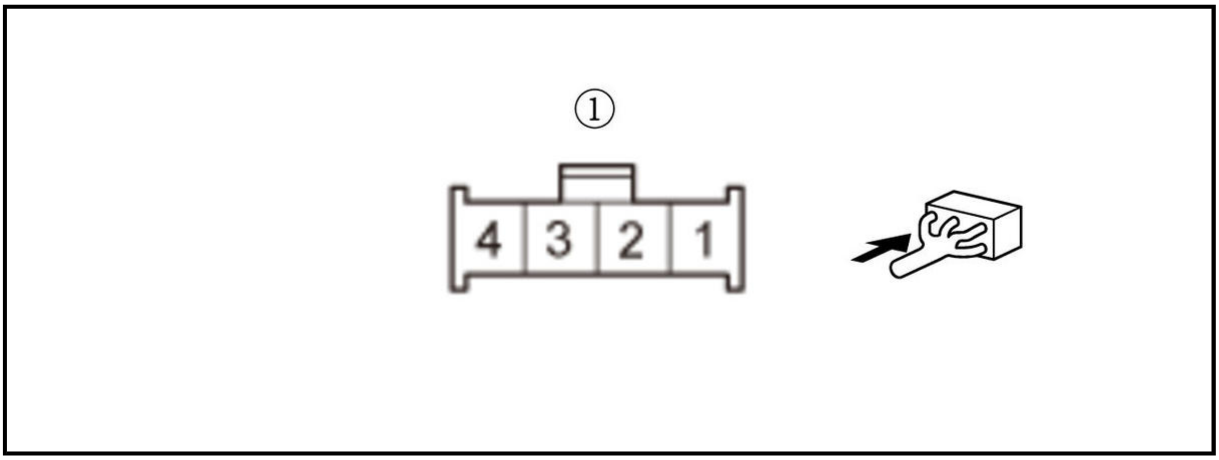
19. Service plug check (contactor control circuit)

-1. **Install the service plug** .

-2. Reconnect the service plug 3P connector.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LCCK) mode
B	Junction board 4P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 3**
Test point 2	Junction board 4P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

Replace the battery condition monitor module .

NO

Replace the service plug.

DTC P0AFA (492)

DTC P0AFA : HV Battery System Voltage Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AFA HV Battery System Voltage Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AFA HV Battery System Voltage Low	B	B	B

   Is DTC P0AFA indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. E5**

   Is the fuse OK?

   YES

   Go to step 3.

   NO

   Replace the No. E5 fuse. Also check for a short to ground on the No. E5 fuse circuit if needed.

3. Relay check

-1. Remove the **service plug** and the **IPU cover** .

-2. **Remove the IGHLDB relay** .

-3. **Test the IGHLDB relay** .

Is the relay OK?

YES

Go to step 4.

NO

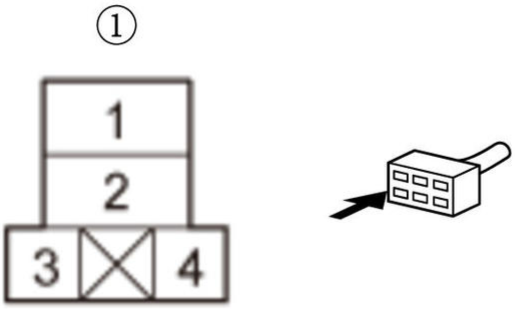
Replace the IGHLDB relay.

4. Open wire check (+B_IMA1/+B_IGB line)

-1. **Do the 12 volt battery terminal reconnection procedure** .

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLDB relay: disconnected
Test point 1	IGHLDB relay 4P socket (female terminal) No. 2, No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

NO

Repair an open in the +B_IMA1/+B_IGB wire between the **No. E5** fuse and IGHLDB relay.

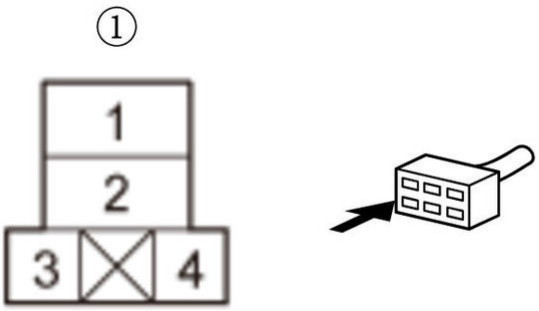
5. Open wire check (IGHLDB line)

-1. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	IGHLDB relay: disconnected
Test point 1	IGHLDB relay 4P socket (female terminal) No. 4: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 19**



Is there 1.0 Ω or less?

YES

Go to step 6.

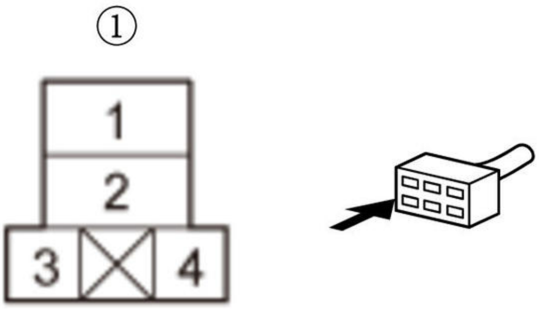
NO

Repair an open in the IGHLDB wire between IGHLDB relay and the battery condition monitor module (E19).

6. Open wire check (IGB line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	IGHLDB relay: disconnected
Test point 1	IGHLDB relay 4P socket (female terminal) No. 1: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 2**



Is there 1.0 Ω or less?

YES

The IGB wire is OK. Replace the battery condition monitor module .

NO

Repair an open in the IGB wire between IGHLDB relay and the battery condition monitor module (E2).

DTC P0B3B (122)

DTC P0B3B : HV Battery Cell Voltage Sense Circuit 1

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B3B HV Battery Cell Voltage Sense Circuit 1	B	B	B

DTC (Electric Powertrain)

1. Problem verification (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B3B HV Battery Cell Voltage Sense Circuit 1	B	B	B

   Is DTC P0B3B indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the battery module the battery condition monitor module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Problem verification (update)

   -1. Clear the DTC with the HDS.

   -2. Do the battery condition monitor module update procedure .

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B3B HV Battery Cell Voltage Sense Circuit 1	B	B	B

Is DTC P0B3B indicated?

YES

Go to step 3.

NO

The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

3. Open wire check (VHB subharness)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector A (28P)
Battery condition monitor module connector B (28P)
Battery module 1 28P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector A (28P): disconnected
B	Battery condition monitor module connector B (28P): disconnected
B	Battery module 1 28P connector: disconnected

Circuit name	Test point 1 (**Battery condition monitor module connector A (28P)**)	Test point 2 (Battery module 1 28P connector (male terminals)): ①

Repair an open in the VHB subharness between the battery condition monitor module and the battery module.

DTC P0B40 (1048)

DTC P0B40 : HV Battery Cell Voltage Sense Circuit 2

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B40 HV Battery Cell Voltage Sense Circuit 2	B	B	B

DTC (Electric Powertrain)

1. Problem verification (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B40 HV Battery Cell Voltage Sense Circuit 2	B	B	B

   Is DTC P0B40 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the battery module the battery condition monitor module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Problem verification (update)

   -1. Clear the DTC with the HDS.

   -2. Do the battery condition monitor module update procedure .

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B40 HV Battery Cell Voltage Sense Circuit 2	B	B	B

Is DTC P0B40 indicated?

YES

Go to step 3.

NO

The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

3. Open wire check (VHB subharness)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector B (28P)
Battery module 1 28P connector
Battery module 2 28P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector B (28P): disconnected
B	Battery module 1 28P connector: disconnected
B	Battery module 2 28P connector: disconnected

YES

The VHB subharness is OK. **Replace the battery condition monitor module** and **the battery pack** .

NO

Repair an open in the VHB subharness between the battery condition monitor module and the battery module.

DTC P0B45 (1049)

DTC P0B45 : HV Battery Cell Voltage Sense Circuit 3

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B45 HV Battery Cell Voltage Sense Circuit 3	B	B	B

DTC (Electric Powertrain)

1. Problem verification (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B45 HV Battery Cell Voltage Sense Circuit 3	B	B	B

   Is DTC P0B45 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the battery module the battery condition monitor module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Problem verification (update)

   -1. Clear the DTC with the HDS.

   -2. **Do the battery condition monitor module update procedure** .

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

Repair an open in the VHB subharness between the battery condition monitor module and the battery module.

DTC P0B4A (1050)

DTC P0B4A : HV Battery Cell Voltage Sense Circuit 4

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B4A HV Battery Cell Voltage Sense Circuit 4	B	B	B

DTC (Electric Powertrain)

1. Problem verification (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B4A HV Battery Cell Voltage Sense Circuit 4	B	B	B

   Is DTC P0B4A indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the battery module the battery condition monitor module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Problem verification (update)

   -1. Clear the DTC with the HDS.

   -2. **Do the battery condition monitor module update procedure** .

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B4A HV Battery Cell Voltage Sense Circuit 4	B	B	B

Is DTC P0B4A indicated?

YES

Go to step 3.

NO

The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

3. Open wire check (VHB subharness)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector B (28P)
Battery condition monitor module connector C (28P)
Battery module 2 28P connector
Battery module 3 28P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector B (28P): disconnected
B	Battery condition monitor module connector C (28P): disconnected
B	Battery module 2 28P connector: disconnected
B	Battery module 3 28P connector: disconnected

YES

The VHB subharness is OK. **Replace the battery condition monitor module** and **the battery pack** .

NO

Repair an open in the VHB subharness between the battery condition monitor module and the battery module.

DTC P0B4F (1051)

DTC P0B4F : HV Battery Cell Voltage Sense Circuit 5

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B4F HV Battery Cell Voltage Sense Circuit 5	B	B	B

DTC (Electric Powertrain)

1. Problem verification (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B4F HV Battery Cell Voltage Sense Circuit 5	B	B	B

Is DTC P0B4F indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the battery module the battery condition monitor module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Problem verification (update)

-1. Clear the DTC with the HDS.

-2. **Do the battery condition monitor module update procedure** .

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B4F HV Battery Cell Voltage Sense Circuit 5	B	B	B

Is DTC P0B4F indicated?

YES

Go to step 3.

NO

The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

3. Open wire check (VHB subharness)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector C (28P)
Battery condition monitor module connector D (16P)
Battery module 3 28P connector
Battery module 4 28P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector C (28P): disconnected
B	Battery condition monitor module connector D (16P): disconnected

B	Battery module 3 28P connector: disconnected
B	Battery module 4 28P connector: disconnected

Repair an open in the VHB subharness between the battery condition monitor module and the battery module.

DTC P0B54 (1052)

DTC P0B54 : HV Battery Cell Voltage Sense Circuit 6

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B54 HV Battery Cell Voltage Sense Circuit 6	B	B	B

DTC (Electric Powertrain)

1. Problem verification (DTC check)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B54 HV Battery Cell Voltage Sense Circuit 6	B	B	B

   Is DTC P0B54 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the battery module the battery condition monitor module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Problem verification (update)

   -1. Clear the DTC with the HDS.

   -2. **Do the battery condition monitor module update procedure** .

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0B54 HV Battery Cell Voltage Sense Circuit 6	B	B	B

   Is DTC P0B54 indicated?

   YES

Go to step 3.

NO

The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

3. Open wire check (VHB subharness)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector D (16P)
Battery module 4 28P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector D (16P): disconnected
B	Battery module 4 28P connector: disconnected

Circuit name	Test point 1 (**Battery condition monitor module connector D (16P)**)	Test point 2 (Battery module 4 28 connector (male terminals)): ①
VH60	No. 9	No. 7
VH61	No. 1	No. 19
VH62	No. 10	No. 8
VH63	No. 2	No. 20
VH64	No. 11	No. 9

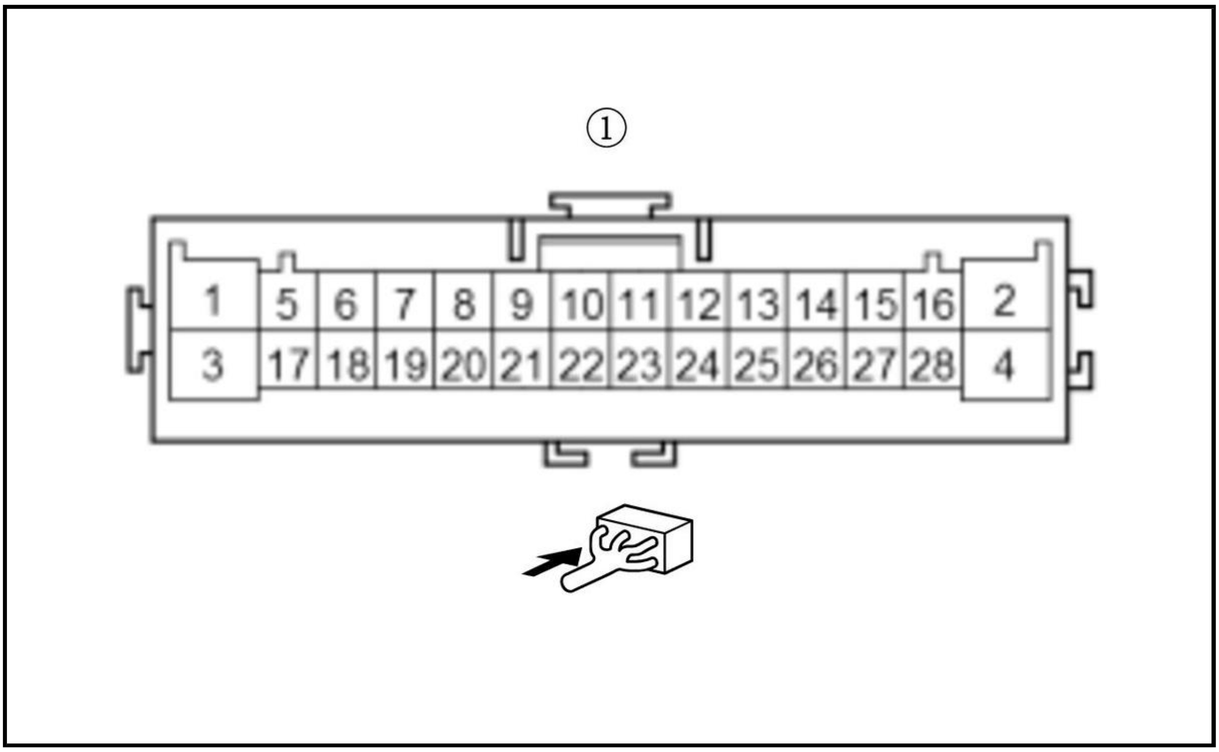
VH68	No. 13	No. 11
VH69	No. 5	No. 23
VH70	No. 14	No. 12

Circuit name	Test point 1 (**Battery condition monitor module connector D (16P)**)	Test point 2 (Battery module 4 28 connector (male terminals)): ①
VH71	No. 6	No. 24
VH72	No. 15	No. 13



Is there 1.0 Ω or less?

YES

The VHB subharness is OK. **Replace the battery condition monitor module** and **the battery pack** .

NO

Repair an open in the VHB subharness between the battery condition monitor module and the battery module.

DTC P0D32 (417) (BATTERY CONDITION MONITOR MODULE)

DTC P0D32 : DC-DC Converter Over Temperature (Battery Condition Monitor Module Detected)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0D32 DC-DC Converter Over Temperature (Battery Condition Monitor Module Detected)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

Turn the vehicle to READY TO DRIVE mode, and wait 750 seconds under these conditions.

- Headlights on high beam
- Hazard warning lights on
- Blower fan at maximum speed
- Rear window defogger on
- Seat heater on, max hot

- A/C switch ON, heater on, max hot

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0D32 DC-DC Converter Over Temperature (Battery Condition Monitor Module Detected)	B	B	B

Is DTC P0D32 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. PCU coolant circuit check

-1. **Do the PCU coolant circuit inspection** .

Is it OK?

YES

Check the cooling fan operation. If it is OK, **replace the PCU** .

NO

Repair or replace parts as needed.

DTC P0DA8 (12)

DTC P0DA8 : HV Battery Voltage/Motor Inverter Voltage Correlation

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0DA8 HV Battery Voltage/Motor Inverter Voltage Correlation	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE1 HV Battery Precharge Contactor Circuit	B	B	B

Is DTC P0AE1 indicated?

YES

Go to the DTC P0AE1 troubleshooting.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0DE6 (74)

DTC P0DE6 : HV Battery Pack Voltage Low

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If the DTC cannot be cleared, replace the battery pack .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0DE6 HV Battery Pack Voltage Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for 10 seconds.

NOTE: Do not turn the vehicle to the READY TO DRIVE mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0DE6 HV Battery Pack Voltage Low	B	B	B

Is DTC P0DE6 indicated?

YES

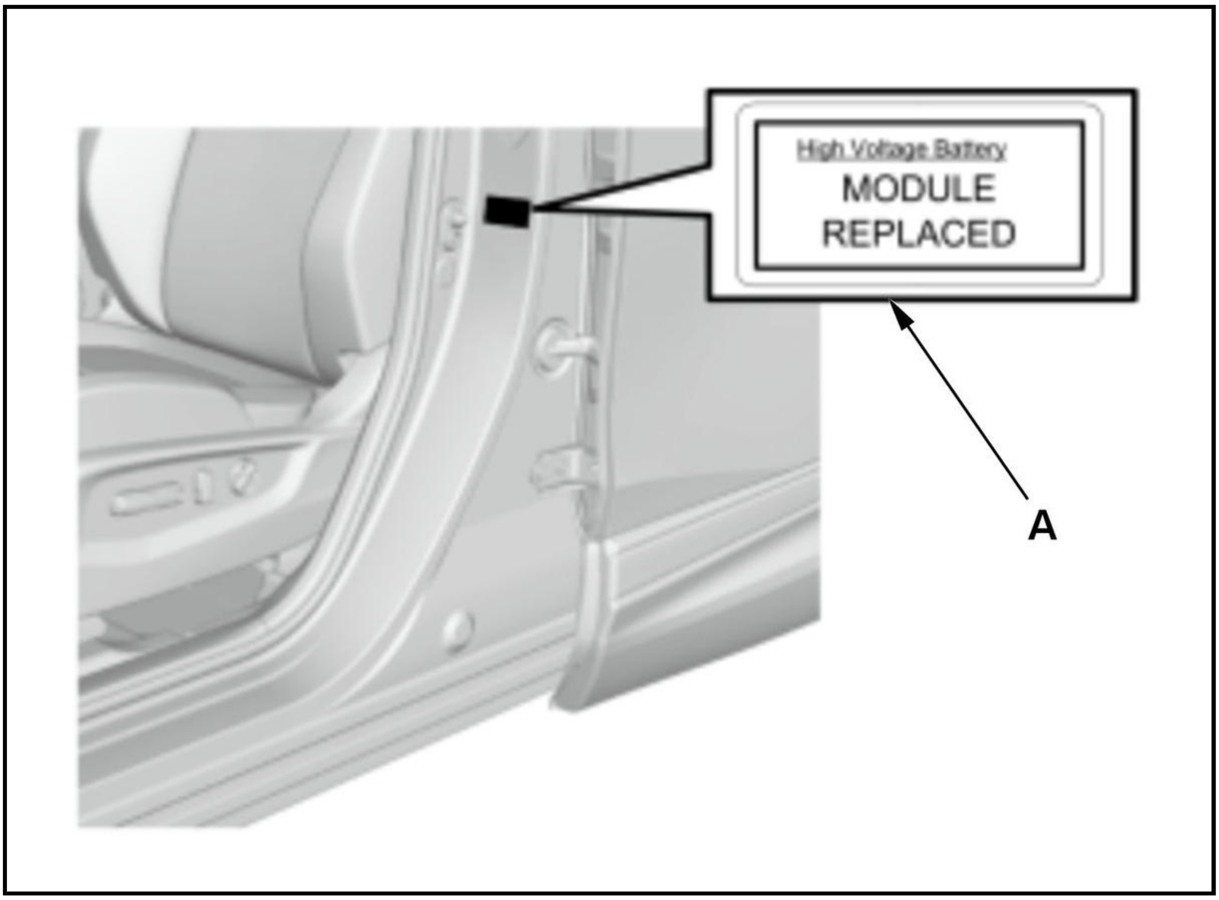
Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Check battery module replacing history

-1. Check the sticker (A) on the left front door jamb area. If the vehicle has been replaced the battery module once already, the sticker is attached.



Is the sticker attached?

YES

Replace the battery pack .

NO

Go to step 3.

3. Identify failure battery module:

NOTE:

- **This step is the procedure for ordering a new replacement battery module.**
- **It is very important to install the new replacement module as soon as possible after it arrives at the dealership. When the module arrived, replace it at once.**

-1. Turn the vehicle to the ON mode.

-2. Select the HV Battery Diagnosis in the System Selection Menu of ELECTRIC POWERTRAIN with the HDS, then select the Current Battery Data, and follow the screen prompts.

NOTE: Select the Battery Type 2. (18Cell - 18Cell - 18Cell - 18Cell)

-3. Identify abnormal battery modules with the HDS.

NOTE: Print the results of the function test.

Is there only one abnormal battery module?

YES

Replace the abnormally determined battery module and battery condition monitor module . Do the following procedures and keep the vehicle until the battery module arrives at the dealership. To prevent changing the high-voltage battery, do not set to READY TO DRIVE during keeping the vehicle.

- Enter the neutral position holding mode .
- Do the 12 volt battery terminal disconnection procedure and continue the neutral position holding mode.
- Remove the service plug .

NO

Replace the battery pack .

DTC P0DE7 (125)

DTC P0DE7 : HV Battery Pack Voltage High

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0DE7 HV Battery Pack Voltage High	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC P0DE7 and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Problem verification

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0DE7 HV Battery Pack Voltage High	B	B	B

Is DTC P0DE7 indicated?

YES

Replace the battery pack , **the battery condition monitor module** , **the PCU** , and **the PCM** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0E2D (1055)

DTC P0E2D : HV Battery Cell Voltage Sense Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E2D HV Battery Cell Voltage Sense Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E2D HV Battery Cell Voltage Sense Circuit	B	B	B

Is DTC P0E2D indicated?

YES

Replace the battery condition monitor module .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1447 (77)

DTC P1447 : HV Battery Pack Deterioration (Middle Severity)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1447 HV Battery Pack Deterioration (Middle Severity)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the READY TO DRIVE mode.

   -5. Test-drive the vehicle; accelerate to 31 mph (50 km/h) and decelerate to 0 mph (0 km/h), repeat that for 10 minutes.

   NOTE: Do not turn the vehicle to OFF (LOCK) mode during test-drive.

   -6. Monitor the OBD STATUS for DTC P1447 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1447 HV Battery Pack Deterioration (Middle Severity)	B

Does the HDS indicate PASSED?

YES

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

If the HDS indicates FAILED, **replace the battery pack** . If the HDS indicates NOT COMPLETED, keep the test-driving until a result comes on.

DTC P144A (78)

DTC P144A : HV Battery Pack Deterioration (High Severity)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P144A HV Battery Pack Deterioration (High Severity)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the READY TO DRIVE mode.

   -5. Test-drive the vehicle; accelerate to 31 mph (50 km/h) and decelerate to 0 mph (0 km/h), repeat that for 10 minutes.

   NOTE: Do not turn the vehicle to OFF (LOCK) mode during test-drive.

-6. Monitor the OBD STATUS for DTC P144A in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P144A HV Battery Pack Deterioration (High Severity)	B

Does the HDS indicate PASSED?

YES

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

If the HDS indicates FAILED, **replace the battery pack** . If the HDS indicates NOT COMPLETED, keep the test-driving until a result comes on.

DTC P1586 (23)

DTC P1586 : HV Battery Current Sensor

NOTE:

- Before you troubleshoot, review the **How to Troubleshoot the Electric Powertrain** and **Electric Powertrain Service Precaution** .
- If any of the DTCs listed below are indicated at the same time as DTC P1586, troubleshoot those DTCs first, then recheck for P1586.
-
    - -

      Traction motor control module: P1D77
    - -

      Battery condition monitor module: P158A, P1597, P1598

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1586 HV Battery Current Sensor	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the READY TO DRIVE mode.

Test-drive the vehicle under these conditions:

- Vehicle speed above 31 mph (50 km/h)
- Maintain the vehicle speed for 2 seconds with brake pedal pressed (brake pedal position switch is ON).

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1586 HV Battery Current Sensor	B	B	B

Is DTC P1586 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (SGISOC circuit, others)

-1. Keep the test-drive condition of the problem verification, and check the parameter(s) below.

Signal	Current conditions	
	Values	Unit
HV Battery Resolution Current Sensor1 Sensing Current	B	B
HV Battery Resolution Current Sensor2 Sensing Current	B	B

-2. Compare the value of HV Battery Resolution Current Sensor1 Sensing Current and HV Battery Resolution Current Sensor2 Sensing Current.

Does the value about same?

YES

Go to step 5.

NO

Go to step 3.

3. Open wire check (SGISOC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. **Remove the IPU and the IPU case** .

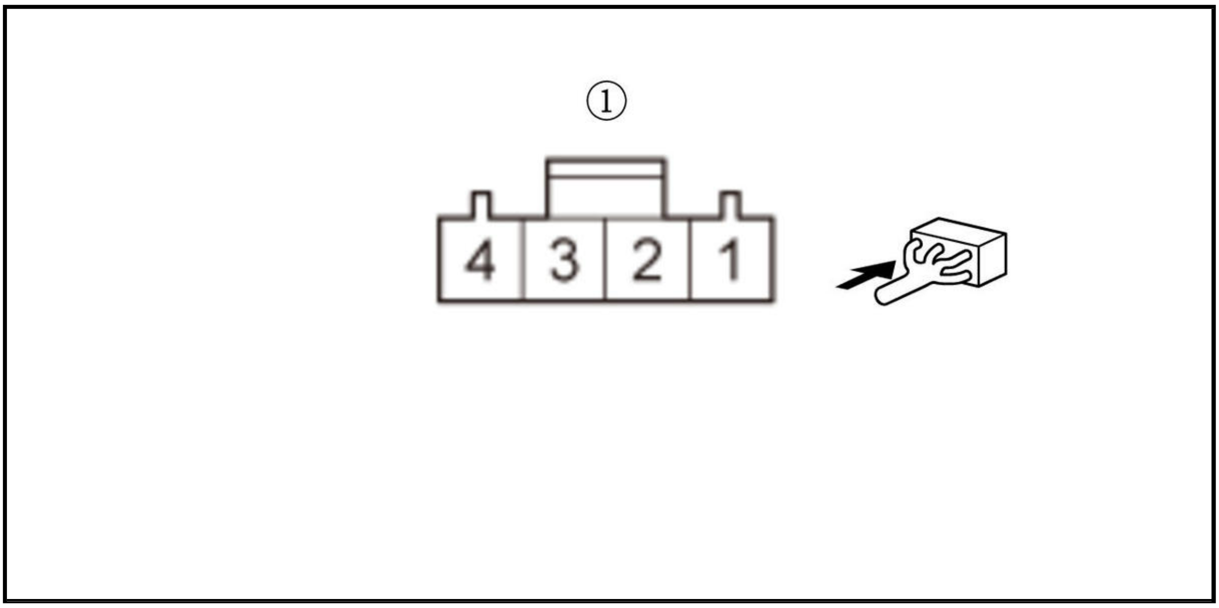
-4. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 29**

Test point 2	Battery current sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Go to step 4

NO

Repair an open in the SGISOC wire between the battery current sensor and the battery condition monitor module (E29).

4. Battery current sensor check

-1. **Substitute a known-good battery current sensor** .

-2. Install all removed parts to the IPU, then **install the IPU** .

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the READY TO DRIVE mode.

Test-drive the vehicle under these conditions:

- Vehicle speed above 31 mph (50 km/h)
- Maintain the vehicle speed for 2 seconds with brake pedal pressed (brake pedal position switch is ON).

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1586 HV Battery Current Sensor	B	B	B

Is DTC P1586 indicated?

YES

Replace the battery condition monitor module .

NO

Replace the original battery current sensor .

5. PCU check

-1. Keep the test-drive condition of the problem verification, and check the parameter(s) below.

Signal	Current conditions	
	Values	Unit
HV Battery Resolution Current Sensor1 Sensing Current	B	B
Motor Inverter Current (BAT)	B	B

-2. Compare the value of HV Battery Resolution Current Sensor1 Sensing Current and Motor Inverter Current (BAT).

Does the value about same?

YES

Replace the battery condition monitor module .

NO

Replace the PCU .

DTC P158A (1095)

DTC P158A : HV Battery Current Sensor Correlation

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158A HV Battery Current Sensor Correlation	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the READY TO DRIVE mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158A HV Battery Current Sensor Correlation	B	B	B

Is DTC P158A indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (SGISOC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

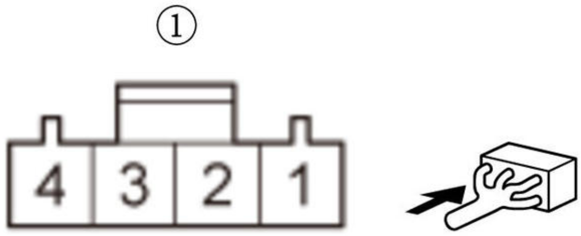
-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 29**
Test point 2	Battery current sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Go to step 3

NO

Repair an open in the SGISOC wire between the battery current sensor and the battery condition monitor module (E29).

3. Battery current sensor check

-1. **Substitute a known-good battery current sensor** .

-2. All removed parts install to the IPU, then **install the IPU** .

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the READY TO DRIVE mode.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158A HV Battery Current Sensor Correlation	B	B	B

Is DTC P158A indicated?

YES

Replace the battery condition monitor module .

NO

Replace the original battery current sensor .

DTC P158B (980)

DTC P158B : HV Battery Current Sensor 1 Circuit

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158B HV Battery Current Sensor 1 Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the READY TO DRIVE mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158B HV Battery Current Sensor 1 Circuit	B	B	B

Is DTC P158B indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (SGISOC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

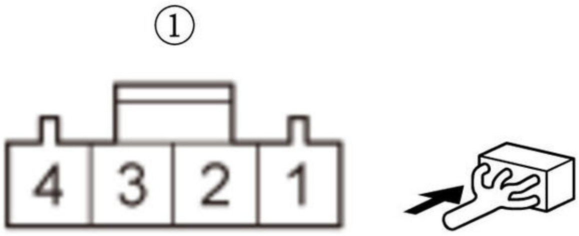
-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 29**
Test point 2	Battery current sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Go to step 3

NO

Repair an open in the SGISOC wire between the battery current sensor and the battery condition monitor module (E29).

3. Battery current sensor check

-1. **Substitute a known-good battery current sensor** .

-2. All removed parts install to the IPU, then **install the IPU** .

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the READY TO DRIVE mode.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158B HV Battery Current Sensor 1 Circuit	B	B	B

Is DTC P158B indicated?

YES

Replace the battery condition monitor module .

NO

Replace the original battery current sensor .

DTC P158D (115)

DTC P158D : HV Battery Current Sensor 1 Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158D HV Battery Current Sensor 1 Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158D HV Battery Current Sensor 1 Circuit Low	B	B	B

Is DTC P158D indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06B1 HV Battery Current Sensor Power	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
Supply Circuit Low			

Is DTC P06B1 indicated?

YES

Go to the DTC P06B1 troubleshooting .

NO

Go to step 3.

3. Determine possible failure area (VCCISOC line, others)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158D HV Battery Current Sensor 1 Circuit Low	B	B	B
P158E HV Battery Current Sensor 2 Circuit Low	B	B	B

Are DTC P158D and P158E indicated at the same time?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (VCCISOC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

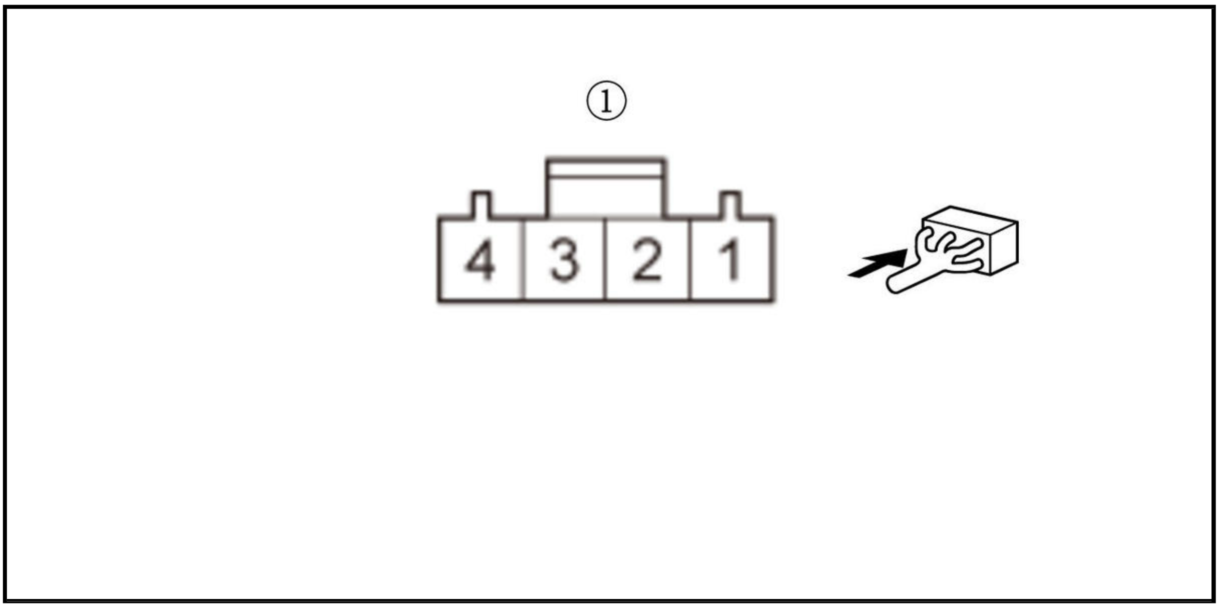
-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 28**
Test point 2	Battery current sensor 4P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Substitute a known-good battery current sensor , then recheck. If DTC P158D is still indicated, **replace the battery condition monitor module** .

NO

Repair an open in the VCCISOC wire between the battery current sensor and the battery condition monitor module (E28).

5. Determine possible failure area (short in ISOC circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 26**
Test point 2	Body ground

Is there continuity?

YES

Go to step 6.

NO

Go to step 7.

6. Shorted wire check (ISOC line)

-1. **Remove the IPU and the IPU case** .

-2. Disconnect the following connector.

Battery current sensor 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 26**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The ISOC wire is OK. **Substitute a known-good battery current sensor** , then recheck. If DTC P158D is still indicated, **replace the battery condition monitor module** .

NO

Repair a short in the ISOC wire between the battery current sensor and the battery condition monitor module (E26).

7. Battery condition monitor module internal circuit (ISOC) check

-1. Reconnect the following connector.

Battery condition monitor module connector E (32P)

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Battery condition monitor module connector E (32P) No. 28**
Terminal B	**Battery condition monitor module connector E (32P) No. 26**

-3. **Do the 12 volt battery terminal reconnection procedure** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158F HV Battery Current Sensor 1 Circuit High	B	B	B

Is DTC P158F indicated?

YES

Go to step 8.

NO

Replace the battery condition monitor module .

8. Open wire check (ISOC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

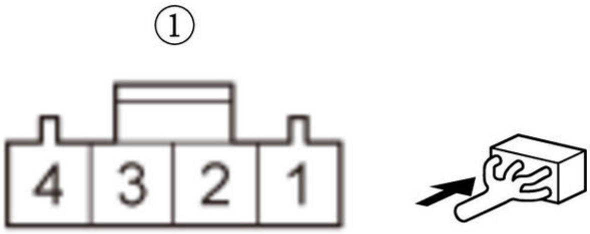
-3. **Remove the IPU and the IPU case** .

-4. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 26**
Test point 2	Battery current sensor 4P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the battery current sensor .

NO

Repair an open in the ISOC wire between the battery current sensor and the battery condition monitor module (E26).

DTC P158E (117)

DTC P158E : HV Battery Current Sensor 2 Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158E HV Battery Current Sensor 2 Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158E HV Battery Current Sensor 2 Circuit Low	B	B	B

   Is DTC P158E indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06B1 HV Battery Current Sensor Power Supply Circuit Low	B	B	B

   Is DTC P06B1 indicated?

   YES

   Go to the DTC P06B1 troubleshooting .

   NO

   Go to step 3.

3. Determine possible failure area (VCCISOC line, others)

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158D HV Battery Current Sensor 1 Circuit Low	B	B	B
P158E HV Battery Current Sensor 2 Circuit Low	B	B	B

   Are DTC P158D and P158E indicated at the same time?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (VCCISOC line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

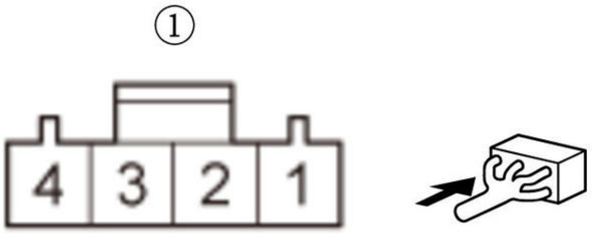
   -2. Remove the **service plug** and the **IPU cover** .

   -3. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 28**
Test point 2	Battery current sensor 4P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Substitute a known-good battery current sensor , then recheck. If DTC P158E is still indicated, **replace the battery condition monitor module** .

NO

Repair an open in the VCCISOC wire between the battery current sensor and the battery condition monitor module (E28).

5. Determine possible failure area (short in ISOCF circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 27**
Test point 2	Body ground

Is there continuity?

YES

Go to step 6.

NO

Go to step 7.

6. Shorted wire check (ISOCF line)

-1. Disconnect the following connector.

Battery current sensor 4P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 27**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The ISOCF wire is OK. **Substitute a known-good battery current sensor** , then recheck. If DTC P158E is still indicated, **replace the battery condition monitor module** .

NO

Repair a short in the ISOCF wire between the battery current sensor and the battery condition monitor module (E27).

7. Battery condition monitor module internal circuit (ISOCF) check

-1. Reconnect the following connector.

Battery condition monitor module connector E (32P)

-2. Connect terminals A and B with a jumper wire.

Terminal A	Battery condition monitor module connector E (32P) No. 28
Terminal B	Battery condition monitor module connector E (32P) No. 27

-3. Do the 12 volt battery terminal reconnection procedure .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1596 HV Battery Current Sensor 2 Circuit High	B	B	B

Is DTC P1596 indicated?

YES

Go to step 8.

NO

Replace the battery condition monitor module .

8. Open wire check (ISOCF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Do the 12 volt battery terminal disconnection procedure .

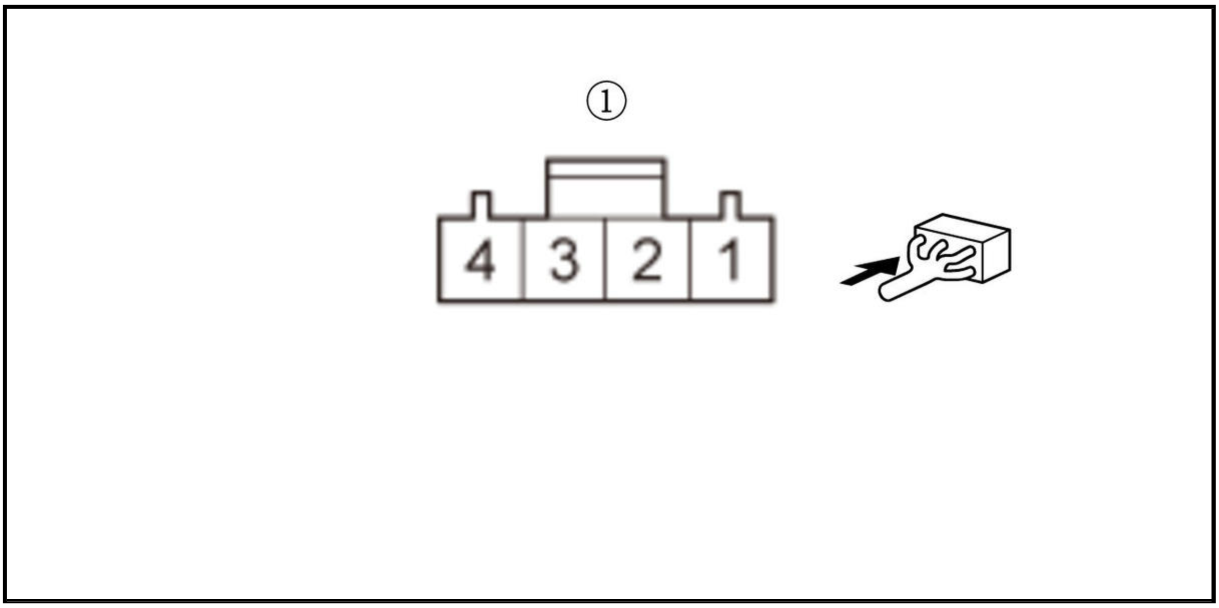
-3. Remove the IPU and the IPU case .

-4. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	Battery condition monitor module connector E (32P) No. 27
Test point 2	Battery current sensor 4P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

Replace the battery current sensor .

NO

Repair an open in the ISOCF wire between the battery current sensor and the battery condition monitor module (E27).

DTC P158F (114)

DTC P158F : HV Battery Current Sensor 1 Circuit High

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158F HV Battery Current Sensor 1 Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P158F HV Battery Current Sensor 1 Circuit High	B	B	B

Is DTC P158F indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Battery condition monitor module internal circuit (SGISOC) check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Battery condition monitor module connector E (32P) No. 29**
Test point 2	Body ground

Is there continuity?

YES

Go to step 3.

NO

Replace the battery condition monitor module .

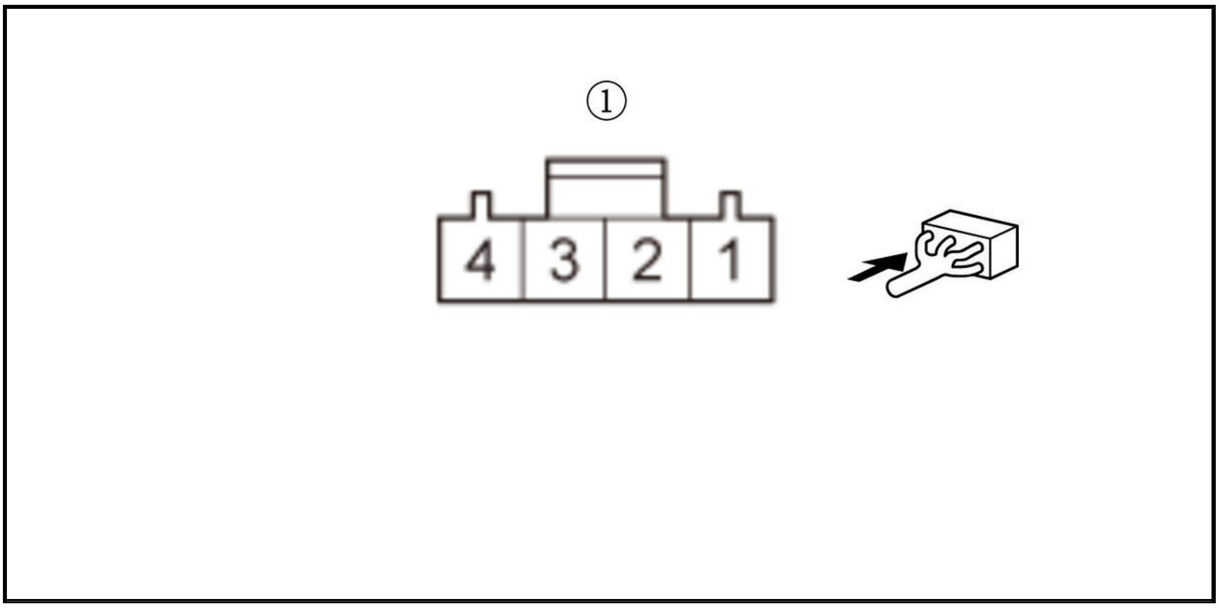
3. Open wire check (SGISOC line)

-1. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 29**
Test point 2	Battery current sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The SGISOC wire is OK. **Replace the battery current sensor** .

NO

Repair an open in the SGISOC wire between the battery current sensor and the battery condition monitor module (E29).

DTC P1596 (116)

DTC P1596 : HV Battery Current Sensor 2 Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1596 HV Battery Current Sensor 2 Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1596 HV Battery Current Sensor 2 Circuit High	B	B	B

Is DTC P1596 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Battery condition monitor module internal circuit (SGISOC) check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Battery condition monitor module connector E (32P) No. 29**
Test point 2	Body ground

Is there continuity?

YES

Go to step 3.

NO

Replace the battery condition monitor module .

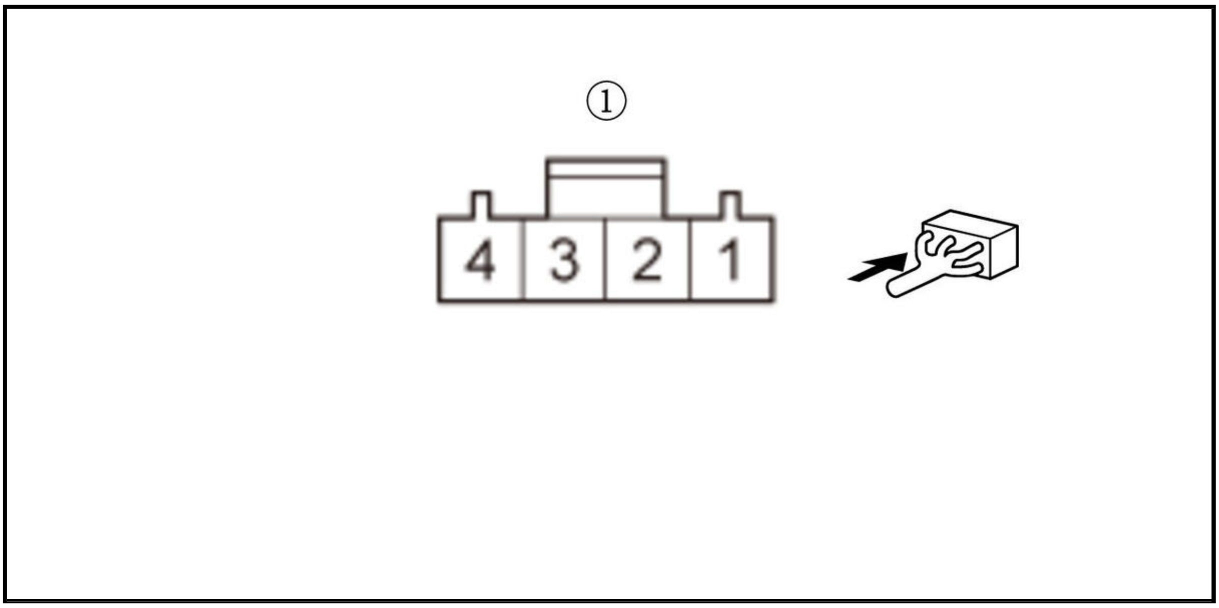
3. Open wire check (SGISOC line)

-1. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 29**
Test point 2	Battery current sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The SGISOC wire is OK. **Replace the battery current sensor** .

NO

Repair an open in the SGISOC wire between the battery current sensor and the battery condition monitor module (E29).

DTC P1597 (65)

DTC P1597 : HV Battery Current Sensor 1 Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1597 HV Battery Current Sensor 1 Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the READY TO DRIVE mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1597 HV Battery Current Sensor 1 Circuit Range/Performance	B	B	B

Is DTC P1597 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (SGISOC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

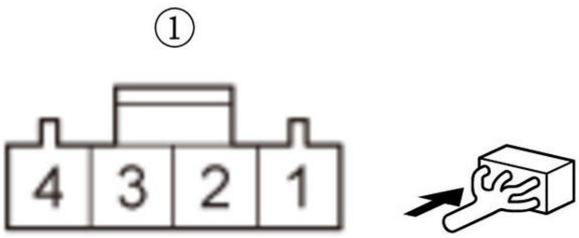
-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
Battery current sensor 4P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 29**
Test point 2	Battery current sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Go to step 3

NO

Repair an open in the SGISOC wire between the battery current sensor and the battery condition monitor module (E29).

3. Battery current sensor check

-1. **Substitute a known-good battery current sensor** .

-2. All removed parts install to the IPU, then **install the IPU** .

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the READY TO DRIVE mode.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1597 HV Battery Current Sensor 1 Circuit Range/Performance	B	B	B

Is DTC P1597 indicated?

YES

Replace the battery condition monitor module .

NO

Replace the original battery current sensor .

DTC P1598 (113)

DTC P1598 : HV Battery Current Sensor 2 Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1598 HV Battery Current Sensor 2 Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1598 HV Battery Current Sensor 2 Circuit Range/Performance	B	B	B

Is DTC P1598 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (SGISOC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

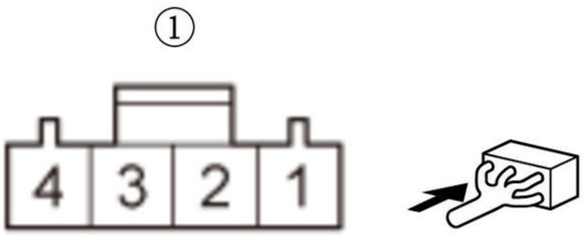
-3. Disconnect the following connectors.

Battery condition monitor module connector E (32P)

Battery current sensor 4P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Battery current sensor 4P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 29**
Test point 2	Battery current sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The SGISOC wire is OK. **Replace the battery current sensor** .

NO

Repair an open in the SGISOC wire between the battery current sensor and the battery condition monitor module (E29).

DTC P1673 (22)

DTC P1673 : IGHLD Relay Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1673 IGHLD Relay Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

   -4. Turn the vehicle to the ON mode, and wait 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1673 IGHLD Relay Circuit	B	B	B

   Is DTC P1673 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A10**

   Is the fuse OK?

   YES

   Go to step 3.

   NO

   Replace the No. A10 fuse. Also check for a short to ground on the No. A10 fuse circuit if needed.

3. IGHLD relay circuit check

   -1. Remove the **service plug** and the **IPU cover** .

   -2. **Remove the IGHLD1 relay** .

   -3. **Test the IGHLD1 relay** .

Is the relay OK?

YES

Go to step 4.

NO

Replace the IGHLD1 relay.

4. Shorted wire check (IGHLD/IG_HOLD1_RLY_CL- line)

-1. Remove the **service plug** and the **IPU cover** .

-2. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLD1 relay: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 20**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 5.

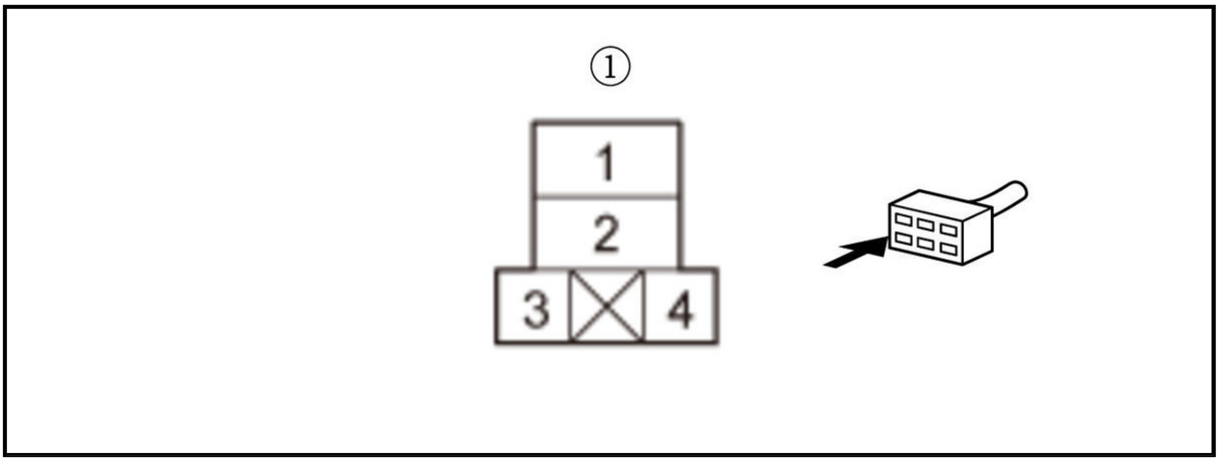
NO

Repair a short in the IGHLD/IG_HOLD1_RLY_CL- wire between the battery condition monitor module (E20) and the IGHLD1 relay.

5. Open wire check (IGHLD/IG_HOLD1_RLY_CL- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLD1 relay: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 20**
Test point 2	IGHLD1 relay 4P socket (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Go to step 6.

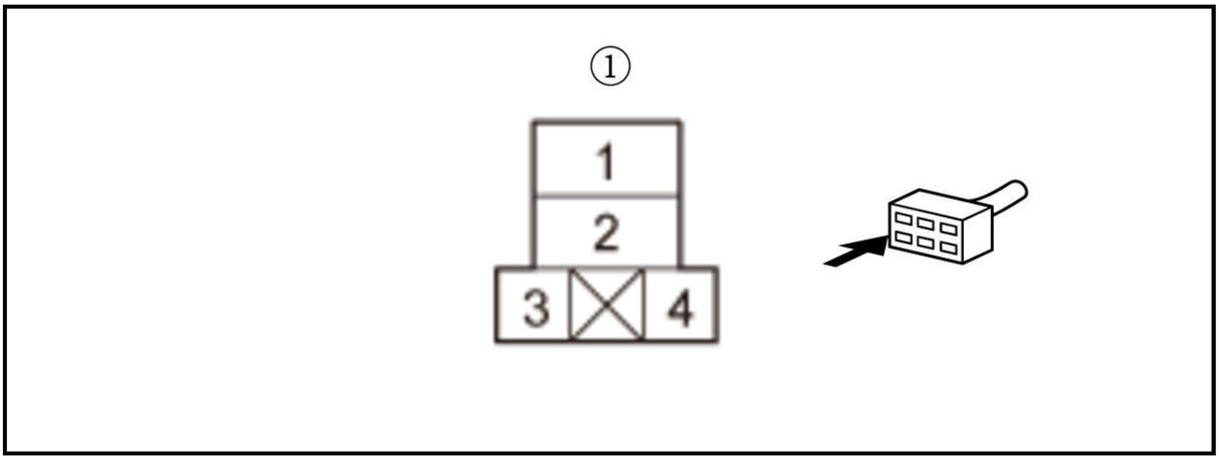
NO

Repair an open in the IGHLD/IG_HOLD1_RLY_CL- wire between the battery condition monitor module (E20) and the IGHLD relay.

6. Open wire check (IGAMONI/IGA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLD1 relay: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 23**
Test point 2	IGHLD1 relay 4P socket (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The IGAMONI/IGA wire is OK. **Replace the battery condition monitor module** .

NO

Repair an open in the IGAMONI/IGA wire between the battery condition monitor module (E23) and the IGHLD relay.

DTC P16C3 (31)

DTC P16C3 : DC-DC Converter Temperature Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P16C3 DC-DC Converter Temperature Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P16C3 DC-DC Converter Temperature Sensor Circuit	B	B	B

   Is DTC P16C3 indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D3A (1085), P1D3B (1086)

DTC P1D3A : Battery Condition Monitor Module EEPROM Error (FSA Operated)

DTC P1D3B : Battery Condition Monitor Module EEPROM Error (FSA Not-Operated)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D3A Battery Condition Monitor Module EEPROM Error (FSA Operated)	B	B	B
P1D3B Battery Condition Monitor Module EEPROM Error (FSA Not-Operated)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D3A Battery Condition Monitor Module EEPROM Error (FSA Operated)	B	B	B
P1D3B Battery Condition Monitor Module EEPROM Error (FSA Not-Operated)	B	B	B

Is DTC P1D3A or P1D3B indicated?

YES

Replace the battery condition monitor module .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D64 (143)

DTC P1D64 : Collision Detection Signal Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D64 Collision Detection Signal Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D64 Collision Detection Signal Circuit	B	B	B

Is DTC P1D64 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. SRS indicator check

   -1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

   -2. Turn the vehicle to the ON mode, and check that the SRS indicator comes on.

   Does the SRS indicator come on?

   YES

   Go to SRS troubleshooting .

   NO

   Go to step 3.

3. Determine possible failure area (SRS unit, CDS line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Do the 12 volt battery terminal disconnection procedure** .

   -3. Wait at least 3 minutes.

   -4. Disconnect the following connector.

SRS unit connector A (39P)

   -5. **Do the 12 volt battery terminal reconnection procedure** .

   -6. Turn the vehicle to the ON mode.

   -7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 1**
Test point 2	Body ground

   Is there about 5.0 V?

   YES

   The CDS wire is OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit; check the connection. If the connection is OK, **replace the SRS unit** .

   NO

   Go to step 4.

4. Shorted wire check (CDS line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the **service plug** and the **IPU cover** .

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	SRS unit connector A (39P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 30**

Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 5.

NO

Repair a short in the CDS wire between the battery condition monitor module (E30) and the SRS unit.

5. Open wire check (CDS line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector A (39P) No. 1**
Terminal B	Body ground

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	SRS unit connector A (39P): disconnected
B	SRS unit connector A (39P) No. 1: jumped to body ground
Test point 1	**Battery condition monitor module connector E (32P) No. 30**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The CDS wire is OK. **Replace the battery condition monitor module** .

NO

Repair an open in the CDS wire between the battery condition monitor module (E30) and the SRS unit.

DTC P1D65 (144)

DTC P1D65 : HV System Shutdown (Collision Detection Signal Detected)

NOTE:

- When the SRS airbag has deployed, this DTC is stored and the motor stops.
- If the SRS airbag has deployed, do the troubleshooting after replacing the SRS airbag. **Refer to Component Replacement/Inspection After Deployment** .
- Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D65 HV System Shutdown (Collision Detection Signal Detected)	B	B	B

DTC (Electric Powertrain)

1. SRS DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs in the SRS with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the troubleshooting for SRS system DTC(s) .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DC7 (349)

DTC P1DC7 : HV Battery Pack Deterioration of Power

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DC7 HV Battery Pack Deterioration of Power	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the READY TO DRIVE mode.

   -5. Test-drive the vehicle; accelerate to 31 mph (50 km/h) and decelerate to 0 mph (0 km/h), repeat that for 10 minutes.

   -6. Monitor the OBD STATUS for DTC P1DC7 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1DC7 HV Battery Pack Deterioration of Power	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the battery pack** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, keep the test-driving until a result comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DFD (272)

DTC P1DFD : Power System Indicator Lighting Request From PCM

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the engine will not start, DTC P1DFD will be stored. To assist in your diagnosis, ask the customer if the vehicle fuel level was low when the issue occurred. Lack of fuel will prevent the engine from starting and cause DTC P1DFD to be recorded.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DFD Power System Indicator Lighting Request From PCM	B	B	B

DTC (Electric Powertrain)

1. PGM-FI system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any DTCs indicated?

YES

Go to the troubleshooting for PGM-FI system DTC(s) .

NO

Go to step 2.

2. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DFD Power System Indicator Lighting Request From PCM	B	B	B

Is DTC P1DFD indicated?

YES

Replace the battery condition monitor module .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DFF (127)

DTC P1DFF : IGHLDB Relay Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DFF IGHLDB Relay Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait 3 minutes.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DFF IGHLDB Relay Circuit	B	B	B

   Is DTC P1DFF indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Relay check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the **service plug** and the **IPU cover** .

   -3. **Remove the IGHLDB relay** .

   -4. **Test the IGHLDB relay** .

   Is the relay OK?

   YES

   Go to step 3.

NO

Replace the IGHLDB relay.

3. Shorted wire check (IGHLDB line)

-1. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLDB relay: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 19**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Check for a short to power in the IGB wire between the battery condition module (E2) and IGHLDB relay. If the wire is OK, **replace the battery condition monitor module** .

NO

Repair a short in the IGHLDB wire between the battery condition monitor module (E19) and the IGHLDB relay.

DTC P262B (590)

DTC P262B : Battery Condition Monitor Module Timer

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P262B Battery Condition Monitor Module Timer	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, and wait 5 minutes.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P262B Battery Condition Monitor Module Timer	B	B	B

Is DTC P262B indicated?

YES

Replace the battery condition monitor module .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U0029 (108) (BATTERY CONDITION MONITOR MODULE)

DTC U0029 : F-CAN Malfunction (Battery Condition Monitor Module Bus-Off)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0029 F-CAN Malfunction (Battery Condition Monitor Module Bus-Off)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (CAN GATEWAY)

Are any DTCs indicated?

YES

The failure is duplicated. Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U0038 (99) (BATTERY CONDITION MONITOR MODULE)

DTC U0038 : EP-CAN Malfunction (Battery Condition Monitor Module Bus-Off)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Battery Condition Monitor Module Bus-Off)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 6 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Battery Condition Monitor Module Bus-Off)	B	B	B

   Is DTC U0038 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted unit check (PCM)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (50P)

   -4. Turn the vehicle to the ON mode.

   -5. Clear the DTC with the HDS.

   -6. Turn the vehicle to the OFF (LOCK) mode.

   -7. Turn the vehicle to the ON mode, and wait 6 seconds.

   -8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Battery Condition Monitor Module Bus-Off)	B	B	B

   Is DTC U0038 indicated?

   YES

   Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted unit check (PCU)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connector.

PCU 33P connector

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Battery Condition Monitor Module Bus-Off)	B	B	B

Is DTC U0038 indicated?

YES

Go to step 4.

NO

Replace the PCU .

4. Shorted unit check (SBW shifter control module)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

SBW shifter control module 20P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Battery Condition Monitor Module Bus-Off)	B	B	B

Is DTC U0038 indicated?

YES

Go to step 5.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good SBW shifter assembly** .

5. Shorted unit check (park pawl actuator driver unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Park pawl actuator driver unit 26P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Battery Condition Monitor Module Bus-Off)	B	B	B

Is DTC U0038 indicated?

YES

Go to step 6.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good park pawl actuator driver unit** .

6. Shorted wire check (EP-CAN A_H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PCU 33P connector: disconnected

B	Battery condition monitor module connector E (32P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 11**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 7.

NO

Repair a short to ground in the EP-CAN A_H wire between the PCM, the PCU, the SBW shifter control module, the park pawl actuator driver unit, and the battery condition monitor module.

7. Shorted wire check (EP-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PCU 33P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 10**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 8.

NO

Repair a short to ground in the EP-CAN A_L wire between the PCM, the PCU, the SBW shifter control module, the park pawl actuator driver unit, and the battery condition monitor module.

8. Shorted wire check (EP-CAN A_H wire to EP-CAN A_L wire)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PCU 33P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 11**
Test point 2	**Battery condition monitor module connector E (32P) No. 10**

Is there 1 MΩ or more?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK. **Replace the battery condition monitor module** .

NO

Repair a short in the EP-CAN A_H wire to the EP-CAN A_L wire between the PCM, the SBW shifter control module, the park pawl actuator driver unit, the PCU, and the battery condition monitor module.

DTC U0100 (BATTERY CONDITION MONITOR MODULE)

DTC U0100 : CAN Malfunction (Battery Condition Monitor Module - PCM)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC U0100, troubleshoot those DTCs first, then recheck for U0100.
-
    - -

      U1204, U1600

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0100 CAN Malfunction (Battery Condition Monitor Module - PCM)	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC U0100 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the battery condition monitor module if it does not have the latest software .

DTC U0110 (BATTERY CONDITION MONITOR MODULE)

DTC U0110 : F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .

- If any of the DTCs listed below are indicated at the same time as DTC U0110, troubleshoot those DTCs first, then recheck for U0110.
-
    - -

      U1205

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0110 F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1205 EP-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B	B	B

   DTC (Electric Powertrain)

   Is DTC U1205 indicated at the same time?

   YES

   Go to the DTC U1205 troubleshooting.

   NO

   Update the battery condition monitor module if it does not have the latest software .

DTC U012D (BATTERY CONDITION MONITOR MODULE)

DTC U012D : F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If any of the DTCs listed below are indicated at the same time as DTC U012D, troubleshoot those DTCs first, then recheck for U012D.
-
    - -

      U12A5

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U012D F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U12A5 EP-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B	B	B

DTC (Electric Powertrain)

Is DTC U12A5 indicated at the same time?

YES

Go to the DTC U12A5 troubleshooting.

NO

Update the battery condition monitor module if it does not have the latest software .

DTC U0146 (306) (BATTERY CONDITION MONITOR MODULE)

DTC U0146 : F-CAN Malfunction (Battery Condition Monitor Module - CAN Gateway)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0146 F-CAN Malfunction (Battery Condition Monitor Module - CAN Gateway)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0146 F-CAN Malfunction (Battery Condition Monitor Module - CAN Gateway)	B	B	B

Is DTC U0146 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CAN gateway system DTCs check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (CAN GATEWAY)

Are any Pending or Confirmed DTCs indicated?

YES

Go to the CAN gateway system troubleshooting .

NO

Go to step 3.

3. Open wire check (F-CAN A_H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

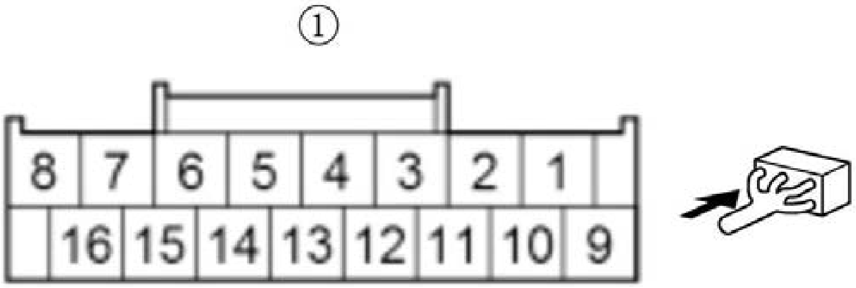
-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
CAN gateway 16P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 9**



Is there 1.0 Ω or less?

YES

Go to step 4.

NO

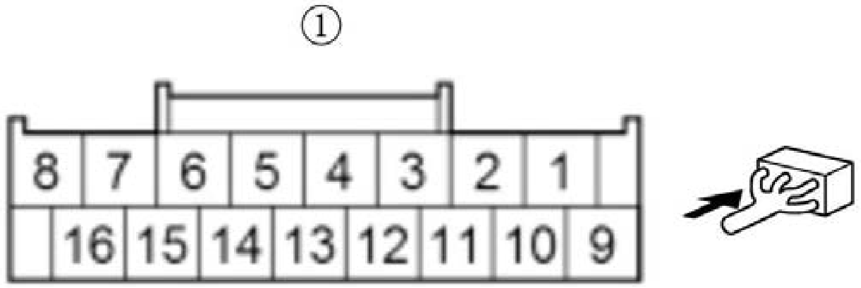
Repair an open in the F-CAN A_H wire between the CAN gateway and the battery condition monitor module (E9).

4. Open wire check (F-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①

Test point 2	**Battery condition monitor module connector E (32P) No. 8**



Is there 1.0 Ω or less?

YES

The F-CAN A_L wire is OK. **Replace the battery condition monitor module** .

NO

Repair an open in the F-CAN A_L wire between the CAN gateway and the battery condition monitor module (E8).

DTC U0155 (106), U1207 (207), U1600 (103) (BATTERY CONDITION MONITOR MODULE)

DTC U0155 : F-CAN Malfunction (Battery Condition Monitor Module - Gauge Control Module)

DTC U1207 : F-CAN Malfunction (Battery Condition Monitor Module - Electric A/C Compressor)

DTC U1600 : F-CAN Malfunction (Battery Condition Monitor Module - PCM)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the battery condition monitor module.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0155 F-CAN Malfunction (Battery Condition Monitor Module - Gauge Control Module)	B	B	B
U1207 F-CAN Malfunction (Battery Condition Monitor Module - Electric A/C Compressor)	B	B	B
U1600 F-CAN Malfunction (Battery Condition Monitor Module - PCM)	B	B	B

DTC (Electric Powertrain)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   DTC (CAN GATEWAY)

   Are any DTCs indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC(s) .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Does the battery condition monitor module detect the CAN gateway Bus channel A?

   Bus A is Not Available

   Go to step 3.

   Bus A is Available

   Go to step 4.

3. Open wire check (F-CAN A_H line, F-CAN A_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the **service plug** and the **IPU cover** .

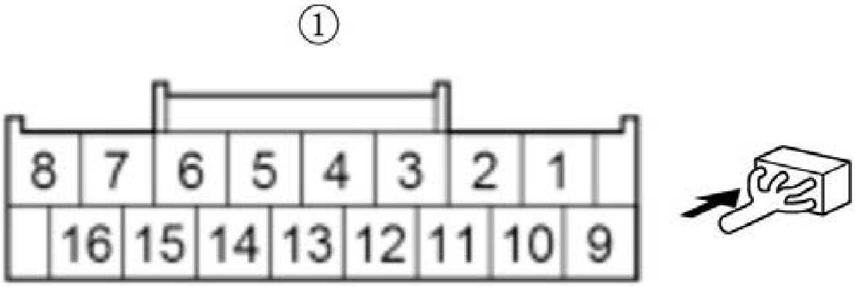
   -3. Disconnect the following connectors.

Battery condition monitor module connector E (32P)	
CAN gateway 16P connector	

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Battery condition monitor module connector E (32P): disconnected
	CAN gateway 16P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 9**
Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test point 1	**Battery condition monitor module connector E (32P) No. 8**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. **Replace the battery condition monitor module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the battery condition monitor module and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0155	Gauge control module	D
U1207	Electric A/C compressor	D
U1600	PCM	A, B

Is it detected normally?

U0155: Gauge control module is Not Available for Bus D

Go to step 7.

U1207: Electric A/C compressor is Not Available for Bus D

Go to step 7.

U1600: PCM is Not Available for Bus A

Go to step 5.

U1600: PCM is Not Available for Bus B

Go to step 6.

Detected normal

Intermittent failure. The system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit, the battery condition monitor module, and the CAN gateway.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. DTC U1600: Jump the SCS line with the HDS, and wait more than 1 minute.

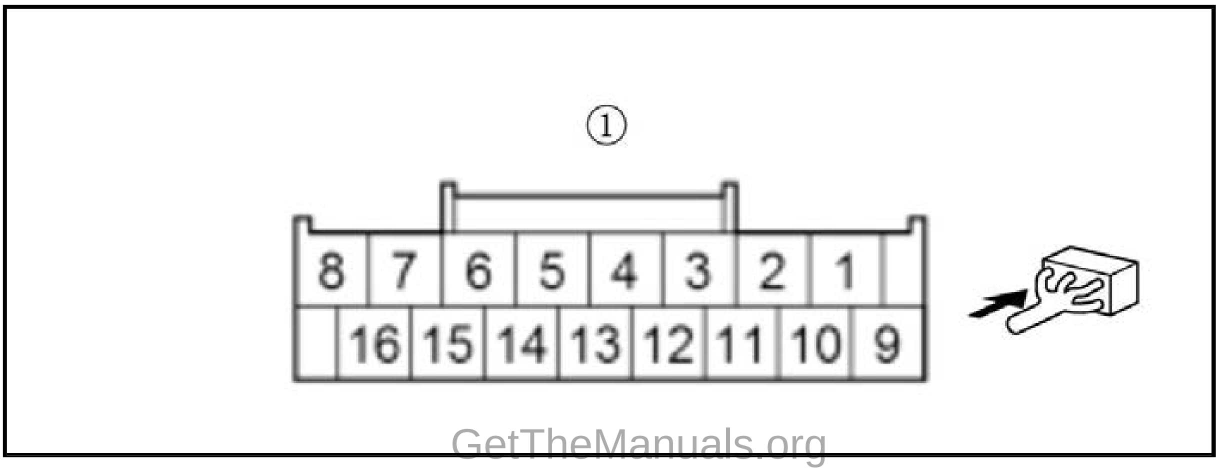
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U1600	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U1600	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK.According to the detected DTC on the following table, update, substitute, or replace the correspond control unit.

DTC	Operation for transmitting control unit
U1600	**Replace the PCM** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. DTC U1600: Jump the SCS line with the HDS, and wait more than 1 minute.

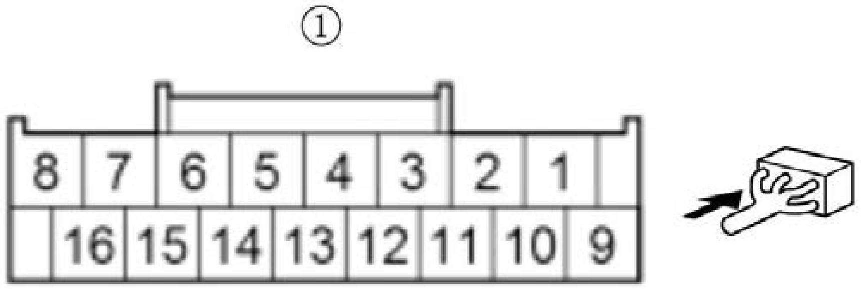
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U1600	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U1600	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. According to the detected DTC on the following table, update, substitute, or replace the correspond control unit.

DTC	Operation for transmitting control unit
U1600	Replace the PCM .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

7. Open wire check (F-CAN D_H line, F-CAN D_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

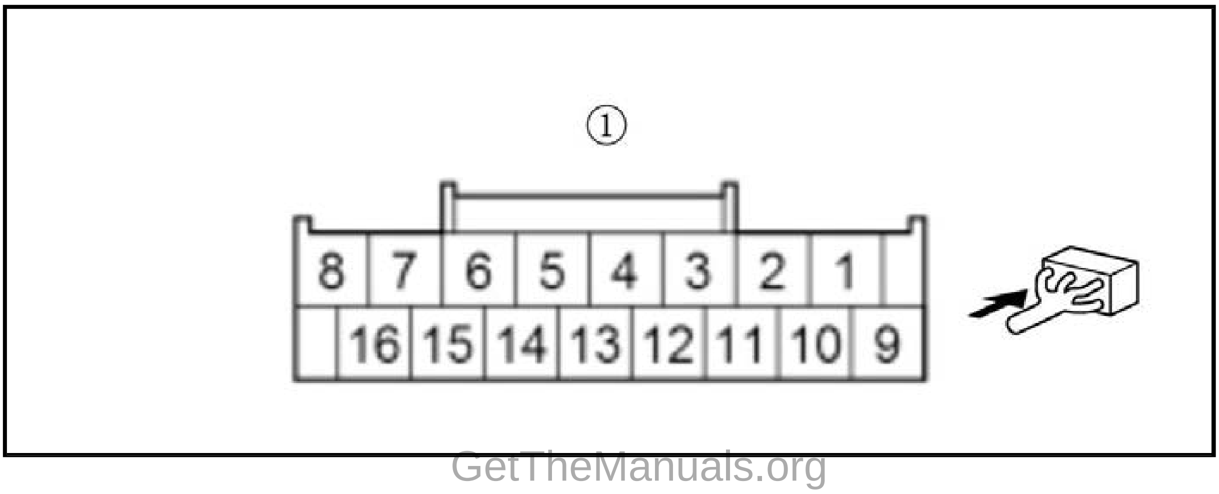
-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

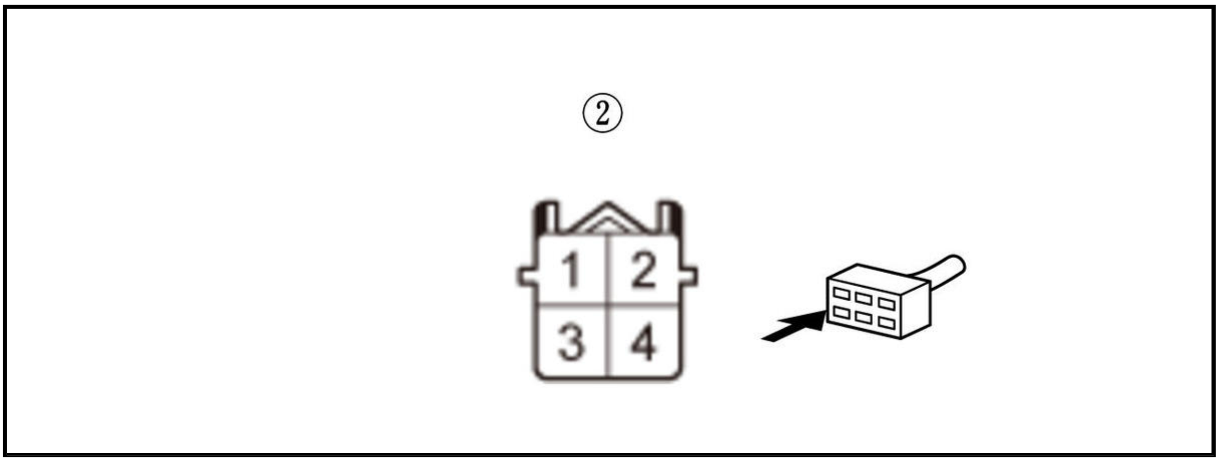
DTC	Connector
-	CAN gateway 16P connector
U0155	Gauge control module connector A (32P)
U1207	Electric A/C compressor 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0155	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	Gauge control module connector A (32P)	No. 19
	F-CAN D_L		No. 15		No. 20
U1207	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	Electric A/C compressor 4P connector (female terminals): ②	No. 4
	F-CAN D_L		No. 15		No. 3





Is there 1.0 Ω or less?

YES

The F-CAN D_H wire and the F-CAN D_L wire are OK.According to the detected DTC on the following table, update, substitute, or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0155	**Replace the gauge control module** .
U1207	**Replace the electric A/C compressor** .

NO

Repair an open in the F-CAN D_H wire or the F-CAN D_L wire between the transmitting control unit and the CAN gateway.

DTC U0298 (BATTERY CONDITION MONITOR MODULE)

DTC U0298 : DC-DC Converter Communication Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC U0298, troubleshoot those DTCs first, then recheck for U0298.
-
    - -

      U1220

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0298 DC-DC Converter Communication Error	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC U0298 and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the battery condition monitor module , then recheck. If DTC U0298 is still indicated, replace the battery condition monitor module.

DTC U0312 (124) (BATTERY CONDITION MONITOR MODULE)

DTC U0312 : Battery Condition Monitor Module Programming Error (Version Mismatch)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0312 Battery Condition Monitor Module Programming Error (Version Mismatch)	B	B	B

DTC (Electric Powertrain)

1. Problem verification (update)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait 30 seconds.

   -4. Turn the vehicle to the ON mode.

   -5. **Update the battery condition monitor module** .

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0312 Battery Condition Monitor Module Programming Error (Version Mismatch)	B	B	B

Is DTC U0312 indicated?

YES

Replace the battery condition monitor module .

NO

Update is complete.

DTC U0599 (35), U1220 (34) (BATTERY CONDITION MONITOR MODULE)

DTC U0599 : DC-DC Converter Serial Communication Receive Error

DTC U1220 : DC-DC Converter Serial Communication Transmit Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0599 DC-DC Converter Serial Communication Receive Error	B	B	B
U1220 DC-DC Converter Serial Communication Transmit Error	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0599 DC-DC Converter Serial Communication Receive Error	B	B	B
U1220 DC-DC Converter Serial Communication Transmit Error	B	B	B

   Is DTC U0599 and/or U1220 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

   Traction motor control module

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   Generator motor control module

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC U0599 or U1220, and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

NO

Go to step 3.

3. CAN gateway system DTCs check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (CAN GATEWAY)

Are any DTCs indicated?

YES

Go to the CAN gateway system troubleshooting .

NO

Go to step 4.

4. Open wire check (F-CAN A_H line)

-1. Remove the **service plug** and the **IPU cover** .

-2. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
PCU 33P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	PCU 33P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 9**
Test point 2	**PCU 33P connector No. 5**

Is there 1.0 Ω or less?

YES

The F-CAN A_H wire is OK. Go to step 5.

NO

Repair an open in the F-CAN A_H wire between the PCU and the battery condition monitor module (E9).

5. Open wire check (F-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	PCU 33P connector: disconnected

Test point 1	**Battery condition monitor module connector E (32P) No. 8**
Test point 2	**PCU 33P connector No. 6**

Is there 1.0 Ω or less?

YES

The F-CAN A_L wire is OK. **Replace the PCU** .

NO

Repair an open in the F-CAN A_L wire between the PCU and the battery condition monitor module (E8).

DTC U1204 (55), U1205 (83), U12A5 (316) (BATTERY CONDITION MONITOR MODULE)

DTC U1204 : EP-CAN Malfunction (Battery Condition Monitor Module - PCM)

DTC U1205 : EP-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)

DTC U12A5 : EP-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the battery condition monitor module.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1204 EP-CAN Malfunction (Battery Condition Monitor Module - PCM)	B	B	B
U1205 EP-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B	B	B
U12A5 EP-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1204 EP-CAN Malfunction (Battery Condition Monitor Module - PCM)	B	B	B
U1205 EP-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U12A5 EP-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B	B	B

Are any DTCs indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (EP-CAN A_H line, EP-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. U1204: Jump the SCS line with the HDS, and wait more than 1 minute.

-4. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	Battery condition monitor module connector E (32P)
U1204	PCM connector A (50P)
U1205	PCU 33P connector
U12A5	PCU 33P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U1204	EP-CAN A_H	**Battery condition monitor module connector E (32P)**	No. 11	**PCM connector A (50P)**	No. 21
	EP-CAN A_L		No. 10		No. 20
U1205	EP-CAN A_H	**Battery condition monitor module connector E (32P)**	No. 11	**PCU 33P connector**	No. 27
	EP-CAN A_L		No. 10		No. 28
U12A5	EP-CAN A_H	**Battery condition monitor module connector E (32P)**	No. 11	**PCU 33P connector**	No. 27
	EP-CAN A_L		No. 10		No. 28

Is there 1.0 Ω or less?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK.According to the detected DTC on the following table, substitute, or replace the corresponding unit.

DTC	Operation for transmitting control unit
U1204	Replace the PCM .
U1205	Replace the PCU .
U12A5	Replace the PCU .

NO

Repair an open in the EP-CAN A_H wire or the EP-CAN A_L wire between the transmitting control unit and the battery condition monitor module.

DTC U1604 (101) (BATTERY CONDITION MONITOR MODULE)

DTC U1604 : F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the battery condition monitor module.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1604 F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1604 F-CAN Malfunction (Battery Condition Monitor Module - Traction Motor Control Module)	B	B	B

Is DTC U1604 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CAN gateway system DTC check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (CAN GATEWAY)

Are any DTCs indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check (receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the battery condition monitor module detect the CAN gateway Bus channel A?

Bus A is Detected

Go to step 5.

Bus A is Not Available

Go to step 4.

4. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connectors.

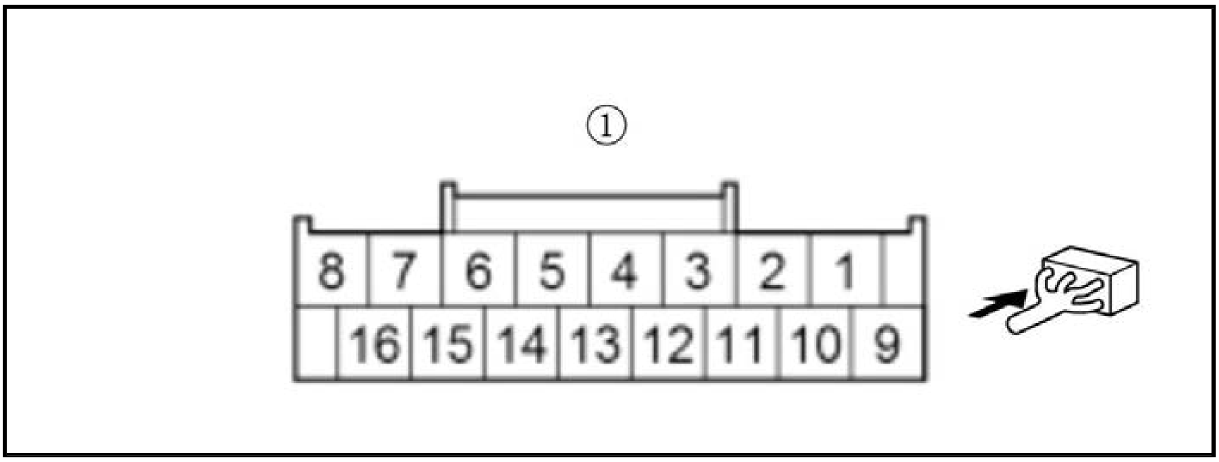
Battery condition monitor module connector E (32P)
CAN gateway 16P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Battery condition monitor module connector E (32P): disconnected
	CAN gateway 16P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 9**
Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test point 1	**Battery condition monitor module connector E (32P) No. 8**

Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. **Replace the battery condition monitor module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the battery condition monitor module and the CAN gateway.

5. F-CAN circuit communication check (transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Connection Check

Does the PCU detect the CAN gateway Bus channel A?

Bus A is Detected

Intermittent failure. The system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

Bus A is Not Available

Go to step 6.

6. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connectors.

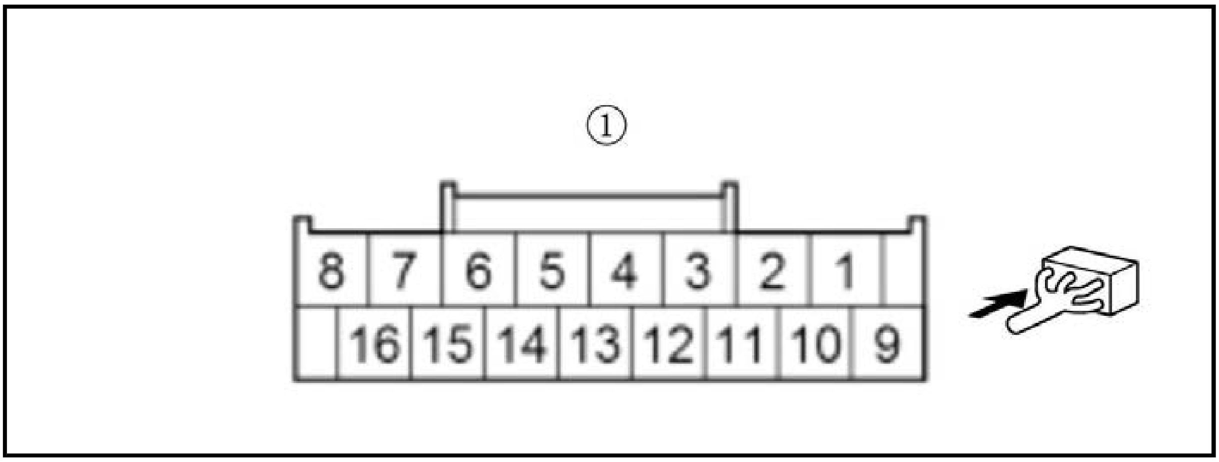
PCU 33P connector
CAN gateway 16P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCU 33P connector: disconnected
	CAN gateway 16P connector: disconnected
Test point 1	**PCU 33P connector No. 5**

Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test point 1	**PCU 33P connector No. 6**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. **Replace the PCU** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the PCU and the CAN gateway.

DTC U1605 (315) (BATTERY CONDITION MONITOR MODULE)

DTC U1605 : F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the battery condition monitor module.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1605 F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1605 F-CAN Malfunction (Battery Condition Monitor Module - Generator Motor Control Module)	B	B	B

Is DTC U012D indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CAN gateway system DTC check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (CAN GATEWAY)

Are any DTCs indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check (receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the battery condition monitor module detect the CAN gateway Bus channel A?

Bus A is Detected

Go to step 5.

Bus A is Not Available

Go to step 4.

4. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

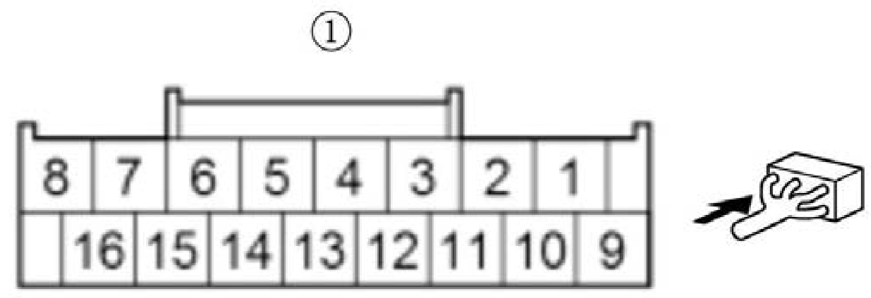
-3. Disconnect the following connectors.

Battery condition monitor module connector E (32P)
CAN gateway 16P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Battery condition monitor module connector E (32P): disconnected
	CAN gateway 16P connector: disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 9**
Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test point 1	**Battery condition monitor module connector E (32P) No. 8**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. **Replace the battery condition monitor module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the battery condition monitor module and the CAN gateway.

5. F-CAN circuit communication check (transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Connection Check

Does the PCU detect the CAN gateway Bus channel A?

Bus A is Detected

Intermittent failure. The system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

Bus A is Not Available

Go to step 6.

6. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connectors.

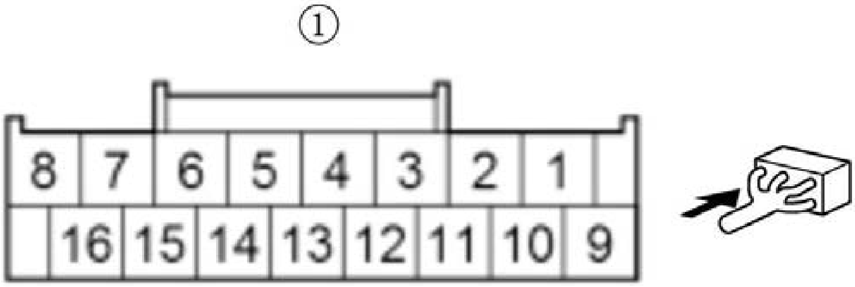
PCU 33P connector
CAN gateway 16P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCU 33P connector: disconnected
	CAN gateway 16P connector: disconnected
Test point 1	**PCU 33P connector No. 5**

Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test point 1	**PCU 33P connector No. 6**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. **Replace the PCU** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the PCU and the CAN gateway.

REMOVAL AND INSTALLATION

ALTERNATOR REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal and Installation

1

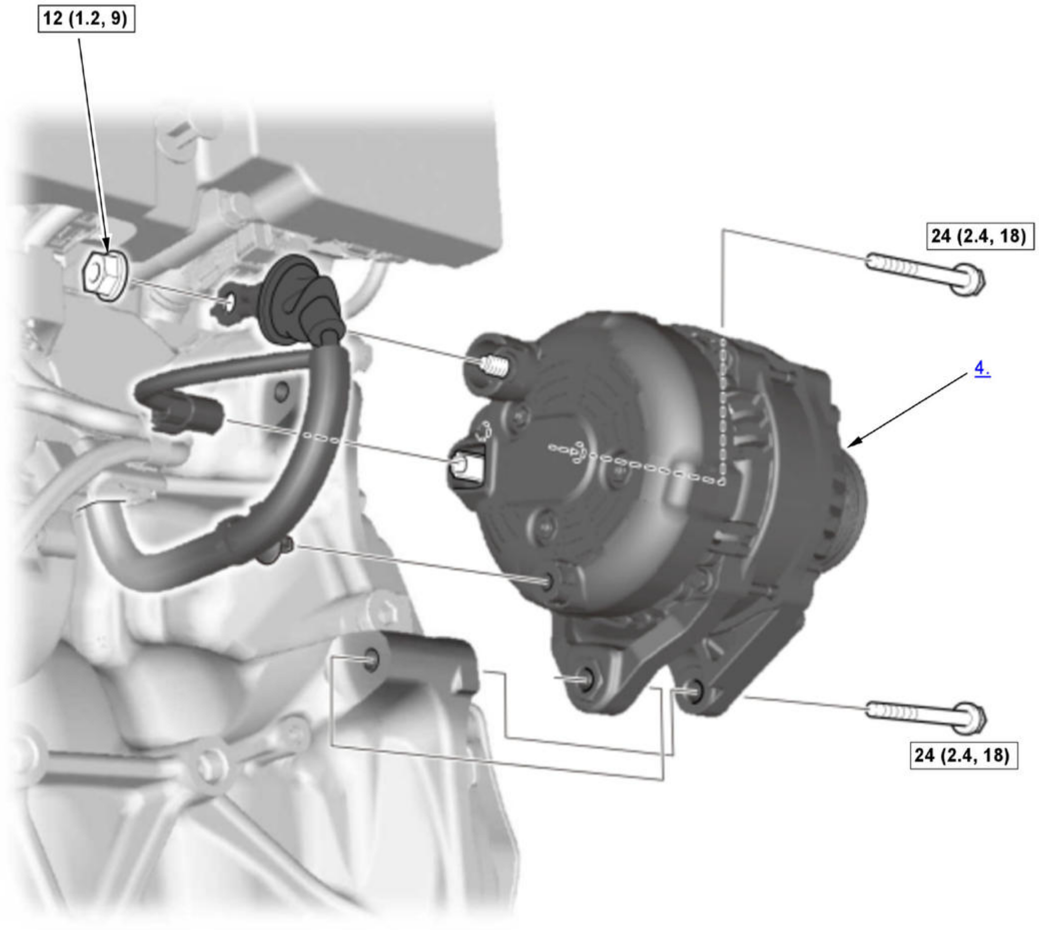


Fig. 1: Alternator Fastener Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

1. 12 Volt Battery Terminal - Disconnect
2. Engine Undercover - Remove
3. Drive Belt - Remove
4. Alternator - Remove
5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE: Make sure the crimped side of the ring terminal faces away from the alternator when you connect the positive alternator cable.

ALTERNATOR REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

1

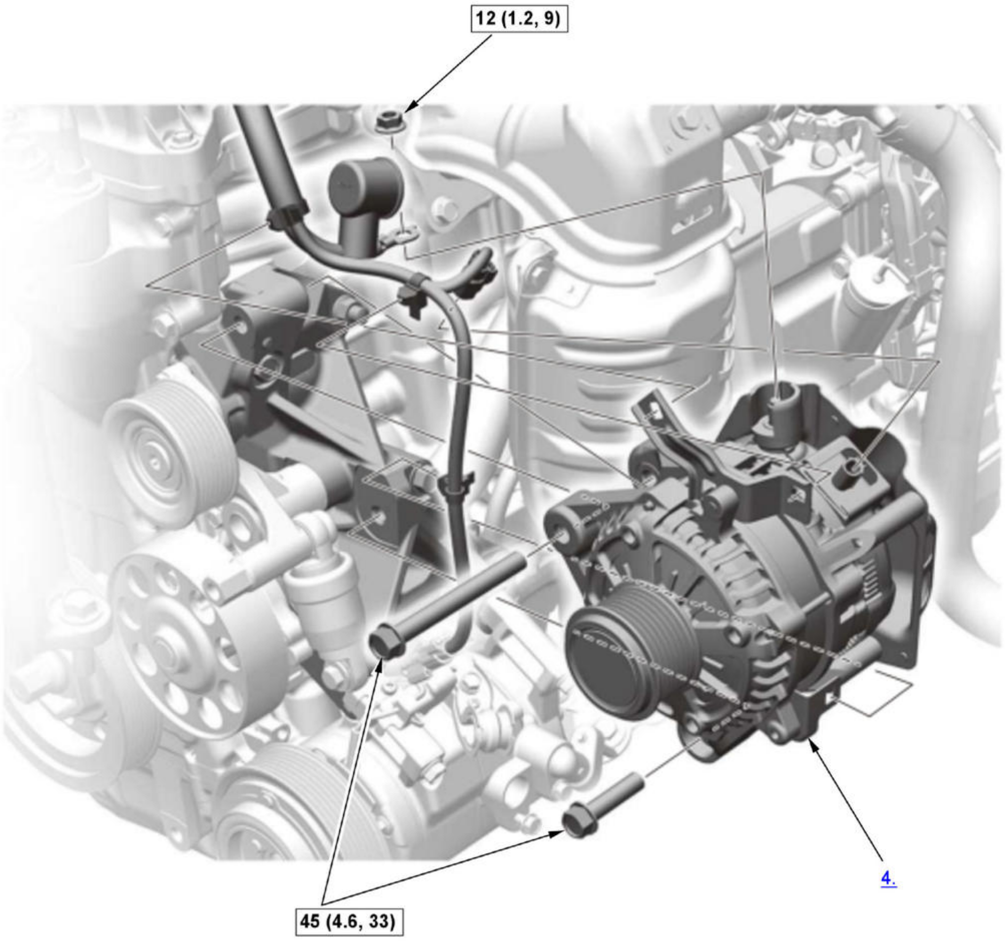

Fig. 2: Alternator Fastener Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

1. 12 Volt Battery Terminal - Disconnect
2. Drive Belt - Remove
3. Drive Belt Auto-Tensioner - Remove
4. Alternator - Remove
5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE: Make sure the crimped side of the ring terminal faces away from the alternator when you connect the positive alternator cable.

OVERHAUL

ALTERNATOR OVERHAUL (1.5 L ENGINE)

*1	These parts have inspection items.

1. Front Bearing - Install

	1. Use a hand press to install the front bearing (A) in the drive-end housing, with the driver handle, 15 x 135L and the bearing driver attachment, 42 x 47 mm.

2. Front Bearing Retainer - Install
3. Rotor - Install
4. Stator Assembly - Install
5. Brush Holder - Install

	1. Push the brushes (A) in, then insert a pin or drill bit (B) (about 1.6 mm (1/16 in) diameter) to hold them there. 2. Install the brush holder. 3. Pull out the pin or drill bit.

6. End Cover - Install
7. Terminal Insulator - Install
8. **OAD Pulley - Install**

Inspection

Brush Holder

1. Brush - Inspect

	1. Measure the length of both brushes (A) with a vernier caliper (B). If either brush is shorter than the service limit, replace the brush holder.

Alternator Brush Length	
Standard (New):	**10.5 mm (0.413 in)**
Service Limit:	**1.5 mm (0.059 in)**

Rotor

2. Rotor Slip Ring - Test

	1. Check for continuity between the slip rings (A): • If there is continuity, go to step 2. • If there is no continuity, replace the rotor assembly. 2. Check for continuity between each slip ring and the rotor (B) and the rotor shaft (C). If there is continuity, replace the rotor assembly.

ALTERNATOR OVERHAUL (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

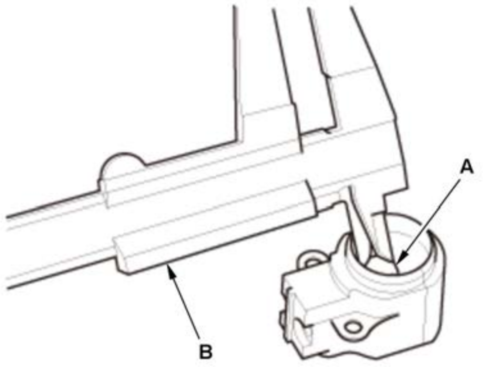
Inspection

Brush Holder

1. Brush - Inspect

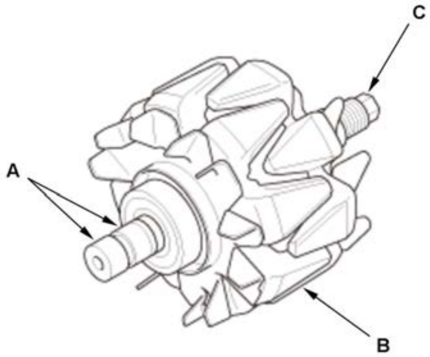


1. Measure the length of both brushes (A) with a vernier caliper (B). If either brush is shorter than the service limit, replace the brush holder.

Alternator Brush Length	
Standard (New):	**10.5 mm (0.413 in)**
Service Limit:	**1.5 mm (0.059 in)**

Rotor

2. Rotor Slip Ring - Test



1. Check for continuity between the slip rings (A):
   - If there is continuity, go to step 2.
   - If there is no continuity, replace the rotor assembly.

2. Check for continuity between each slip ring and the rotor (B) and the rotor shaft (C).If there is continuity, replace the rotor assembly.

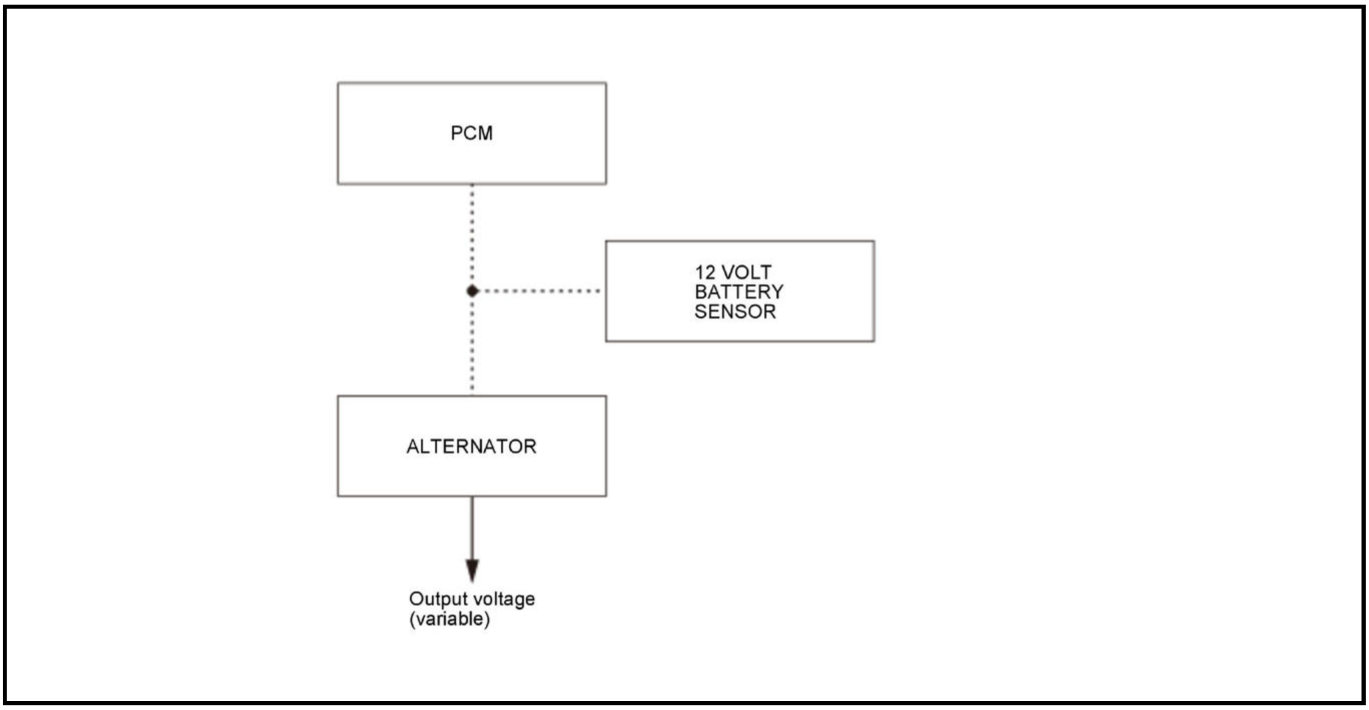
DESCRIPTION & OPERATION

CHARGING SYSTEM DESCRIPTION

Overview

The PCM gathers vehicle operating system data and determines the required charging rate. Based on that data, the PCM commands the alternator to provide a specific charging rate (voltage) between 12.5 and 14.5 volts, using 0.1 volt steps. In some operating conditions, the alternator may bypass PCM control and use a default value.

Depending on the vehicle condition, the variable control is not activated.



When the alternator is at fault, one or more of the following DTC is stored. Refer to the corresponding troubleshooting.

DTC	Detection Item
P0562	Charging System Low Voltage
P065A	ACG No Charging Malfunction
P1549	Charging System High Voltage
P16BB	Alternator B Terminal Circuit Low Voltage
P16E2	PGM-FI-ACG LIN Communication Error
P16E4	ACG High-temperature

SYMPTOM TROUBLESHOOTING INDEX

CHARGING SYSTEM SYMPTOM TROUBLESHOOTING INDEX

NOTE: If no DTCs are indicated when confirming them with the HDS, the alternator is normal because of multistage control one.

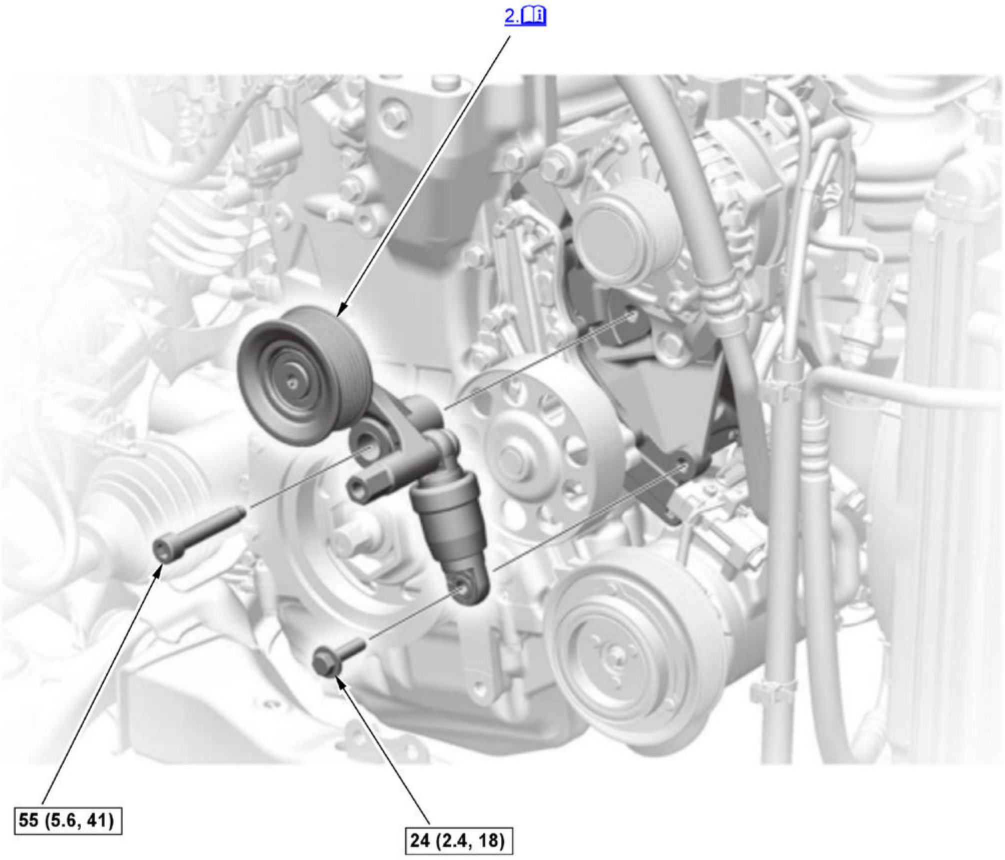
Symptom	Diagnostic procedure	Also check for
12 volt charging system indicator stays on	Do the gauge control module self-diagnostic function procedure .	B
With OAD pulley: Over-run alternator decoupler (OAD) pulley is making an abnormal noise	Check for a broken over-run alternator decoupler (OAD) pulley.	B

REMOVAL, INSTALLATION & INSPECTION

DRIVE BELT AUTO-TENSIONER REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

1



2.
55 (5.6, 41)
24 (2.4, 18)

Fig. 3: Drive Belt Auto-Tensioner Torque Specifications
Courtesy of HONDA, U.S.A., INC.

□	Torque: N.m (kgf.m, lbf.ft)

2

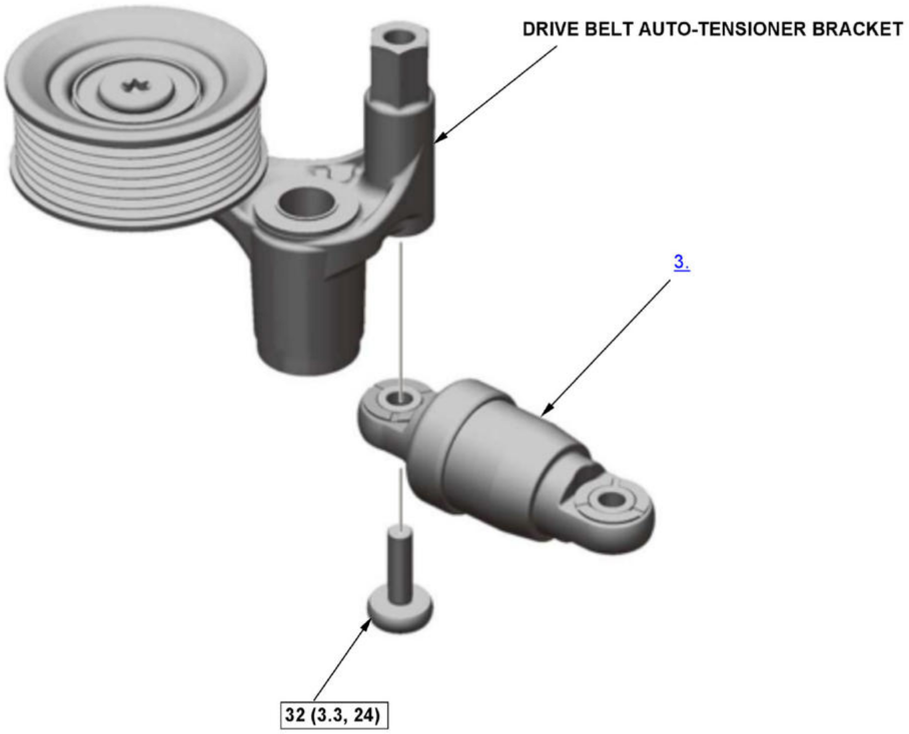


Fig. 4: Drive Belt Auto-Tensioner Torque Specifications
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. **Drive Belt - Remove**
2. Drive Belt Auto-Tensioner - Remove

   NOTE: Check for oil leaks from the drive belt auto-tensioner damper and check for damage to the damper rubber.

3. Drive Belt Auto-Tensioner Damper - Remove
4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.
   NOTE: **Do the drive belt auto-tensioner air bleeding** .

Inspection

1. Drive Belt Auto-Tensioner - Position Check

	1. Turn the vehicle to the ON mode, and make sure to turn the A/C switch OFF, then turn the vehicle to the OFF (LOCK) mode. 2. Check the position of the drive belt auto-tensioner indicator pointer (A). 3. Start the engine, then check the position again with the engine idling. If the position of the indicator moves or fluctuates a lot, replace the drive belt auto-tensioner. 4. Check for abnormal noise from the tensioner pulley. If you hear any abnormal noise, replace the drive belt auto-tensioner.

2. Drive Belt - Remove
3. Drive Belt Auto-Tensioner - Inspect

	1. Set a wrench on the drive belt auto-tensioner, and slowly turn the wrench in the direction of the arrow. **NOTE:** • This is a hydraulic type auto-tensioner, so you must turn the wrench slowly for at least 3 seconds. • Check the belt for cracks or damage. • Check for oil leakage from the damper rubber bellows. • If the tensioner does not move smoothly, or you hear abnormal noise, replace the drive belt auto-tensioner.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

DRIVE BELT REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

NOTE: Where icon is shown, see below for further information.

1

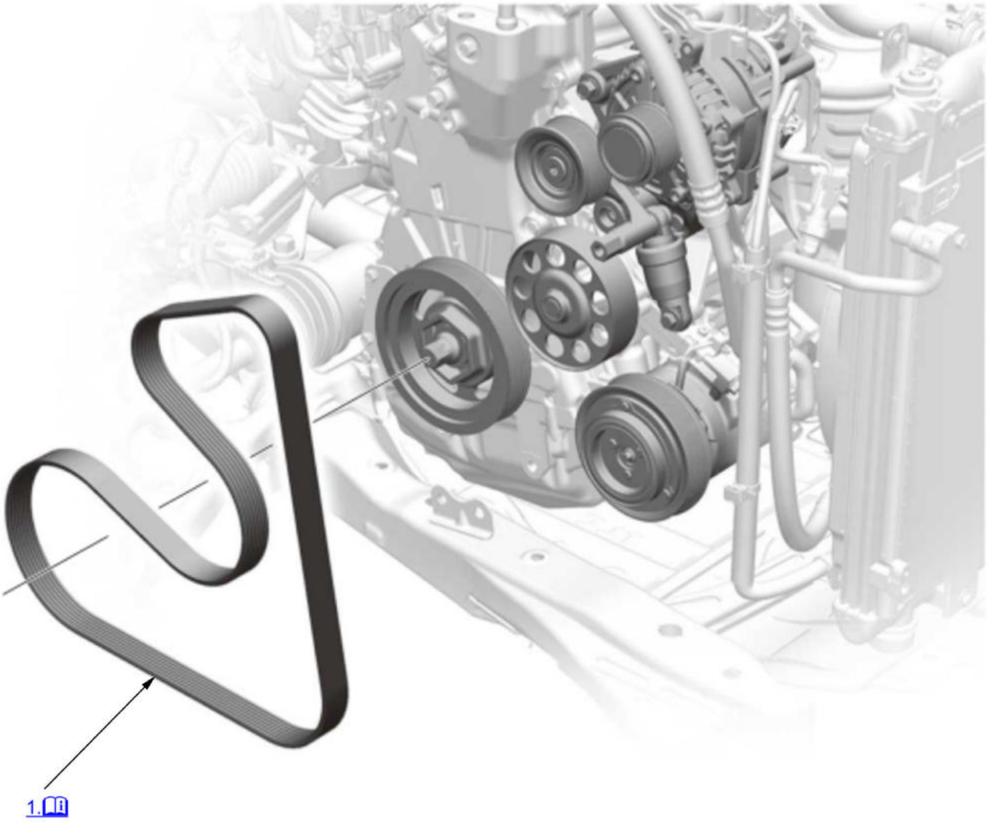

Fig. 5: Drive Belt Routing (2.4L)
Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes, and precautions

1. Drive Belt - Remove

	1. Set a wrench on the drive belt auto-tensioner (A), and slowly turn the wrench in the direction of the arrow, then remove the drive belt (B). **NOTE:** This is a hydraulic type auto-tensioner, so you must turn the wrench slowly for at least 3 seconds.

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Inspection

1. Drive Belt - Inspect

	1. Inspect the belt for cracks or damage. If the belt is cracked or damaged, replace it. 2. Check the position of the drive belt auto-tensioner indicator's pointer (A) is within the standard range (B) as shown. If it is out of the standard range, replace the drive belt. **NOTE:** When replaced a new drive belt, check the position of the drive belt auto-tensioner indicator's pointer is within the standard range (C) as shown.

2. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the drive belt, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").

OVER-RUN ALTERNATOR DECOUPLER (OAD) PULLEY REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Alternator OAD Pulley Holder 07AAB-TK8A100

Removal and Installation

NOTE: ℹ Where icon is shown, see below for further information.

1

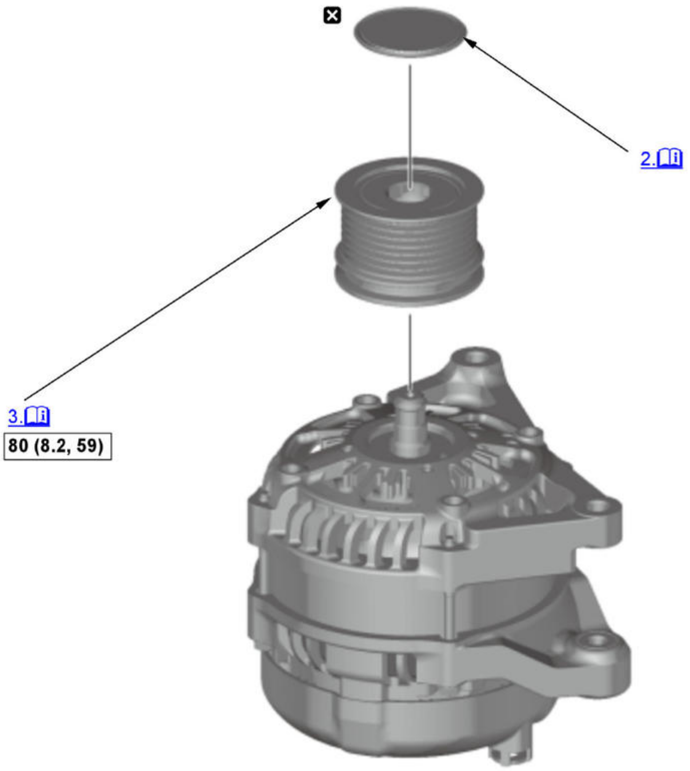

Fig. 6: Over-Run Alternator Decoupler (OAD) Pulley Torque Specifications
Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes, and precautions
▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Alternator - Remove**
2. OAD Pulley Seal Cap - Remove

	1. Remove the OAD pulley seal cap (A) by piercing the center of the rubber cap with a flat screwdriver and prying it loose. **NOTE:** While the cap is off, the grease inside the OAD pulley is exposed. Do not wipe the grease off, and make sure it does not become contaminated.

3. OAD Pulley - Remove

	1. Clamp the alternator firmly in a vise. 2. Insert the alternator OAD pulley holder into the OAD pulley.

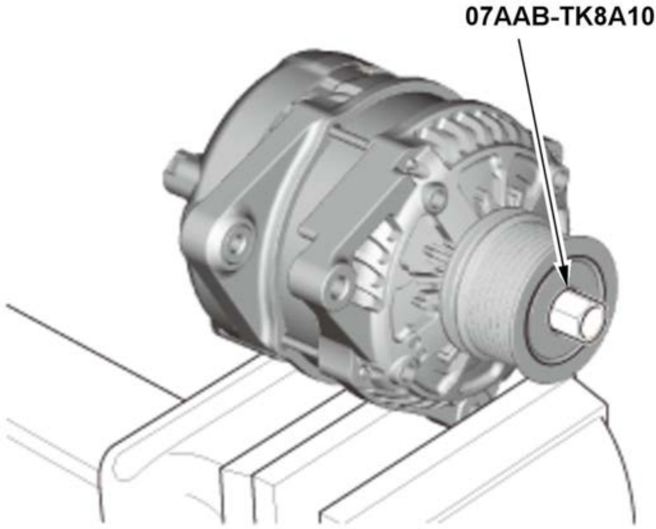
	3. Place a 10 mm socket (A) through center of the alternator OAD pulley holder (B), onto the nut on the end of the alternator shaft. 4. Hold the alternator OAD pulley holder with a 17 mm wrench (C), then turn the alternator shaft clockwise. 5. Remove the OAD pulley (D).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal. **NOTE:** • When installing do not distort the OAD pulley seal cap. • Make sure to check that the cap is installed securely.

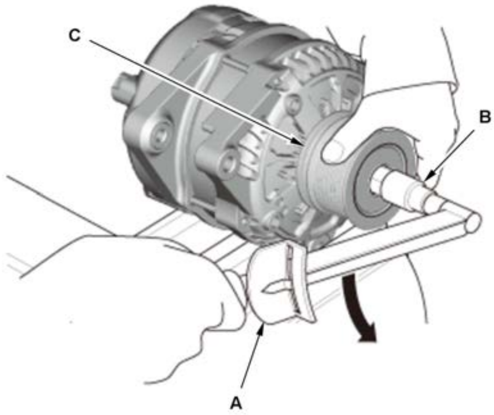
Inspection

1. OAD Pulley - Inspect



1. Clamp the alternator firmly in a vise.

2. Insert the alternator OAD pulley holder into the OAD pulley.

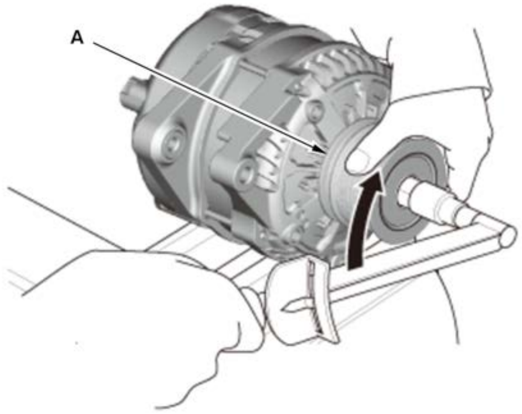


3. Place a beam type torque wrench (A) with a 17 mm socket wrench (B) on the alternator OAD pulley holder.

4. While holding the OAD pulley (C), rotate the alternator shaft counterclockwise. Make sure the alternator shaft is locked when applying the specified torque.

- If the alternator shaft locks, go to step 3.
- If it does not lock, replace the OAD pulley.

Specified Torque:
11 N.m (1.1 kgf.m, 8 lbf.ft)



5. While holding the OAD pulley (A), rotate the alternator shaft clockwise. Check that the alternator shaft rotates at the specified torque or less.

- If the alternator shaft rotates at the specified torque or less, it is normal. Install a new OAD pulley seal cap.
- If it does not rotate at the specified torque or less, replace the OAD pulley.

Specified Torque:
0.8 N.m (0.08 kgf.m, 0.6 lbf.ft) max

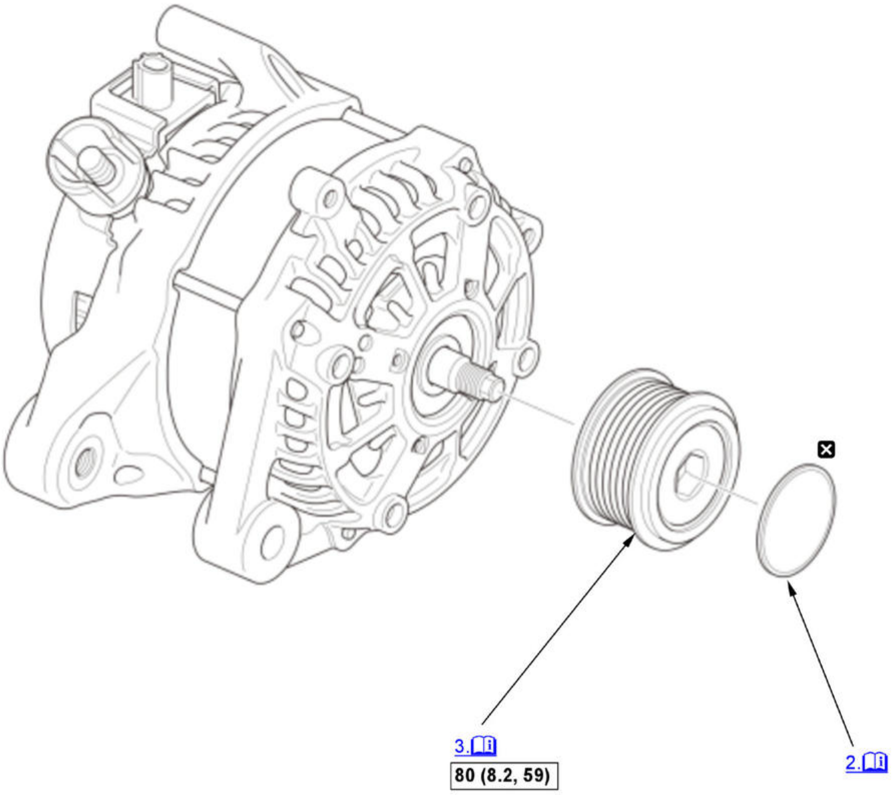
Special Tools Required

Image	Description/Tool Number
	Alternator OAD Pulley Holder 07AAB-TK8A100

Removal and Installation

NOTE: ℹ Where icon is shown, see below for further information.

1



[Fig. 7: Over-Run Alternator Decoupler (OAD) Pulley Torque Specifications](#)
Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes, and precautions
▭	Torque: N.m (kgf.m, lbf.ft)

Replace

1. **Alternator - Remove**
2. OAD Pulley Seal Cap - Remove

	1. Clamp the alternator firmly in a vise. 2. Remove the OAD pulley seal cap (A) by piercing the center of the rubber cap with a flat screwdriver and prying it loose. **NOTE:** While the cap is off, the grease inside the OAD pulley is exposed. Do not wipe the grease off, and make sure it does not become contaminated.

3. OAD Pulley - Remove

	1. Insert the alternator OAD pulley holder into the OAD pulley.

	2. Place a 10 mm hex wrench (A) through center of the alternator OAD pulley holder (B), into hex in the end of the alternator shaft. 3. Hold the alternator OAD pulley holder with a 17 mm wrench (C), then turn the alternator shaft clockwise. 4. Remove the OAD pulley (D).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal. **NOTE:** • When installing do not distort the OAD pulley seal cap. • Make sure to check that the cap is installed securely.

Inspection

1. OAD Pulley - Inspect

	1. Insert the alternator OAD pulley holder into the OAD pulley.

	2. Place a beam type torque wrench (A) with a 17 mm socket wrench (B) on the alternator OAD pulley holder. 3. While holding the OAD pulley (C), rotate the alternator shaft counterclockwise. Make sure the alternator shaft is locked when applying the specified torque. • If the alternator shaft locks, go to step 4. • If it does not lock, replace the OAD pulley.

Specified Torque:
13 N.m (1.3 kgf.m, 10 lbf.ft)

	4. While holding the OAD pulley (A), rotate the alternator shaft clockwise. Check that the alternator shaft rotates at the specified torque or less. • If the alternator shaft rotates at the specified torque or less, it is normal. Install the OAD pulley seal cap. • If it does not rotate at the specified torque or less, replace the OAD pulley.

Specified Torque:
0.8 N.m (0.08 kgf.m, 0.6 lbf.ft) max.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

12 VOLT CHARGING SYSTEM INDICATOR STAYS ON

Diagnostic procedure

- Do the gauge control module self-diagnostic function procedure .

WITH OAD PULLEY: OVER-RUN ALTERNATOR DECOUPLER (OAD) PULLEY IS MAKING AN ABNORMAL NOISE

Diagnostic procedure

- Check for a broken over-run alternator decoupler (OAD) pulley.

DISASSEMBLY AND REASSEMBLY

BATTERY PACK DISASSEMBLY AND REASSEMBLY

Disassembly

WARNING:

- The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.
- Wear insulated gloves and use insulated tools to protect you from electrical shock. When removing or installing high voltage items, always use them. Wrap the high voltage items with insulating tape after removing. Please be careful when you see ⚠ on the illustration.

NOTE:

- ℹ Where icon is shown, for further information see below.
- Wear insulated gloves and use insulated tools to protect you from electrical shock.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.
- Strong impact (i.e., dropping the high voltage battery, collision damage) may cause electrolyte leaks, internal short circuits and heat increase resulting in fire. Avoid impact to the high voltage battery.
- Organic electrolyte is poisonous. If ingested, get medical attention immediately.
- High voltage battery damage may cause flammable gas or electrolyte leaks and may result in fire. Do not damage the high voltage battery and keep sparks, flame and cigarettes away.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain **service precautions** before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

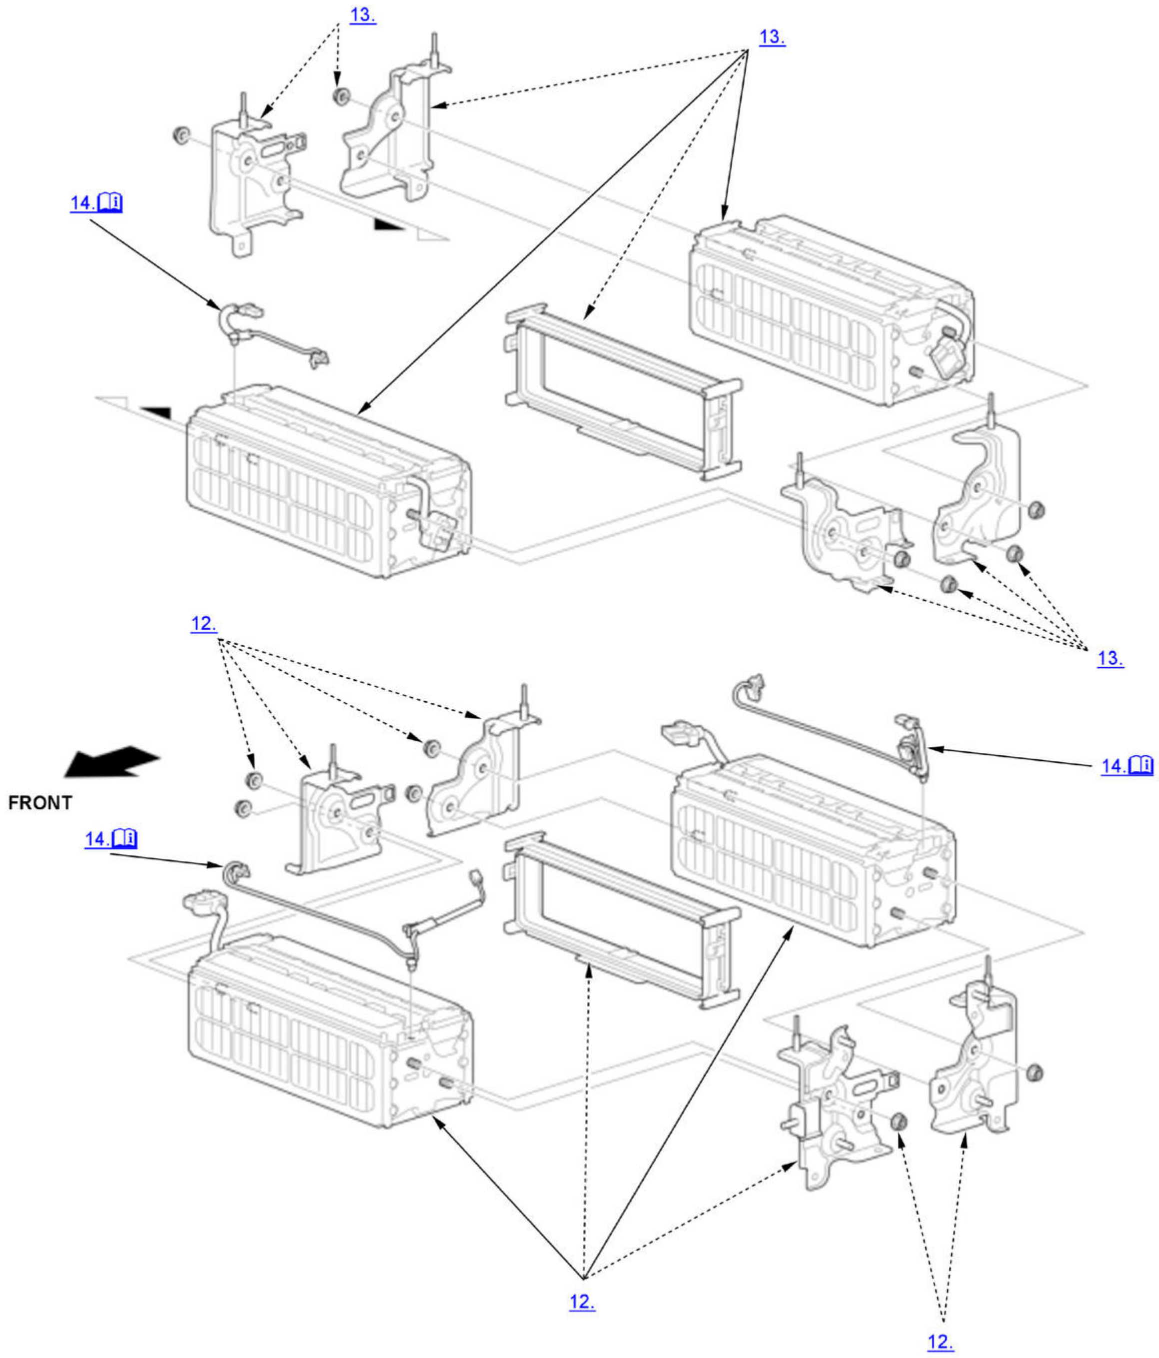

Fig. 4: Exploded View Of Battery Pack Components For Disassembly (4 Of 4)
Courtesy of HONDA, U.S.A., INC.

1. Battery Pack Assy - Remove
2. Service Plug Base - Remove

	**NOTICE:** - High voltage electricity flows in the battery terminal and busbar after disconnecting the service plug. Do all procedures one by one and keep the terminal covers closed when you are not working on them. - Keep the terminal covers closed when you are not working on them. 1. Open the terminal cover (A). 2. Remove the negative terminal (B) then close the terminal cover.

	3. Open the positive terminal cover (A). 4. Remove the positive terminal (B) then close the terminal cover. 5. Disconnect the clip (C) then remove the service plug base (D).

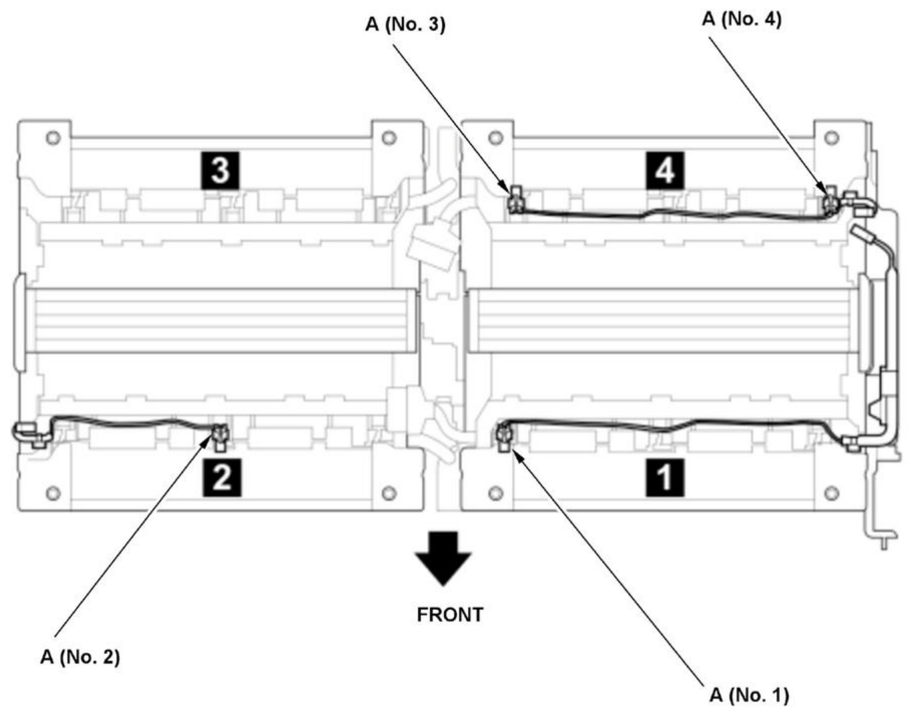
3. IPU Upper Frame - Remove

	1. Disconnect the connectors (A). 2. Release the tabs (B). 3. Move the harness (C) and remove the upper frame.

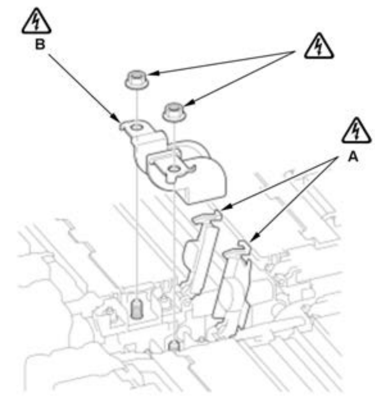
4. Battery Module, High Voltage Battery Module Temperature Sensor - Position check

NOTE: Record the battery temperature sensor mounting position (A).

1. Mark the battery module with a number as shown.



5. Busbar (Battery Module 1-2) - Remove



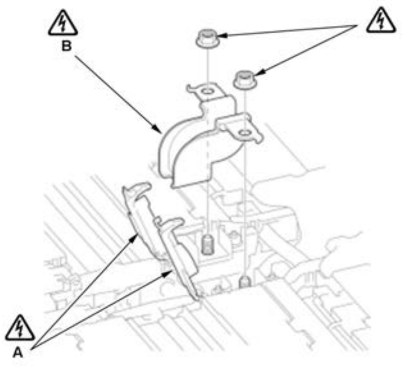
NOTICE:

- High voltage electricity flows in the battery terminal and busbar after disconnecting the service plug. Do all procedures one by one and keep the terminal covers closed when you are not working on them.
- Never reuse a bent or damaged busbar.

1. Open the terminal covers (A).

2. Remove the busbar (B), then close the terminal covers.

6. Busbar (Battery Module 3-4) - Remove



NOTICE:

- High voltage electricity flows in the battery terminal and busbar after disconnecting the service plug. Do all procedures one by one and keep the terminal covers closed when you are not working on them.
- Never reuse a bent or damaged busbar.

1. Open the terminal covers (A).

2. Remove the busbar (B), then close the terminal covers.

7. Side Plate End Bindbar - Remove

8. Left Battery Module Assy. (Battery Module 1 and Battery Module 4) - Remove
9. IPU Sub Harness - Remove
10. Right Battery Module Assy. (Battery Module 2 and Battery Module 3) - Remove
11. Battery Lower Duct, IPU Lower Frame - Remove
12. Battery Module 1 and Battery Module 4 - Remove
13. Battery Module 2 and Battery Module 3 - Remove
14. High Voltage Battery Module Temperature Sensor - Remove

 	**NOTE:** Be sure to record the mounting position before removing the battery temperature sensor. 1. Press tab (A) in the direction of the arrow. 2. Lift the high voltage battery module temperature sensor (B) in the direction of the arrow. 3. Remove the harness clamp (C). 4. Remove the battery temperature sensor harness (D) from the harness holder (E).

Reassembly

WARNING:

- The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.

- Wear insulated gloves and use insulated tools to protect you from electrical shock. When removing or installing high voltage items, always use them. Wrap the high voltage items with insulating tape after removing. Please be careful when you see ⚠ on the illustration.

NOTE:

- ℹ Where icon is shown, for further information see below.
- Wear insulated gloves and use insulated tools to protect you from electrical shock.
- To avoid damaging the wiring and terminals, connect the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.
- Strong impact (i.e., dropping the high voltage battery, collision damage) may cause electrolyte leaks, internal short circuits and heat increase resulting in fire. Avoid impact to the high voltage battery.
- Organic electrolyte is poisonous. If ingested, get medical attention immediately.
- High voltage battery damage may cause flammable gas or electrolyte leaks and may result in fire. Do not damage the high voltage battery and keep sparks, flame and cigarettes away.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. 1. High Voltage Battery Module Temperature Sensor - Install

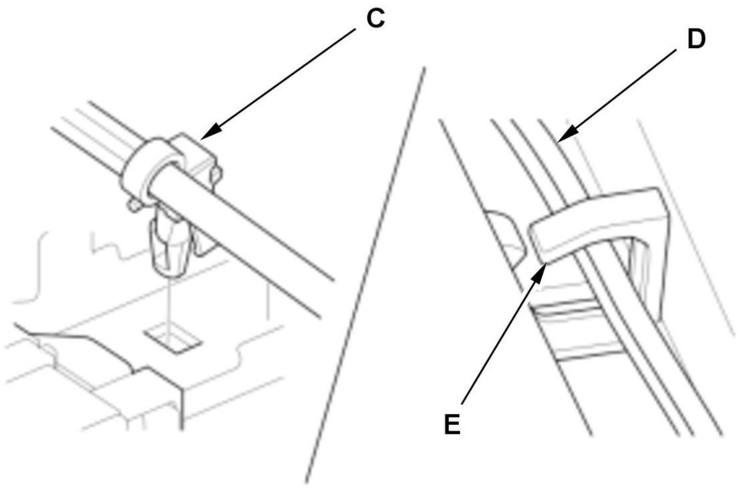
NOTE: Always install the high voltage battery module temperature sensor in the same position as before removal.

1. Install the high voltage battery module temperature sensor (A) as shown by the arrow.

2. Make sure the locking tab (B) locks the high voltage battery module temperature sensor as shown.

3. Install the harness clamp (C).

4. Attach the high voltage battery module temperature sensor harness (D) to the harness holder (E).



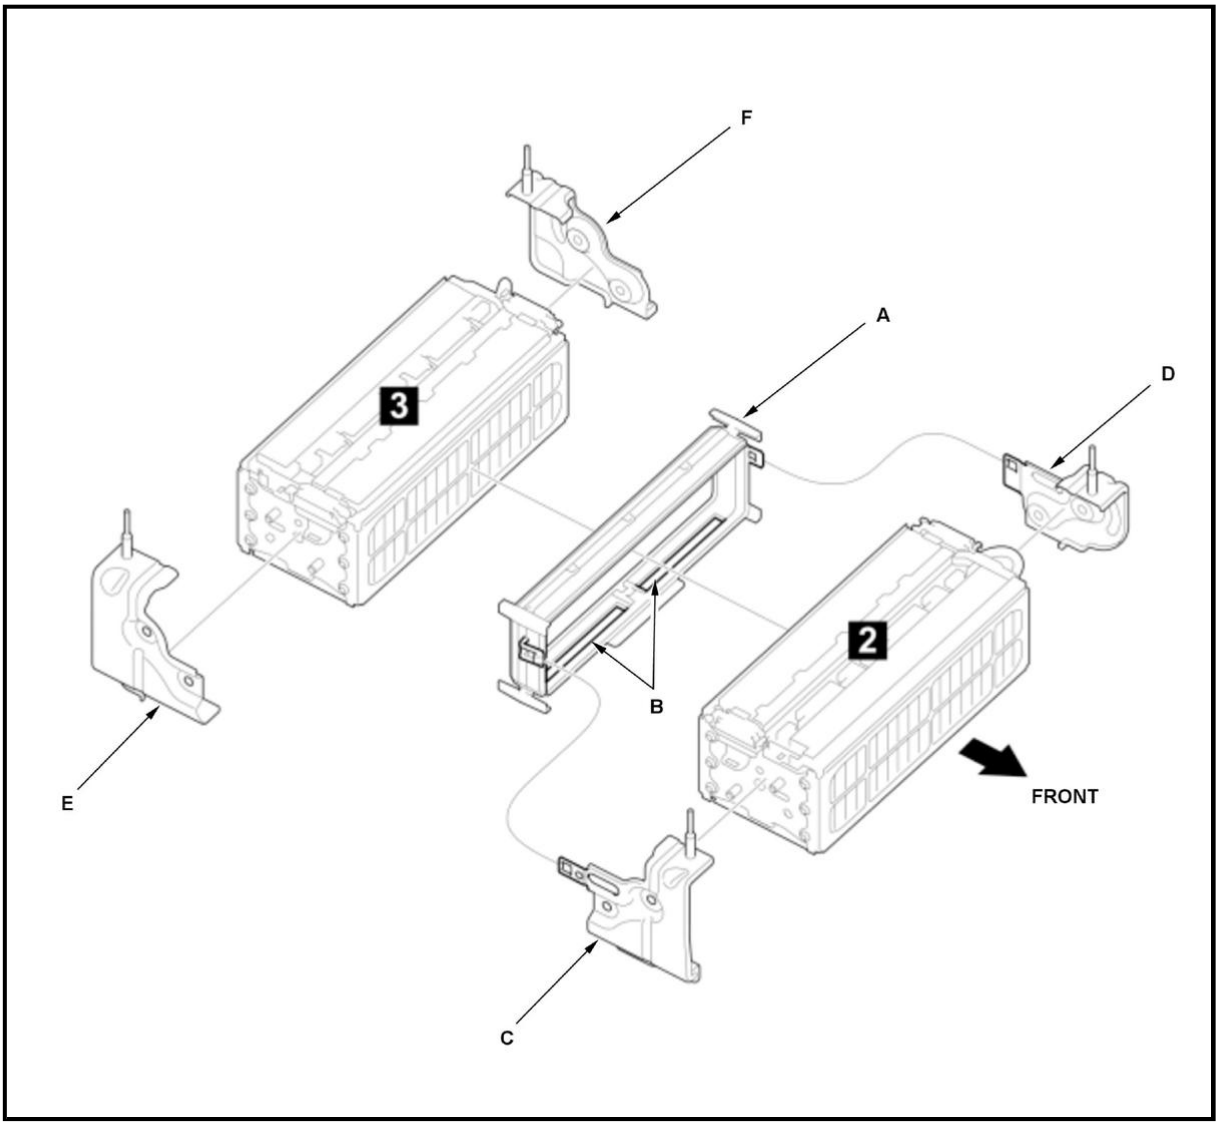
2. Battery Module 2 and Battery Module 3 - Install

1. Install battery module 2, battery module 3, battery middle duct (A), and each plate according to the following table and figure.

NOTICE:

- Check the marking on each plate before starting work.
- Be careful not to pinch the seal part of the battery middle duct.
- Install the battery middle duct with the cooling air outlet (B) facing downward.

Battery module No.	Plate name	Punch mark
Battery module 2	R. end front plate (C)	10
	L. middle front plate (D)	60
Battery module 3	R. end rear plate (E)	30
	L. middle rear plate (F)	80



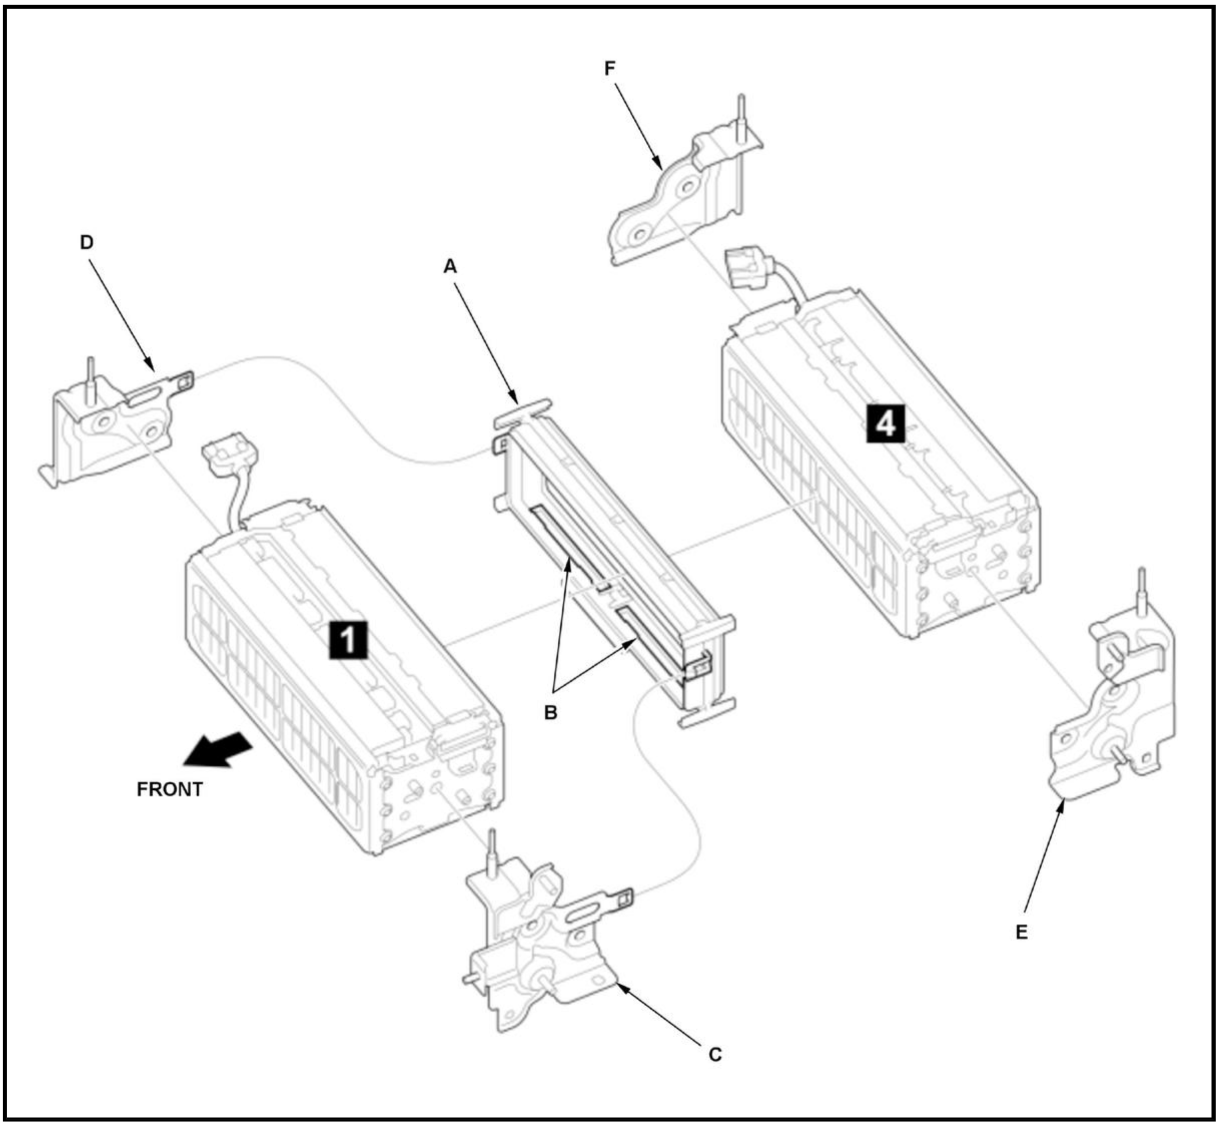
3. Battery Module 1 and Battery Module 4 - Install

1. Install battery module 1, battery module 4, battery middle duct (A), and each plate according to the following table and figure.

NOTICE:

- Check the marking on each plate before starting work.
- Be careful not to bite the seal part of the battery middle duct.
- Install the battery middle duct with the cooling air outlet (B) facing downward.

Battery module No.	Plate name	Punch mark
Battery module 1	L. end front plate (C)	50
	R. middle front plate (D)	20
Battery module 4	L. end rear plate (E)	70
	R. middle rear plate (F)	40



4. Battery Lower Duct, IPU Lower Frame - Install
5. Side Plate End Bindbar (Battery Module 2 - Battery Module 3) - Loosely Install
6. Right Battery Module Assy. (Battery Module 2 and Battery Module 3) - Install

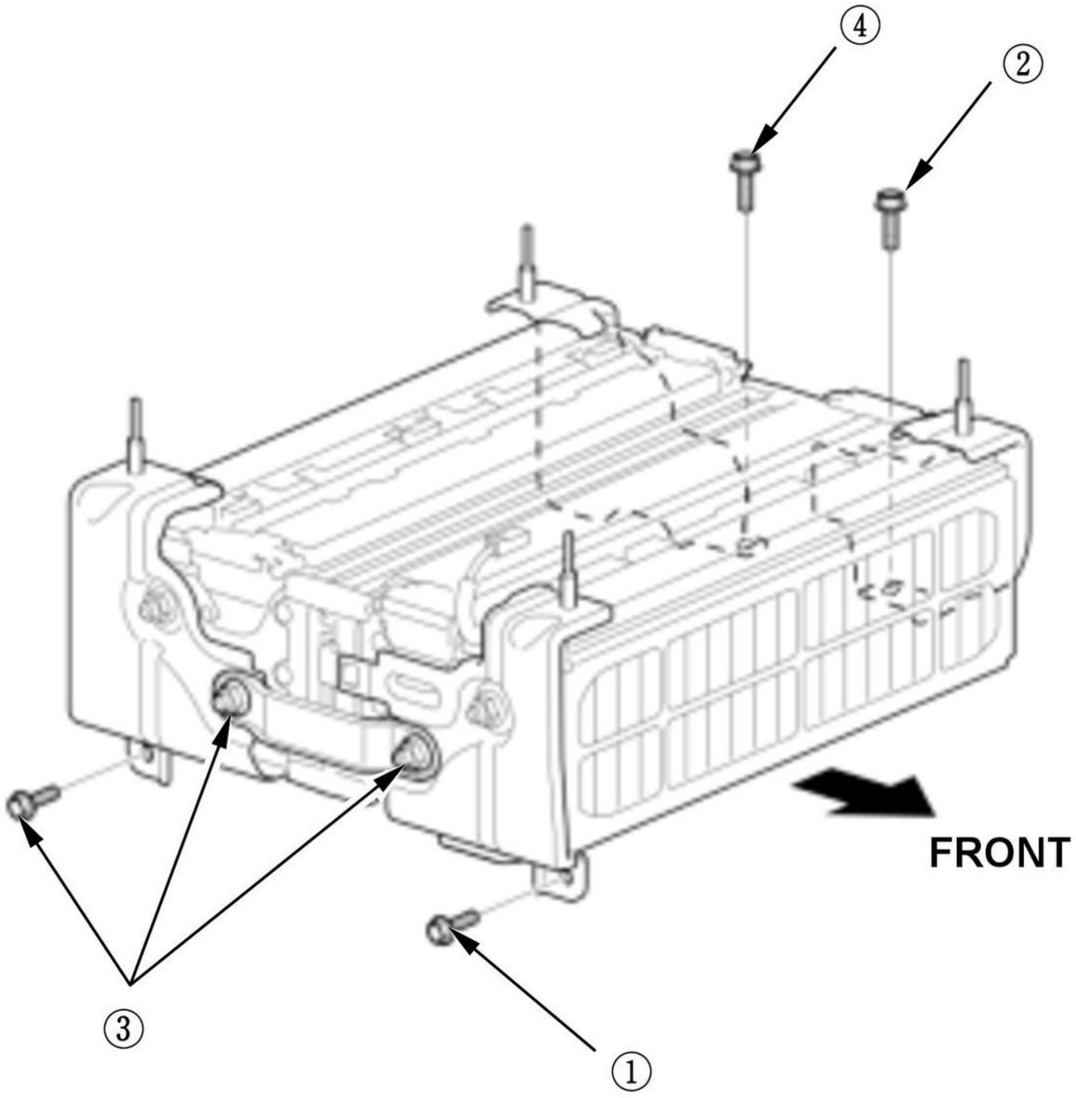


Fig. 9: Right Battery Module Assembly Bolts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

NOTICE:

- Tighten with the specified torque in the order shown in the figure.
- Make sure that the battery middle duct and battery lower duct seals do not get caught or lifted.
- Align the dowel pins and install them.

7. IPU Sub Harness - Install
8. Side Plate End Bindbar (Battery Module 1 - Battery Module 4) - Loosely Install
9. Left Battery Module Assy. (Battery Module 1 and Battery Module 4) - Install

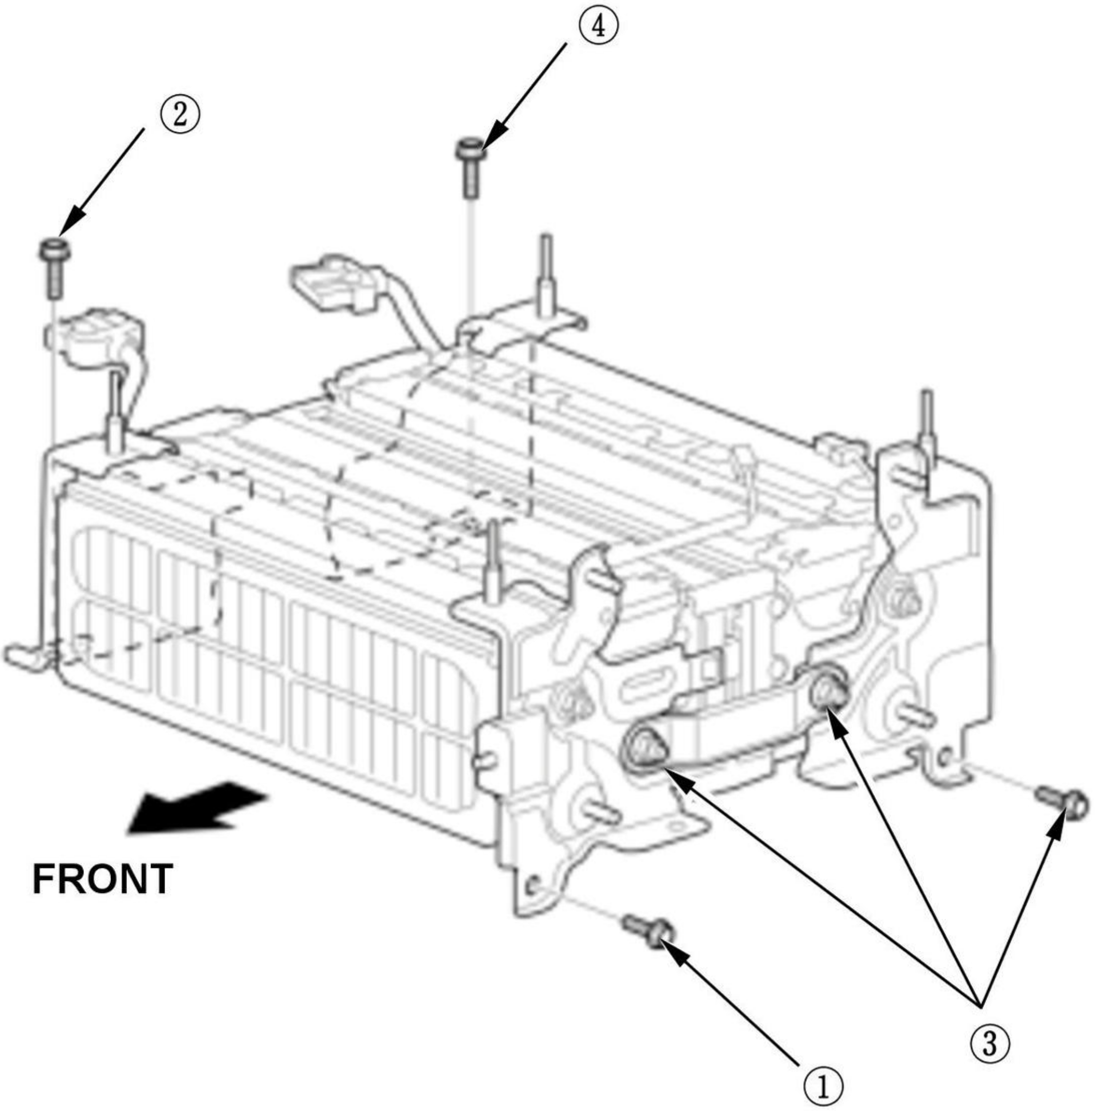

Fig. 10: Left Battery Module Assembly Bolts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

NOTICE:

- Tighten with the specified torque in the order shown in the figure.
- Make sure that the battery middle duct and battery lower duct seals do not get caught or lifted.
- Align the dowel pins and install them.

10. Busbar (Battery Module 3-4) - Install

	**NOTICE:** • High voltage electricity flows in the battery terminal and busbar after disconnecting the service plug. Do all procedures one by one and keep the terminal covers closed when you are not working on them. • When installing the busbar, measure the voltage according to the following procedure and confirm that it is normal. 1. Open the battery module terminal cover (A). 2. Measure the voltage between the terminals (B).

	• If the measured value is outside the normal value, go back to step 2-1, and reassemble the battery module. • If the measured value is normal, proceed to the next step.

Standard:	**1 V or less**

	3. Install the busbar (A). 4. Close the terminal covers (B). **NOTE:** Never reuse a bent or damaged busbar.

11. Busbar (Battery Module 1-2) - Install

	**NOTICE:** • High voltage electricity flows in the battery terminal and busbar after disconnecting the service plug. Do all procedures one by one and keep the terminal covers closed when you are not working on them. • When installing the busbar, measure the voltage according to the following procedure and confirm that it is normal. 1. Open the battery module terminal cover (A). 2. Measure the voltage between the terminals (B). • If the measured value is outside the normal value, go back to step 2-1, and reassemble the battery module. • If the measured value is normal, proceed to the next step.

Standard:	**1 V or less**

	3. Install the busbar (A). 4. Close the terminal covers (B). **NOTE:** Never reuse a bent or damaged busbar.

12. IPU Upper Frame - Install

	1. Install the upper frame. 2. Install the tabs (A). 3. Connect the connectors (B).

13. Service Plug Base - Install

	**NOTICE:** High voltage electricity flows in the battery terminal and busbar after disconnecting the service plug. Do all procedures one by one and keep the terminal covers closed when you are not working on them. 1. Open the battery module terminal covers (A). 2. Measure the voltage between the terminals (B). • If the measured value is outside the normal value, go back to step 2-1, and reassemble the battery module. • If the measured value is normal, proceed to the next step.

Standard:	**1 V or less**

	3. Install the terminals (A). 4. Close the terminal covers (B). 5. Install the harness clamp (C).

14. **Battery Pack Assy - Install**

JUNCTION BOARD DISASSEMBLY AND REASSEMBLY

Disassembly and Reassembly

NOTE: **How to read the torque specifications** .

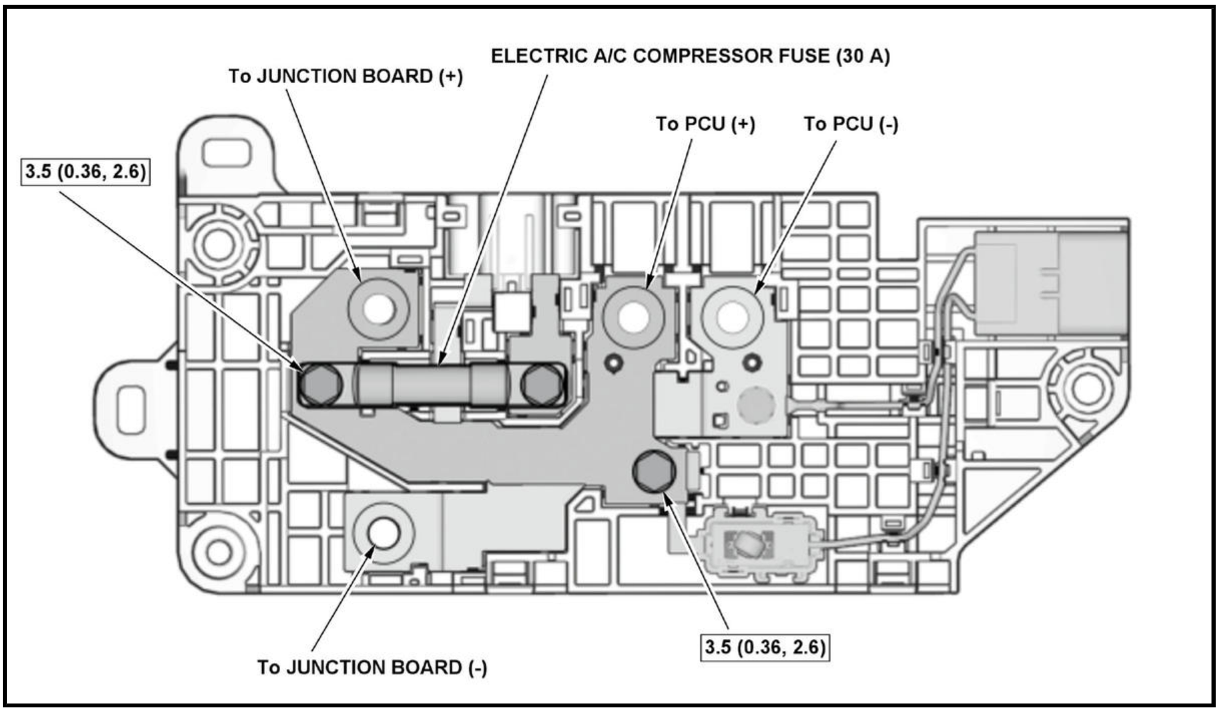
Disassembly and Reassembly

NOTE: How to read the torque specifications .

1. Subjunction Board - Remove
2. Subjunction Board Disassemble and Reassemble

   NOTE: If necessary, replace the fuse(s).



3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

REMOVAL AND INSTALLATION

BATTERY CONDITION MONITOR MODULE REMOVAL AND INSTALLATION

Removal and Installation

WARNING:

- The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.
- Wear insulated gloves and use insulated tools to protect you from electrical shock. When removing or installing high voltage items, always use them. Wrap the high voltage items with insulating tape after removing. Please be careful when you see ⚠ on the illustration.

NOTE:

- Use covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.
- Make sure the HDS has the latest HDS software version.
- If you are replacing the battery condition monitor module, do the all procedures.
- If you are removing the battery condition monitor module, do procedure 3 (Service Plug - Turn Off) through procedure 8 (All Removed Parts - Install).

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain service precautions before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

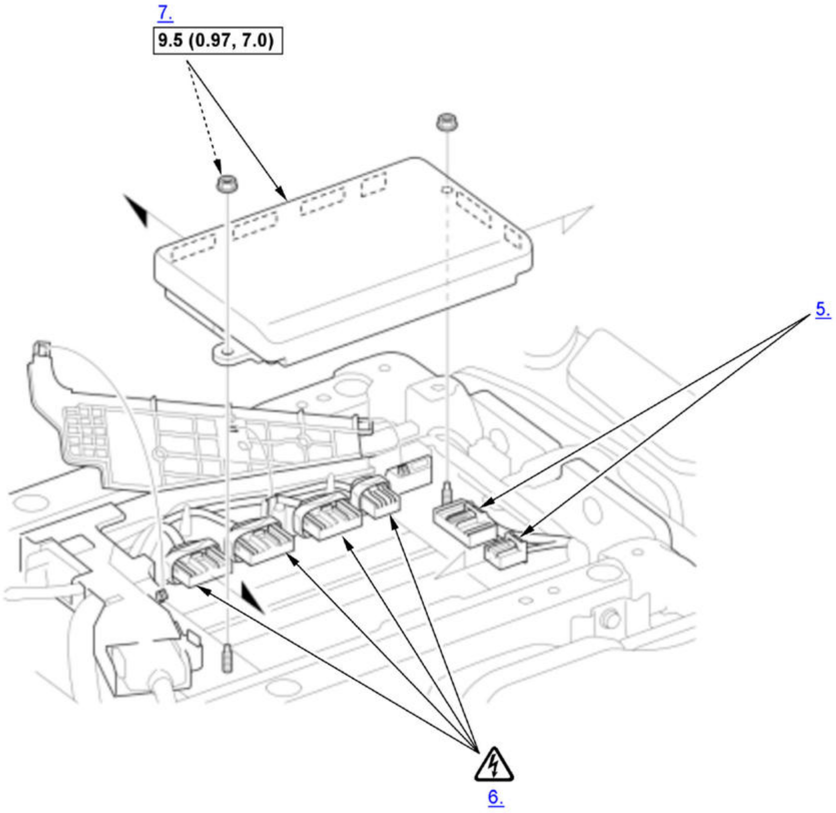


Fig. 11: Exploded View Of Battery Condition Monitor Module Components
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. HDS - Connect
2. Read Data (Battery Condition Monitor Module Data) - Select

> 1. Select the Electric Powertrain system with the HDS.
>
> 2. Select the HV Battery / HV Battery ECU Replacement, then follow the screen prompts.
>
> 3. Select the HV Battery ECU Replacement, then select Read Data, and follow the screen prompts.
>
> **NOTE:**
>
> - Doing this step copies (Read) the battery condition monitor module data from the original battery condition monitor module so you can later download (Write) it into the new battery condition monitor module.
> - If the Read Data procedure is failed, go to the next procedure.

3. Service Plug - Turn Off
4. IPU Cover - Remove
5. Connector (Battery Condition Monitor Module) - Disconnect
6. Connector (IPU Subharness) - Disconnect
7. Battery Condition Monitor Module - Remove
8. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.

9. **HDS - Connect**
10. Write Data (Battery Condition Monitor Module Data) - Select

> 1. Select the Electric Powertrain system with the HDS.
>
> 2. Select the HV Battery / HV Battery ECU Replacement, then follow the screen prompts.
>
> 3. Select the HV Battery ECU Replacement, then select Write Data, and follow the screen prompts.
>
> **NOTE:** If the Write Data procedure is failed, this procedure is complete.

11. **Battery Condition Monitor Module - Update** (When Replacing)

BATTERY PACK REMOVAL AND INSTALLATION

Removal and Installation

WARNING:

- The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.
- Wear insulated gloves and use insulated tools to protect you from electrical shock. When removing or installing high voltage items, always use them. Wrap the high voltage items with insulating tape after removing. Please be careful when you see ⚠ on the illustration.

NOTE:

- Use covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.
- Strong impact (i.e., dropping the high voltage battery, collision damage) may cause electrolyte leaks, internal short circuits and heat increase resulting in fire. Avoid impact to the high voltage battery.
- Organic electrolyte is poisonous. If ingested, get medical attention immediately.
- High voltage battery damage may cause flammable gas or electrolyte leaks and may result in fire. Do not damage the high voltage battery and keep sparks, flame and cigarettes away.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain **service precautions** before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

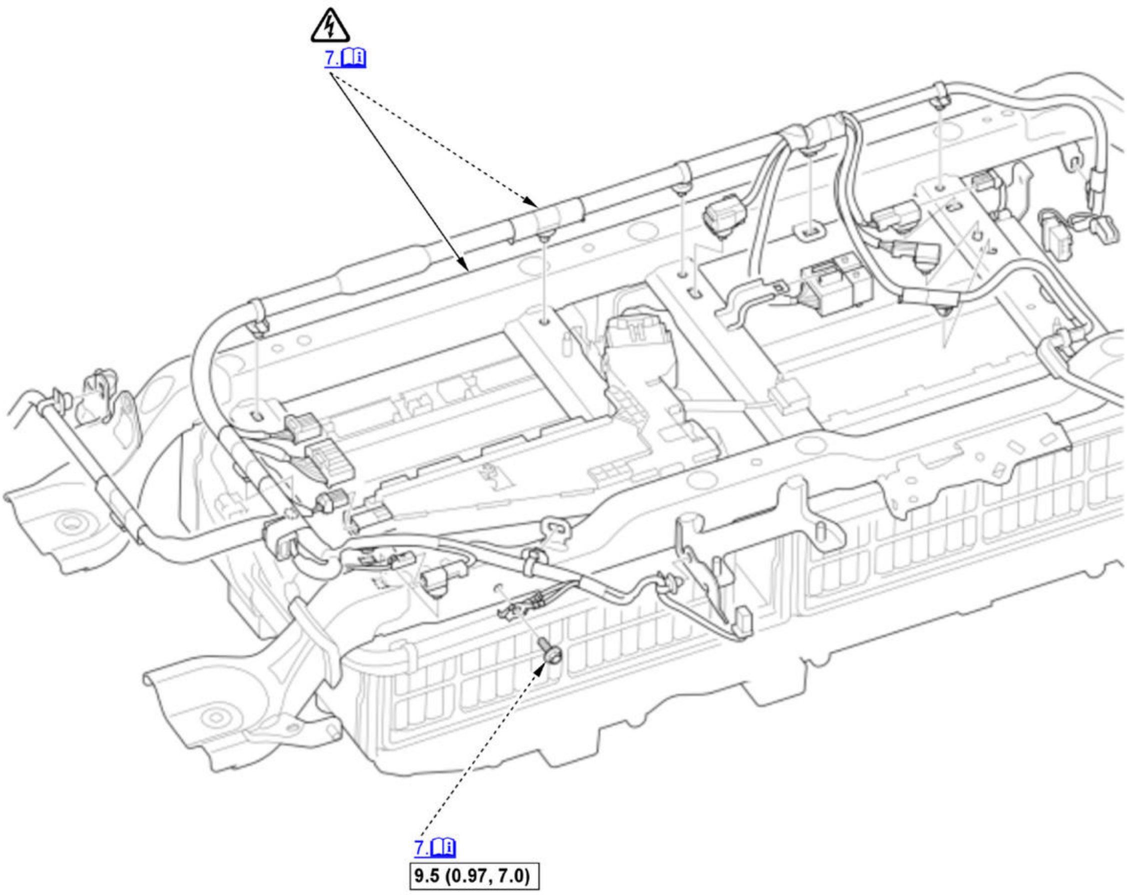

Fig. 12: Battery Pack Components
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. Service Plug - Turn Off
2. IPU Assembly, and IPU Case - Remove
3. IPU Air Inlet Front Duct and IPU Air Inlet Rear Duct - Remove
4. Battery Condition Monitor Module - Remove
5. Subjunction Board - Remove
6. Junction Board - Remove
7. Battery Pack Assembly - Remove

   1. If necessary, remove the IPU harness.

8. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

9. Battery Condition Monitor Module - Reset (When Replacing)

   NOTE: When replacing the battery pack, do the following procedure.

1. Connect the HDS to the data link connector (DLC) .

2. Make sure the HDS communicates with the vehicle and the Electric Powertrain system. If it doesn't, go to the DLC circuit troubleshooting

3. Select the Electric Powertrain system with the HDS.

4. Select the HV Battery / HV Battery ECU Replacement, then follow the screen prompts.

5. Select the HV Battery Replacement, then follow the screen prompts.

COOLANT TEMPERATURE SENSOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE: Do not spill the PCU coolant on the surrounding parts. If you spill the PCU coolant, wipe the PCU coolant off immediately.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

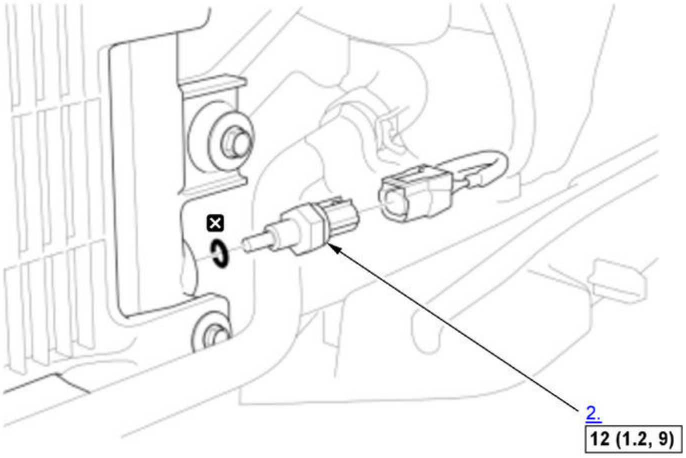

Fig. 13: Coolant Temperature Sensor Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. PCU Coolant - Drain
2. PCU Coolant Temperature Sensor - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. PCU Coolant - Refill and Air Bleed

COOLING PIPE REMOVAL AND INSTALLATION (ELECTRIC POWERTRAIN)

Removal and Installation

NOTE:

- ℹ Where icon is shown, for further information see below.
- If the cooling hose clamps and/or the cooling pipes were damaged, replace it.
- Do not spill the PCU coolant on the surrounding parts. If you spill the PCU coolant, wipe the PCU coolant off immediately.

Radiator Inlet Pipe A

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

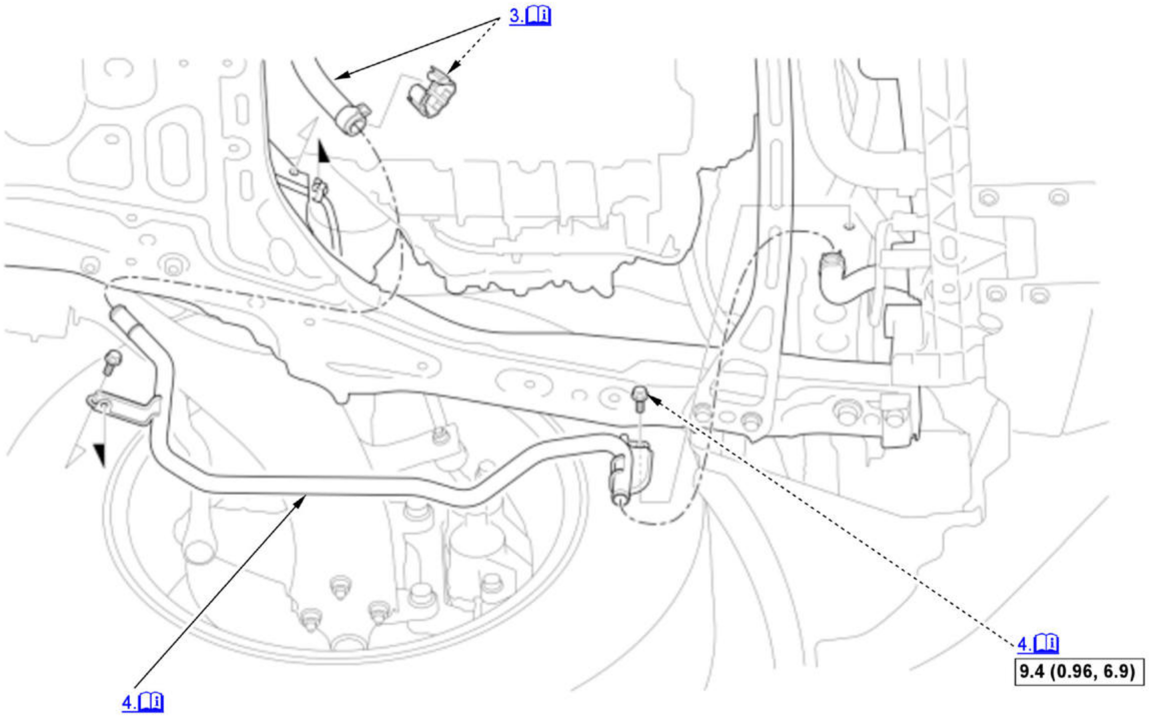

Fig. 14: Exploded View Of Radiator Inlet Pipe A Replacement Components (Electric Powertrain)
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

1. PCU Coolant - Drain
2. Engine Undercover - Remove
3. Cooling Hose - Disconnect

   NOTE: The hose band clip is no need to install when connecting the cooling hose.

4. Radiator Inlet Pipe A - Remove

   Note for installation

   Make sure the hose clamps are properly positioned and tightened, and make sure that they do not interfere with the surrounding parts.

5. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

6. PCU Coolant - Refill and Air Bleed

Radiator Inlet Pipe B

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

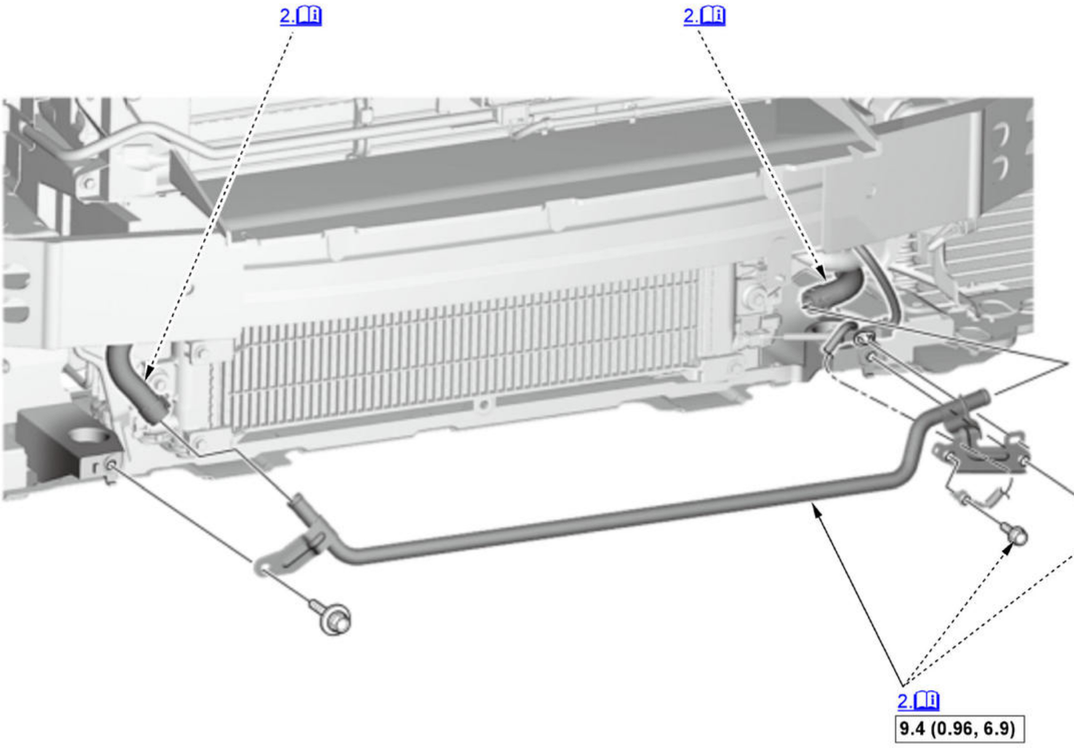

Fig. 15: Exploded View Of Radiator Inlet Pipe B Replacement Components (Electric Powertrain)

2. Intake Air Duct A and Intake Air Duct C - Remove
3. Cooling Hose - Disconnect
4. Engine Undercover - Remove
5. PCU Electric Coolant Pump - Remove
6. PCU Electric Coolant Pump Bracket - Remove (If Necessary)
7. Cooling Hose - Remove (If Necessary)

   Note for installation

   Make sure the hose clamps are properly positioned and tightened, and make sure that they do not interfere with the surrounding parts.

8. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

9. PCU Coolant - Refill and Air Bleed

EXPANSION TANK REMOVAL AND INSTALLATION (ELECTRIC POWERTRAIN)

Removal and Installation

NOTE:

- 📖 Where icon is shown, for further information see below.

- Do not spill the PCU coolant on the surrounding parts. If you spill the PCU coolant, wipe the PCU coolant off immediately.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

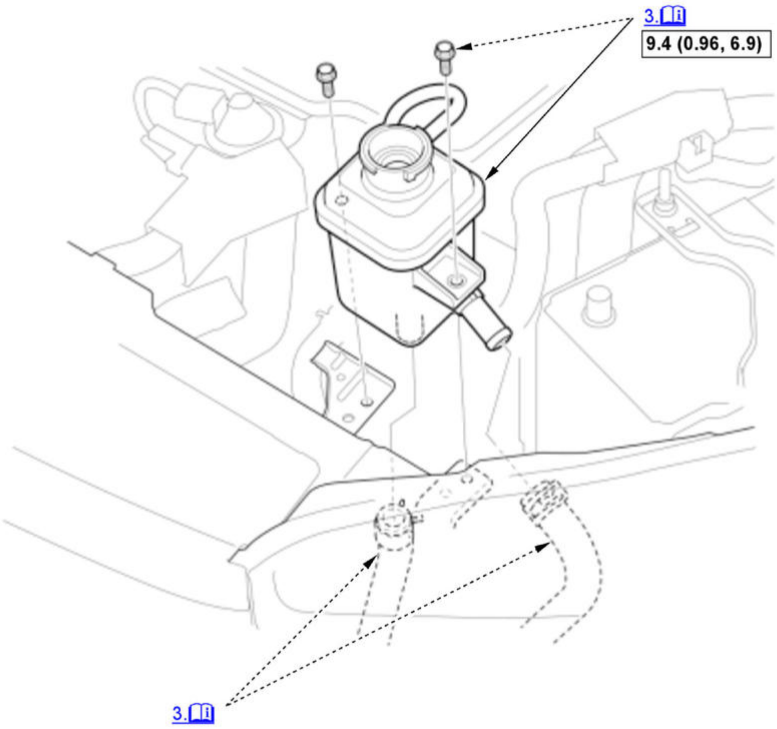

Fig. 18: Exploded View Of Expansion Tank Replacement Components (Electric Powertrain)
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

1. Expansion Tank Cap - Remove

   NOTE: Wait until the PCU coolant is cool, then carefully remove the radiator cap.

2. Intake Air Duct A and Intake Air Duct C - Remove
3. Expansion Tank - Remove

   NOTE: Drain the PCU coolant from the expansion tank.

   Note for installation

   Make sure the hose clamps are properly positioned and tightened, and make sure that they do not interfere with the surrounding parts.

4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

5. PCU Coolant - Refill and Air Bleed

HIGH VOLTAGE BATTERY MODULE FAN REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

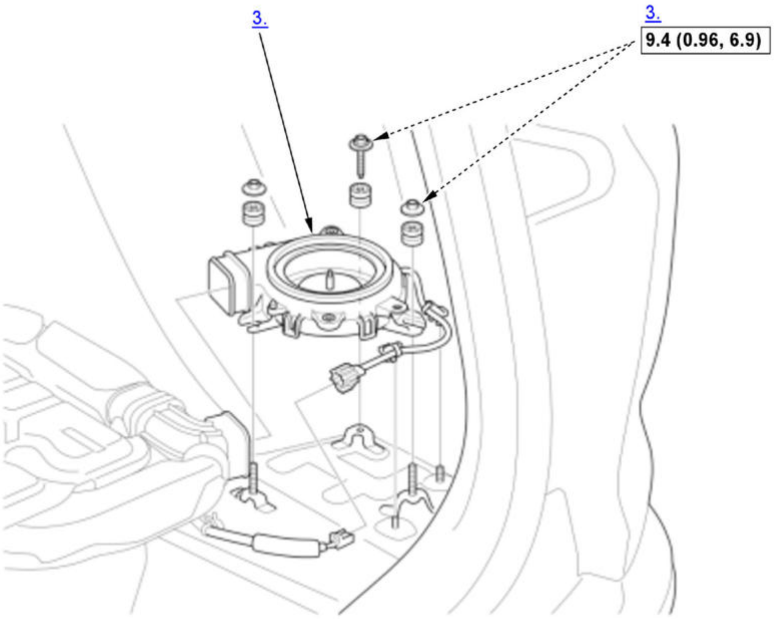

Fig. 19: Exploded View Of High Voltage Battery Module Fan Components

▭	Torque: N.m (kgf.m, lbf.ft)

1. Rear Side Trim Panel (Right Side of The Vehicle) - Remove
2. Intake Duct Joint and Inlet Lower Duct - Remove
3. High Voltage Battery Module Fan - Remove
4. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

HIGH VOLTAGE MOTOR POWER INVERTER MODULE CABLE REMOVAL AND INSTALLATION

Replacement

WARNING:

The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.

NOTE:

- How to read the torque specifications .
- Wear insulated gloves and use insulated tools to protect you from electrical shock.
- When removing or installing items marked with ⚠ , always use insulated tools, and wrap the items with insulating tape.
- Use covers to avoid damaging painted surfaces.

- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain **service precautions** before doing repairs or service.

1. High Voltage Motor Power Inverter Module Cable - Replace

    1. **Turn the service plug OFF** , then disconnect the high voltage motor power inverter module cable terminals and connectors, and remove the high voltage motor power inverter module cable as shown.

    NOTE: If the high voltage motor power inverter module cable clamp was damaged, replace it.

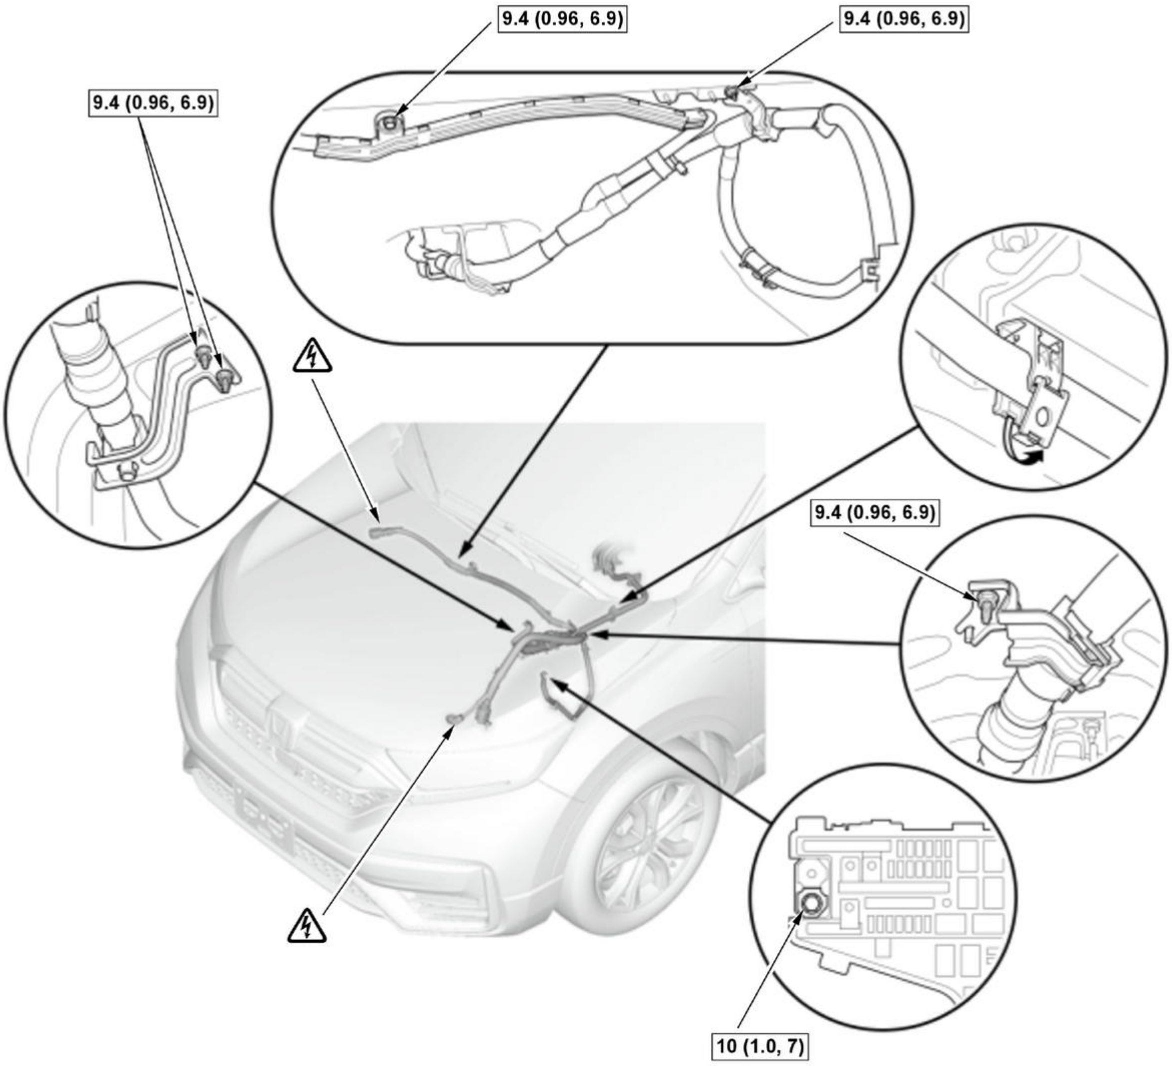

Fig. 20: Exploded View Of High Voltage Motor Power Inverter Module Cable Replacement Components (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

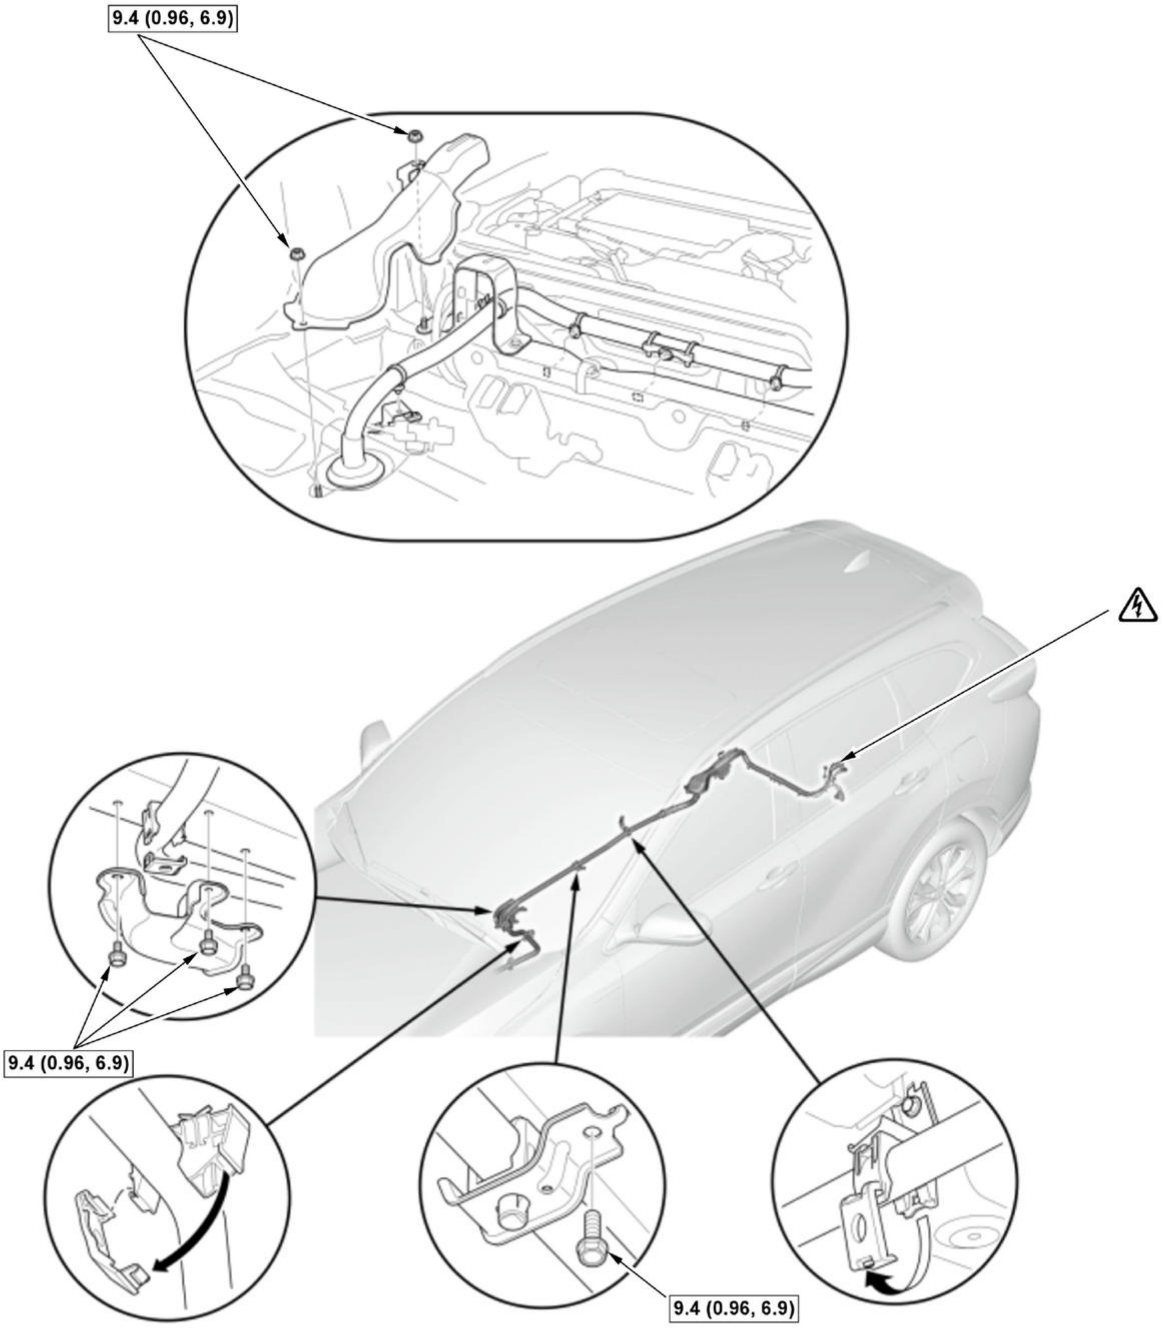

Fig. 21: Exploded View Of High Voltage Motor Power Inverter Module Cable Replacement Components (2 Of 2)
Courtesy of HONDA, U.S.A., INC.

IPU AIR DUCT REMOVAL AND INSTALLATION

Removal and Installation

WARNING:

- The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.
- Wear insulated gloves and use insulated tools to protect you from electrical shock. When removing or installing high voltage items, always use them. Wrap the high voltage items with insulating tape after removing. Please be careful when you see ⚠ on the illustration.

NOTE:

- Use covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.
- When installing the rubber joint parts, do not use any oil or lubricants.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain service precautions before doing repairs or service.

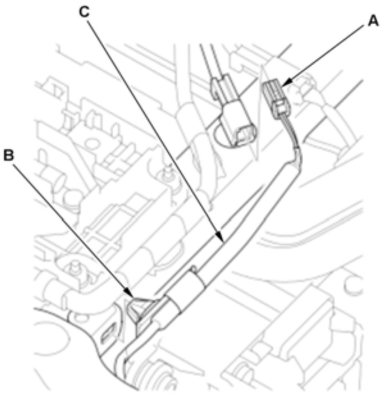
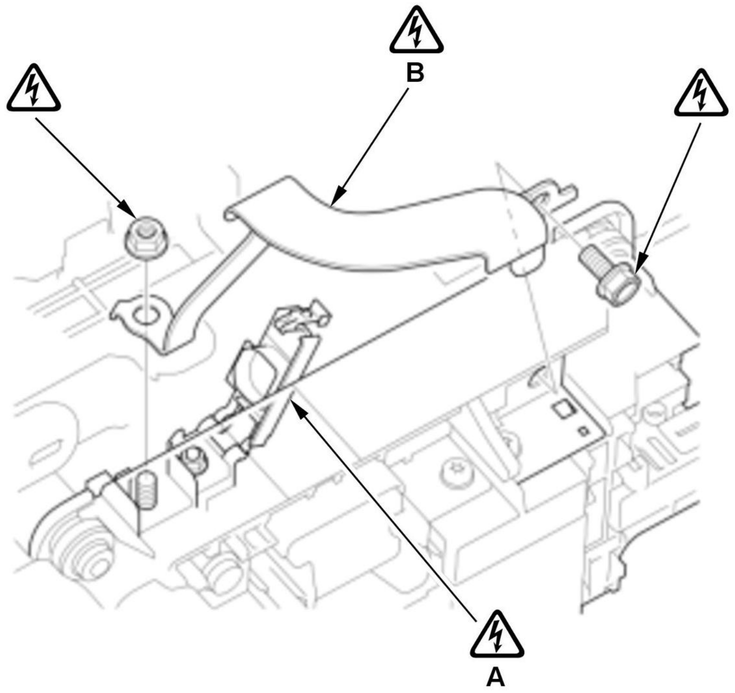
1. **Service Plug - Turn Off**
2. **IPU Case - Remove**
3. **Junction Board Negative Busbar and Junction Board Positive Busbar - Remove**
4. Battery Negative Busbar - Remove



NOTE: High voltage electricity flows in the battery terminal and busbar after disconnecting the service plug. Do all procedures one by one and keep the terminal covers closed when you are not working on them.

1. Disconnect the connector (A) and remove the harness clamp (B).

2. Move the harness (C).



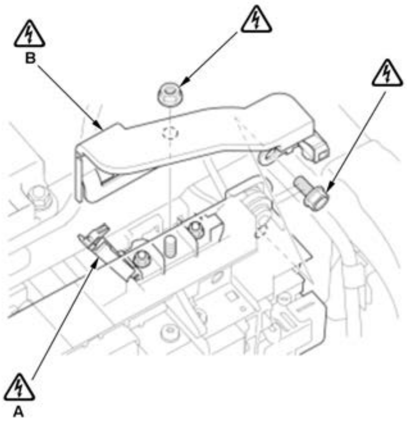
3. Open the battery module negative terminal cover (A).

4. Remove the battery negative busbar (B).

NOTE: Never reuse a bent or damaged busbar.

5. Close the battery module negative terminal cover.

5. Battery Positive Busbar - Remove



NOTE: High voltage electricity flows in the battery terminal and busbar after disconnecting the service plug. Do all procedures one by one and keep the terminal covers closed when you are not working on them.

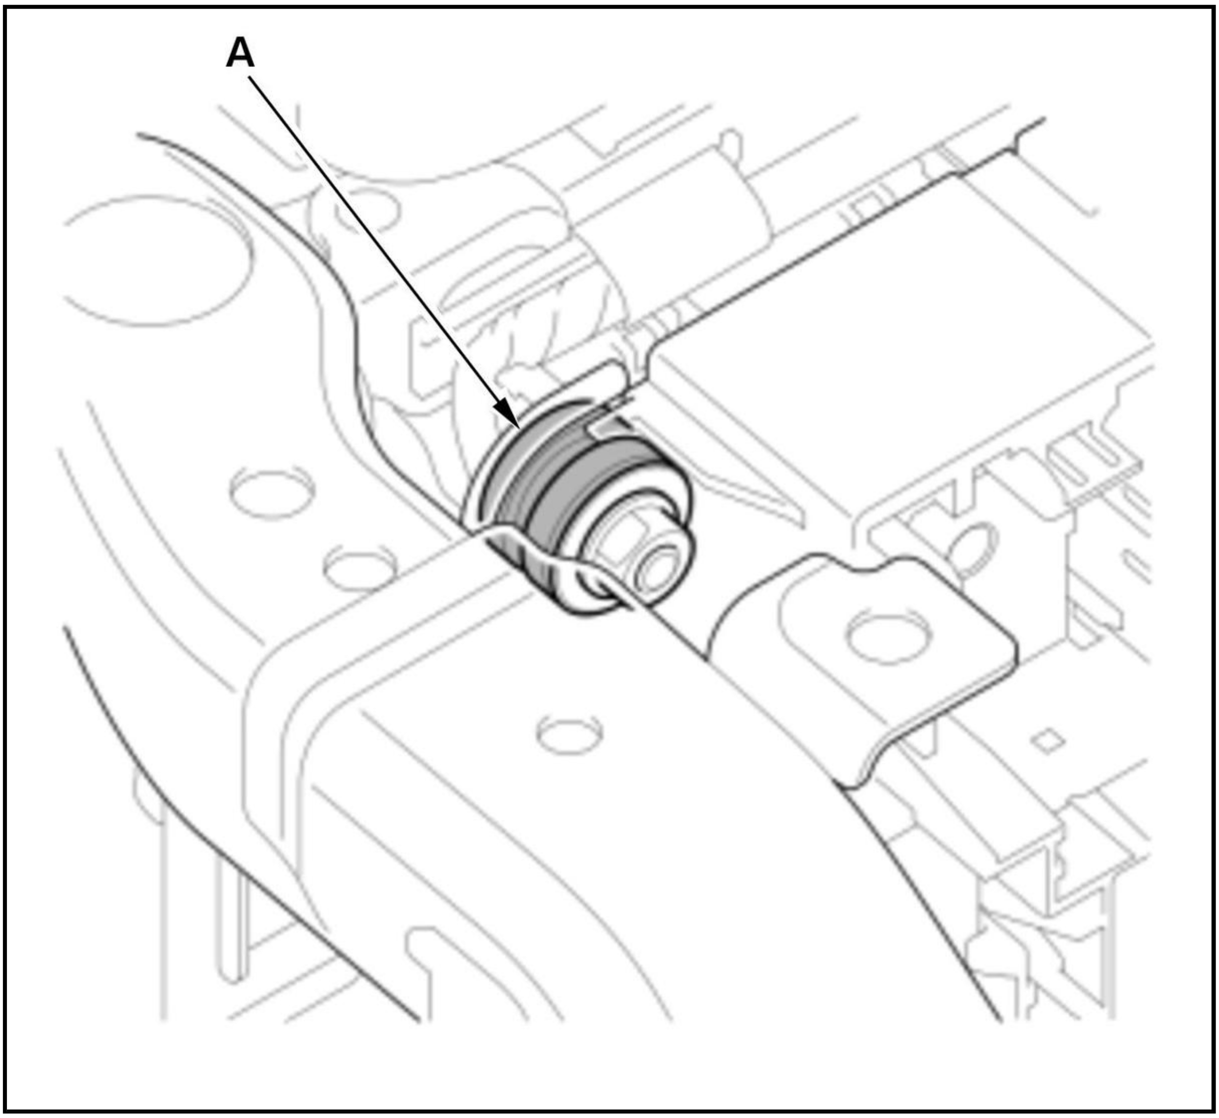
1. Open the battery module positive terminal cover (A).

2. Remove the battery positive busbar (B).

NOTE: Never reuse a bent or damaged busbar.

3. Close the battery module positive terminal cover.

6. Junction Board - Remove



NOTE: If the mounting rubbers (A) are stuck on the bracket, pry only on the mounting rubbers. Do not pry on the junction board.

7. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

PCU REMOVAL AND INSTALLATION

Removal and Installation

WARNING:

- The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.
- Wear insulated gloves and use insulated tools to protect you from electrical shock. When removing or installing high voltage items, always use them. Wrap the high voltage items with insulating tape after removing. Please be careful when you see ⚠ on the illustration.

NOTE:

- ℹ Where icon is shown, for further information see below.
- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.

- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.
- Do not spill the PCU coolant on the surrounding parts. If you spill the PCU coolant, wipe the PCU coolant off immediately.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain service precautions before doing repairs or service.

Procedure

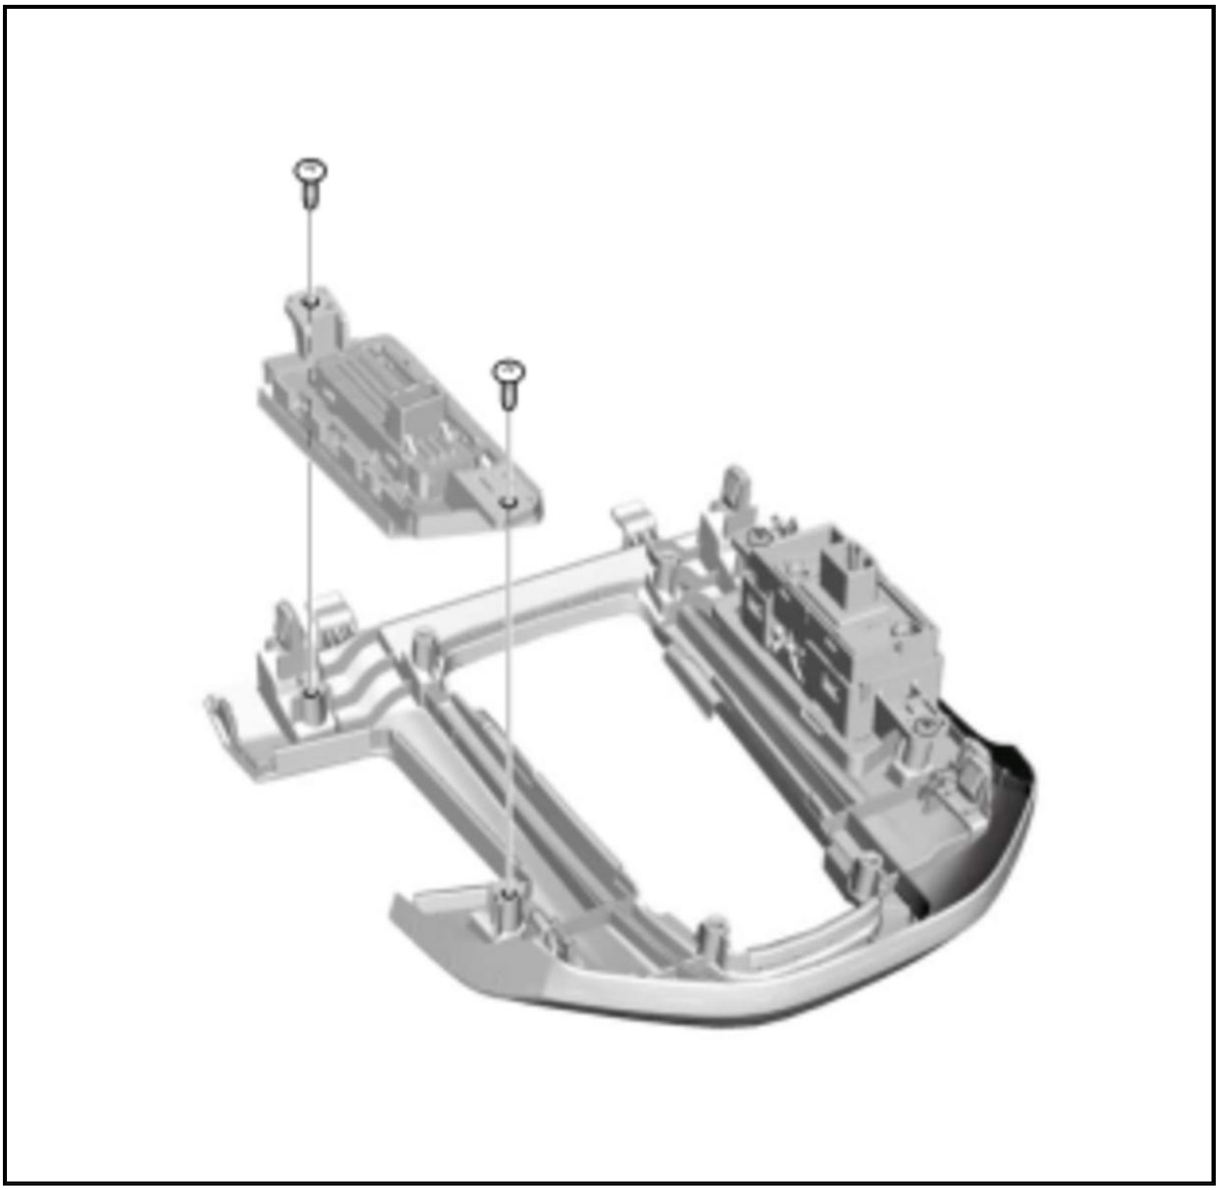
REMOVAL, INSTALLATION & TEST

EV SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1. Escutcheon Panel - Remove
2. EV Switch - Remove

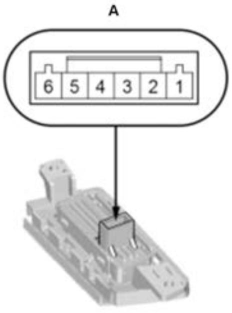


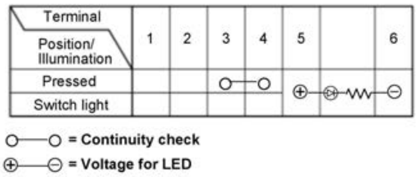
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. EV Switch - Test





Terminal / Position/ Illumination	1	2	3	4	5		6
Pressed			○—	—○			
Switch light					⊕—	—▷|—WW—	—⊖

○—○ = Continuity check

⊕—⊖ = Voltage for LED

1. Check for continuity between the EV switch 6P connector (male terminals) (A) terminals No. 3 and No. 4 while operating the switch through all positions.

2. Connect battery power and ground to terminals No. 5 and No. 6 to test the LED for illumination.

NOTE: The following information is an important operating characteristic; the diode bias causes the diode to conduct electricity in one direction (forward), while not allowing the flow of electricity in the opposite direction (reverse).

3. If the switch does not operate as specified, replace the EV switch.

DESCRIPTION & OPERATION

BATTERY SYSTEM DESCRIPTION

For locations of each component on vehicle, refer to Component Location Index.

The high voltage battery uses a Li-ion (lithium ion) battery. A Li-ion battery is lightweight, compact in size and has a long lifespan. The high voltage battery charging is provided by the electric power from the generator motor or the traction motor via inverter in the PCU.

Control

The high voltage battery is equipped with multiple sensors that send information to the battery condition monitor module.

Battery Output Control

The amount of power that can be removed from or put into a battery will vary depending on various conditions such as the temperature of the battery and the health of the battery. If more power is moved into or out of the battery than the battery can safely handle, the battery life will be shortened or in a worse case situation, the battery could be damaged severely (thermal runaway, fluid leakage, etc.). To prevent damage and maximize the battery capacity over the life of the battery, the battery charging and discharging is controlled by the battery condition monitor module. The battery condition monitor module uses inputs from the battery module temperature sensors, the battery current sensor, and the state of charge (SOC) calculated by the battery condition monitor module to control the power into and out of the battery. The battery condition monitor module uses the above information as well as the demand for power to determine the optimum power of the battery at all times.

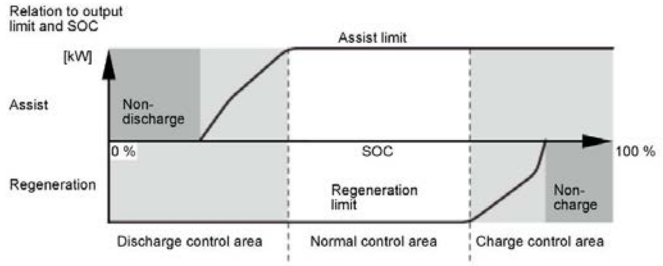
SOC Management Control

To prevent deterioration of the battery, the SOC is controlled by the battery condition monitor module. If necessary, the battery condition monitor module will limit the power output if the SOC should reach unacceptable levels.

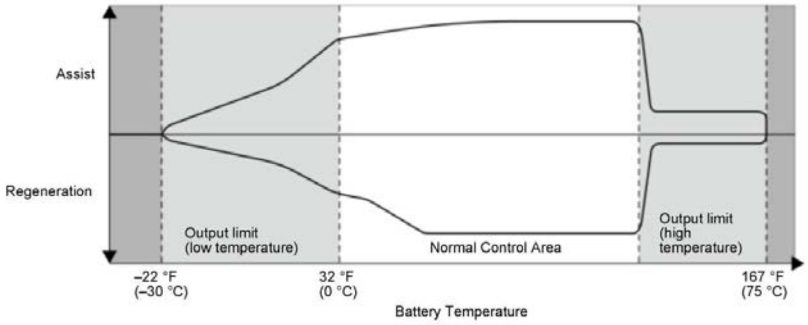
HDS Parameter	Normal Control Area
SOC	0 - 100 %
Motor Power Save (Affected by HV Battery SOC)	No/Restricted



Temperature Management Control

To prevent damage to the battery in extreme high or low temperatures, the battery condition monitor module may limit the battery power. The battery condition monitor module also controls the operation of the high voltage battery module fan.

HDS Parameter	Normal Control Area
HV Battery Module Temperature Sensor 1	Depending on battery temperature
HV Battery Module Temperature Sensor 2	Depending on battery temperature
HV Battery Module Temperature Sensor 3	Depending on battery temperature
HV Battery Module Temperature Sensor 4	Depending on battery temperature



High Voltage Circuit Shut-Off Control at the time of Collision Detection

When the SRS unit detects a collision signal (front collision, side collision, rear collision), the battery condition monitor module stores the DTC according to a signal from the SRS unit, and the high voltage circuit is cut off by switching the contactors to OFF. At this time, the POWER SYSTEM indicator, the 12 volt charging system indicator, and the SRS indicator come on, and the READY indicator goes out. The collision shut-off control is cancelled by using the HDS to clear the DTC in the battery condition monitor module.

Components

Junction Board/Subjunction Board

The junction board and the subjunction board isolate the high voltage battery, and distribute power to other high voltage systems. The junction board and subjunction board are installed in the IPU. The main fuse, the contactors, and the battery current sensor are located on the junction board.

Contactor

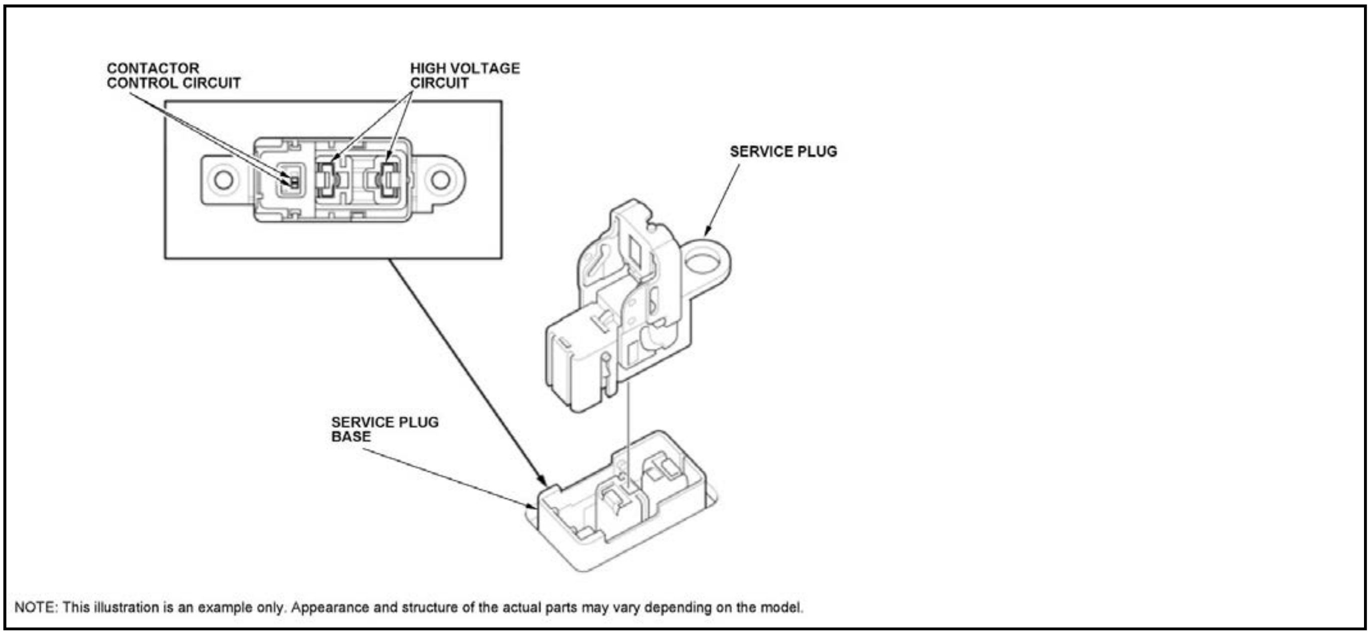
The high voltage contactor and the bypass contactor are arranged on the positive pole side of the battery pack, while the high voltage sub contactor is arranged on the negative pole side. These contactors are controlled by the battery condition monitor module and perform connection and disconnection of the high voltage circuit. When the contactor connects to the positive pole side, the bypass contactor switches to ON before the high voltage contactor is turned on connecting the high voltage circuit via a pre-charge resistance limits the rush current until the capacitor is charged; this serves to protect the system. Several large capacitors are located in the PCU. When the system starts up, these capacitors are discharged and if the battery were connected by the high voltage contactor a very large and damaging current would flow. This is referred to as inrush current. This current could damage various components but would cause arcing on the high voltage contactor. To prevent a large inrush current, a bypass contactor is switches to ON first at start up. This connects the high voltage battery to the various capacitors thru a resistor limiting the current and allowing the capacitors to charge. In a very short time the capacitors are charged, then the high voltage contactor switches to ON and the bypass contactor switches to OFF.

Battery Current Sensor

The battery current sensor detects the input and output current of the high voltage battery. The input/output current detected by the sensor is sent to the battery condition monitor module; it is used for calculating the remaining capacity of the state of charge (SOC).

Service Plug

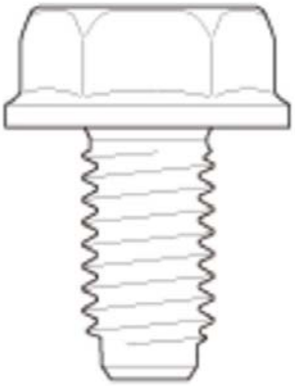
The service plug is installed in the high voltage circuit of the high voltage battery and in the contactor control circuit. By removing this plug, the high voltage circuit and the contactor control circuit can be interrupted when the electric powertrain system or the parts around it have to be inspected or serviced. This ensures that safe inspection and servicing work can be done. **When removing the service plug, make sure you have read the electric powertrain service precautions**.



NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

Special Bolt

A high tension, truss head type special bolt is used on high voltage circuit connection points to properly secure the connection and reduce the possibility of becoming loose. Do not replace these bolts with any other type.



High Voltage Battery Module Fan

When the electric powertrain system repeats the charging and discharging cycles, the battery pack become hot. To dissipate this heat - and to maintain the high voltage battery performance and protection of the system - a high voltage battery module fan is installed in the IPU. The high voltage battery module fan uses a fan motor control circuit and a speed sensor built in, and the battery condition monitor module controls the high voltage battery module fan so that the high voltage battery temperature is kept at a suitable level. The cooling air intake is located at right side of the rear seat, and it passes through the battery pack, then discharged to the luggage compartment.

Battery Power Cable

The battery power cable located between the IPU and the PCU is protected by a corrugated tube and an orange aluminum pipe against external damages, and is secured with a clamp under the floor. Inside the pipe are the high voltage cable, the 12 volt power supply cable from the DC-DC convertor, and the electric A/C compressor cable.

ELECTRIC POWERTRAIN SYSTEM DESCRIPTION

For locations of each component on vehicle, **refer to Component Location Index**.

The electric powertrain system is powered by high voltage motors and the engine. The system switches the driving power depending on driving conditions or by the manual operation of the EV switch and enables driving with the use of optimal available power. Major components are the engine, the two high voltage motors, the power control unit (PCU), the high voltage battery, and the battery power cable.

Control

The electric powertrain system operates during EV driving mode and hybrid driving mode. When EV driving mode is selected, the PCU sends power from the high voltage battery to the traction motor located within the transmission (e-CVT), and the vehicle is propelled by the traction motor. The engine drives the generator motor to generate electrical power. The generated electric power is supplied to the traction motor and charging of the high voltage battery depends on current driving conditions. While driving with the electric powertrain system, the high voltage battery is recharged depending on driving conditions. When recharging, the inverter sends the power that was generated from the high voltage motor in the transmission (e-CVT) to the high voltage battery.

EV Switch

The EV switch allows the driver to select EV driving mode when vehicle conditions allow for the use of EV driving mode. When the EV switch is pressed, the PCM determines if the current vehicle condition is capable of driving in EV driving mode. If EV driving mode drive is possible, the driving mode changes to EV driving mode, and the EV mode indicator on the gauge control module illuminates. If EV driving mode is not possible, the vehicle is kept in current hybrid driving mode, and the reason is displayed in the gauge control module.

Driving Modes

The electric powertrain system has the following driving modes: EV driving mode, HV driving mode, and engine driving mode. The available driving modes are determined and selected by the PCM depending on the vehicle's current condition. EV driving mode can be manually selected by the driver and is available based on current vehicle condition. When the vehicle is driven at low speeds, and during regenerative braking, the electric powertrain system operates in the EV driving mode. During high-load conditions such as acceleration, the system switches to an HV driving mode that uses both the electric motor and the internal combustion engine. At high speeds, the system enters the engine driving mode, using the gasoline engine to propel the vehicle.

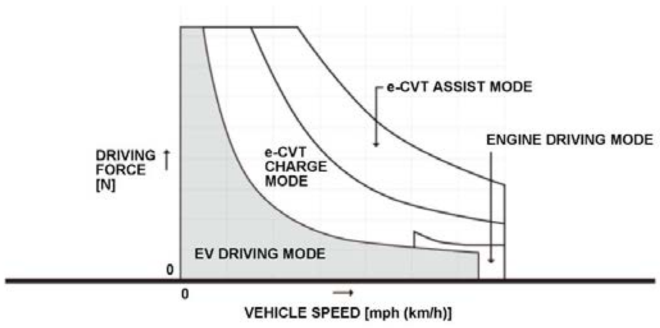
HIGH VOLTAGE BATTERY
REGENERATION
BATTERY CHARGING
ACCELERATION
HIGH SPEED CRUISE

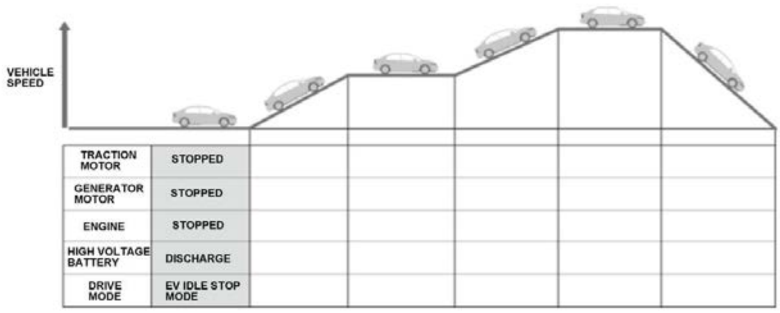
EV Driving Mode

When EV driving mode has been selected, the vehicle's drive propulsion and regenerative braking is performed by the traction motor only. The EV driving mode operates at a specific vehicle speed range and during low load conditions. The EV driving mode maximum speed is 81 mph (130 km/h), depending on the battery state of charge.



EV Idle Stop Mode

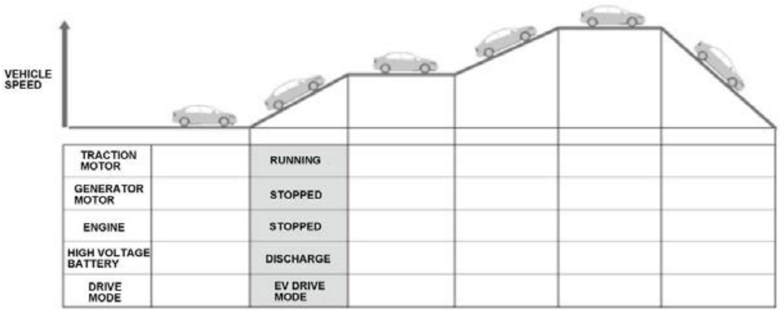
During EV idle stop mode, the traction motor, generator motor, and engine are all stopped. At this time, the high voltage battery supplies power to various devices of the vehicle.



TRACTION MOTOR	STOPPED					
GENERATOR MOTOR	STOPPED					
ENGINE	STOPPED					
HIGH VOLTAGE BATTERY	DISCHARGE					
DRIVE MODE	EV IDLE STOP MODE					

EV Drive Mode

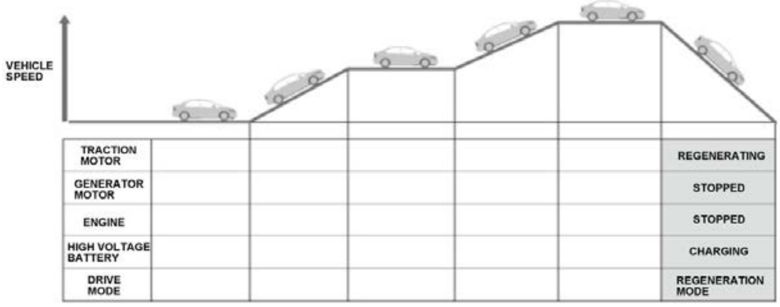
During EV drive mode, the traction motor supplies driving force. The generator motor and the engine do not operate. At this time, the high voltage battery energizes the traction motor.



TRACTION MOTOR		RUNNING				
GENERATOR MOTOR		STOPPED				
ENGINE		STOPPED				
HIGH VOLTAGE BATTERY		DISCHARGE				
DRIVE MODE		EV DRIVE MODE				

Regeneration Mode

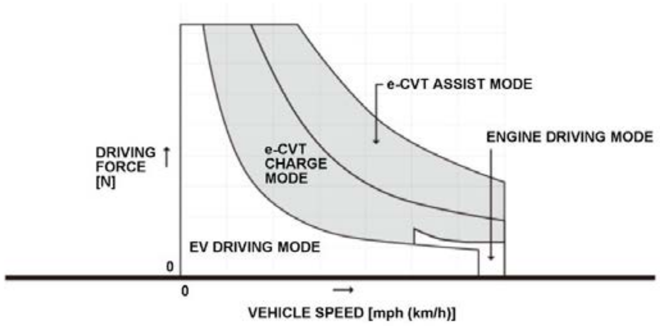
The regeneration mode is used during deceleration. The engine and generator motor are in a stopped condition, and the traction motor generates power that is supplied to the high voltage battery.



TRACTION MOTOR						REGENERATING
GENERATOR MOTOR						STOPPED
ENGINE						STOPPED
HIGH VOLTAGE BATTERY						CHARGING
DRIVE MODE						REGENERATION MODE

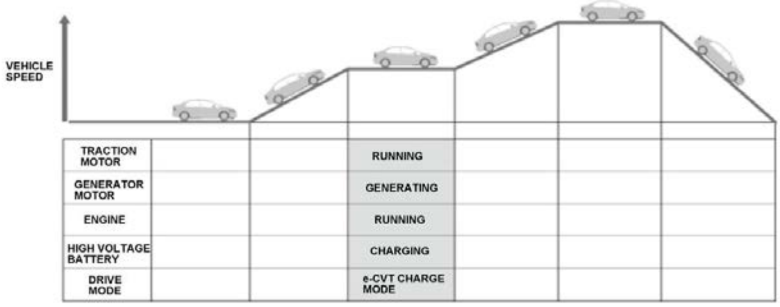
HV Driving Mode

While driving in the HV driving mode during acceleration, the engine powers the vehicle by activating the generator motor to generate power. The generated power is used to activate the traction motor to drive the vehicle. Depending on the battery's state of charge and the load condition of the traction motor, the high voltage battery is recharged while driving.



e-CVT Charge Mode

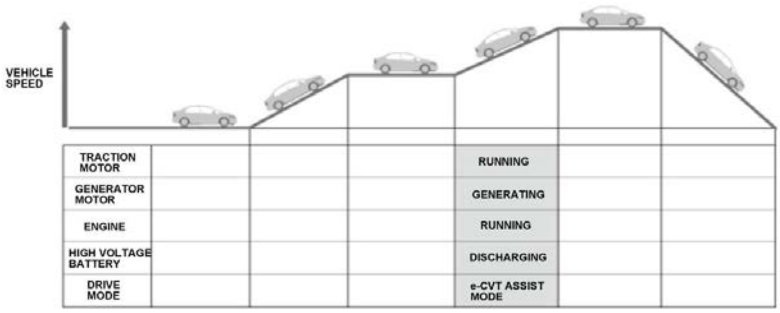
The e-CVT charge mode is used at vehicle speed ranges suitable for charging, and its activation range varies depending on the state of charge of the high voltage battery. During e-CVT charge mode, the engine energizes the generator motor to send electric power to the high voltage battery. The traction motor provides driving power to the drive wheel, using the electric power from generator motor. The engine is actively controlled to operate at optimum RPM ranges according to driving conditions. The generator motor generates more power than what is required by the traction motor to drive the vehicle. Generated power not used by the traction motor is used to recharge the high voltage battery.



TRACTION MOTOR			RUNNING			
GENERATOR MOTOR			GENERATING			
ENGINE			RUNNING			
HIGH VOLTAGE BATTERY			CHARGING			
DRIVE MODE			e-CVT CHARGE MODE			

e-CVT Assist Mode

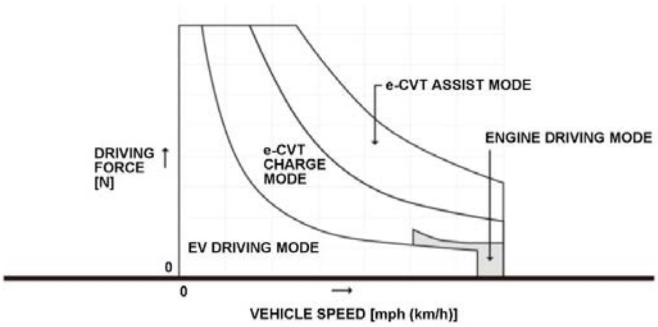
The e-CVT assist mode is primarily used during acceleration, and its activation range varies depending on the high voltage battery state of charge. The driving power during e-CVT assist mode is similar to that of the e-CVT drive mode. The engine energizes the generator motor, and the traction motor provides the driving power to the drive wheel. During e-CVT assist mode, the traction motor sends a large amount of torque to the drive wheel, therefore requiring more electric power as compared with other modes. The engine activates the generator at optimum RPM ranges, and available electric power is used directly by the traction motor. If the generator motor generates insufficient power to accommodate the needs of the traction motor, additional power is supplied from the high voltage battery.



TRACTION MOTOR				RUNNING		
GENERATOR MOTOR				GENERATING		
ENGINE				RUNNING		
HIGH VOLTAGE BATTERY				DISCHARGING		
DRIVE MODE				e-CVT ASSIST MODE		

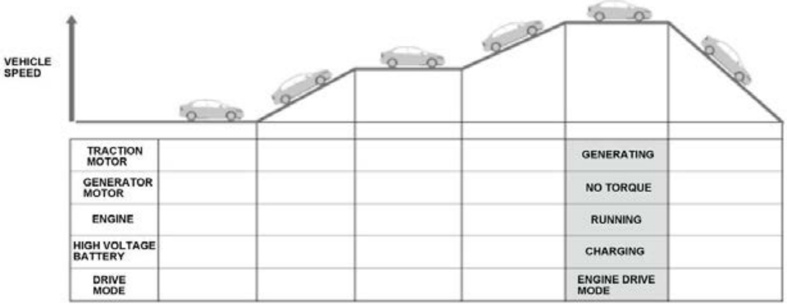
Engine Driving Mode

The engine driving mode uses the power of the engine only at high speeds and low loads. The engine driving mode is primarily used during high-speed cruising. The operating range of the engine driving mode varies depending on the high voltage battery state of charge, driving force conditions and current speed of the vehicle.



Engine Drive Mode

During engine drive mode, the engine output is supplied to the drive wheel and the traction motor. This allows the vehicle to be mechanically driven by the engine, while the high voltage battery is charged with power created by the traction motor. The generator motor is not operated during engine drive mode.



MOTOR CONTROL SYSTEM DESCRIPTION

For locations of each component on vehicle, **refer to Component Location Index**.

The motor control system includes the traction motor, the generator motor, the gear unit, and the phase current sensors in the transmission (e-CVT), the motor control module in the power control unit (PCU) that controls the high voltage motors, the cooling system for cooling the PCU interior, the inverter that transforms the motor voltage into an appropriate voltage, and the direct connector pin that connect the high voltage motors to the PCU.

Control

The traction motor is located in the transmission (e-CVT). It produces driving force and generates power for the high voltage battery. The generator motor is located in the transmission (e-CVT). It charges the high voltage battery and generates power for engine startup.

The motor control module receives each information from the following units/sensors and control the traction motor and generator motor. In addition, the motor control module coordinates it so that the voltage from the traction motor and generator motor accords to the voltage of the high voltage battery.

Units/Sensors	Information
Motor rotor position sensors	Rotary speed of the motor
	Rotatory direction of the motor
Phase current sensors	Current value of the motor
Battery condition monitor module	Current value of the high voltage battery

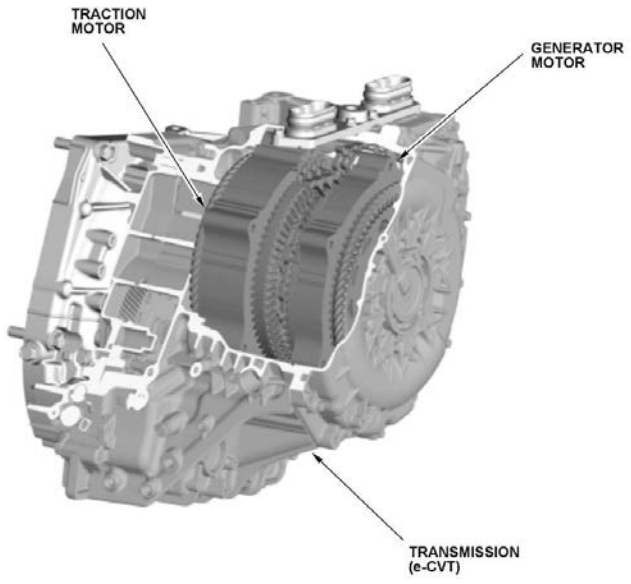
Components

PCU

The inverter, the DC-DC converter, and the motor control module are located in the power control unit (PCU). It contains a cooling system composed of a dedicated radiator, PCU electric coolant pump, and expansion tank. This cooling system enables temperature adjustment inside the PCU. The motor control module controls the traction motor and the generator motor, and communicates with the PCM to coordinate with the engine and transmission operation. The motor control module contains a rewritable ROM and uses an updating tool to enable latest program updates.

Traction Motor/Generator Motor

The traction motor is located in the transmission (e-CVT). It produces driving force and generates power for the high voltage battery. The generator motor is also located in the transmission (e-CVT). It recharges the high voltage battery and generates power for engine startup. Each motor is a lightweight, compact, and highly efficient three phase synchronous motor. It is positioned together with the gear unit in the transmission (e-CVT). The motor consists of a three coil stator secured in the housing, and a rotor with permanent magnets in its outer circumference. A motor rotor position sensor is also located in the transmission (e-CVT). It detects the position of the press-fitted motor rotor position rotor, to determine the rotor's rotation position (phase). The stator coil utilizes distributed winding to reduce vibration and enable stable torque during high speed operation.



DC-DC Converter

To maintain the 12 volt system voltage, the system uses a DC-DC converter. The DC-DC converter converts high voltage direct current into low voltage direct current with little energy loss.

The temperature of the DC-DC converter is monitored by the motor control module built into the PCU, and in case of an abnormal rise of the temperature, the motor control module stops the operation of the DC-DC converter, which causes the 12 volt charging system indicator to come on. The operation of the DC-DC converter also stops when an abnormality with the input voltage or output voltage is detected; this causes the 12 volt charging system indicator to come on, and a warning is displayed on the multi-information display.

When the DC-DC converter stops operation because of an abnormality, there will be an insufficiency of 12 volt power, which restricts the output of the electric powertrain system, according to the output drop of the 12 volt battery.

Cooling System

The PCU cooling system is a water cooling system consisting of a dedicated PCU electric coolant pump, radiator, expansion tank, coolant hose/pipe, and PCU. PCU coolant absorbs heat from the water jacket inside the PCU, passes through the radiator interior and releases heat to the atmosphere. The PCU electric coolant pump adopts a 12 volt DC brushless water pump, and has a built in motor and ECU.

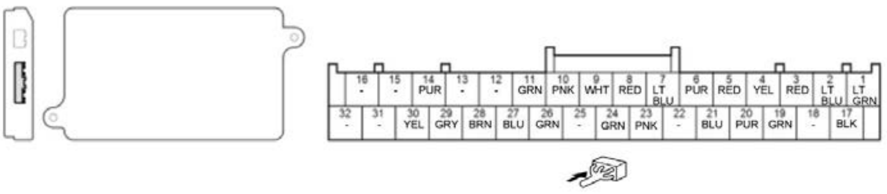
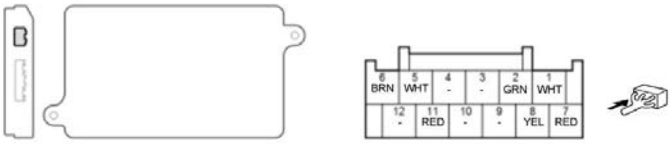
Battery Condition Monitor Module Connector E (32P) (female terminals)



Terminal number	Terminal name	Description
1	VBU	Power source for battery condition monitor module (backup)
2	IGB	Power source for battery condition monitor module
3	CNTPS	Power source for contactors
4	CNTP	Drives high voltage contactor
5	CNTN	Drives high voltage sub contactor
6	PRE	Drives bypass contactor
7	IG1MONI	Detects IG1 signal
8	F-CAN A_L	Sends and receives F-CAN A communication signal (LOW)
9	F-CAN A_H	Sends and receives F-CAN A communication signal (HIGH)
10	EP-CAN A_L	Sends and receives EP-CAN communication signal (LOW)
11	EP-CAN A_H	Sends and receives EP-CAN communication signal (HIGH)
12	Not used	B
13	Not used	B
14	NFAN	Detects high voltage battery module fan revolution speed signal
15	Not used	B
16	Not used	B
17	PG	Ground for battery condition monitor module
18	Not used	B
19	IGHLDB	Drives IGHLDB relay
20	IGHLD	Drives IGHLD relay
21	IGHLD2	Drives IGHLD2 relay
22	Not used	B
23	IGAMONI	Detects IGA signal
24	FANCTL	Drives high voltage battery module fan
25	Not used	B
26	ISOC	Detects battery current sensor signal (normal range)
27	ISOCF	Detects battery current sensor signal (fine range)
28	VCCISOC	Provides battery current sensor reference voltage
29	SGISOC	Sensor ground for battery current sensor
30	CDS	Detects collision detection signal from SRS unit
31	Not used	B
32	Not used	B

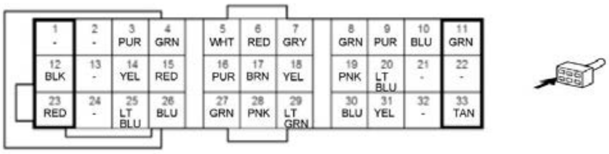
Battery Condition Monitor Module Connector F (12P) (female terminals)



Terminal number	Terminal name	Description
1	TBATT1	Detects high voltage battery module temperature sensor 1 signal
2	TBATT3	Detects high voltage battery module temperature sensor 3 signal
3	Not used	B
4	Not used	B
5	MODID1	Detects high voltage battery module identification resistor signal
6	SGTB	Sensor ground for high voltage battery module
7	TBATT2	Detects high voltage battery module temperature sensor 2 signal
8	TBATT4	Detects high voltage battery module temperature sensor 4 signal
9	Not used	B
10	Not used	B
11	MODID2	Detects high voltage battery module identification resistor signal
12	Not used	B

MOTOR CONTROL MODULE CONNECTOR FOR INPUTS AND OUTPUTS

Motor Control Module 33P connector (female terminals)



Terminal number	Terminal name	Description
1	Not used	B
2	Not used	B
3	S1G	Inputs generator motor motor rotor position sensor (SIN) signal
4	R1G	Outputs generator motor motor rotor position sensor excitation signal
5	F-CAN A_H	Sends and receives F-CAN A communication signal (HIGH)
6	F-CAN A_L	Sends and receives F-CAN A communication signal (LOW)
7	NEWP	Detects PCU electric coolant pump revolution speed signal
8	R1M	Outputs traction motor motor rotor position sensor excitation signal
9	S1M	Inputs traction motor motor rotor position sensor (SIN) signal
10	TMOT	Detects traction motor temperature sensor signal
11	IGA	Power source for motor control module
12	PG	Ground for motor control module
13	Not used	B
14	S3G	Inputs generator motor motor rotor position sensor (SIN) signal
15	R2G	Outputs generator motor motor rotor position sensor excitation signal
16	TWPCU	Detects PCU coolant temperature sensor signal
17	SGTEMP	Sensor ground for PCU coolant temperature sensor and transmission fluid temperature sensor
18	EWP	Drives PCU electric coolant pump
19	R2M	Outputs traction motor motor rotor position sensor excitation signal
20	S3M	Inputs traction motor motor rotor position sensor (SIN) signal
21	Not used	B
22	Not used	B
23	TATF	Detects transmission fluid temperature sensor signal
24	Not used	B
25	S4G	Inputs generator motor motor rotor position sensor (COS) signal
26	S2G	Inputs generator motor motor rotor position sensor (COS) signal
27	EP-CAN A_H	Sends and receives EP-CAN communication signal (HIGH)
28	EP-CAN A_L	Sends and receives EP-CAN communication signal (LOW)
29	NGENPLS	Outputs generator motor revolution speed signal
30	S2M	Inputs traction motor motor rotor position sensor (COS) signal
31	S4M	Inputs traction motor motor rotor position sensor (COS) signal

Terminal number	Terminal name	Description
32	Not used	B
33	IG_PCU_EWP	Drives PCU electric coolant pump relay

CALIBRATION CORRECTION

MOTOR ROTOR POSITION CALIBRATION

Rewriting

NOTE: Do the motor rotor position calibration whenever any of these actions are done.

- The PCU (integrated with the motor control module) is replaced.
- The transmission (e-CVT) (integrated with the motors) is replaced or disassembled.

1. HDS - Connect
2. Motor Rotor Position - Calibrate

1. Select the Electric Powertrain system with the HDS.

2. Select the Adjustment MENU, then select the Motor Rotor Position Sensor Learning, and follow the screen prompts.

INSPECTION

MOTOR ROTOR POSITION SENSOR CIRCUIT INSPECTION (GENERATOR MOTOR CONTROL MODULE)

NOTE: Before testing, check for DTCs. If any DTCs are indicated, troubleshoot the indicated DTCs first.

Shorted wire check (generator motor motor rotor position sensor circuit)

Turn the vehicle to the OFF (LOCK) mode.

-2. Do the 12 volt battery terminal disconnection procedure .

-3. Disconnect the following connector.

PCU 33P connector

Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected

Connector	Test circuit	Terminal
PCU 33P connector	S1G	No. 3
	S2G	No. 26
	S3G	No. 14
	S4G	No. 25
	R1G	No. 4
	R2G	No. 15

- If there is no continuity, the generator motor motor rotor position sensor circuit is not shorted. Go to step 2 (Open wire check).
- If there is continuity, go to the next step.

-5. Disconnect the following connector.

Motor rotor position sensor 12P connector

Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Motor rotor position sensor 12P connector: disconnected
B	PCU 33P connector: disconnected

Connector	Test circuit	Terminal
PCU 33P connector	S1G	No. 3
	S2G	No. 26
	S3G	No. 14
	S4G	No. 25
	R1G	No. 4
	R2G	No. 15

- If there is no continuity, faulty generator motor motor rotor position sensor. Replace the transmission (e-CVT) assembly .

- If there is continuity, repair a short in the generator motor motor rotor position sensor circuit between the PCU and the generator motor motor rotor position sensor.

Open wire check (generator motor motor rotor position sensor circuit)

Disconnect the following connector.

Motor rotor position sensor 12P connector

Check for continuity between the following terminals respectively.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Motor rotor position sensor 12P connector: disconnected

S1G line

Test point 1	**PCU 33P connector No. 3**
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 3: ①

S2G line

Test point 1	**PCU 33P connector No. 26**
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 2: ①

S3G line

Test point 1	**PCU 33P connector No. 14**
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 9: ①

S4G line

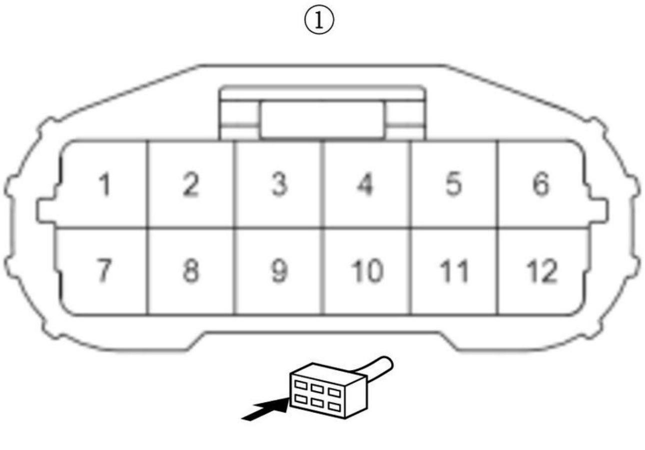
Test point 1	**PCU 33P connector No. 25**
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 8: ①

R1G line

Test point 1	**PCU 33P connector No. 4**
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 1: ①

R2G line

Test point 1	**PCU 33P connector No. 15**
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 7: ①



- If there is continuity, the generator motor motor rotor position sensor circuit is OK.
- If there is no continuity, repair an open in the generator motor motor rotor position sensor circuit between the PCU and the generator motor motor rotor position sensor.

MOTOR ROTOR POSITION SENSOR CIRCUIT INSPECTION (TRACTION MOTOR CONTROL MODULE)

NOTE: Before testing, check for DTCs. If any DTCs are indicated, troubleshoot the indicated DTCs first.

Shorted wire check (traction motor motor rotor position sensor circuit)

Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connector.

PCU 33P connector

Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected

Connector	Test circuit	Terminal
PCU 33P connector	S1M	No. 9
	S2M	No. 30
	S3M	No. 20
	S4M	No. 31
	R1M	No. 8
	R2M	No. 19

- If there is no continuity, the traction motor motor rotor position sensor circuit is not shorted. Go to step 2 (Open wire check).
- If there is continuity, go to the next step.

-5. Disconnect the following connector.

Motor rotor position sensor 12P connector

Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Motor rotor position sensor 12P connector: disconnected
B	PCU 33P connector: disconnected

Connector	Test circuit	Terminal
PCU 33P connector	S1M	No. 9
	S2M	No. 30
	S3M	No. 20
	S4M	No. 31
	R1M	No. 8
	R2M	No. 19

- If there is no continuity, faulty traction motor motor rotor position sensor. **Replace the transmission (e-CVT) assembly** .
- If there is continuity, repair a short in the traction motor motor rotor position sensor circuit between the PCU and the traction motor motor rotor position sensor.

Open wire check (traction motor motor rotor position sensor circuit)

Disconnect the following connector.

Motor rotor position sensor 12P connector

Check for continuity between the following terminals respectively.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Motor rotor position sensor 12P connector: disconnected

S1M line

Test point 1	**PCU 33P connector No. 9**
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 6: ①

S2M line

Test point 1	PCU 33P connector No. 30
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 5: ①

S3M line

Test point 1	PCU 33P connector No. 20
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 12: ①

S4M line

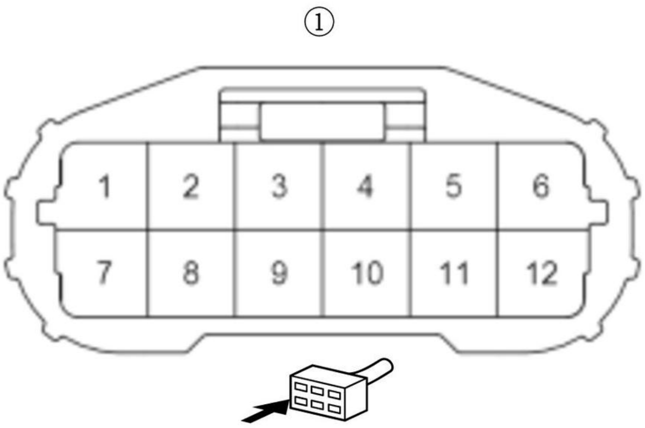
Test point 1	PCU 33P connector No. 31
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 11: ①

R1M line

Test point 1	PCU 33P connector No. 8
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 4: ①

R2M line

Test point 1	PCU 33P connector No. 19
Test point 2	Motor rotor position sensor 12P connector (female terminals) No. 10: ①



- If there is continuity, the traction motor motor rotor position sensor circuit is OK.
- If there is no continuity, repair an open in the traction motor motor rotor position sensor circuit between the PCU and the traction motor motor rotor position sensor.

PCU COOLANT CIRCUIT INSPECTION

NOTE: Before testing, check for DTCs. If any DTCs are indicated, troubleshoot the indicated DTCs first.

Visual check

Check that the opening of the front bumper is not blocked with dust, and clean it if needed.

Check the radiator, the A/C condenser, and the fan shroud assembly for the following conditions, and repair them if needed:

- Broken or deformed radiator
- Fins of radiator and A/C condenser are blocked with dust
- Broken or deformed radiator fan, or broken or deformed fan shroud
- Radiator fun contacting with a fan shroud
- Corrosion of radiator fan motor
- Debris in the fans

Cooling circuit check:

Check for these conditions at the cooling line, and repair if needed:

- Coolant level
- Coolant leakage from cooling circuit
- Air mixing into cooling circuit

3. Expansion tank cap check

Test the expansion tank cap, and replace it if needed.

DTC check (PCU electric coolant pump)

Connect the HDS to the DLC .

-2. Turn the vehicle to the ON mode.

-3. Select the Electric Powertrain in the System Selection Menu.

-4. Clear any stored DTCs.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode.

-7. Select the ELECTRIC WATER PUMP TEST in the Electric Powertrain FUNCTION TEST with the HDS, then select START.

Check for Pending or Confirmed DTCs with the HDS.

- DTC is indicated: Do the indicated DTC(s) troubleshooting.

REWRITE

BATTERY CONDITION MONITOR MODULE UPDATE

Procedure

1. Battery Condition Monitor Module - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

MOTOR CONTROL MODULE UPDATE

Procedure

1. Motor Control Module - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

SERVICE PROCEDURE

COOLANT REPLACEMENT AND CHECK (ELECTRIC POWERTRAIN)

Special Tools Required

Image	Description/Tool Number
	Honda GR8 Battery Diagnostic Station with AST Module (12 Volt) MTRGR811ASTH*

*Available through the Honda Tool and Equipment Program 888-424-6857

Replacement

NOTE:

- How to read the replacement symbols .

- Running the PCU electric coolant pump without coolant may cause damage to the pump. The pump may get activated when the vehicle is turned to the ON mode.
- PCU coolant is poisonous. If ingested, get medical attention immediately.
- Use covers to avoid damaging painted surfaces.
- Do not spill the PCU coolant on the surrounding parts. If you spill the PCU coolant, wipe the PCU coolant off immediately.

1. Expansion Tank Cap - Remove

	1. Wait until the PCU coolant is cool, then carefully remove the expansion tank cap (A).

2. Front Bumper - Remove
3. PCU Coolant - Drain

	1. Loosen the radiator drain plug (A), and drain the PCU coolant. 2. Tighten the radiator drain plug securely with a new O-ring.

4. PCU Coolant - Refill

1. Install the coolant charger (A), then pour Honda Long Life Antifreeze/Coolant Type 2 until the expansion tank is filled to the MAX mark (B).

NOTE:

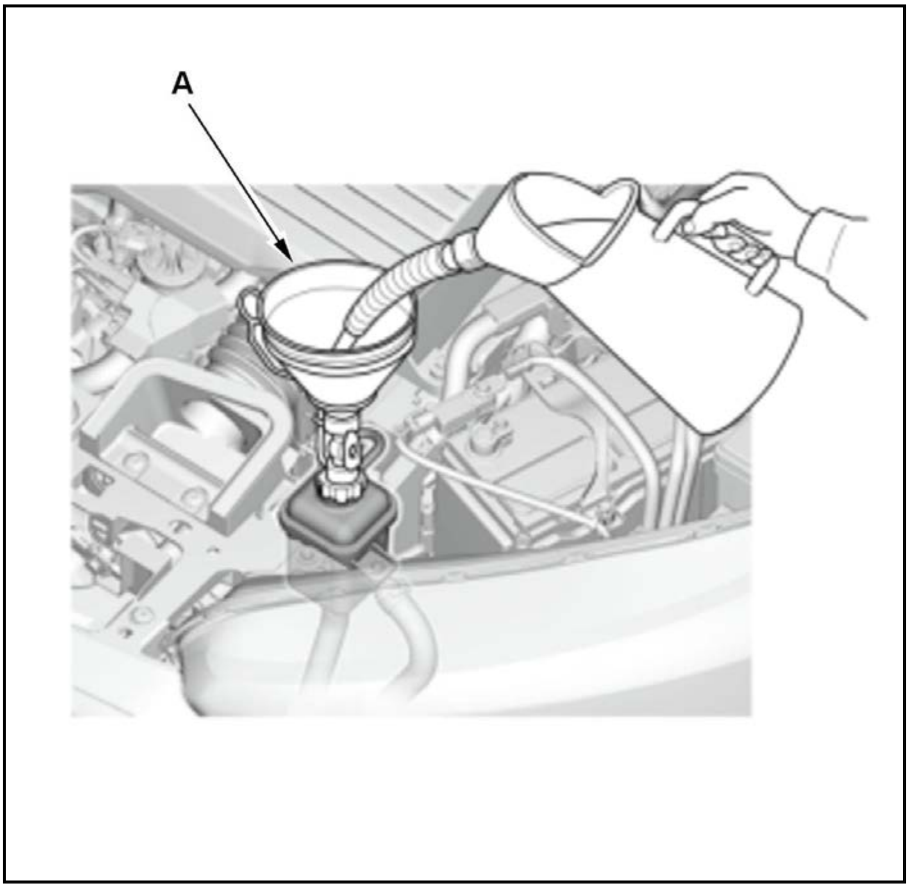
- **Always use Honda Long Life Antifreeze/Coolant Type 2, and if necessary add Honda Extreme Cold Weather Antifreeze/Coolant Type 2. Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.**

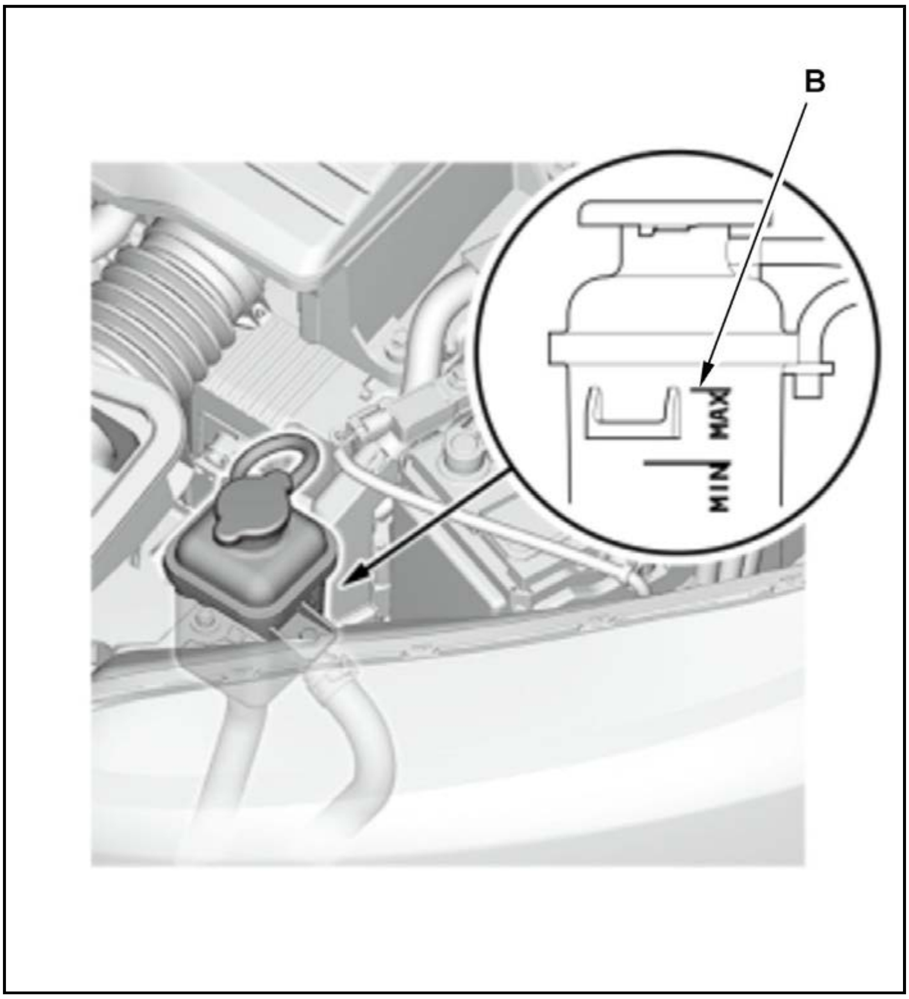
- **Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Honda Extreme Cold Weather Antifreeze/Coolant Type 2 is a 100 % concentration coolant. Do not add water to either coolant.**
- **If the vehicle is regularly driven in very low temperatures (lower than - 22 deg. F (- 30 deg. C)), a 60 % concentration of coolant should be used.**

Operation	**Vehicle Usage (Desired Mixture)**	**Current Mixture**	**Coolant Drain**	**Add Amount of Honda Extreme Cold Weather Antifreeze/Coolant Type 2 (100 % concentrate)**	**Then add Acura Long Life Antifreeze/Coolant Type 2 (50/50)**
PCU Coolant Change	Normal Area (50/50)	50/5060/40 unknown	Drain radiator and expansion tank	None	Top off the cooling system
	Very Cold Area (60/40)	50/50 unknown	Drain radiator and expansion tank	About 0. 3 L (10 fl oz)	
		60/40		About 0. 2 L (7 fl oz)	
PCU Removal	Normal Area (50/50)	-	-	None	
	Very Cold Area (60/40)	-	-	About 0. 3 L (10 fl oz)	
PCU Coolant Winterizing	Very Cold Area (60/40)	50/50	Drain about 0. 3 L (10 fl oz) from radiator	About 0. 3 L (10 fl oz)	
		unknown*	Drain radiator and expansion tank	About 0. 3 L (10 fl oz)	

*: When you want to winterize the coolant with the minimum amount of coolant change but the current coolant concentration in the vehicle is unknown, you must drain all coolant from the cooling system.

PCU Coolant Refill Capacities (Including the expansion tank capacity of 0. 31 L (0. 082 US gal))	
At PCU Coolant Change	**0. 93 L (0. 246 US gal)**
At PCU removal	**1. 60 L (0. 423 US gal)**





5. PCU Coolant - Air Bleed

1. Connect the Honda GR8 battery diagnostic station and set it to the power supply mode.

2. Connect the HDS to the data link connector (DLC)

3. Select the Adjustment MENU in the Electric Powertrain system with the HDS.

4. Select the Coolant Air Bleeding.

5. Press the START to drive the PCU electric coolant pump (EWP), then wait more than 10 minutes.

NOTE:

- **Pour coolant as needed when the coolant level drops. If the coolant level keeps changing or bubbles are seen even after 10 minutes, continue to drive the EWP until the coolant level stabilizes and there**

are no more bubbles.

- **When the POWER SYSTEM indicator comes on, clear the DTC with the HDS, then return to step 2.**

6. Press the STOP to finish driving the EWP forcibly.

7. Check the coolant level and add coolant as necessary until it is at the MAX mark.

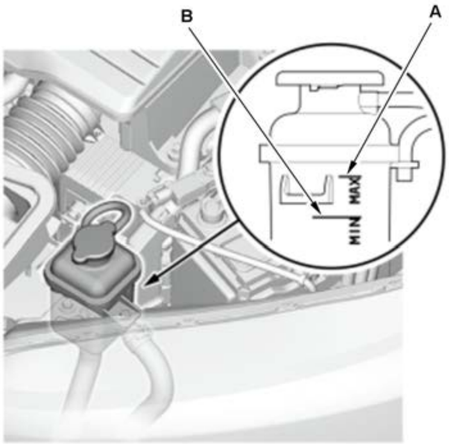
8. Install the expansion tank cap.

6. Front Bumper - Install

Check

NOTE: Do not spill the PCU coolant on the surrounding parts. If you spill the PCU coolant, wipe the PCU coolant off immediately.

1. PCU Coolant - Check



1. Check the coolant level in the coolant expansion tank. Make sure it is between the MAX mark (A) and the MIN mark (B).

2. If the coolant level in the coolant expansion tank is at or below the MIN mark, add coolant to bring it on the MAX mark, then inspect the cooling system for leaks.

NOTE:

- **Always use Honda All Season Antifreeze/Coolant Type 2. Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.**
- **Honda All Season Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Do not add water.**

ELECTRIC POWERTRAIN SERVICE PRECAUTIONS

General Information

The electric powertrain system uses high voltage circuits and an organic solution (lithium-ion) contained battery module. Improper handling may cause serious injury such as electrocution. When working on or around the electric powertrain system, pay attention to the following precautions.

Preparation items

- Protective items (insulated gloves or rubber gloves, protective goggles, protective shoes)
- ABC fire extinguisher (available for both oil fires and electric fires)
- Shop towels (for wiping off the electrolyte)
- Insulating tape

Precautions when Working on High Voltage Areas

CAUTION: **Be careful not to let the electrolyte get into your eyes or contact your skin. Doing so may cause loss of your eyesight or skin damage. If electrolyte gets into your eyes or comes into contact with your skin, immediately flush with a large amount of water and seek medical attention.**

Be careful not to let the electrolyte get into your eyes or contact your skin. Doing so may cause loss of your eyesight or skin damage. If electrolyte gets into your eyes or comes into contact with your skin, immediately flush with a large amount of water and seek medical attention.

- Wear insulated gloves and use insulated tools to protect you from electrical shock. When removing or installing high voltage items, always use them. Wrap the high voltage items with insulating tape after removing. Please be careful when you see ⚡ on the illustration.
- Always inspect protective equipment for holes, tears, or other damage.
- Keep uniform pockets free of items, especially tools and metallic objects. Items may fall out and fall on to exposed high-voltage parts, creating a hazard.
- As a safety warning, attach a sign saying, WORKING ON HIGH-VOLTAGE PARTS. DO NOT TOUCH! to the steering wheel.
- Be sure to shut off the electrical circuits and isolate the electric powertrain system and related parts before servicing the electric powertrain system. (Refer to "Turning Off and ON Power to the High Voltage Circuit" below)
- The high voltage cables and their covers are identified by orange coloring. The caution labels are attached to high voltage and other related parts.
- Do not touch bare wires that could carry a high-voltage. If you must touch them, put on insulated gloves, and measure the voltage between the body grounds. If the voltage is above the 12 volt battery voltage, insulate the part with insulating tape before performing an operation to prevent shorting the battery module.
- When insulating a high voltage area with insulating tape, be sure to cover it thoroughly.
- Check around the battery module for electrolyte leaks and adhesion before starting your work. If you encounter a leak, you must wear insulated protective equipment (protective eyeglasses, insulated gloves, insulated shoes, and insulating tools) as it may cause electrical shock.
- Organic electrolyte is poisonous. If ingested, get medical attention immediately.
- Keep sparks and flames away from the battery module, leaking electrolyte from the battery is flammable. Always work in a well ventilated area.
- Strong impact (i. e., dropping the high voltage battery, collision damage) may cause electrolyte leaks, internal short circuits and heat increase resulting in fire. Avoid impact to the high voltage battery.
- Do not disassemble the battery module when doing a repair or replacement procedure.
- Seal the replaced battery module and any shop towels or rags used to wipe the electrolyte in a P. P. (Polypropylene) bag, and keep it in a well-ventilated area away from sparks and flames. Make sure to dispose these items according to local regulations.
- Inspect all high voltage related parts near the battery module for electrolyte. If you find electrolyte, you must replace the part(s).

Updating Control Units

NOTE:

- When updating control units, use the most current version of the HDS software and interface device. Refer to available service information for more information about updating control units.
- High temperature in the motor compartment might cause the motor control module (built into the PCU) to become too hot to run the update. If the motor has been running before this procedure, open the hood and cool the motor compartment.

The following control units can be updated.

- Motor control module (built into the PCU)
- Battery condition monitor module

Collision Shutoff History Clear Command

When the battery condition monitor module receives a collision detection signal (CDS) from the SRS unit, the battery condition monitor module updates the collision shutoff history, and stores it in the nonvolatile memory located inside the module. The battery condition module monitor stops supplying power to the high-voltage circuits disrupting the control signal to be sent to the high-voltage contactor inside the battery module the next time the system is being turned on. To resume power supply to the high-voltage circuits, the collision shutoff history needs to be cleared. Do the following procedures to clear the collision shutoff history.

1. Check the battery high voltage wires (orange coated) for damage. If any damage is found, replace the damaged wire harness or component, then go to step 2.

2. **Connect the HDS to the data link connector (DLC)**

3. Make sure the HDS communicates with the vehicle and the Electric Powertrain system. If it doesn't, **go to the DLC circuit troubleshooting**

4. Select the Electric Powertrain system with the HDS.

5. Clear the DTC with the HDS while the engine is stopped.

Other Precautions

High temperature may damage the battery module. When drying paint in a heated paint booth, make sure the temperature does not exceed 149 deg. F (65 deg. C).

No-Load Charging Procedure

When the vehicle is stored for an extended period of time, the expected life cycle of the high voltage battery may be affected. To reduce this possibility, the no-load charging procedure should be conducted at least once every 12 months of vehicle storage. The no-load charging should be conducted under the following conditions:

- Apply the parking brake, and block the front wheels.

- Firmly press the brake pedal, and turn the vehicle to the READY TO DRIVE mode.
- Press the accelerator pedal to the floor for 10 seconds while pressing the brake pedal. After 10 seconds, the vehicle starts the engine and holds the engine speed at 1, 200 rpm automatically for high voltage battery charging.

  NOTE:

-
  - Do not release the accelerator pedal and brake pedal during high voltage battery charging.
  - After the high voltage battery charging is completed, the engine stops automatically.
- After engine stops, turn the vehicle to the OFF (LOCK) mode.

Turning Off and On Power to the High Voltage Circuit

The following procedure should be done before you work on or near any energized high voltage components. Follow the procedure exactly. Otherwise, you may be injured or may damage equipment.

NOTE: Wear insulated gloves and use insulated tools to protect you from electrical shock. Always use them when removing or installing high-voltage items. Wrap the high voltage items with insulating tape after removing. Please be careful when you see ⚠ on the illustration.

Service Plug Location & Disconnect Procedure

NOTE:

- Secure the service plug in a safe location to prevent other personnel from installing the service plug while the vehicle is being repaired or serviced.
- If the service plug is damaged, replace it.

1. **Connect the HDS to the data link connector (DLC)** .

2. Make sure the HDS communicates with the vehicle and the Electric Powertrain system. If it doesn't, go to the DLC circuit troubleshooting. **go to the DLC circuit troubleshooting**

3. Select the Electric Powertrain system with the HDS.

4. Check the DTC and note it if any DTCs are stored.

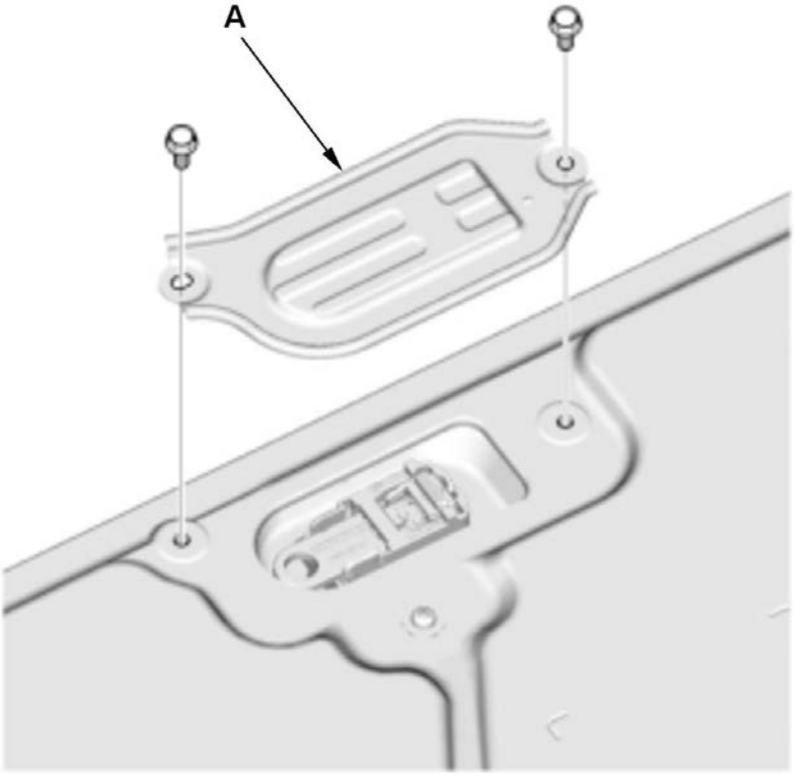
5. Turn the vehicle to the OFF (LOCK) mode, then put the remote away to avoid starting of the vehicle.

6. **Do the 12 volt battery terminal disconnection procedure**

7. **Remove the cargo floor cover** .

8. **Remove the tool box** .

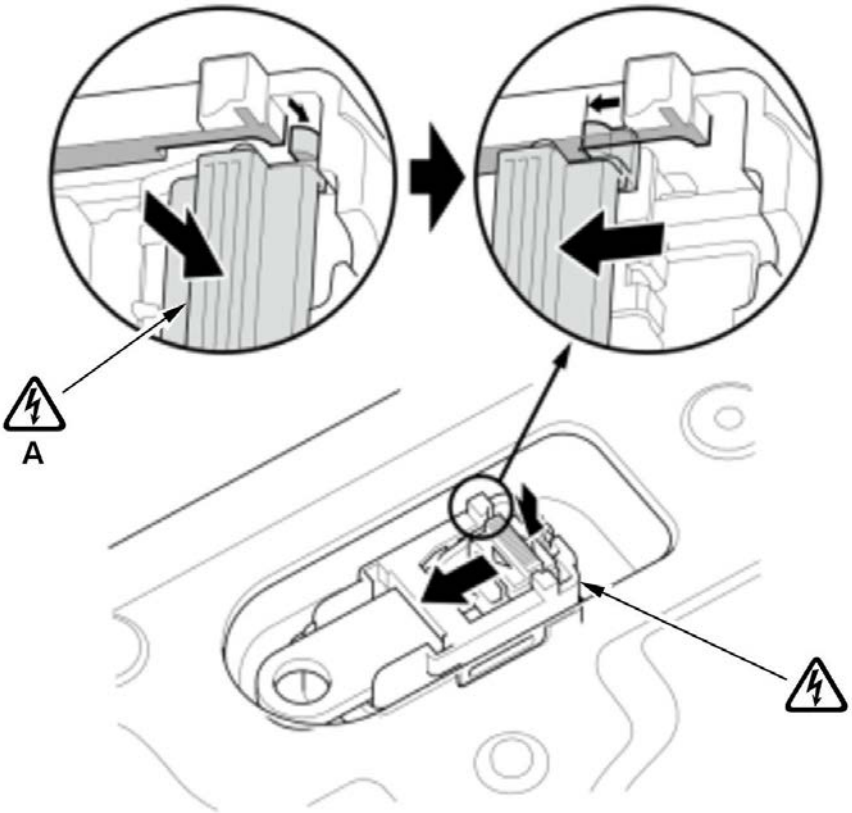
9. Remove the service plug lid (A).



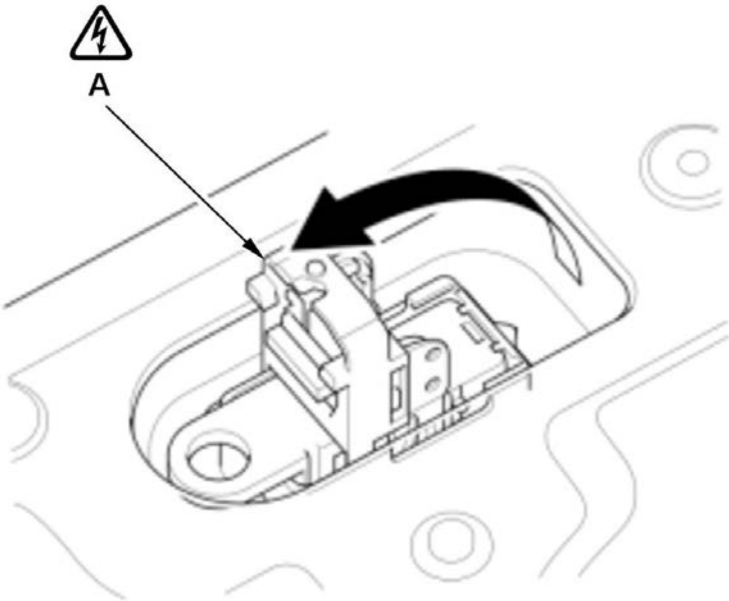
Push down and slide back the tab (A) to the off position until you hear a click.

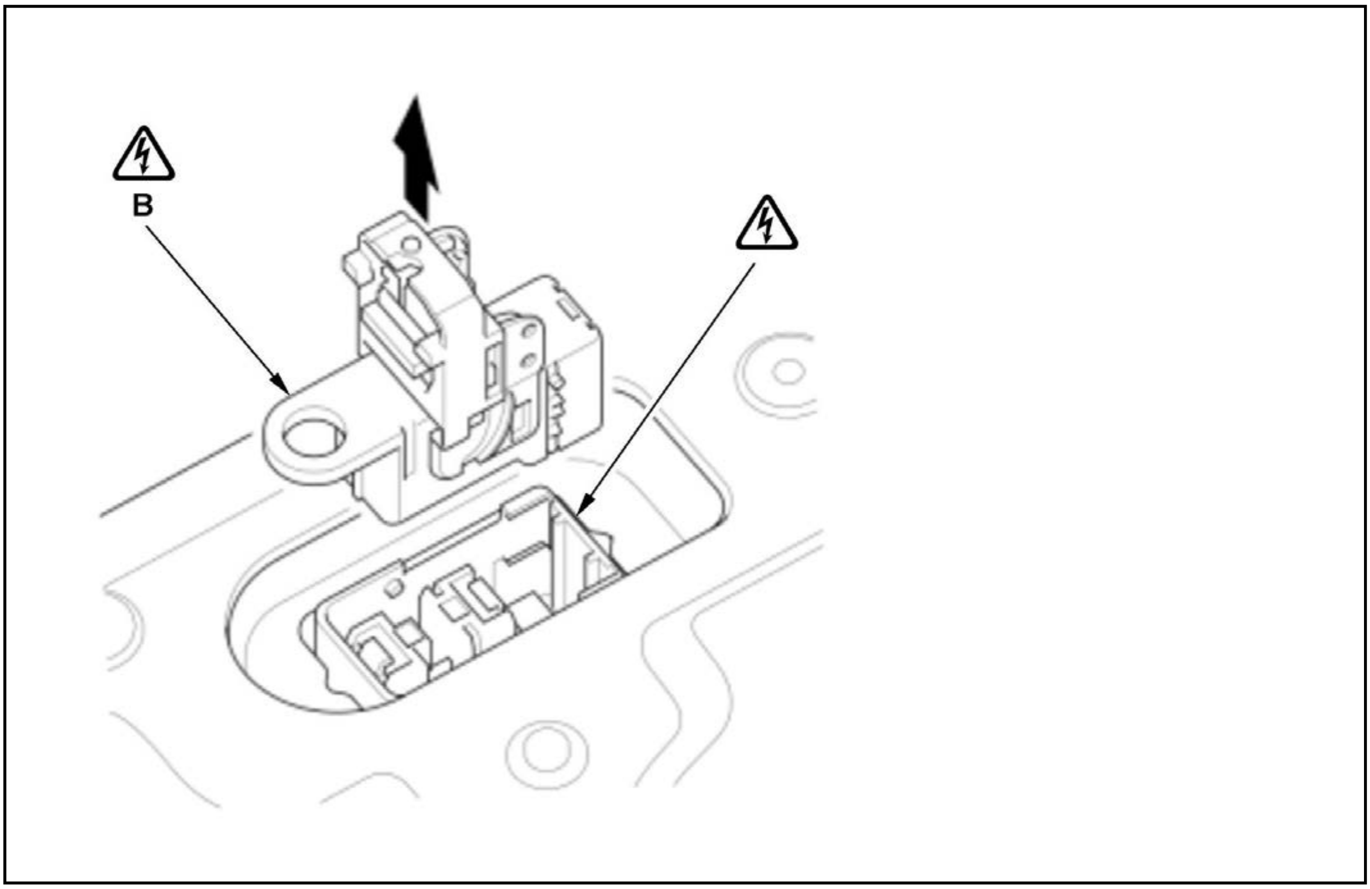
NOTE:

- **When removing or installing the service plug or items marked with ⚡ , always use insulated tools, and wrap the items with insulating tape.**
- **Secure the service plug in a safe location to prevent other personnel from installing the service plug while the vehicle is being repaired or serviced.**
- **Operate with the tab.**
- **Do not insert a finger in the gap to let the tab slide.**

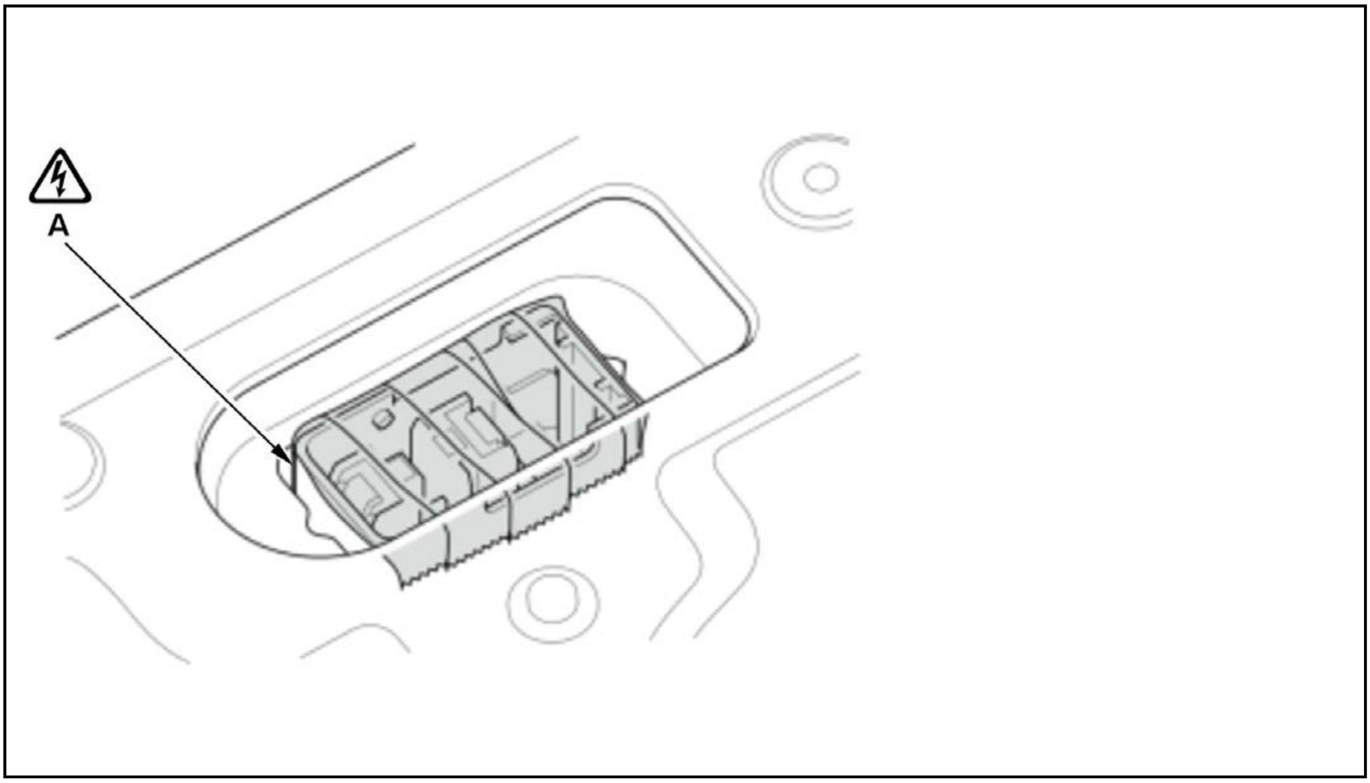


11. Raise the lever (A), and remove the service plug (B).





12. Wrap the service plug base (A) with insulating tape.



13. **Do the 12 volt battery negative terminal reconnection procedure**

14. Turn the vehicle to the ON mode.

15. Select the Electric Powertrain system with the HDS.

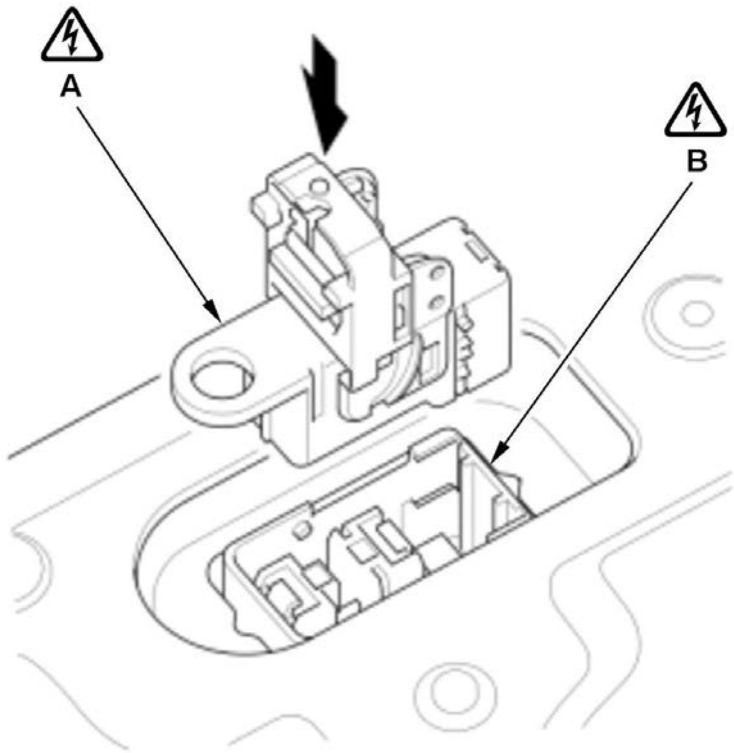
16. Check the Motor Inverter Voltage (GEN) in the Data List with the HDS, then make sure it is 30 V or less.

17. **Do the 12 volt battery negative terminal disconnection procedure** .

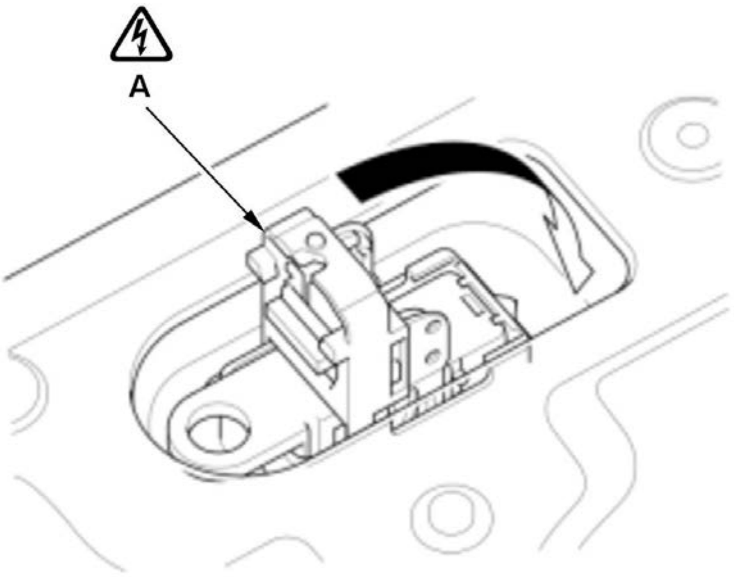
Turning On the Service Plug

NOTE: **How to read the torque specifications** .

1. Remove insulating tape and insert the service plug (A) to the service plug base (B) as shown.

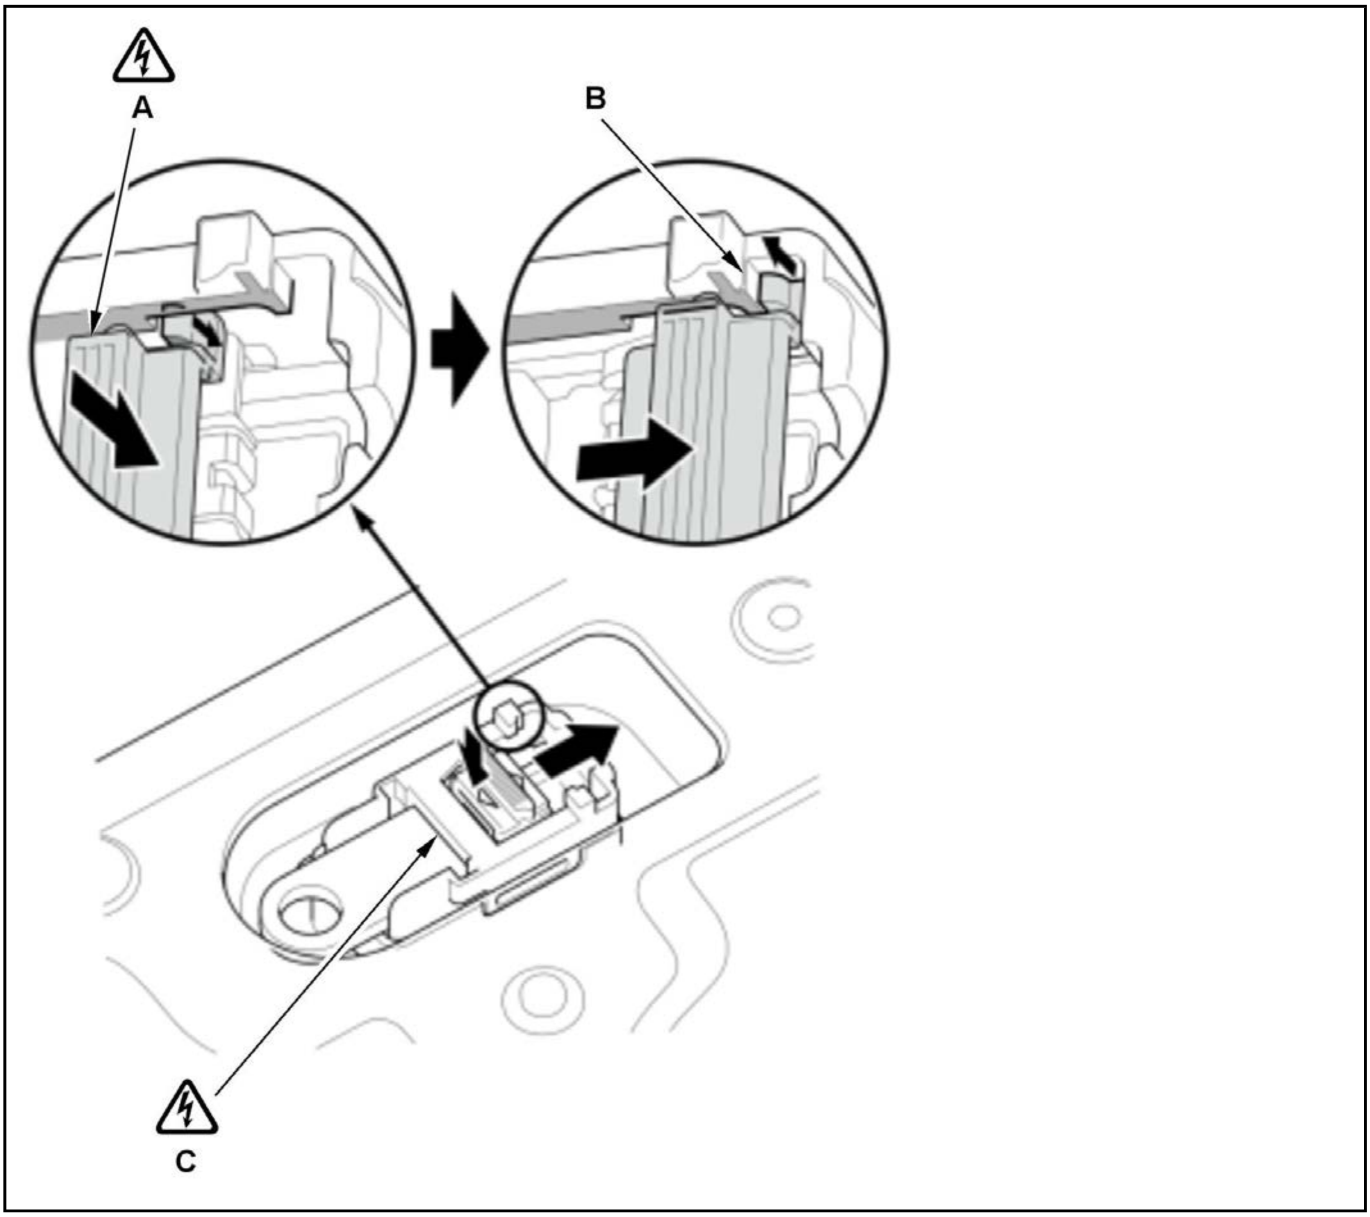


2. Lower the lever (A) to set the locked position.

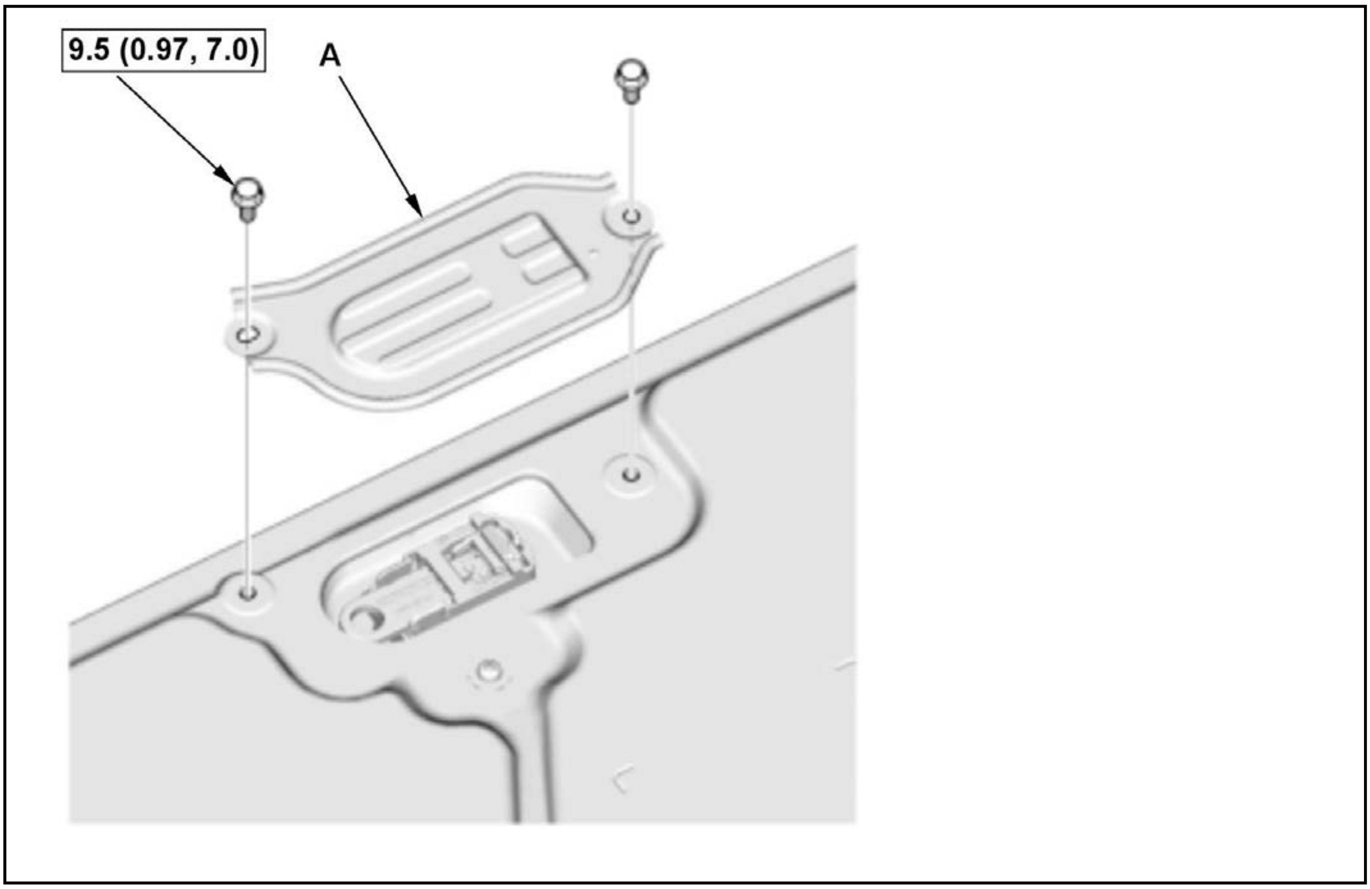


3. Push and slide the tab (A) to the locked position (B) while holding the lever (C).

NOTE: Confirm that the lever does not disengage.



4. Install the service plug lid (A).



5. **Install the tool box** .

6. **Install the cargo floor cover**

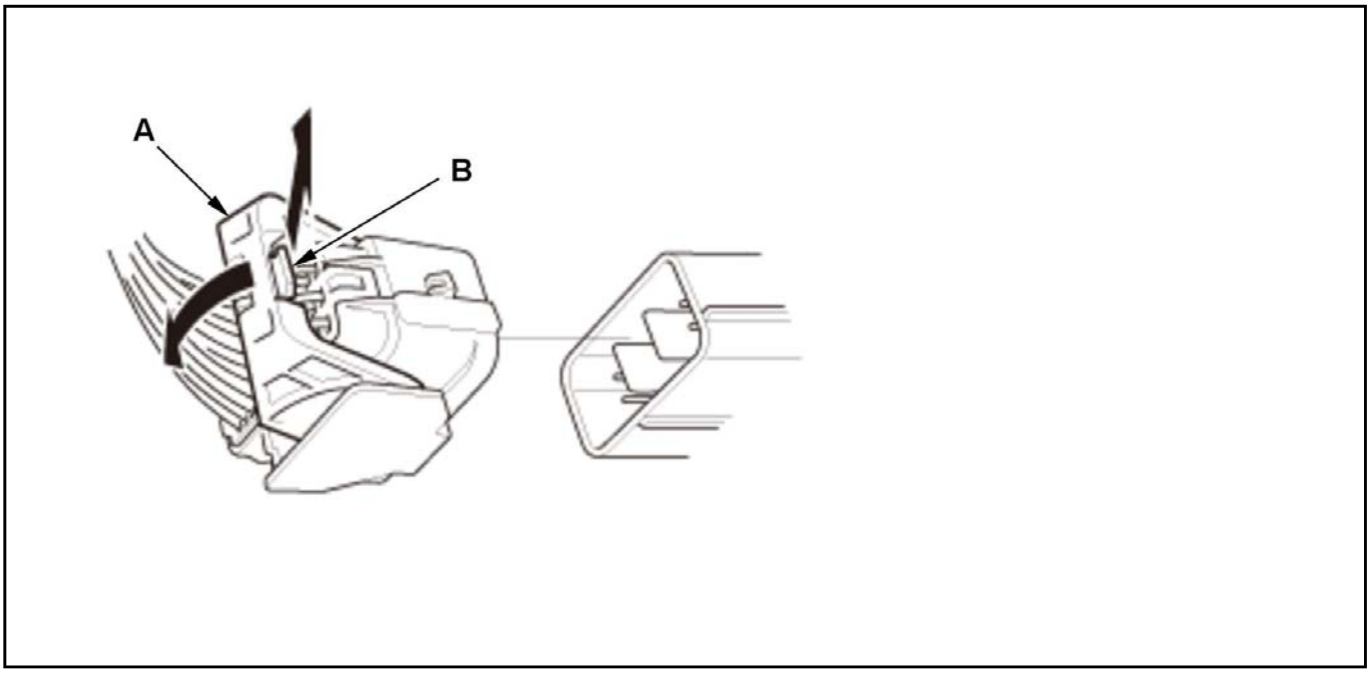
7. **Do the 12 volt battery terminal reconnection procedure** .

Disconnecting and Reconnecting the Connector

Lever-Locked Connector

1. Raise the lever (A) while pushing the tab (B) in the direction of the arrow.

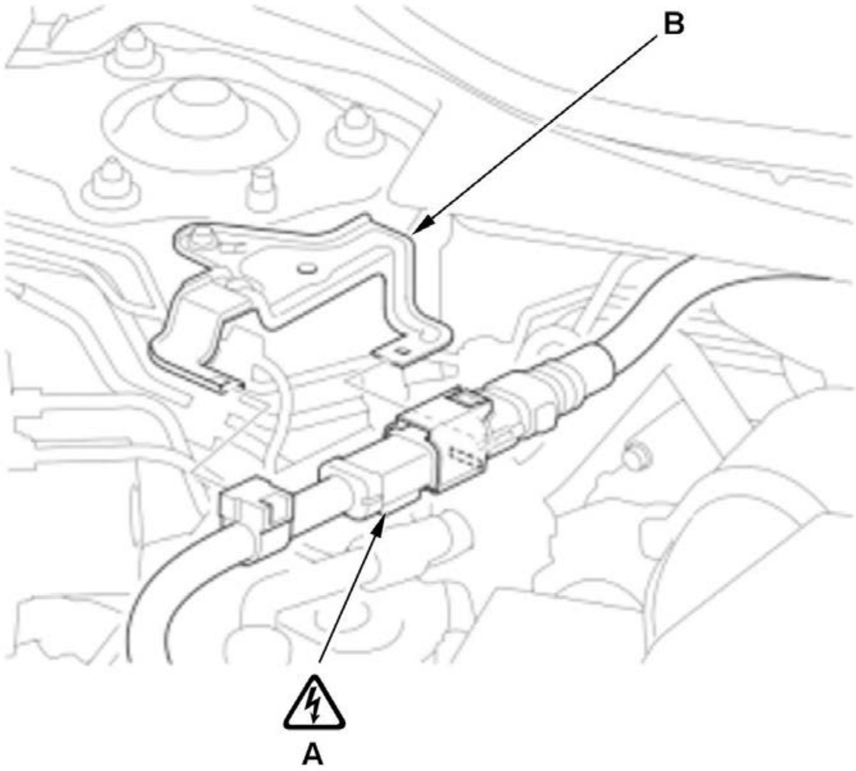
NOTE: **The following illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.**



Slider-Locked Connector

NOTE: **How to read the torque specifications** .

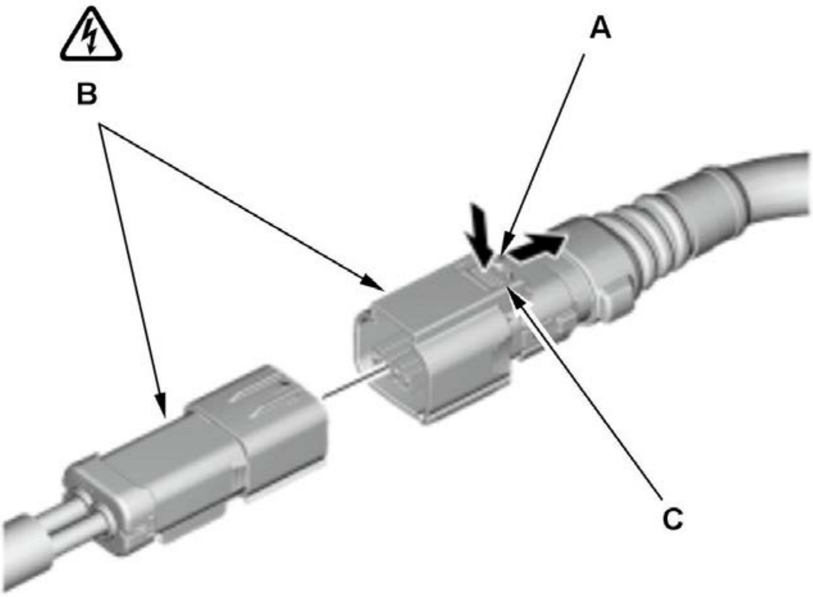
1. Remove the connector (A) from the bracket (B).

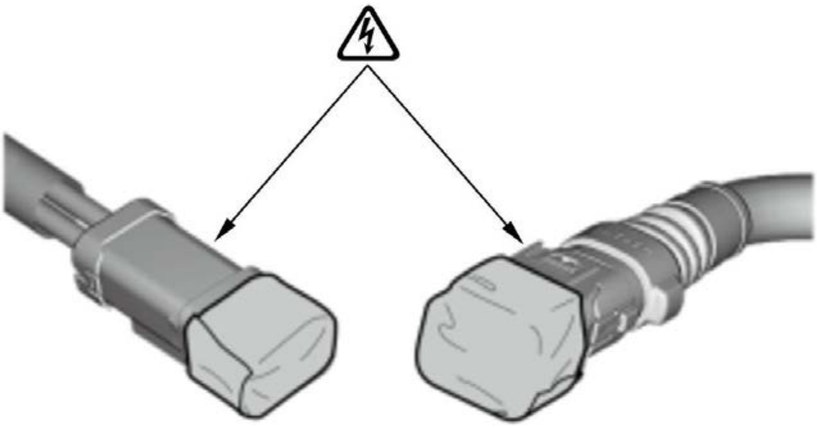


Move the slider (A) in the direction of the arrow, then disconnect the connector (B) while pushing the tab (C).

NOTE:

- **When removing or installing the service plug or items marked with ⚠ , always use insulated tools, and wrap the items with insulating tape.**
- **The following illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.**





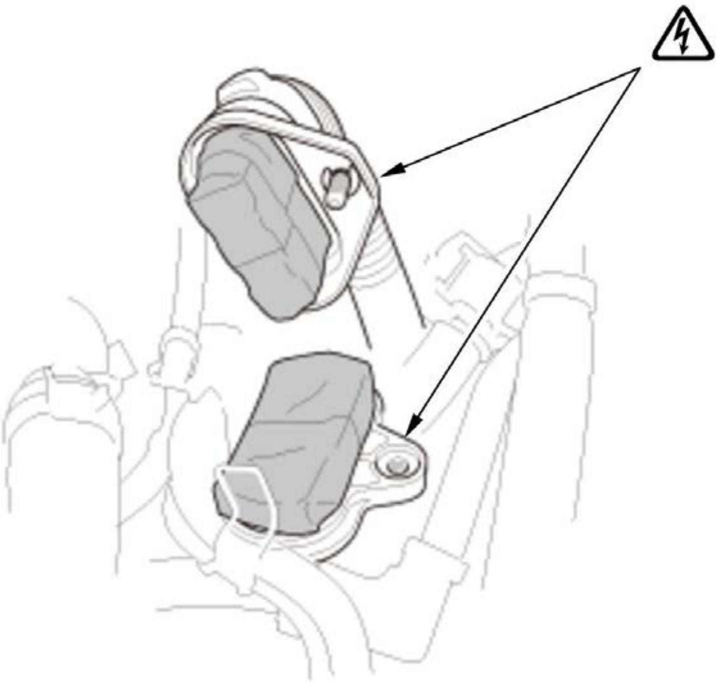
Power Cable Connector

NOTE: How to read the torque specifications .

Disconnect the power cable connector, and wrap the items with insulating tape.

NOTE:

- **The connector is removed by loosening the bolt.**
- **When removing or installing the service plug or items marked with ⚠ , always use insulated tools, and wrap the items with insulating tape.**
- **The following illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.**



How to Cable Connector Bolt Replacement

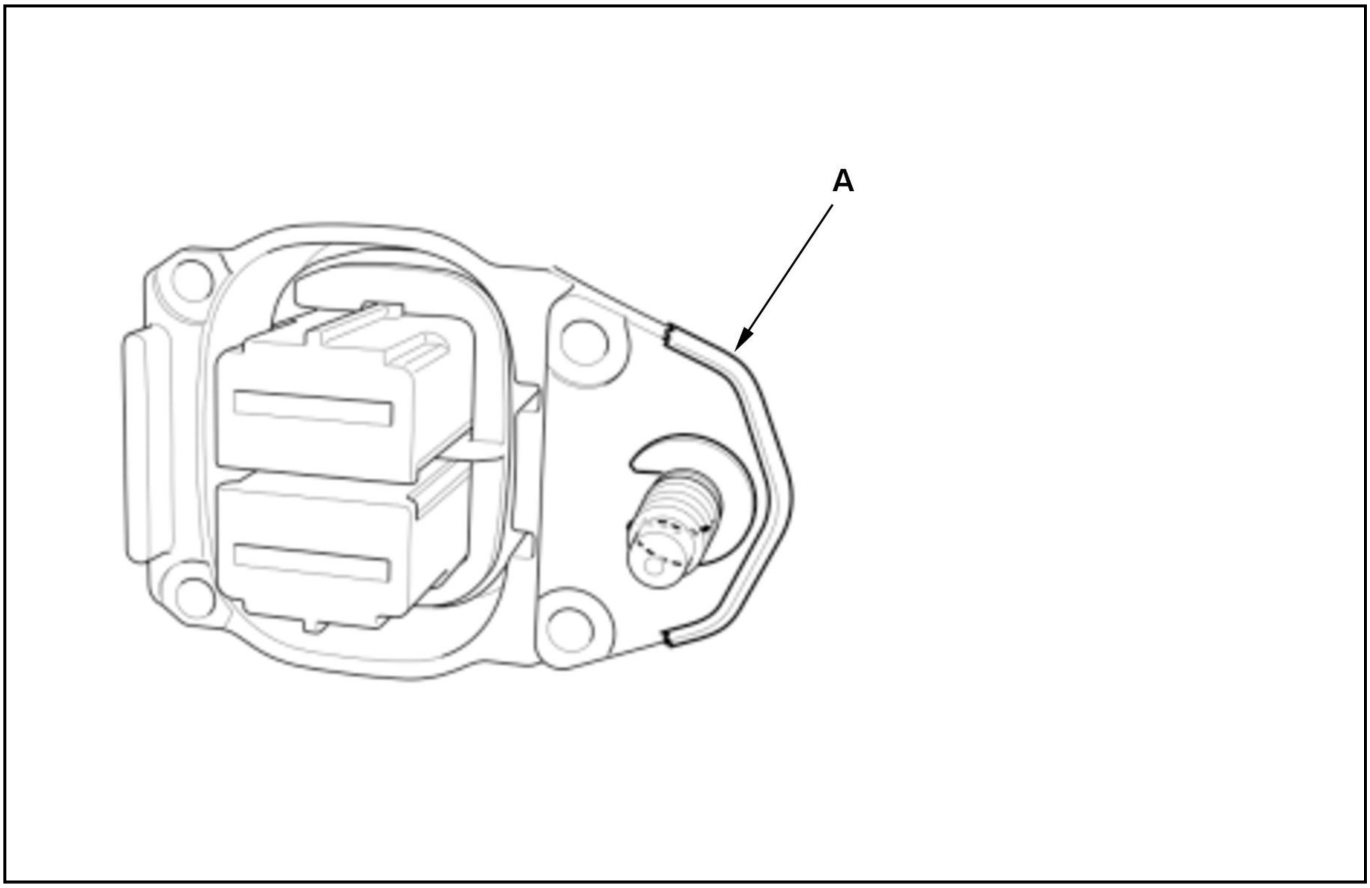
Removal procedure

NOTE:

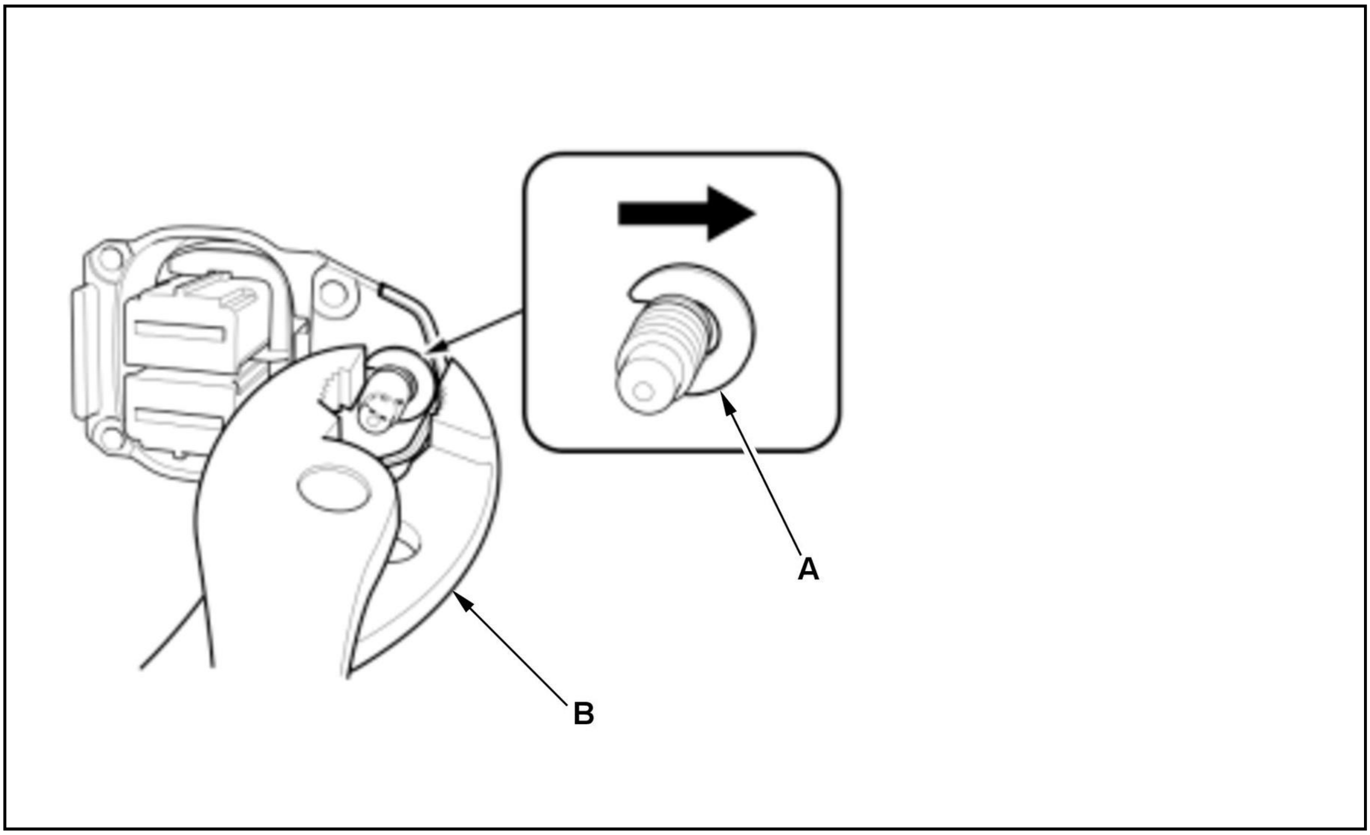
- When replacing the connector bolt, replace the cable if there are any damages, scratches or coating deterioration on the aluminum portion of the connector or resin parts.

- The following illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.
- If necessary, remove the orange cable cover.

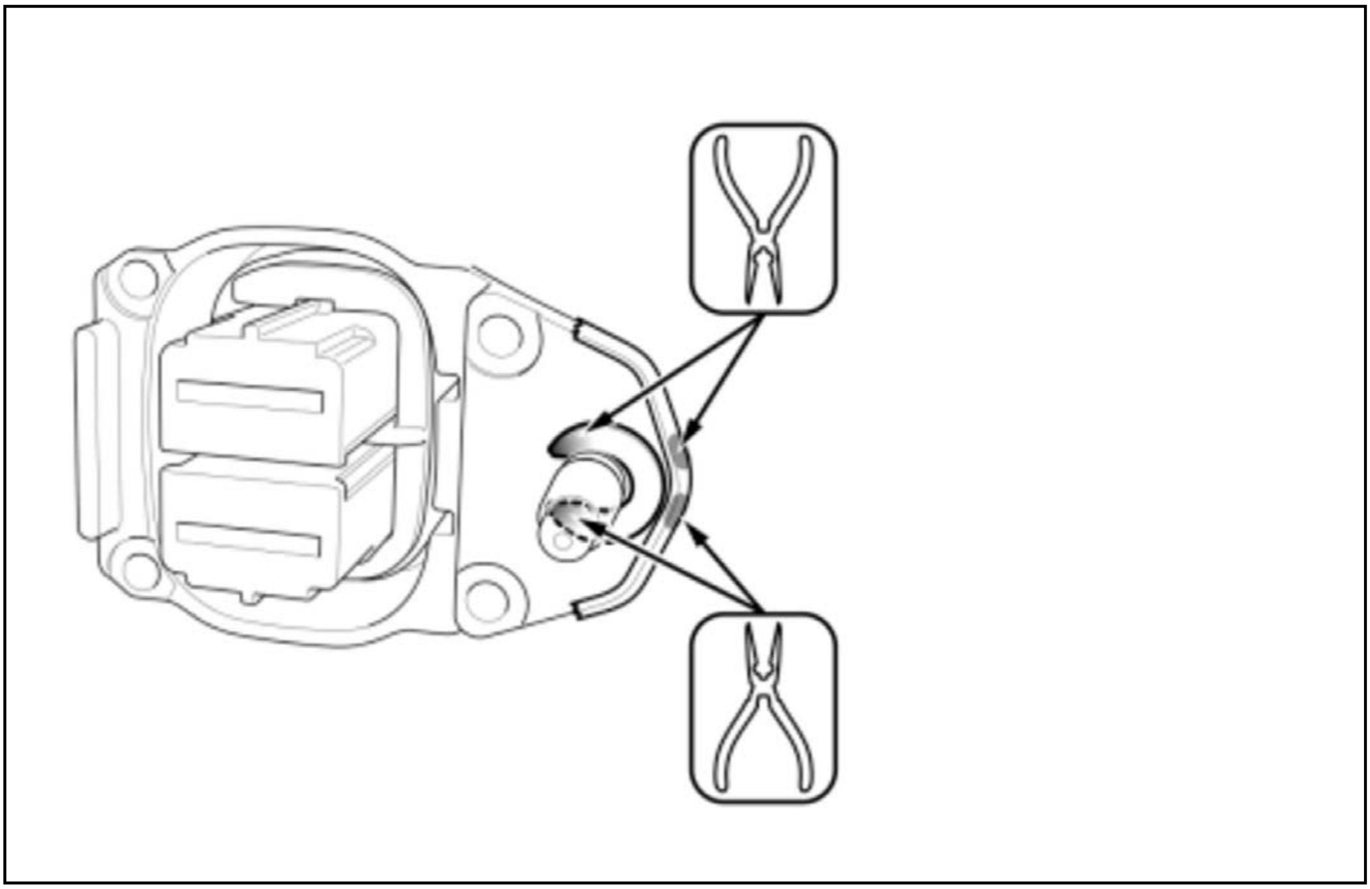
1. Apply protective tape to the connector (A) as shown.



2. Adjust the position of the bolt clip (A) as shown. By using pliers (B), move the clip a bit toward the arrow as shown.



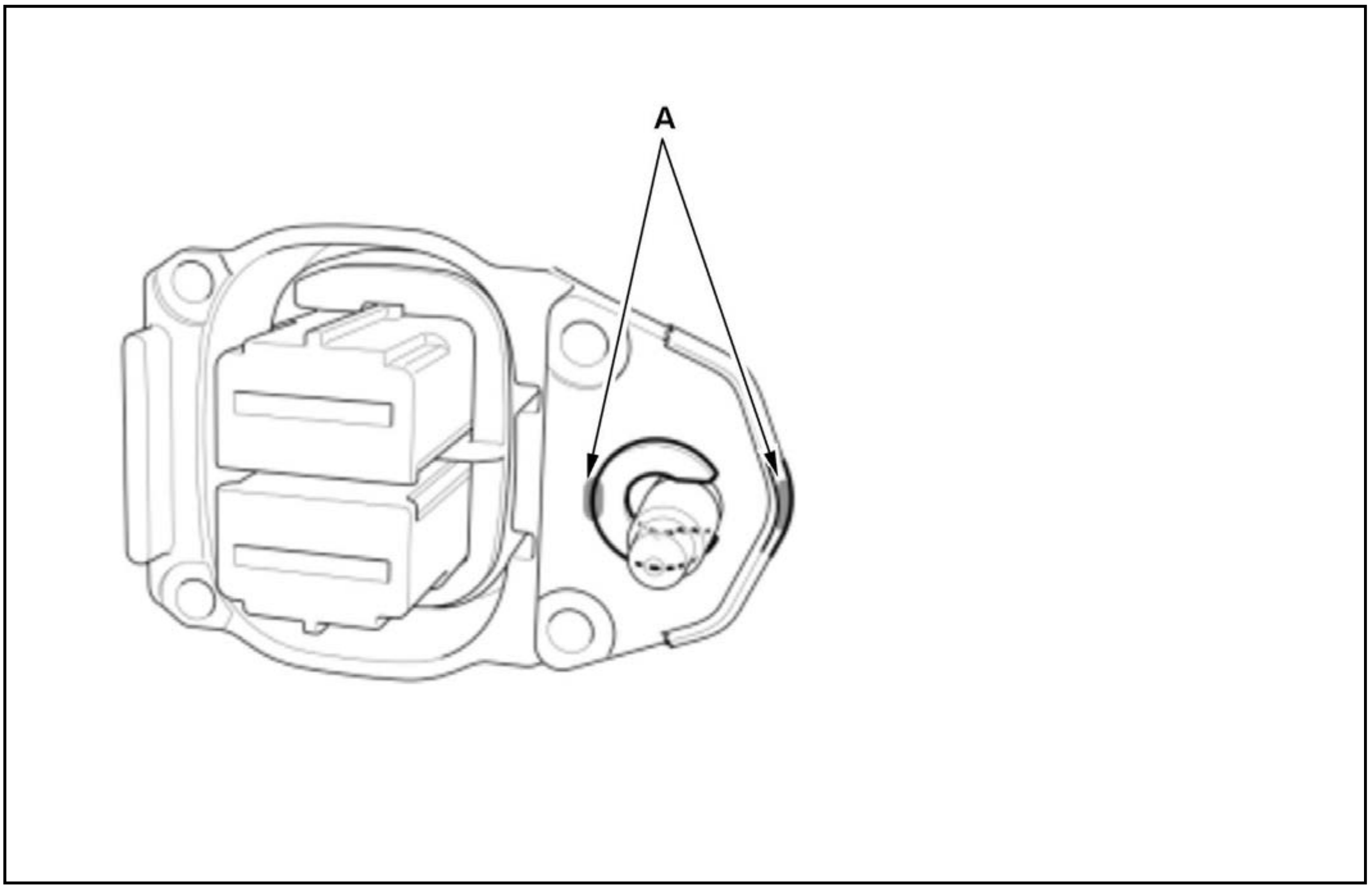
3. Put 2 long nose pliers onto the areas as shown and remove the bolt clip by gripping the pliers tightly. Then, remove the bolt.



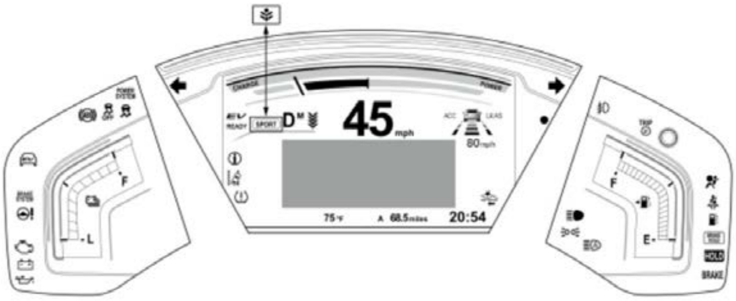
Installation procedure

1. Place the bolt clip as shown. Put pliers onto the areas (A) as shown and install the clip by gripping the pliers tightly.

NOTE: Install the bolt clip into a groove, not into a screw thread.



SYSTEM WARNING/INDICATOR INDEX



NOTE:

- Check the diagnostic trouble code (DTC) with the HDS, then refer to the indicated DTC's troubleshooting.
- There are some indicators displayed on the multi-information display (MID).

Indicator	Indicator Name	Fault Detection Unit	HDS System Menu (DTC Check)	Diagnostic Procedure
	12 VOLT CHARGING SYSTEM INDICATOR(Red)	PCM Battery condition monitor module Motor control module	PGM-FI ⇨ DTCs/Freeze Data Electric Powertrain ⇨ DTCs/Freeze Data	PGM-FI system general troubleshooting information PGM-FI system DTC troubleshooting index PGM-FI system symptom troubleshooting index Electric powertrain system general troubleshooting information Electric powertrain system DTC troubleshooting index Electric powertrain system symptom troubleshooting index
	LOW OIL PRESSURE INDICATOR (Red)	PCM	PGM-FI ⇨ DTCs/Freeze Data	PGM-FI system general troubleshooting information PGM-FI system DTC troubleshooting index Engine lubrication system symptom troubleshooting index

SYMPTOM TROUBLESHOOTING

ELECTRIC POWERTRAIN SYMPTOM TROUBLESHOOTING - 12 VOLT CHARGING SYSTEM INDICATOR COMES ON FAINTLY, NO DTCS SET

1. The 12 volt charging system indicator may faintly illuminate when the vehicle is in READY TO DRIVE mode during extremely cold weather -22 deg. F (-30 deg. C). As the battery module temperature increases, the 12 volt charging system indicator will turn off.

ELECTRIC POWERTRAIN SYMPTOM TROUBLESHOOTING - 12 VOLT CHARGING SYSTEM INDICATOR NEVER COMES ON, NO DTCS SET

1. HDS communication check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the HDS to the DLC.

-3. Turn the vehicle to the ON mode, and read the HDS

Does the HDS identify the vehicle?

YES

Go to step 2.

NO

Do the DLC circuit troubleshooting.

2. Gauge control module check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the gauge control module self-diagnostic function** .

Does the 12 volt charging system indicator flash?

YES

Intermittent failure, the system is OK at this time.

NO

Substitute a known-good gauge control module , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

ELECTRIC POWERTRAIN SYMPTOM TROUBLESHOOTING - 12 VOLT CHARGING SYSTEM INDICATOR STAYS ON, NO DTCS SET

1. PGM-FI system DTC check

-1. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any Pending or Confirmed DTCs indicated?

YES

The failure is duplicated. **Go to the troubleshooting for PGM-FI system DTC(s)** .

NO

Go to step 2.

2. Problem verification 1

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
History of DC-DC Converter Stop 2	1	B	B	B

Does the current condition(s) match the threshold?

YES

The system is OK at this time. The 12 volt charging system indicator will turn off when the state-of charge (SOC) increases.

NO

Go to step 3.

3. Problem verification 2

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
DC-DC Converter Temperature	B	B

Is 217 deg. F (103 deg. C) or more indicated?

YES

The system is OK at this time. The 12 volt charging system indicator will turn off when the DC-DC converter temperature decreases.

NO

Go to step 4.

4. Problem verification 3

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HV Battery Total Voltage	115. 8 - 315	V	B	B

Does the current condition(s) match the threshold?

YES

Go to step 5.

NO

The system is OK at this time. The 12 volt charging system indicator will turn on when the DC-DC converter temperature increases or over the operating voltage range temporary.

5. Gauge control module check

-1. Turn the vehicle to the ON mode.

-2. **Do the gauge control module self-diagnostic function** .

Does the 12 volt charging system indicator flash?

YES

Replace the PCU .

NO

Substitute a known-good gauge control module , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

ELECTRIC POWERTRAIN SYMPTOM TROUBLESHOOTING - POWER SYSTEM INDICATOR NEVER COMES ON, NO DTCS SET

1. Gauge control module check

-1. **Do the gauge control module self-diagnostic function** .

Does the POWER SYSTEM indicator flash?

YES

Intermittent failure, the system is OK at this time.

NO

Substitute a known-good gauge control module , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

ELECTRIC POWERTRAIN SYMPTOM TROUBLESHOOTING - POWER SYSTEM INDICATOR STAYS ON, NO DTCS SET

1. HDS communication check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the HDS to the DLC.

-3. Turn the vehicle to the ON mode, and read the HDS.

Does the HDS identify the vehicle?

YES

Go to step 2.

NO

Do the DLC circuit troubleshooting.

2. Gauge control module check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the gauge control module self-diagnostic function** .

Does the POWER SYSTEM indicator flash?

YES

Intermittent failure, the system is OK at this time.

NO

Substitute a known-good gauge control module , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

ELECTRIC POWERTRAIN SYMPTOM TROUBLESHOOTING - THE MESSAGE (HIGH VOLTAGE BATTERY CHARGE TOO LOW, VEHICLE CANNOT START) IS INDICATED ON THE MULTI-INFORMATION DISPLAY

1. Diagnostic interview (lack of fuel)

-1. Interview to the customer; Before the failure, the vehicle lacked fuel.

Fuel is lacked before the failure?

YES

Check the fuel level on the gauge. If it is OK, **enter the maintenance mode** to charge the high voltage battery.

NO

Go to the symptom troubleshooting in the fuel and emissions systems . **NOTE:** This vehicle has a fail-safe function that leave the SOC of the high voltage battery when the generation function has failed. Start the engine by **maintenance mode** if you want to use the SOC of the high voltage battery in the vehicle maintenance. At that time, make sure the SOC of the high voltage battery.

SYMPTOM TROUBLESHOOTING INDEX

ELECTRIC POWERTRAIN SYMPTOM TROUBLESHOOTING INDEX

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom in the sequence listed until you find the cause.

Symptom	Diagnostic procedure	Also check for
Vehicle does not go into READY TO DRIVE mode, and HDS does not communicate with the PCM (POWER SYSTEM indicator comes on and stays on)	**Troubleshoot the PCM power and ground circuits** .	• No power to PCM • No ground to PCM • Short in reference voltage circuit
POWER SYSTEM indicator stays on, no DTCs set	**Symptom troubleshooting**.	B
POWER SYSTEM indicator never comes on, no DTCs set	**Symptom troubleshooting**.	B
12 volt charging system indicator stays on, no DTCs set	**Symptom troubleshooting**.	B
12 volt charging system indicator comes on faintly, no DTCs set	**Symptom troubleshooting**.	B
12 volt charging system indicator never comes on, no DTCs set	**Symptom troubleshooting**.	B
The word (High Voltage Battery Charge Too Low, Vehicle Cannot Start) is indicated on the multi-information display	**Symptom troubleshooting**.	B
Vehicle will not operate on either electric motor or gasoline engine (POWER SYSTEM indicator works OK, no DTCs set, immobilizer indicator stays on or flashes)	**Check the immobilizer system** .	B
HDS does not communicate with the Electric Powertrain System	**Troubleshoot the DLC circuit**.	Correct HDS software

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

12 VOLT CHARGING SYSTEM INDICATOR COMES ON FAINTLY, NO DTCS SET

Diagnostic procedure

- **Symptom troubleshooting**.

12 VOLT CHARGING SYSTEM INDICATOR NEVER COMES ON, NO DTCS SET

Diagnostic procedure

- Symptom troubleshooting.

12 VOLT CHARGING SYSTEM INDICATOR STAYS ON, NO DTCS SET

Diagnostic procedure

- Symptom troubleshooting.

HDS DOES NOT COMMUNICATE WITH THE ELECTRIC POWERTRAIN SYSTEM

Diagnostic procedure

- Troubleshoot the DLC circuit.

Also check for

Correct HDS software

POWER SYSTEM INDICATOR NEVER COMES ON, NO DTCS SET

Diagnostic procedure

- Symptom troubleshooting.

POWER SYSTEM INDICATOR STAYS ON, NO DTCS SET

Diagnostic procedure

- Symptom troubleshooting.

THE WORD (HIGH VOLTAGE BATTERY CHARGE TOO LOW, VEHICLE CANNOT START) IS INDICATED ON THE MULTI-INFORMATION DISPLAY

Diagnostic procedure

- Symptom troubleshooting.

VEHICLE DOES NOT GO INTO READY TO DRIVE MODE, AND HDS DOES NOT COMMUNICATE WITH THE PCM (POWER SYSTEM INDICATOR COMES ON AND STAYS ON)

Diagnostic procedure

- Troubleshoot the PCM power and ground circuits .

Also check for

- No power to PCM
- No ground to PCM
- Short in reference voltage circuit

VEHICLE WILL NOT OPERATE ON EITHER ELECTRIC MOTOR OR GASOLINE ENGINE (POWER SYSTEM INDICATOR WORKS OK, NO DTCS SET, IMMOBILIZER INDICATOR STAYS ON OR FLASHES)

Diagnostic procedure

- Check the immobilizer system .

TEST

EXPANSION TANK CAP TEST (ELECTRIC POWERTRAIN)

Test

NOTE: Do not spill the PCU coolant on the surrounding parts. If you spill the PCU coolant, wipe the PCU coolant off immediately.

1. Expansion Tank Cap - Remove

   NOTE: Wait until the PCU coolant is cool, then carefully remove the radiator cap.

2. Expansion Tank Cap - Test

	1. Wet the expansion tank cap (A) seal with coolant, then install it on a commercially available pressure tester (B). 2. Apply a pressure of **34. 3-63. 7 kPa (0. 350-0. 650 kgf/cm 2, 4. 97-9. 24 psi)** 3. Check for a drop in pressure. 4. If the pressure drops, replace the expansion tank cap.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

RADIATOR TEST (ELECTRIC POWERTRAIN)

Test

1. **Expansion Tank Cap - Remove**

   NOTE: Wait until the PCU coolant is cool, then carefully remove the radiator cap.

2. Radiator - Test

	1. **Fill the expansion tank with coolant to the MAX mark of the expansion tank**. 2. Attach a commercially available pressure tester (A) to the radiator, and apply a pressure of **34. 3-63. 7 kPa (0. 350-0. 650 kgf/cm 2, 4. 97-9. 24 psi)** 3. Inspect for coolant leaks and a drop in pressure. 4. If coolant leaks and a drop in pressure, repair it if needed.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

DLC TROUBLESHOOTING

DLC CIRCUIT TROUBLESHOOTING (ELECTRIC POWERTRAIN)

NOTE: If you suspect the HDS or the HDS DLC cable may be the source of the communication problem, verify that they are working properly by connecting them to a known-good vehicle and system and checking for communication problems.

1. Fuse check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A10**

Is the fuse OK?

YES

Go to step 2.

NO

Replace the No. A10 fuse. Also check for a short to ground on the No. A10 fuse circuit if needed.

2. Fuse check 2

-1. Check the following fuse.

Fuse	No. D3

Is the fuse OK?

YES

Go to step 3.

NO

Replace the No. D3 fuse. Also check for a short to ground on the No. D3 fuse circuit if needed.

3. Open wire check (PG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the service plug.

-3. Remove the IPU cover .

-4. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	Battery condition monitor module connector E (32P) No. 17
Test point 2	Body ground

Is there 1. 0 Ω or less?

YES

Go to step 4

NO

Repair an open in the PG wire between the battery condition monitor module and G701.

4. Open wire check (IG1MONI line)

-1. Reconnect the following connector.

Battery condition monitor module connector E (32P)

-2. Do the 12 volt battery terminal reconnection procedure .

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

Test point 1	Battery condition monitor module connector E (32P) No. 7
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 5

NO

Repair an open in the IG1MONI wire between the No. D3 fuse and the battery condition monitor module.

5. Open wire check (IGAMONI line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	Battery condition monitor module connector E (32P) No. 23

Test point 2	Body ground

Is there battery voltage?

YES

Go to step 6

NO

Go to step 8.

6. Open wire check (F-CAN A_H line, F-CAN A_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Do the 12 volt battery terminal disconnection procedure** .

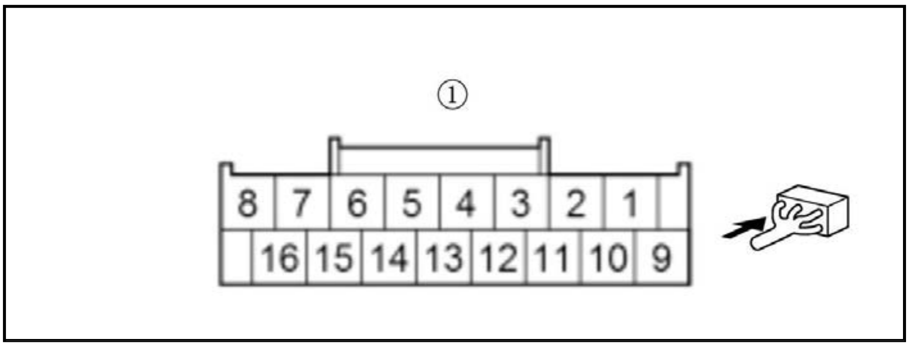
   -3. Disconnect the following connectors.

CAN gateway 16P connector
Battery condition monitor module connector E (32P)

   -4. Measure the resistance between test points 1 and 2 respectively.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 9**

Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	**Battery condition monitor module connector E (32P) No. 8**



Is there 1. 0 Ω or less?

YES

Go to step 7.

NO

Repair an open or poor connection in the F-CAN A_H wire or F-CAN A_L between the CAN gateway and the battery condition monitor module.

7. Shorted wire check (F-CAN A_H line, F-CAN A_L line)

   -1. Measure the resistance between test points 1 and 2 respectively.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	**Battery condition monitor module connector E (32P) No. 9**
Test point 2	Body ground

Test point 1	**Battery condition monitor module connector E (32P) No. 8**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The F-CAN A wires are OK. Replace the battery condition monitor module .

NO

Repair a short in the F-CAN A_H wire or F-CAN A_L wire between the CAN gateway and the battery condition monitor module.

8. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the IGHLD1 relay .

-3. Test the IGHLD1 relay .

Is the relay OK?

YES

Go to step 9.

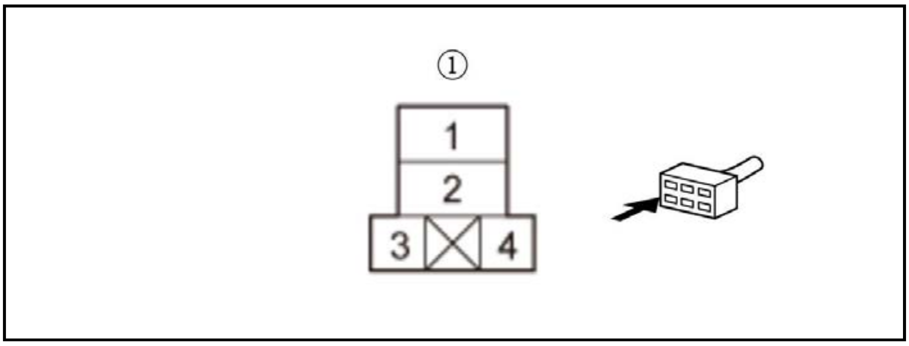
NO

Replace the IGHLD1 relay.

9. Open wire check (+B_IG_HOLD1 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLD1 relay: disconnected
Test point 1	IGHLD1 relay 4P socket (female terminals) No. 1, No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 10.

NO

Repair an open in the +B_IG_HOLD1 wire between the No. A10 fuse and the IGHLD1 relay.

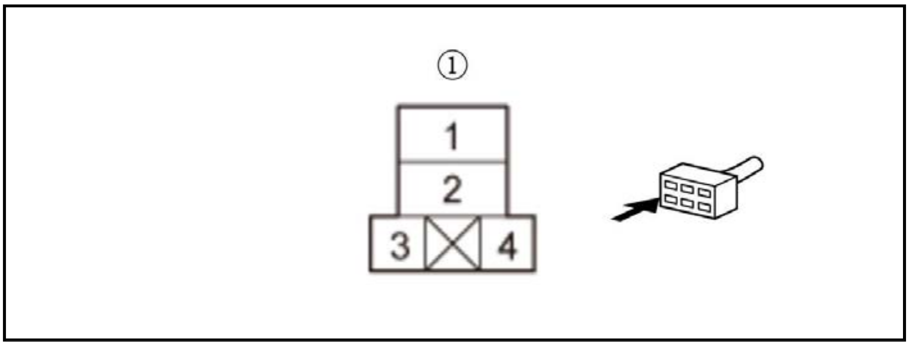
10. Open wire check (IGA/IGAMONI line)

-1. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLD1 relay: disconnected
B	Battery condition monitor module connector E (32P): disconnected
Test point 1	IGHLD1 relay 4P socket (female terminals) No. 2: ①
Test point 2	Battery condition monitor module connector E (32P) No. 23



Is there 1. 0 Ω or less?

YES

The IGA/IGAMONI wire is OK. Repair an open in the IGHLD wire between the IGHLD1 relay and the battery condition monitor module.

NO

Repair an open in the IGA/IGAMONI wire between the IGHLD1 relay and the battery condition monitor module.

REMOVAL AND INSTALLATION

12 VOLT BATTERY SENSOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- Where icon is shown, for further information see below.
- With the driver's door open, turn the vehicle to the OFF (LOCK) mode, then wait at least 3 minutes before disconnecting the 12 volt negative battery cable.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

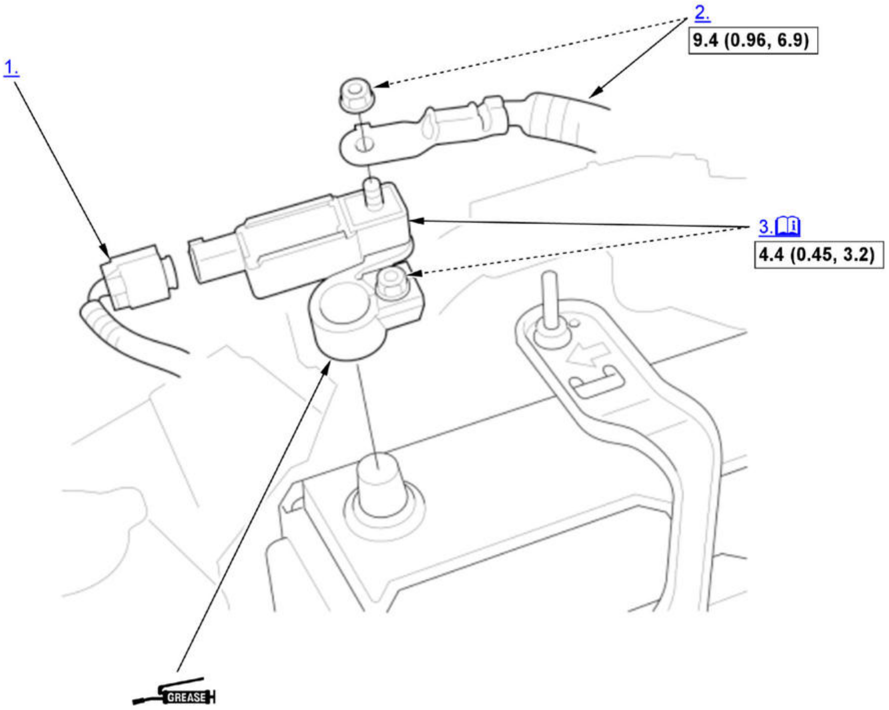


Fig. 1: Exploded View Of 12 Volt Battery Sensor Replacement Components
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)
GREASE	Multipurpose Grease

1. Connector - Disconnect
2. Cable - Disconnect
3. 12 Volt Battery Sensor - Remove

NOTE: To protect the 12 volt battery sensor connector from damage, do not hold it when removing the negative terminal.

Note for installation

NOTE:

- Make sure the areas between the negative terminal and the 12 volt battery sensor are clean.
- To protect the 12 volt battery sensor connector from damage, do not hold it when installing the negative terminal.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. 12 Volt Battery - After the Installation Procedure

12 VOLT BATTERY TERMINAL DISCONNECTION AND RECONNECTION

Removal

NOTE: With the driver's door open, turn the vehicle to the OFF (LOCK) mode, then wait at least 3 minutes before disconnecting the 12 volt negative battery cable.

1. 12 Volt Battery Terminals - Disconnect

	1. Make sure the vehicle is in the OFF (LOCK) mode. 2. Disconnect and isolate the 12 volt battery sensor (A) with the cable (B) from the 12 volt battery (C). **NOTE:** • Always disconnect the negative side first. • To protect the 12 volt battery sensor connector (D) from damage, do not hold it when removing the terminal (E). • Do not disconnect the cable from the 12 volt battery sensor unless you replace the 12 volt battery sensor. 3. Open the cover (F). 4. Disconnect the terminal (G) from the 12 volt battery.

Installation

NOTE:

- How to read the torque specifications.
- If the 12 volt battery performed abnormally, test the 12 volt battery before installation.

1. 12 Volt Battery Terminals - Connect

 4.4 (0.45, 3.2) C E D A G GREASE F B GREASE	1. Clean the 12 volt battery terminals. 2. Connect the terminal (A) to the 12 volt battery (B). **NOTE:** Always connect the positive side first. 3. Connect the 12 volt battery sensor (C) with the cable (D) to the 12 volt battery. **NOTE:** To protect the 12 volt battery sensor connector (E) from damage, do not hold it when installing the terminal (F). 4. Apply multipurpose grease to the terminals to prevent corrosion. 5. Close the cover (G).

6. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

7. 12 Volt Battery - After the Installation Procedure

Test

1. 12 Volt Battery - Test

WARNING:

A 12 volt battery can explode if you do not follow the proper procedure, causing serious injury to anyone nearby.

Follow all procedures carefully and keep sparks and open flames away from the 12 volt battery.

Software Version

Make sure you have the latest software for the ED-18 and GR8.

To check the software version on the ED-18, do this:

- Press the POWER button.
- Read the version number on the screen. It should appear for about 3 seconds.
- Or you can select: Language> Options> Info> Version. The version number will appear near the top of the screen.

Check that this is the latest version on iN > Service > Service Bay > Diagnostic Tool Software Versions.

To check the software version on the GR8, do this:

- Press the POWER button.
- Read the version number on the screen. It should appear for about 5 seconds.
- Or from the Main Menu, select: Options> Info> Version. The version number will appear on the screen.

Using the ED-18 Battery Tester (12 Volt)

NOTE: For setup, customization, and other available features, refer to the ED-18 user's manual.

1. Connect the leads to the positive and negative terminals.

2. Use the arrow keys to select the Battery test and press ENTER and follow the prompts.

NOTE:

- Make sure to enter the correct cold cranking ampere (CCA) rating of the 12 volt battery. You can find the CCA printed on the label on the top of the 12 volt battery. If the CCA rating is not entered correctly, the test result will not be accurate.
- Make sure to select FLOODED (FLA) for the 12 volt battery type.

3. Here are the four possible 12 volt battery conditions:

- GOOD BATTERY: The 12 volt battery has at least 60 percent of its charge and required no action.
- GR8 DIAGNOSTIC NEEDED: The battery voltage is below 60 percent of its state-of-charge, and the condition of the 12 volt battery is unknown. Use the GR8 to charge the 12 volt battery and properly diagnose it.
- REPLACE BATTERY: The 12 volt battery condition is poor. Replace it.
- BAD CELL: There is an internal problem with the 12 volt battery. Replace it.

Using the GR8 Battery Diagnostic Station with AST Module (12 Volt)

NOTE:

- For setup, customization, and other available features, refer to the GR8 user's manual.
- On the GR8, you can select two modes: DEALER INVENTORY or CUSTOMER VEHICLE:
-
    - DEALER INVENTORY: Use this mode for vehicles in dealer inventory. The GR8 charges the 12 volt battery to 80% of its state-of-charge. If the 12 volt battery condition is OK, the GR8 states the 12 volt battery is GOOD. If you leave the GR8 attached to the 12 volt battery, it changes to Top Off mode, and continues to charge the 12 volt battery until it is at 100% of its state-of-charge.
    - CUSTOMER VEHICLE: In order to give a waiting customer quicker service, the GR8 charges the 12 volt battery to 60% of its state-of-charge. If the 12 volt battery condition is OK, the GR8 states the 12 volt battery is GOOD. If you leave the GR8 attached to the 12 volt battery, it will enter Top Off mode, and continues to charge the 12 volt battery until it is at 100% of its state-of-charge.

1. Connect the leads to the positive and negative terminal of the 12 volt battery.

2. Use the arrow keys to select Diagnostic, and follow the prompts.

NOTE:

- Make sure to enter the correct cold cranking ampere (CCA) rating of the 12 volt battery. You can find the CCA printed on the label on the top of the 12 volt battery. If the CCA rating is not entered correctly, the test result will not be accurate.
- Make sure to select FLOODED (FLA) for the 12 volt battery type.

3. Here are the three possible 12 volt battery conditions:

- GOOD BATTERY: The 12 volt battery state of health is good and state of charge is at least 60%.
- REPLACE BATTERY: The 12 volt battery condition is poor. Replace it.
- BAD CELL: There is a problem with the 12 volt battery. Replace it.

RELAY CIRCUIT BOARD REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1. **Relay Circuit Board - Remove**
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. Relay Circuit Board - Test

CONNECTOR C (18P)

The relay circuit board is part of the under-hood fuse/relay box, and it contains these relay circuits:

- Brake light relay circuit
- Electric heater coolant pump relay circuit
- Electric VTC relay circuit
- Ignition coil relay circuit
- PGM-FI main relay 1 circuit
- PGM-FI subrelay circuit
- RFC diode
- Security horn circuit diode
- Security horn relay circuit

NOTE:

- Make sure the correct test lead (+ or -) is placed on the terminal.
- When checking for continuity across the diode, use the diode setting (—▶|—) on the digital volt/ohm meter to check the diode bias.

- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

Electric Heater Coolant Pump Relay Circuit, Electric VTC Relay Circuit, and RFC Diode

Electric heater coolant pump relay circuit

- There should be continuity between terminals C15 and C7, when 12 volt battery power is connected to terminal C6, and body ground is connected to terminal C8.
- There should be no continuity between terminals C15 and C7 when terminal C8 is disconnected.

Electric VTC relay circuit

- There should be battery voltage at terminal B5 when 12 volt battery power is connected to terminal B4, and body ground is connected to terminal C2.
- There should be no voltage at terminal B5 when terminal C2 is disconnected.

RFC diode

- There should be continuity between terminals A1 and A2.

The relay circuit board is part of the under-hood fuse/relay box, and it contains these relay circuits:

- Brake light relay circuit
- Ignition coil relay circuit
- PGM-FI main relay 1 circuit
- PGM-FI subrelay circuit
- Starter cut relay 1 circuit
- Starter cut relay 2 circuit

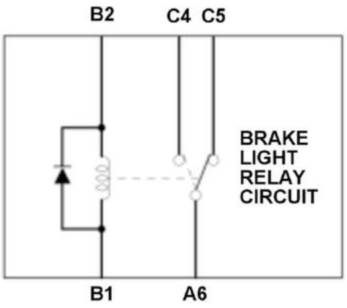
NOTE:

- Make sure the correct test lead (+or -) is placed on the terminal.
- When checking for continuity across the diode, use the diode setting (▶|) on the digital volt/ohm meter to check the diode bias.
- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

Brake Light Relay Circuit

Brake light relay circuit

- There should be continuity between terminals C4 and A6, when 12 volt battery power is connected to terminal B2, and 12 volt battery ground is connected to terminal B1.
- There should be no continuity between terminals C4 and A6, and there should be continuity between terminals C5 and A6 when terminal B1 is disconnected.



Ignition Coil Relay Circuit, PGM-FI Main Relay 1 Circuit, and PGM-FI Subrelay Circuit

Ignition coil relay circuit

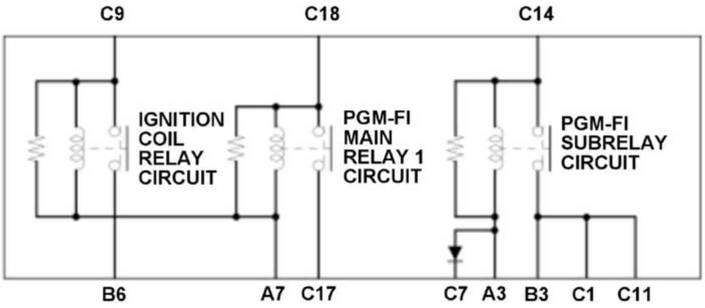
- There should be battery voltage at terminal B6 when 12 volt battery power is connected to terminal C9, and 12 volt battery ground is connected to terminal A7.
- There should be no voltage at terminal B6 when terminal A7 is disconnected.

PGM-FI main relay 1 circuit

- There should be battery voltage at terminal C17 when 12 volt battery power is connected to terminal C18, and 12 volt battery ground is connected to terminal A7.
- There should be no voltage at terminal C17 when terminal A7 is disconnected.

PGM-FI subrelay circuit

- There should be battery voltage at terminal B3, C1 and C11 when 12 volt battery power is connected to terminal C14, and 12 volt battery ground is connected to terminal A3.
- There should be no voltage at terminal B3, C1 and C11 when terminal A3 is disconnected.
- There should be continuity between terminals A3 and C7.



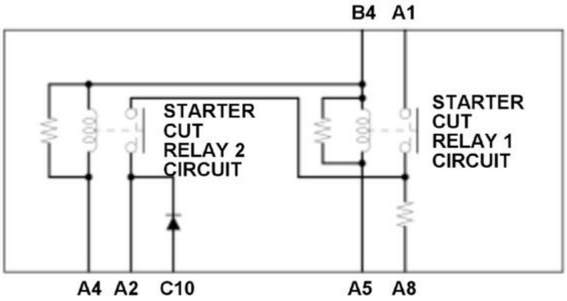
Starter Cut Relay 1 Circuit and Starter Cut Relay 2 Circuit

Starter cut relay 1 circuit

- There should be continuity between terminals A1 and A8, when 12 volt battery power is connected to terminal B4, and 12 volt battery ground is connected to terminal A5.
- There should be no continuity between terminals A1 and A8 when terminal A5 is disconnected.

Starter cut relay 2 circuit

- There should be continuity between terminals A2 and A8, when 12 volt battery power is connected to terminal B4, and 12 volt battery ground is connected to terminal A4.
- There should be no continuity between terminals A2 and A8 when terminal A4 is disconnected.
- There should be continuity between terminals C10 and A2.



REMOVAL AND INSTALLATION

12 VOLT BATTERY SENSOR REMOVAL AND INSTALLATION

Removal and Installation

☐	Torque: N.m (kgf.m, lbf.ft)
GREASE	Multipurpose Grease

1. 12 Volt Battery Sensor - Remove

   NOTE:

   - Make sure the areas between the negative terminal and the 12 volt battery sensor are clean.
   - To protect the 12 volt battery sensor connector from damage, do not hold it when installing the negative terminal.
   - Do the operation after reconnecting the 12 volt battery terminal.

2. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

12 VOLT BATTERY TERMINAL DISCONNECTION AND RECONNECTION

Removal

NOTE:

- With the driver's door open, turn the vehicle to the OFF (LOCK) mode, then wait at least 3 minutes before disconnecting the 12 volt negative battery cable.
- Canada models: When turning the vehicle to the ON mode for the first time after the 12 volt battery is reconnected, turn the vehicle to the ON mode while depressing the brake pedal for the immobilizer mutual authentication between the body control module and the VSA modulator-control unit.

1. 12 Volt Battery Terminals - Disconnect

 **Type A** **Type B** 	1. Make sure the vehicle is turned to the OFF (LOCK) mode. 2. Disconnect and isolate the 12 volt battery sensor (A) with the cable (B) from the 12 volt battery (C). **NOTE:** - Always disconnect the negative side first. - To protect the 12 volt battery sensor connector (D) from damage, do not hold it when removing the terminal (E). - Do not disconnect the 12 volt battery sensor from the cable. 3. Open the cover (F). 4. Disconnect the terminal (G) from the 12 volt battery.

DESCRIPTION & OPERATION

WIRELESS CHARGER SYSTEM DESCRIPTION (2020 2021)

Overview

Some models come equipped with the wireless charger. The wireless charger can charge the battery (like a smartphone) that is placed on top of the wireless charger, without a charging cable. This system uses the law of electromagnetic induction.

Basic Control

The wireless charger system begins to charge a battery of a wireless device (like a smartphone) as soon as it detects the device on the wireless charger. The charger receives the radio frequency signal from the audio-navigation unit or the audio unit (dispaly audio type) via the B-CAN. Charging frequency is controlled so that it will not interfere with the receiving frequency of the radio. When a remote communicates to the body control module by LF communication, the charger momentarily stops charging so it will not interfere with the keyless access system.

The following conditions will stop battery charging:

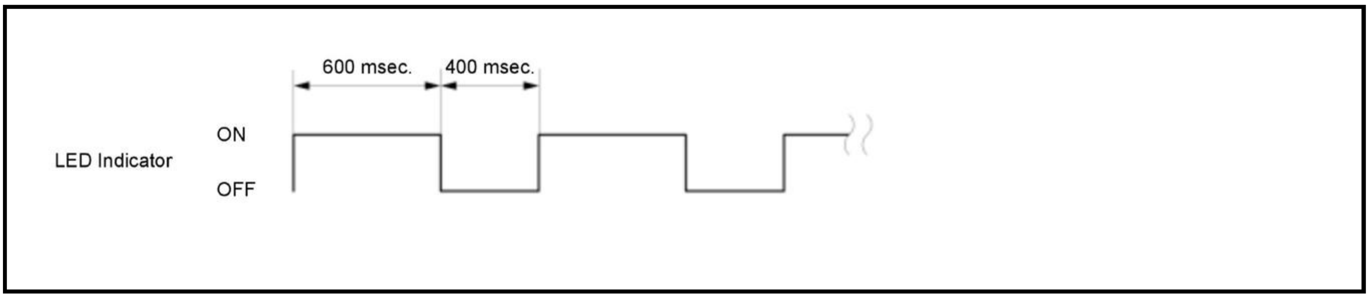
- When the battery of the device becomes full.
- When an object is placed between the charger and the wireless device that prevents detection.
- When the wireless device is placed out of the charging area.

LED Indicator Function

As charging starts, the amber indicator turns on, and as charging stops, the green indicator turns on. When a failure occurs, the indicator (s) will flash.

Operation Mode State	Indicator	
	Green	Amber
Standby	ON	OFF
Power Transfer	OFF	ON
Abnormal Termination	FLASH	FLASH
Hardware Failure	OFF	FLASH

Flash Pattern



Failsafe Function

Hardware Failsafe Control

When the CPU is reset due to a CPU program runaway or a drop in the 5 V supply voltage, it changes to failsafe.

Software Failsafe Control

When any of the data from the B-CAN circuit cannot be received within a specified time, or an unusual combination of the data is recognized, the wireless charger moves to the software failsafe. The data that cannot be received is forced to a pre-programmed value.

WIRELESS CHARGER SYSTEM DESCRIPTION - SYSTEM DIAGRAM (2020 2021)

3	B-CAN_H	Communication line	---
4	---	Not used	---
5	---	Not used	---
6	ACC KEYLOCK	ACC power source	With vehicle in ACCESSORY or ON mode: about battery voltage
7	+B BACK UP	Power source for wireless charger	About battery voltage at all times

CHECK

PARASITIC DRAW CHECK

Special Tools Required

LH41 AC/DC low current clamp meter, FLULH41A**: Available through the Honda Tool and Equipment Program, 888-424-6857

1. Parasitic draw check 1

   -1. Make sure the 12 volt battery is fully charged, and that all the vehicle's electrical accessories are turned off.

   -2. With hood latch switch: Order to recognize that the hood is closed, disconnect the hood latch switch 2P connector then connect the hood latch switch 2P connector terminals No. 1 and No. 2 with a jumper wire.

   -3. Turn the vehicle to the ON mode.

   -4. Turn the vehicle to the OFF (LOCK) mode.

   -5. Get out of the vehicle, and close all doors and tailgate securely.

   -6. Lock the doors with the keyless remote/transmitter.

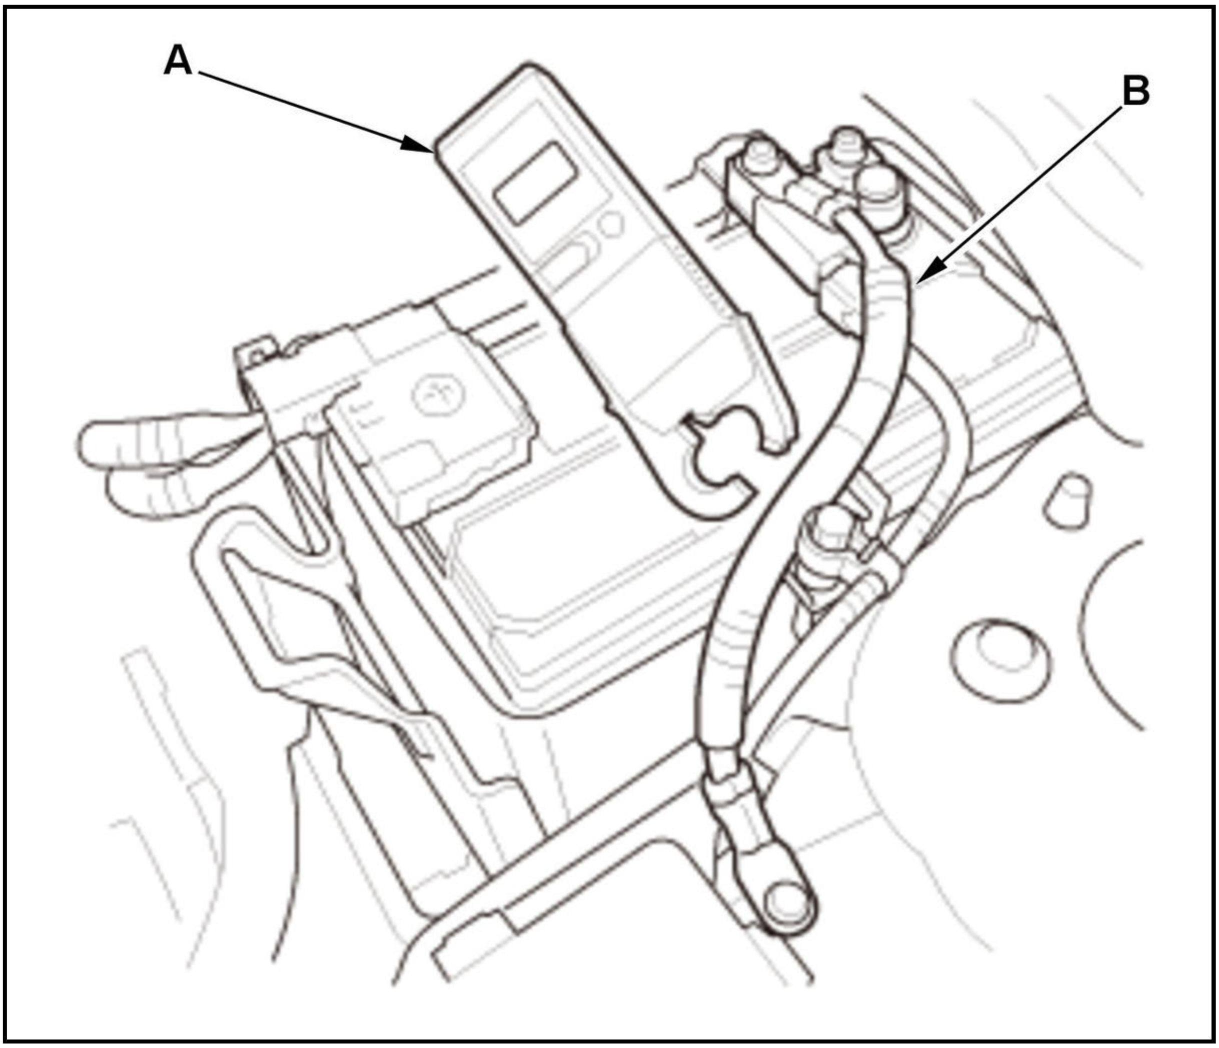
   -7. Make sure the individual map lights are turned off, and the security alarm system is armed (with security).

   -8. Wait for at least 20 minutes.

   -9. Attach the LH41 AC/DC low current clamp meter (A) to the 12 volt battery ground cable (B). Follow the equipment manufacturer's instructions, then measure the parasitic draw.

   NOTE: If you are using a digital multimeter: go to step 2.

12 volt battery size	Threshold of the parasitic draw
55B24, L2	27.0 mA



Is the measured valued less than the threshold?

YES

Intermittent failure, the system is normal at this time.

NO

Go to step 3.

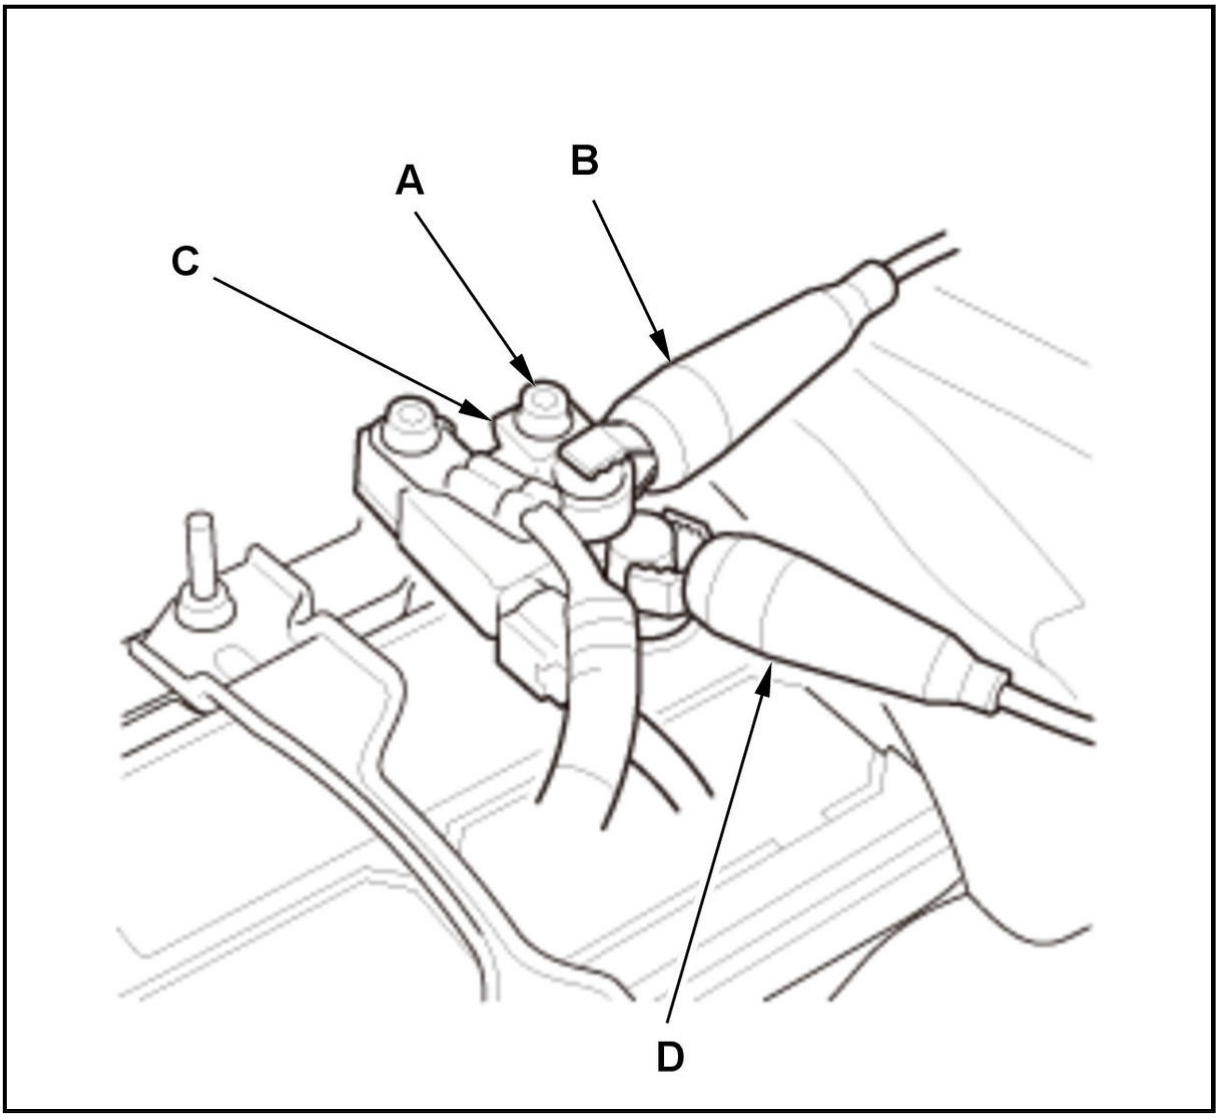
2. Parasitic draw check 2:

   Check the following items before measuring:

   - Set the multimeter dial to the DCA (direct current amps) range.
   - Plug the red test probe into the red A (Amps) jack, and plug the black test probe into the COM jack.
   - To avoid blowing an input fuse, start by setting the range above 10 A.

   -2. Loosen the nut (A) on the 12 volt battery negative terminal.

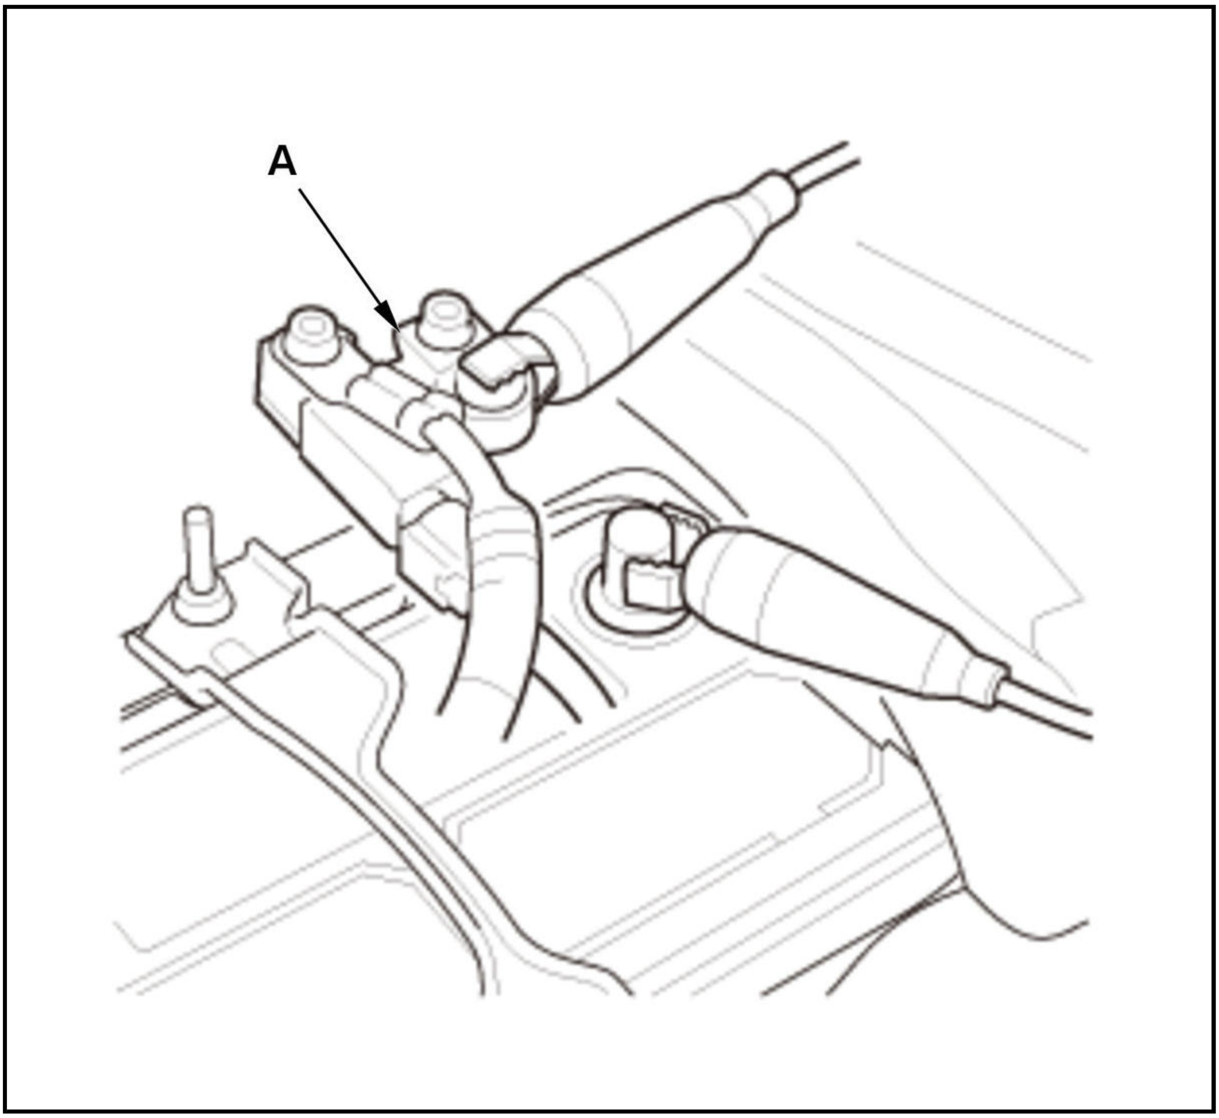
   NOTE: Follow the instructions exactly to avoid disconnecting the 12 volt battery ground cable terminal from the 12 volt battery negative terminal.



-3. Connect the red (+) test lead (B) to the 12 volt battery ground cable terminal (C).

-4. Carefully slide the 12 volt battery ground cable terminal upwards from the 12 volt battery negative terminal post to maintain contact and avoid disconnection. Then connect the black (-) test lead (D) to the 12 volt battery negative terminal post.

-5. Disconnect the 12 volt battery ground cable terminal (A) from the 12 volt battery negative terminal.



-6. Measure the parasitic draw.

NOTE: If the measured value is over the threshold, wait 10 minutes and recheck.

12 volt battery size	Threshold of the parasitic draw
55B24, L2	27.0 mA

Is the measured valued less than the threshold?

YES

Intermittent failure, the system is normal at this time.

NO

Go to step 3.

3. Electrical equipment check

-1. Check if there are any aftermarket electrical accessories installed on the vehicle.

Are there any aftermarket electrical accessories installed?

YES

Remove any installed aftermarket accessories and do parasitic draw tests again.

NO

Go to step 4.

4. Parasitic draw check 3

-1. Remove the BACK UP fuse while the test leads are connected, and measure the parasitic draw.

12 volt battery size	Threshold of the parasitic draw
55B24, L2	14.0 mA

Is the measured valued less than the threshold?

YES

Go to step 5.

NO

Go to step 6.

5. Parasitic draw check 4

-1. Install the BACK UP fuse.

-2. Short the B-CAN_H line to B-CAN_L line with a jumper wire while the test leads are connected.

-3. Turn the vehicle to the ON mode and then the OFF (LOCK) mode.

-4. Get out of the vehicle, and close all doors and tailgate securely.

-5. Wait for at least 40 seconds.

-6. Measure the parasitic draw.

12 volt battery size	Threshold of the parasitic draw
55B24, L2	27.0 mA

Is the measured valued less than the threshold?

YES

Disconnect the control units from the B-CAN circuit one at a time, perform step 3-6 above, then measure the parasitic draw. Do the input test for the control unit that reduced the parasitic draw to less than the threshold when disconnected.

NO

Disconnect the control units from the back-up fuse circuit one at a time, perform step 3-6 above, then measure the parasitic draw. Replace the control unit that reduced the parasitic draw to less than the threshold when disconnected.

6. Parasitic draw check 4

-1. Remove the IG MAIN 1 fuse and IG MAIN 2 fuse (with keyless access system) while the test leads are connected.

-2. Turn the vehicle to the ON mode and then the OFF (LOCK) mode.

-3. Get out of the vehicle, and close all doors and tailgate securely.

-4. Wait for at least 40 seconds.

-5. Measure the parasitic draw.

12 volt battery size	Threshold of the parasitic draw
55B24, L2	27.0 mA

Is the measured valued less than the threshold?

YES: With keyless access system

Go to step 7.

YES: Without keyless access system

Go to step 8.

NO

Remove the fuse (s) one at a time, and identify the parts which excessively consume current.

NO

If all electrical circuits are OK, check the starter system circuit.

NO

Perform the starter performance test.

7. Parasitic draw check 5 (with keyless access system)

-1. Install the IG MAIN 1 and IG MAIN 2 fuses.

-2. Disconnect under-dash fuse/relay box connector C (27P) while the test leads are connected, and measure the parasitic draw.

12 volt battery size	Threshold of the parasitic draw
55B24, L2	27.0 mA

Is the measured valued less than the threshold?

YES

Replace the under-dash fuse/relay box .

NO

Repair a short to ground in the +B IG MAIN wire.

NO

Repair a short to ground in the +B IG MAIN2 wire.

8. Parasitic draw check 5 (without keyless access system)

-1. Install the IG MAIN 1 fuse.

-2. Disconnect the ignition switch 7P connector while the test leads are connected, and measure the parasitic draw.

12 volt battery size	Threshold of the parasitic draw
55B24, L2	27.0 mA

Is the measured valued less than the threshold?

YES

Replace the ignition switch .

NO

Repair a short to ground in the wire.

INPUT TEST

WIRELESS CHARGER INPUT TEST (2020 2021)

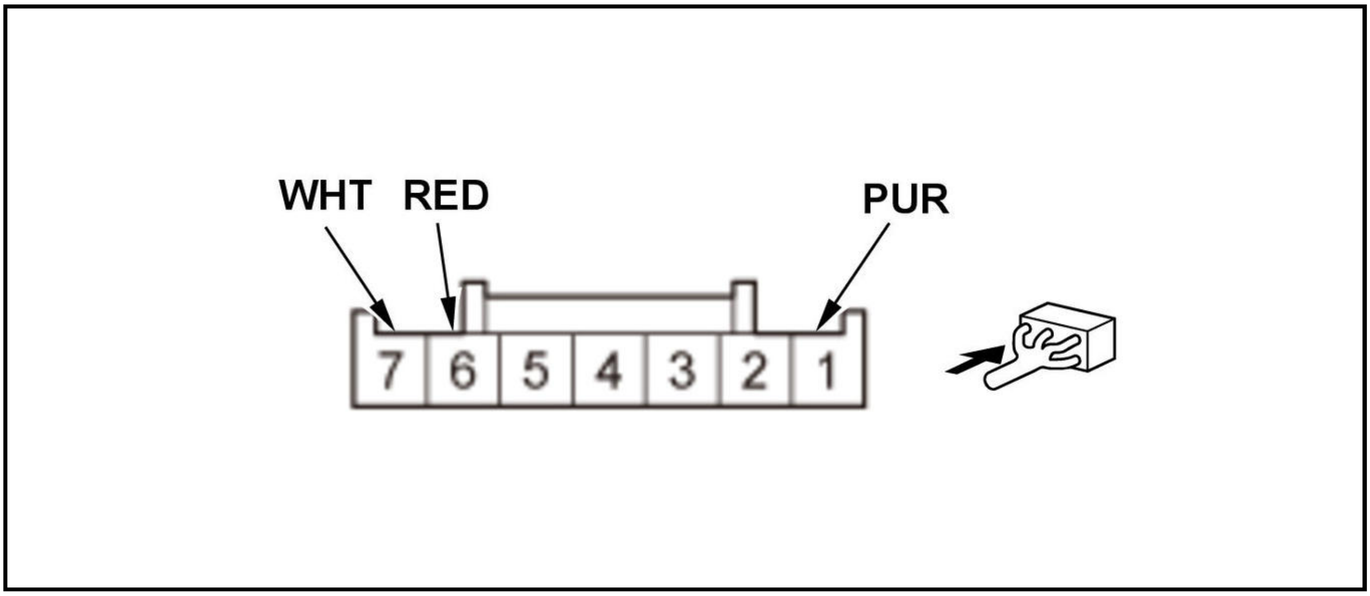
NOTE:

- Make sure the fuses associated with the system are OK.
- Before testing, check for DTCs. If any DTCs are indicated, troubleshoot those DTCs first.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the wireless charger 7P connector.

Wireless Charger 7P Connector (female terminals)



Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 4.

Reconnect the connector to the wireless charger, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, replace the wireless charger .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
7	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire
6	RED	Vehicle ACCESSORY mode	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire
1	PUR	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire

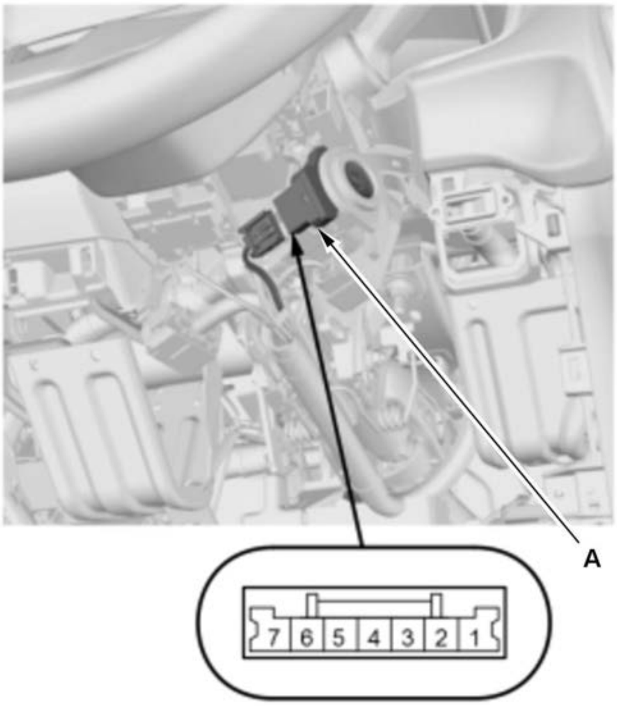
TEST

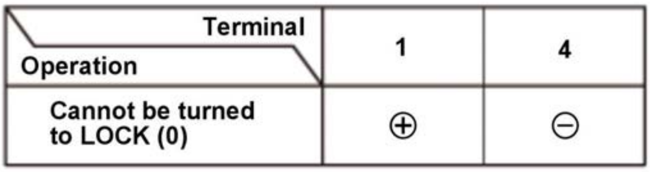
KEY INTERLOCK SOLENOID TEST

Test

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Column Covers - Remove**
2. Key Interlock Solenoid - Test





Terminal / Operation	1	4
Cannot be turned to LOCK (0)	⊕	⊖

1. Turn the ignition switch to LOCK (0).

2. Disconnect the connector.

3. Turn the ignition switch to ACCESSORY (I).

4. Check the solenoid operation by connecting power and ground according to the table.

NOTE: To prevent damage to the actuator, apply battery voltage only momentarily.

5. If the key interlock solenoid does not work properly, the key interlock solenoid is faulty; **replace the steering lock**

(A).

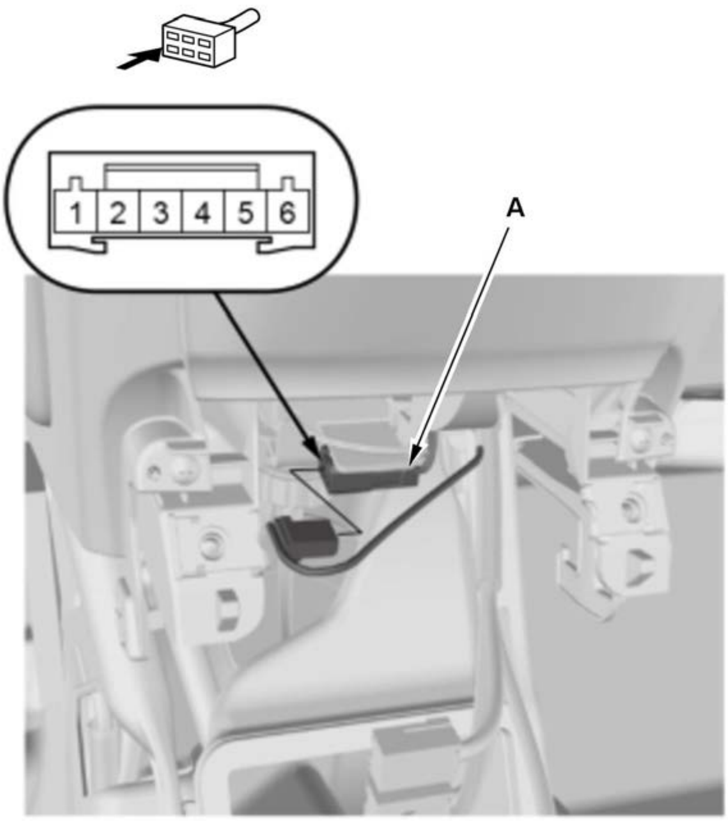
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

PARK PIN SWITCH TEST

Test

1. **Center Console - Remove**
2. Park Pin Switch - Test



Condition \ Terminal	3	4
P		
Out of P or Pressed Shift Lever Button	○	○

1. Disconnect the connector.

2. Check for continuity between the terminals in each shift lever condition according to the table.

3. If the continuity is not as specified, **check the shift cable adjustment**

If the cable adjustment is OK, the park pin switch is faulty; **replace the shift lock unit** (A).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

GROUND TO COMPONENTS INDEX

GROUND TO COMPONENTS INDEX

Ground	Component (s) or circuit (s) grounded	Feature
G1	12 volt battery	B
G2	Engine mount bracket	B
G3	Transmission mount bracket	B
G101	CKP sensor* 2, CMP sensor A* 2, CMP sensor B* 2, Ignition coils, PCM (three wires)* 1,	*1: 1.5 L engine *2: 2.4 L engine

Ground	Component (s) or circuit (s) grounded	Feature
	PCM (four wires)* 2, Rocker arm oil control solenoid* 2, Shielding between the PCM and the high pressure fuel pump* 2, Shielding between the PCM and the knock sensor* 2, Shielding between the PCM and the injectors* 2, Transmission range switch* 2, VTC oil control solenoid valve* 2, VTC oil control solenoid valve A* 1, VTC oil control solenoid valve B* 1	
G102	PCM (three wires)* 1, PCM (two wires)* 2, Shielding between the PCM and the A/F sensor (sensor 1)* 1, Shielding between the PCM and the high pressure fuel pump* 1, Shielding between the PCM and the knock sensor* 1, Shielding between the PCM and the injectors* 1	*1: 1.5 L engine *2: 2.4 L engine
G151* 1	Auxiliary transmission fluid pump* 2, TCM (two wires), Transmission range switch	*1: 1.5 L engine *2: With auto idle stop system
G161	CVT drive pulley pressure control solenoid valve, CVT driven pulley pressure control solenoid valve	B
G162	CVT clutch pressure control solenoid valve, CVT lock-up clutch control solenoid valve	B
G201	VSA modulator-control unit (two wires)	B
G202	EPS control unit	B
G251	Brake fluid level switch, Hood latch switch, Left front fog light, Millimeter wave radar* 1, Power transistor, Relay control module (two wires), Right front fog light, Right headlight (high beam)* 2,	*1: With ACC *2: HIGH/LOW beam (HALOGEN type) *3: With headlight manual leveling system *4: With shutter grille *5: With washer fluid level switch *6:'20-21

Ground	Component (s) or circuit (s) grounded	Feature
	Right headlight (LED control unit), Right headlight (low beam)* 2, Right headlight leveling motor* 3, Shielding between the PCM and the EVAP leak check module* 6, Shutter grille (lower)* 4, Washer fluid level switch* 5	

Ground	Component (s) or circuit (s) grounded	Feature
G351	A/C condenser fan motor, Console accessory power socket relay, Electric brake booster, Fan control relay, Front accessory power socket relay, Front blower motor relay, Front seat heater relay circuit (built into the under-dash fuse/relay box)* 1, Heated windshield wiper area (two wires)* 2, Horn (HIGH), Horn (LOW), Left headlight (high beam)* 3, Left headlight (LED control unit), Left headlight (low beam)* 3, Power door lock relay circuit (DR UNLOCK) (built into the under-dash fuse/relay box), Power door lock relay circuit (LOCK) (built into the under-dash fuse/relay box), Power door lock relay circuit (UNLOCK) (built into the under-dash fuse/relay box), Relay control module, Shutter grille (upper)* 4, Starter solenoid diode* 5, Tailgate release actuator relay circuit (built into the under-dash fuse/relay box), Windshield wiper control unit/motor	*1: With front seat heater *2: With heated windshield wiper area *3: HIGH/LOW beam (HALOGEN type) *4: With shutter grille *5: 2.4 L engine

Ground	Component (s) or circuit (s) grounded	Feature
G352*	DC-DC converter	*: With auto idle stop system

Ground	Component (s) or circuit (s) grounded	Feature
G401	Audio remote-HFL switch* 1, Automatic dimming inside mirror, Automatic lighting/rain sensor* 2, Body control module (three wires), CAN gateway* 3, CMBS OFF switch* 4, Console accessory power socket relay, Data link connector (DLC) (two wires), Driver's door key cylinder switch, Driver's door lock knob switch, Driver's door outer handle, Driver's power window motor, Driver's vanity mirror light* 5, Driving position memory switch* 7, Electrical compass unit* 8, Electric steering lock* 9* 11, Engine start/stop switch* 9, Front accessory power socket relay* 24, Front individual map lights, Front passenger's door lock knob switch, Front passenger's power window switch, Front seat heater relay circuit (built into the under-dash fuse/relay box)* 12, Gauge control module, Heated windshield wiper area switch* 13, Heater pad* 14, HomeLink unit* 15, Horn switch, Ignition key switch* 10,	*1: With multi-information displayr *2: With automatic wipe *3: With CAN gateway *4: With CMBS *5: With driver's vanity mirror light *6: With passenger's vanity mirror light *7: With DPMS *8: With electrical compass *9: With keyless access system *10: Without keyless access system *11: With electric steering lock *12: With front seat heater *13: With heated windshield wiper area *14: With heated steering wheel *15: With HomeLink *16: With moonroof *17: With panoramic glass roof *18: With LaneWatch *19: With BSI *20: With mirror defogger *21: With ACC *22: With paddle shifter *23: With TPMS switch *24: With front accessory power socket *25: With USB port light

LEARNING RESET CLEAR

12 VOLT BATTERY INTERNAL RESISTANCE RESET (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Procedure

NOTE:

- At every engine startup, the PCM updates and records the internal resistance of the 12 volt battery. When the average of past internal resistance (multiple memories) exceeds a threshold value, the PCM judges it as deterioration of the 12 volt battery.
- A 12 volt battery cancel or a PCM reset does not clear the recorded internal resistance values of the 12 volt battery in the PCM.
- The Idle Stop Inhibit (Battery Deterioration) can be checked by HDS.

1. 12 Volt Battery Internal Resistance - Reset

1. Make sure all electrical items (the A/C, the audio, the lights, etc.) are off.

2. Turn the vehicle to the OFF (LOCK) mode.

3. Turn the vehicle to the ACCESSORY mode.

NOTE: The internal resistance of the 12 volt battery may not be updated if the engine starts up immediately from the OFF (LOCK) mode without going through the ACCESSORY mode and ON mode.

4. Turn the vehicle to the ON mode.

5. Start the engine, and let it idle for 1 minute or more.

6. Turn the vehicle to the OFF (LOCK) mode.

7. Repeat steps 3 through 6 four times or more.

8. Check if the auto idle system is operating properly according to the conditions listed in **Auto Idle Stop System Inspection**

If the system is not operating, go to the next step.

9. **Connect the HDS to the data link connector**

10. Select the PGM-FI system with the HDS.

11. Check the Idle Stop Inhibit (Battery Deterioration) in the Data ListS.

.**NOTE:**

- Normal: Reset is complete.
- INHIBITED: **Replace the 12 volt battery** , then do this 12 volt battery internal resistance reset procedure again.

SYMPTOM TROUBLESHOOTING

12 VOLT BATTERY SYMPTOM TROUBLESHOOTING - LOW OR DEAD 12 VOLT BATTERY

Low or dead 12 volt battery

NOTE:

- A 12 volt battery might be discharged under these conditions:
-
    - -

      Driving a vehicle 6 miles (10 km) or less per day.
    - -

Leaving a vehicle idling with high electrical loads such as headlight, seat heaters, wipers, rear window defogger, etc.

- When doing the following operation during the measurement of the parasitic draw, it may not be measured accurate:
-
    - -

      Approaching a vehicle with remote.
    - -

      Locking or unlocking a door.

Indication Example

- Latest History -
Duration: 22 hours
Discharge: 300 mAh
Average current: 14 mA

Data	Value
Current immediately after IG OFF	-3.82 A
Average current from immediately after IG OFF to 1 hour	-990 mA
Average current from 1 hour to 2 hours	-10 mA
Average current of 1 hour just before IG ON	-10 mA

1. PGM-FI system check

   -1. Check for PGM-FI DTCs.

   DTC (PGM-FI)

DTC Description	Confirmed DTC	Pending DTC
P0562 Charging System Low Voltage	B	B
P065A ACG No Charging Malfunction	B	B

DTC Description	Confirmed DTC	Pending DTC
P16BB ACG B Terminal Circuit Low Voltage	B	B

   Are DTCs P0562, P065A, and/or P16BB indicated?

   YES

   Go to indicated DTCs troubleshooting .

   NO

   Go to step 2.

2. Parasitic draw check

   -1. Check all the BATTERY CONSUMPTION CURRENT HISTORY with the HDS.

   Battery Consumption Current History

12 volt battery size	Threshold of the average current
55B24, L2	27.0 mA

Are all the values of average current from 1 hour to 2 hours less than the threshold?

YES

Check the 12 volt battery .

NO

Go to step 3.

3. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Get out of the vehicle, and close all doors, hood, and tailgate securely.

-3. Lock the doors with the keyless remote/transmitter.

-4. Make sure the individual map lights are turned off and the security alarm system is armed (with security).

-5. Wait 130 minutes or more.

-6. Turn the vehicle to the ON mode.

-7. Check the latest BATTERY CONSUMPTION CURRENT HISTORY with the HDS.

Battery Consumption Current History

12 volt battery size	Threshold of the average current
55B24, L2	27.0 mA

Is the value of average current from 1 hour to 2 hours less than the threshold?

1. **YES**

   Intermittent failure, the system is OK at this time.The possible cause could be that an incorrect parasitic draw value was recorded:

   - A switch was not turned off.
   - The vehicle's accessories were operated for a long time with the vehicle ignition was in the ACCESSORY mode.

   NO

   Go to the parasitic draw check.

WIRELESS CHARGER SYMPTOM TROUBLESHOOTING - WIRELESS CHARGER INDICATOR DOES NOT COME ON (2020 2021)

Wireless charger indicator does not come on

NOTE: Check the fuses and relays associated with the system, and check for a short in the related lines.

1. Open wire check (+B BACK UP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Wireless charger 7P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	OFF (LOCK) modeWireless charger 7P connector: disconnected
Test point 1	**Wireless charger 7P connector No. 7**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 2.

NO

Repair an open or high resistance in the wire.

2. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	OFF (LOCK) modeWireless charger 7P connector: disconnected
Test point 1	**Wireless charger 7P connector No. 1**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Replace the wireless charger .

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

DESCRIPTION & OPERATION

WIRELESS CHARGER SYSTEM DESCRIPTION

Overview

Some models come equipped with the wireless charger. The wireless charger can charge the battery (like a smartphone) that is placed on top of the wireless charger, without a charging cable. This system uses the law of electromagnetic induction.

Basic Control

The wireless charger system begins to charge a battery of a wireless device (like a smartphone) as soon as it detects the device on the wireless charger. The charger receives the radio frequency signal from the audio unit via the B-CAN. Charging frequency is controlled so that it will not interfere with the receiving frequency of the radio. When a remote communicates to the body control module by LF communication, the charger momentarily stops charging so it will not interfere with the keyless access system.

The following conditions will stop battery charging:

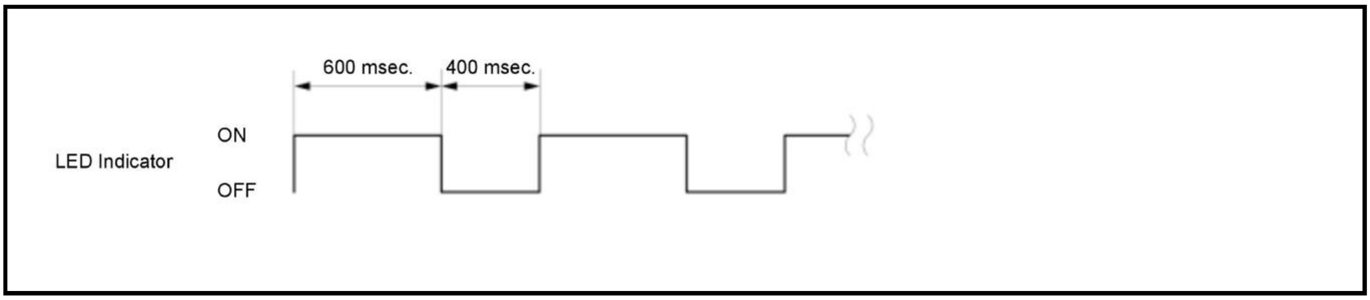
- When the battery of the device becomes full.
- When an object is placed between the charger and the wireless device that prevents detection.
- When the wireless device is placed out of the charging area.

LED Indicator Function

As charging starts, the amber indicator turns on, and as charging stops, the green indicator turns on. When a failure occurs, the indicator(s) will flash.

Operation Mode State	Indicator	
	Green	Amber
Standby	ON	OFF
Power Transfer	OFF	ON
Abnormal Termination	FLASH	FLASH
Hardware Failure	OFF	FLASH

Flash Pattern



600 msec.
400 msec.
ON
LED Indicator
OFF

Failsafe Function

Hardware Failsafe Control

When the CPU is reset due to a CPU program runaway or a drop in the 5 V supply voltage, it changes to failsafe.

Software Failsafe Control

When any of the data from the B-CAN circuit cannot be received within a specified time, or an unusual combination of the data is recognized, the wireless charger moves to the software failsafe. The data that cannot be received is forced to a pre-programmed value.

G701	Battery condition monitor module, High voltage battery module fan	B
G801	Shielding between the electric A/C compressor and the subjunction board, Shielding between the PCU and the subjunction board	B

SYMPTOM TROUBLESHOOTING

12 VOLT BATTERY SYMPTOM TROUBLESHOOTING - LOW OR DEAD 12 VOLT BATTERY

NOTE:

- A 12 volt battery might be discharged under these conditions:
-
    - -

      Driving a vehicle 6 miles (10 km) or less per day.

    - -

      Leaving a vehicle idling with high electrical loads such as headlight, seat heaters, wipers, rear window defogger, etc.

- When doing the following operation during the measurement of the parasitic draw, it may not be measured accurate:
-
    - -

      Approaching a vehicle with remote.
    - -

      Locking or unlocking a door.

Indication Example

- Latest History -
Duration: 22 hours
Discharge: 300 mAh
Average current: 14 mA

Data	Value
Current immediately after IG OFF	-3.82 A
Average current from immediately after IG OFF to 1 hour	-990 mA
Average current from 1 hour to 2 hours	-10 mA
Average current of 1 hour just before IG ON	-10 mA

1. BCM system check

   -1. Check for PGM-FI DTCs.

   DTC (Electric Powertrain)

DTC Description	Confirmed DTC	Pending DTC
P0A94 DC-DC Converter Performance	B	B

   Is DTC P0A94 indicated?

   YES

   Go to indicated DTCs troubleshooting .

   NO

   Go to step 2.

2. Parasitic draw check

   -1. Check all the BATTERY CONSUMPTION CURRENT HISTORY with the HDS.

   Battery Consumption Current History

Threshold of the average current
27.0 mA

   Are all the values of average current from 1 hour to 2 hours less than the threshold?

   YES

   Check the 12 volt battery .

NO

Go to step 3.

3. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Get out of the vehicle, and close all doors, hood, and tailgate securely.

-3. Lock the doors with the keyless remote/transmitter.

-4. Make sure the individual map lights are turned off and the security alarm system is armed (with security).

-5. Wait 130 minutes or more.

-6. Turn the vehicle to the ON mode.

-7. Check the latest BATTERY CONSUMPTION CURRENT HISTORY with the HDS.

Battery Consumption Current History

Threshold of the average current
27.0 mA

Is the value of average current from 1 hour to 2 hours less than the threshold?

1. **YES**

   Intermittent failure, the system is OK at this time.The possible cause could be that an incorrect parasitic draw value was recorded:

   - A switch was not turned off.
   - The vehicle's accessories were operated for a long time with the vehicle ignition was in the ACCESSORY mode.

   NO

   Go to the parasitic draw check.

WIRELESS CHARGER SYMPTOM TROUBLESHOOTING - WIRELESS CHARGER INDICATOR DOES NOT COME ON

NOTE: Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.

1. Open wire check (+B_BACK_UP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Wireless charger 7P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	OFF (LOCK) modeWireless charger 7P connector: disconnected
Test point 1	**Wireless charger 7P connector No. 7**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 2.

NO

Repair an open or high resistance in the wire.

2. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	OFF (LOCK) modeWireless charger 7P connector: disconnected
Test point 1	**Wireless charger 7P connector No. 1**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Replace the wireless charger .

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE BODY ELECTRICAL

Tips and Precautions

Special Tools Required

Back Probe Adapter, 17 mm 07TAZ-001020A

Before Troubleshooting

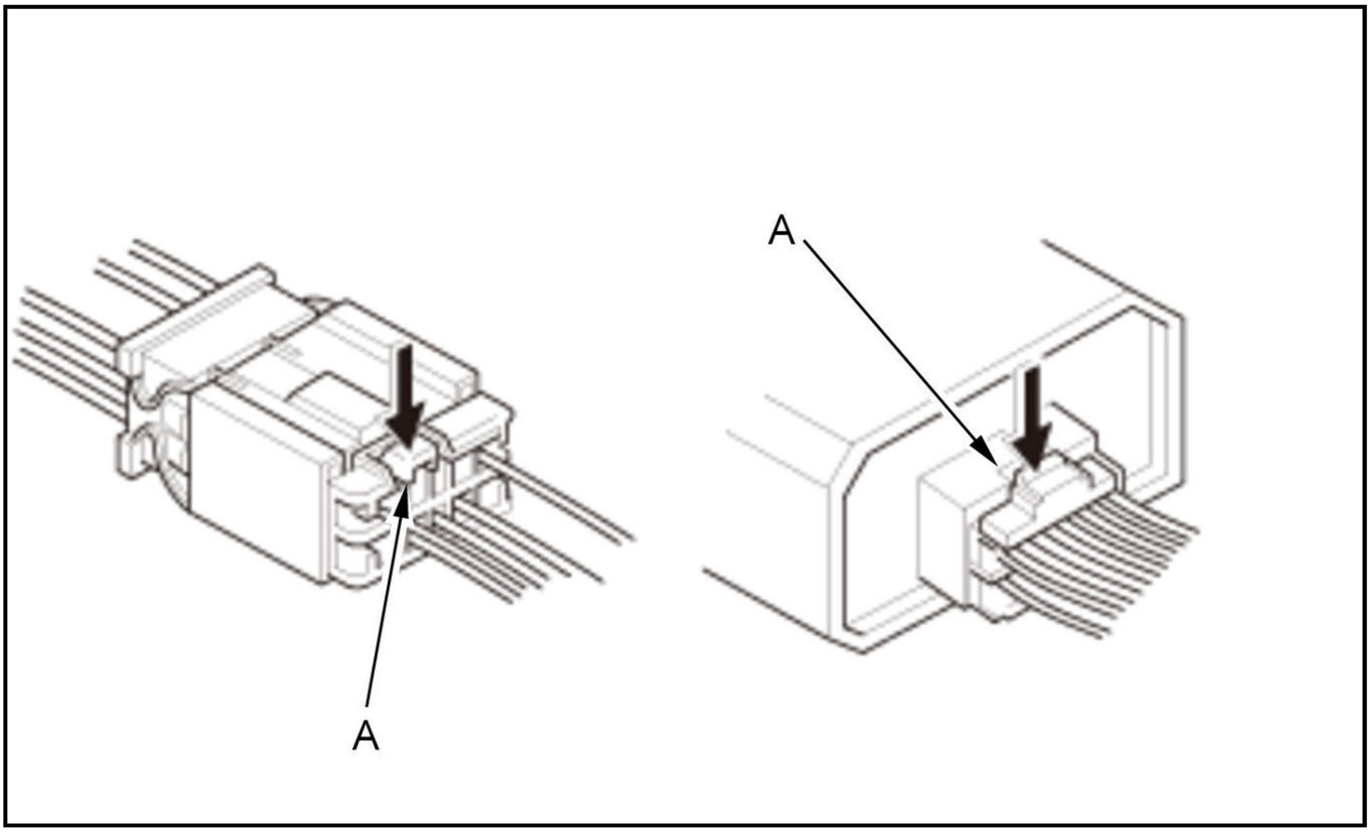
1. Check applicable fuses in the appropriate fuse/relay box.Check the 12 volt battery for damage, state of charge, and clean and tight connections.

CAUTION:

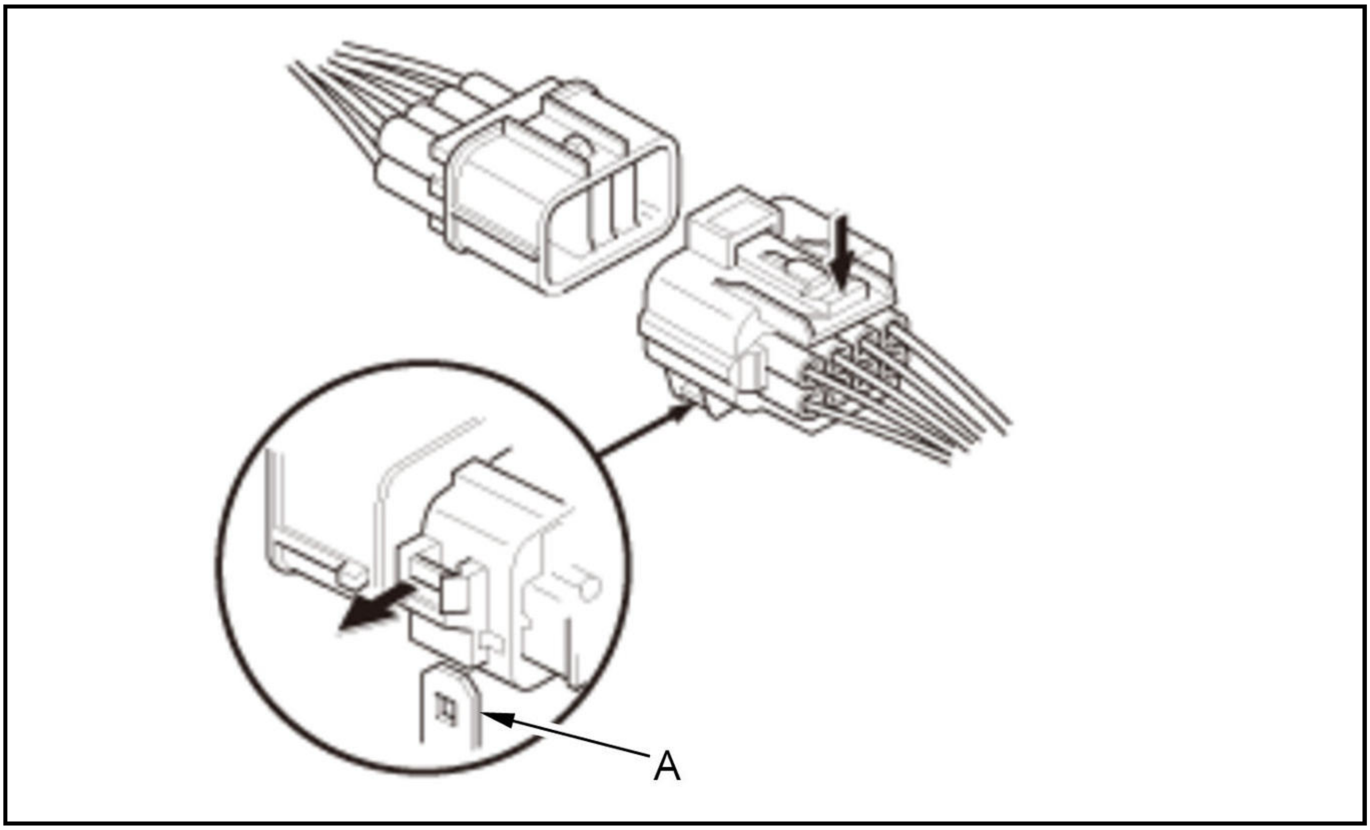
- **Do not quick-charge a 12 volt battery unless the 12 volt battery ground cable has been disconnected; otherwise you will damage the alternator diodes.**
- **Do not attempt to crank the engine with the 12 volt battery ground cable loosely connected, or you will severely damage the wiring.**

Handling Connectors

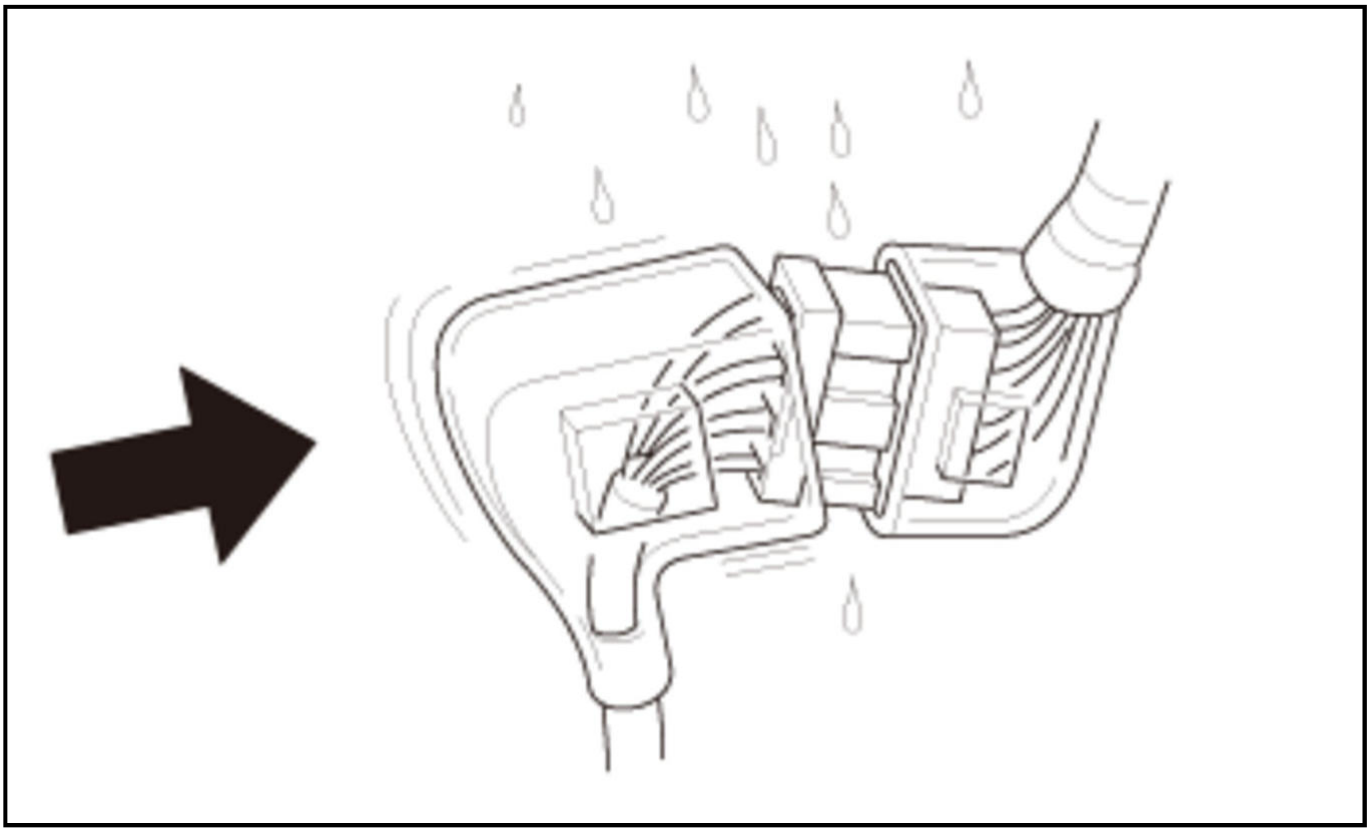
- Make sure the connectors are clean and have no loose wire terminals.
- Make sure multiple cavity connectors are packed with dielectric grease (except waterproof connectors).
- All connectors have press-down release type locks (A).



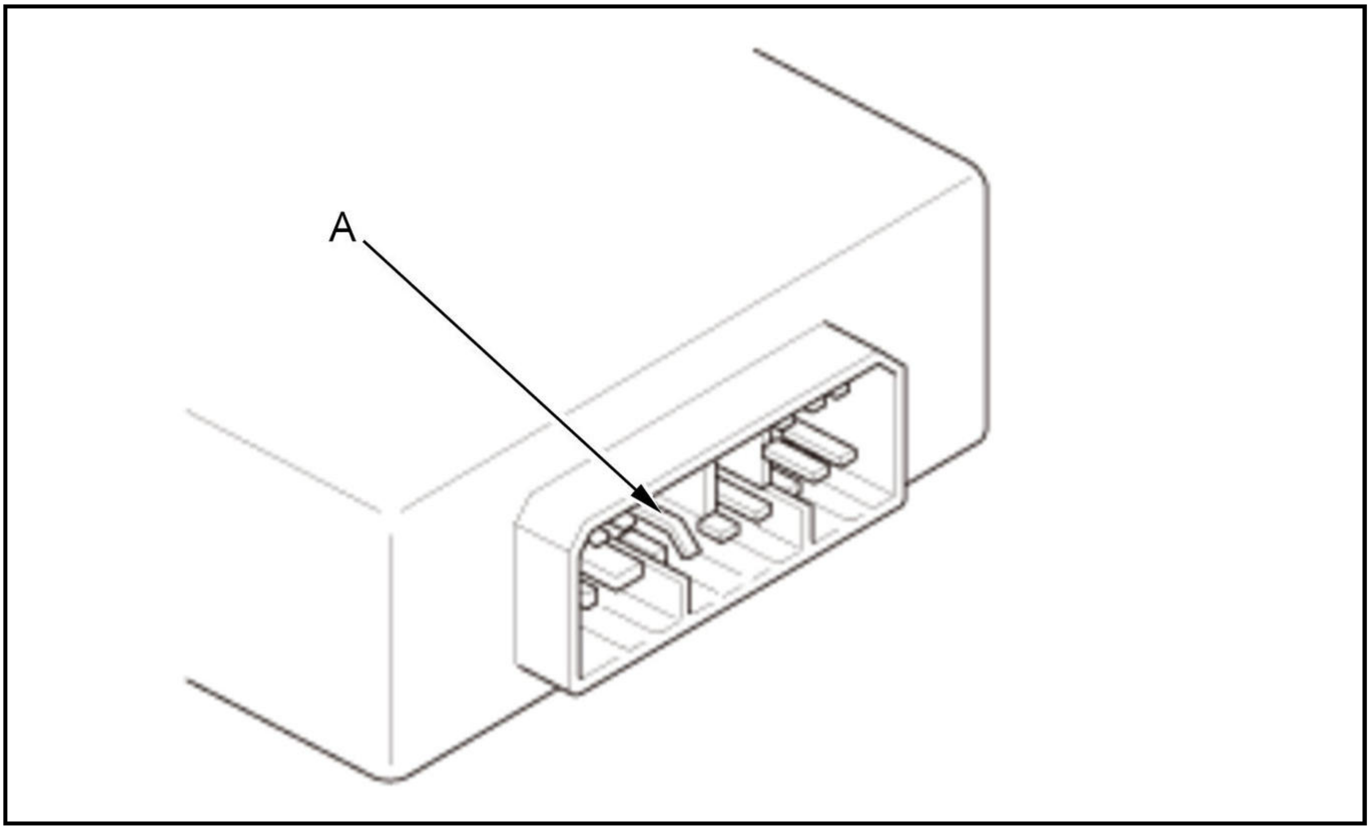
- Some connectors have a clip on their side used to attach them to a mount bracket on the body or on another component. This clip has a pull type lock.
- Some mounted connectors cannot be disconnected unless you first release the lock and remove the connector from its mount bracket (A).



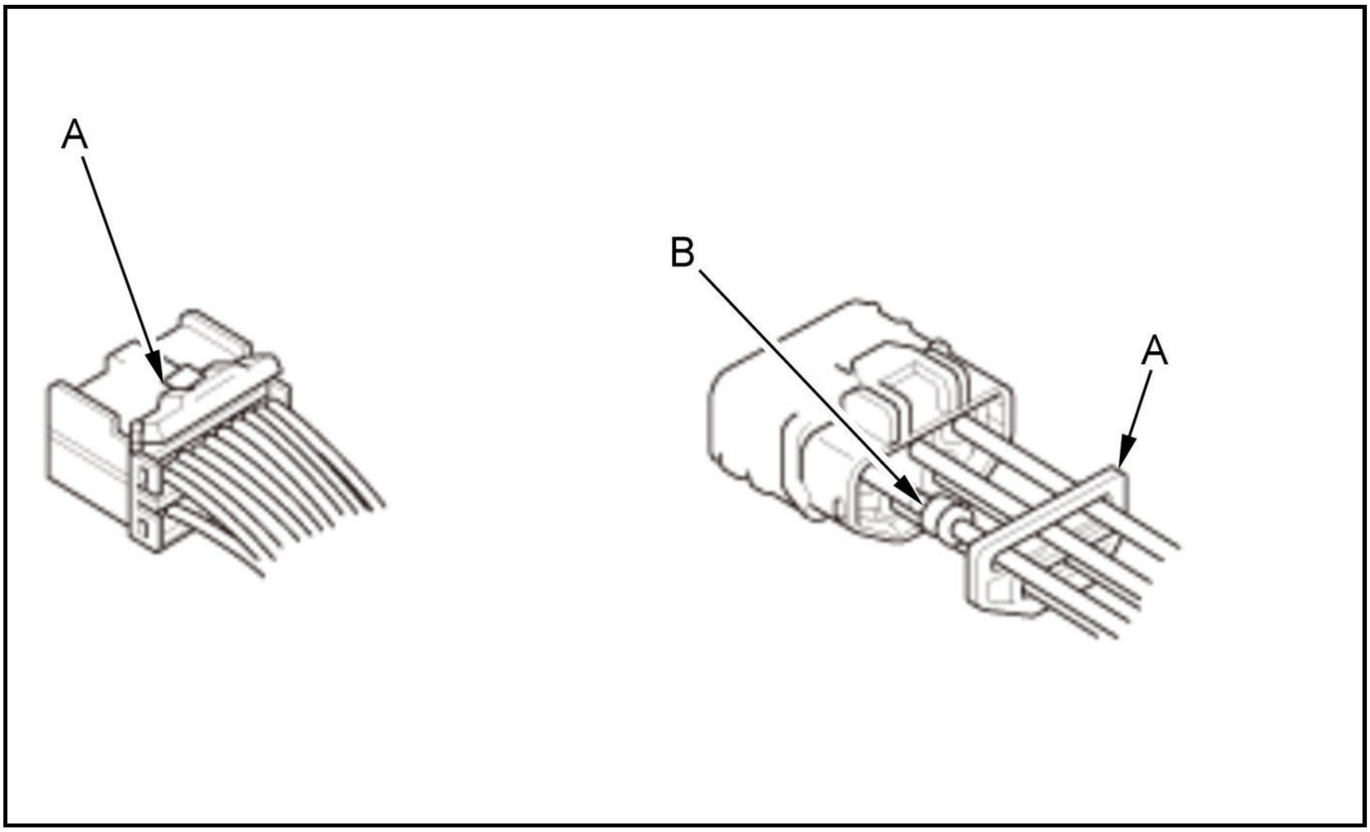
- Never try to disconnect connectors by pulling on their wires; pull on the connector halves instead.
- Always reinstall plastic covers.



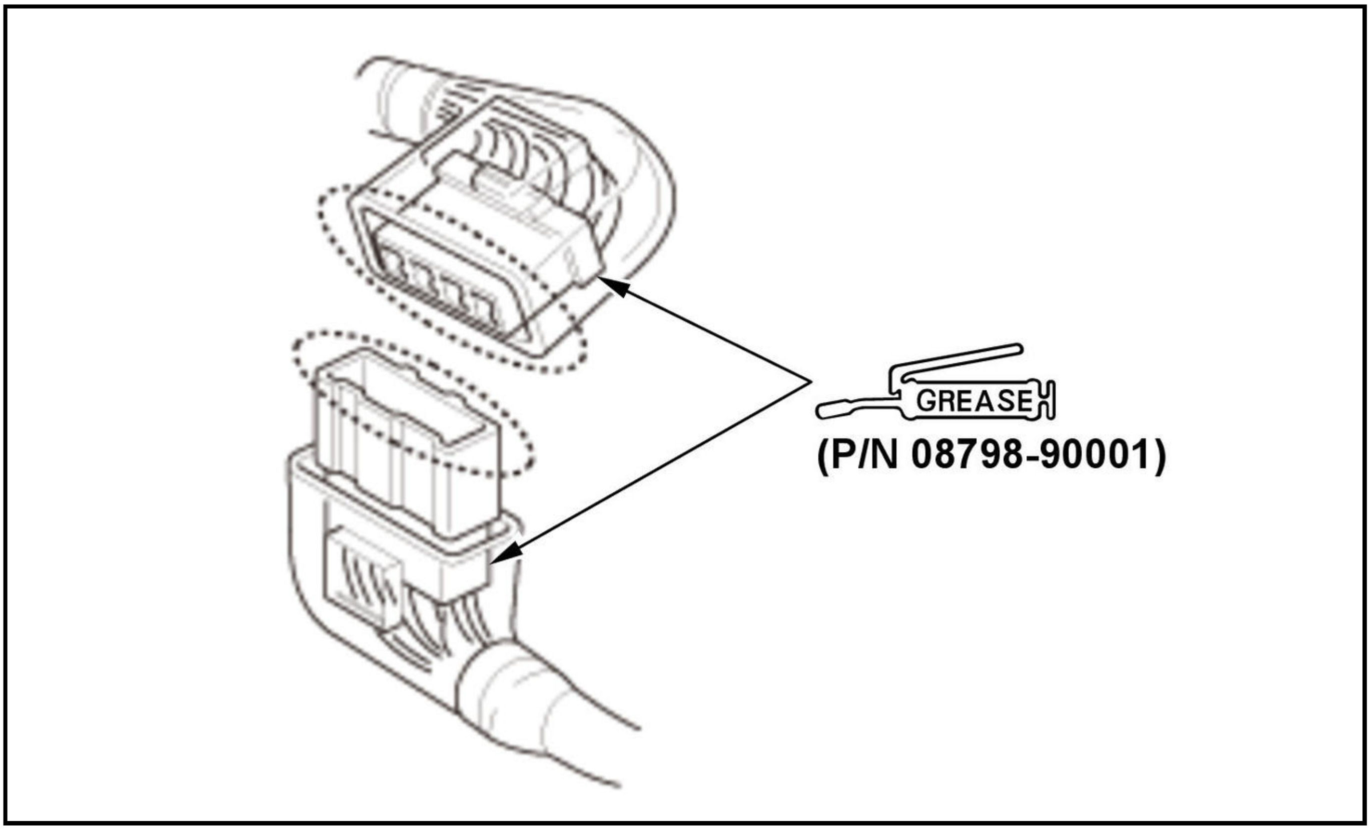
- Before connecting connectors, make sure the terminals are in place and not bent (A).



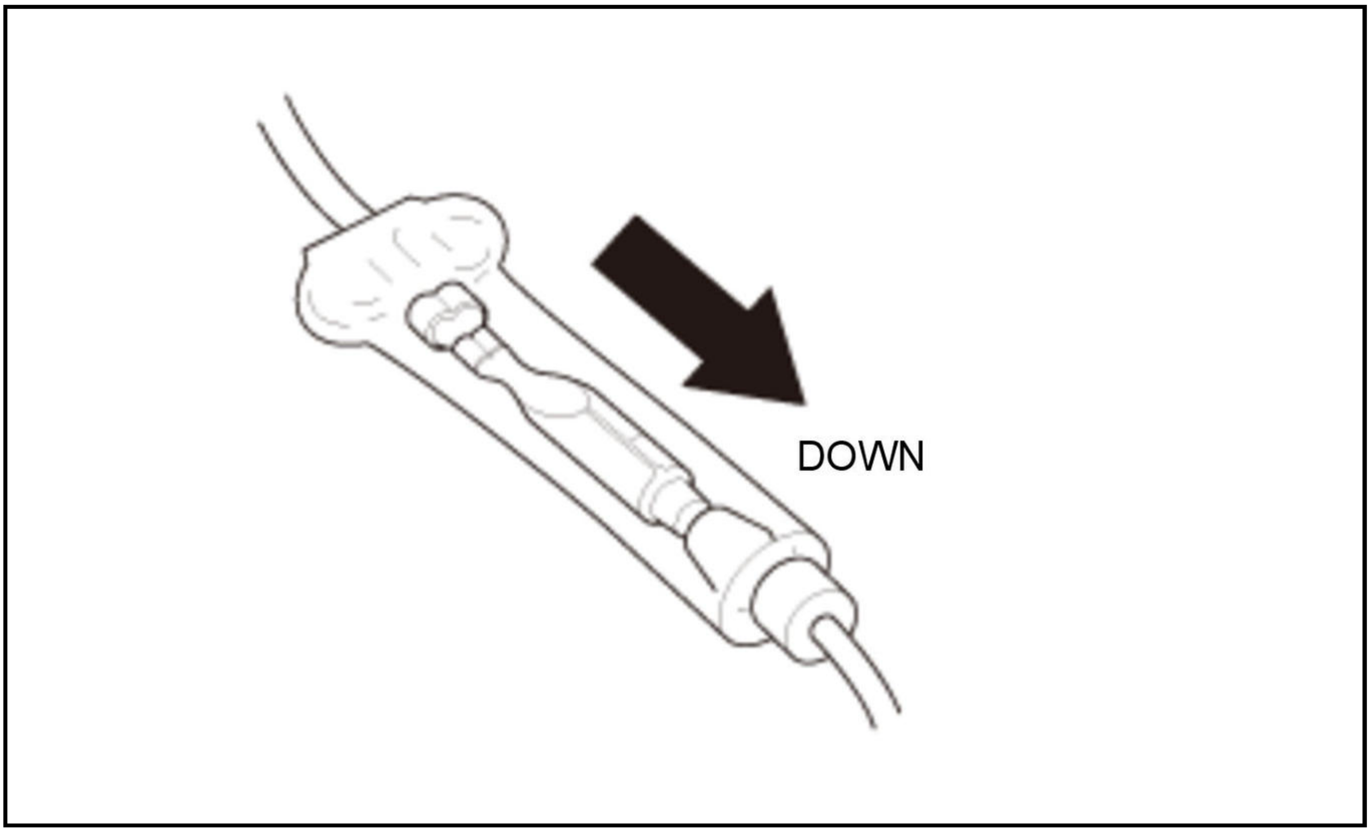
- Check for loose retainers (A) and rubber seals (B).



- The backs of some connectors are packed with dielectric grease. Add grease if necessary. If the grease is contaminated, replace it.

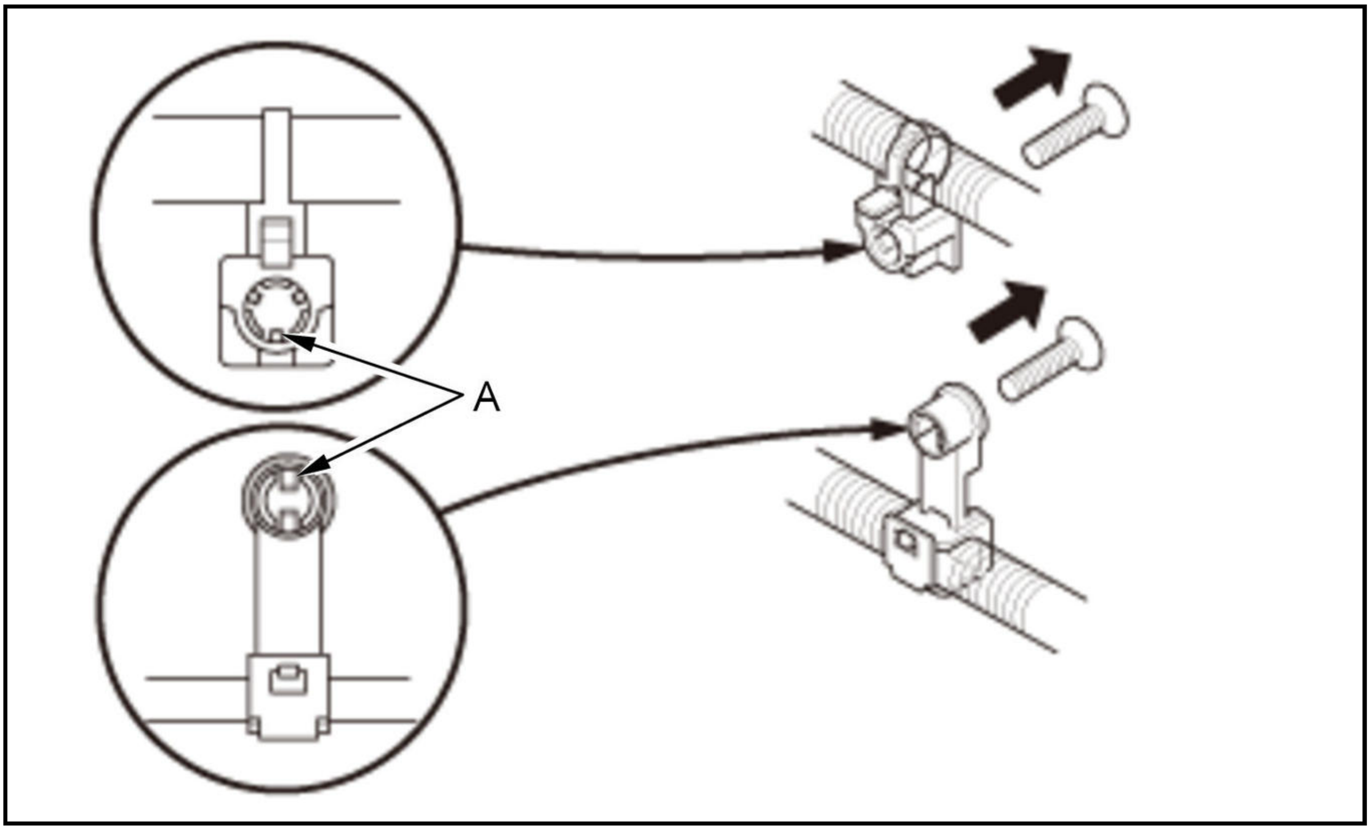


- Insert the connector all the way and make sure it is securely locked.
- Position wires so that the open end of the cover faces down.

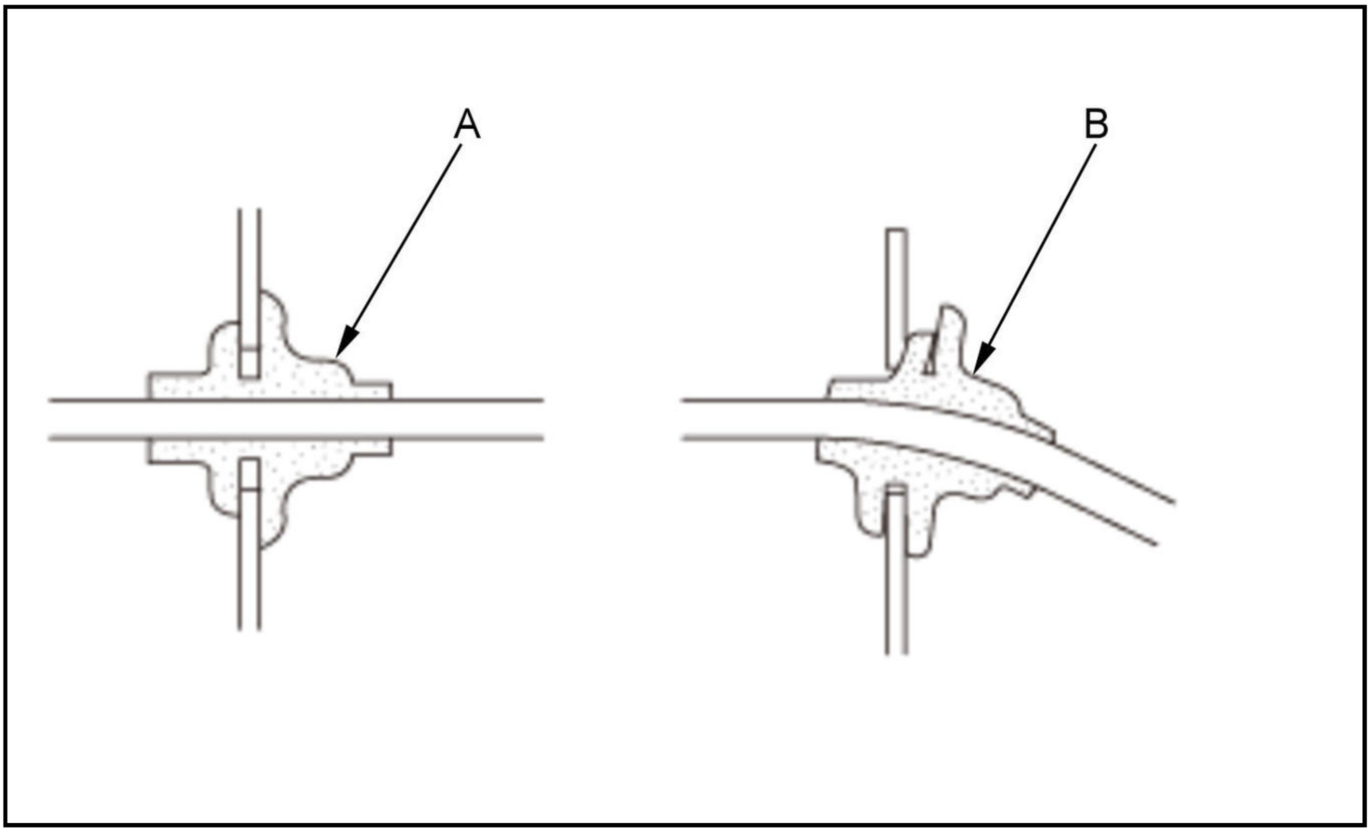


Handling Wires and Harnesses

- Secure wires and wire harnesses to the frame with their respective wire ties at the designated locations.
- Remove clips carefully; do not damage their locks (A).

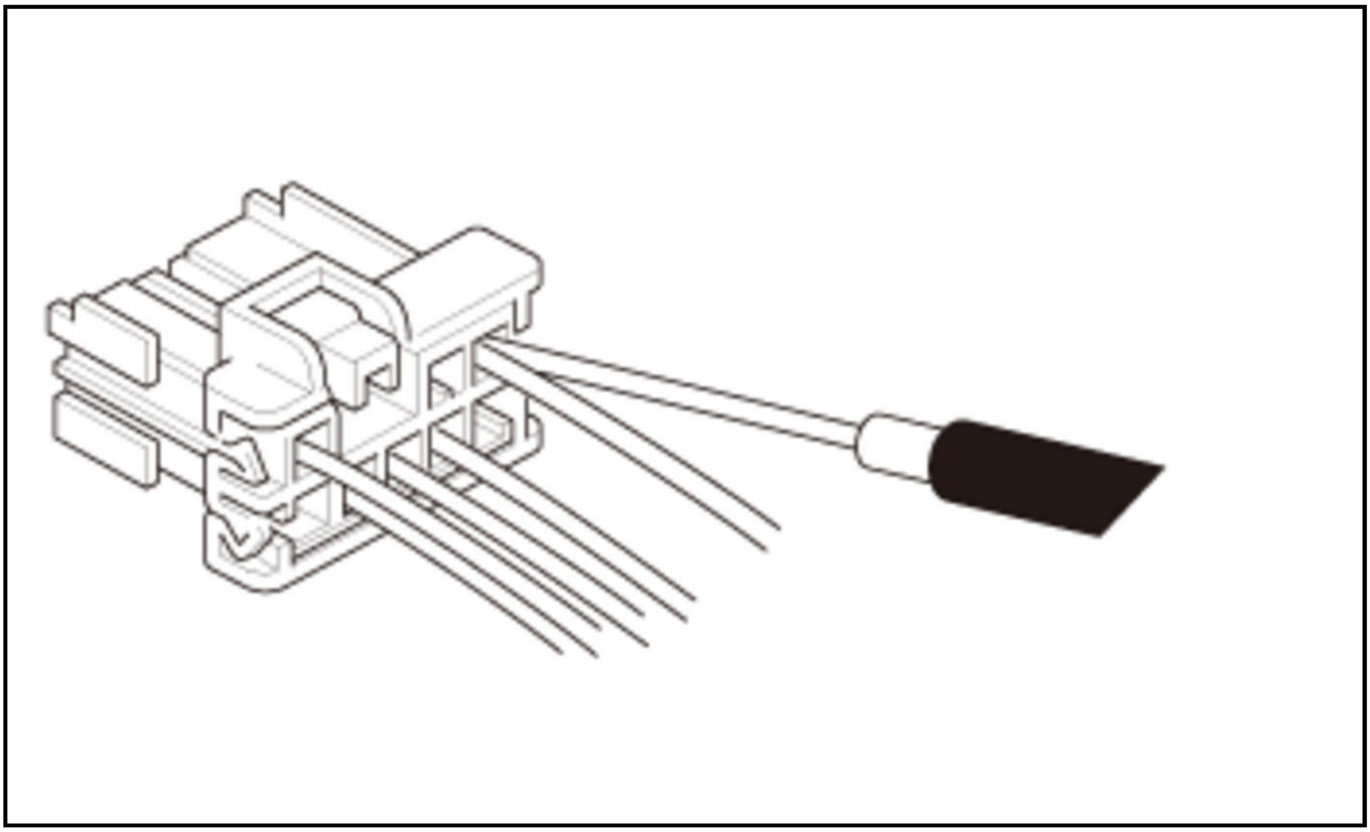


- After installing harness clips, make sure the harness does not interfere with any moving parts.
- Keep wire harnesses away from exhaust components and other hot parts, from sharp edges of brackets and holes, and from exposed screws and bolts.
- Seat grommets in their grooves properly (A). Do not leave grommets distorted (B).

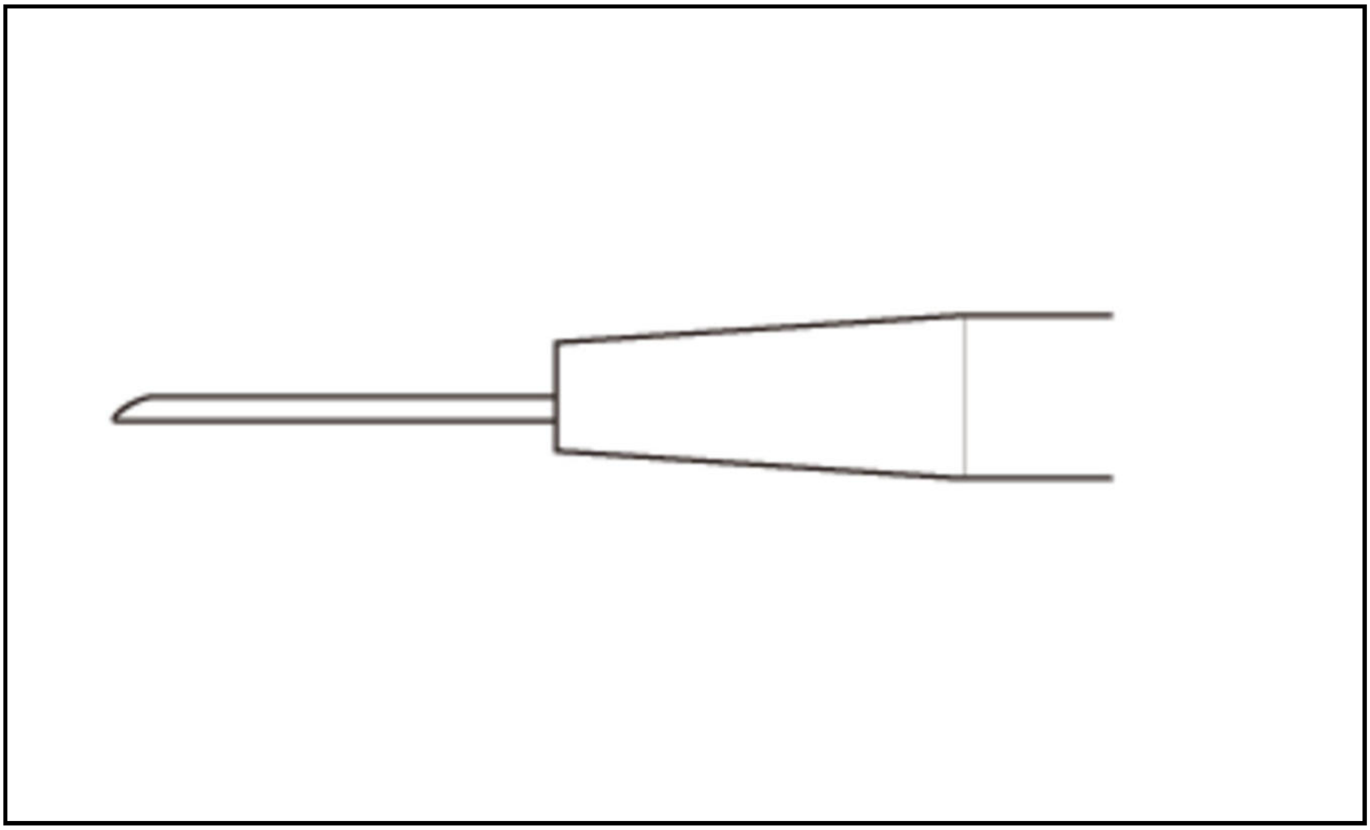


Testing and Repairs

- Do not use wires or harnesses with broken insulation. Replace them or repair them by wrapping the break with electrical tape or shrink tubing.
- Never attempt to modify, splice, or repair SRS wiring. If there is an open or damage to the SRS wiring or terminals, replace the harness.
- After installing parts, make sure that no wires are pinched under them.
- When using electrical test equipment, follow the manufacturer's instructions and those described in this repair service information
- If possible, insert the probe of the tester from the wire side (except waterproof connectors).



- Use back probe adapter, 17mm 07TAZ-001020A.



- Refer to the instructions in the Honda Terminal Kit for identification and replacement of connector terminals.

Five-Step Troubleshooting

1. Verify The Complaint: Turn on all the components in the problem circuit to verify the customer complaint. Note the symptoms. Do not begin disassembly or testing until you have narrowed down the problem area.

2. Analyze The Schematic: Look up the schematic for the problem circuit. Determine how the circuit is supposed to work by tracing the current paths from the power feed through the circuit components to ground. If several circuits fail at the same time, the fuse or a ground is a likely cause. Based on the symptoms and your understanding of the circuit operation, identify one or more possible causes of the problem.

3. Isolate The Problem By Testing The Circuit: Make circuit tests to check the diagnosis you made in step 2. Keep in mind that a logical, simple procedure is the key to efficient troubleshooting. Test for the most likely cause of failure first. Try to make tests at points that are easily accessible.

4. Fix The Problem: Once the specific problem is identified, make the repair. Be sure to use proper tools and safe procedures.

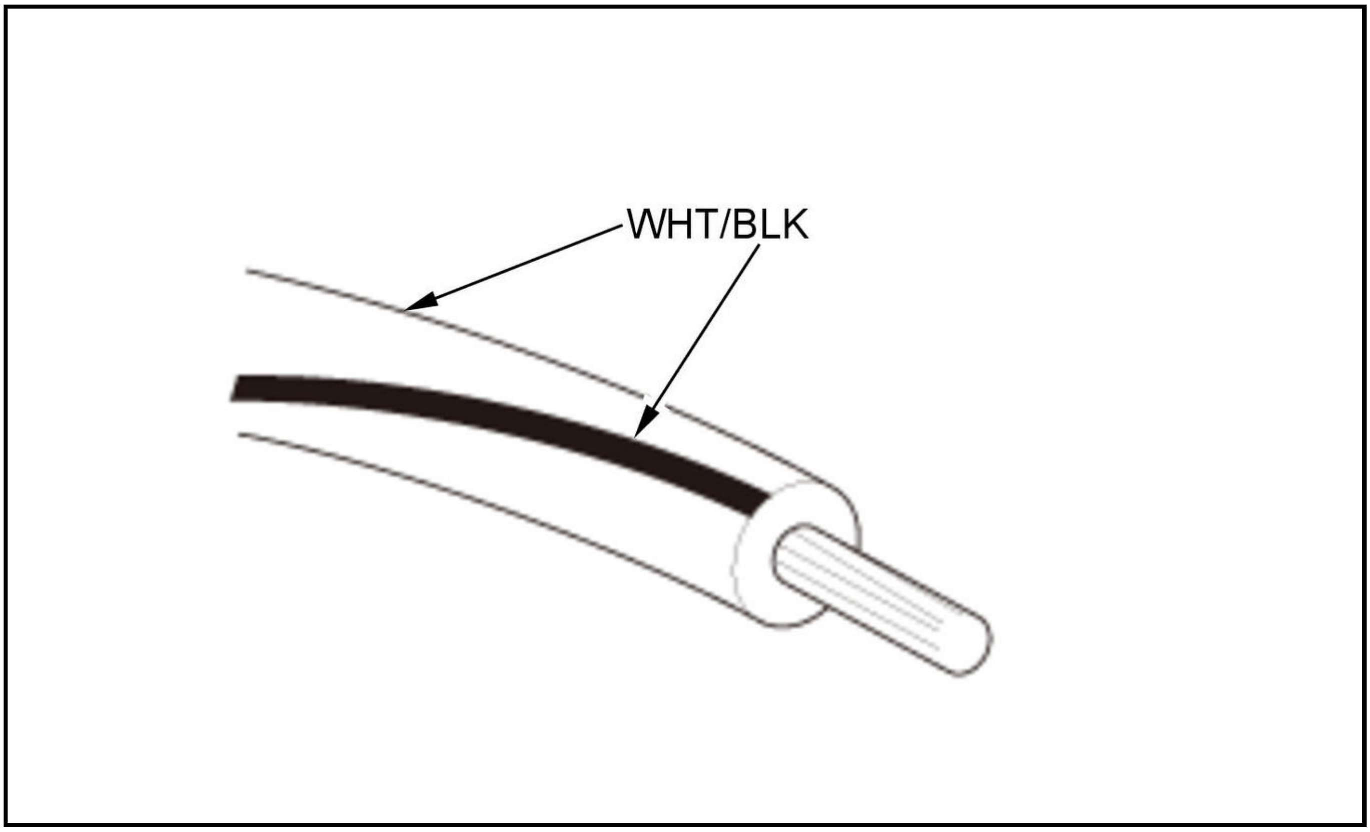
5. Make Sure The Circuit Works: Turn on all components in the repaired circuit in all modes to make sure you've fixed the entire problem. If the problem was a blown fuse, be sure to test all of the circuits on the fuse. Make sure no new problems turn up and the original problem does not recur.

Wire Color Codes

The following abbreviations are used to identify wire colors in the circuit schematics:

WHT	White
YEL	Yellow
BLK	Black
BLU	Blue
GRN	Green
RED	Red
ORN	Orange
PNK	Pink
BRN	Brown
GRY	Gray
PUR	Purple
TAN	Tan
LT BLU	Light Blue
LT GRN	Light Green
LT PUR	Light Purple

The wire insulation has one color or one color with another color stripe. The second color is the stripe.



Troubleshoot the B-CAN Circuit Related Problems

Check the PCM for DTCs and troubleshoot PCM or F-CAN loss of communication errors first.

How to check for DTCs with the HDS (preferred method)

The HDS can check F-CAN and B-CAN communication status, read and clear DTCs, display data list, and perform function tests.

Check for DTCs

1. Connect the HDS to the data link connector (DLC) .

2. Select BODY ELECTRICAL, then select the desired MODE TEL, and check for DTCs. If the DTCs do not pertain to the select menu, select the ALL DTC Check icon to view all Body Electrical DTCs.

NOTE: For specific operations, refer to the HDS user's manual.

3. If any DTCs are indicated, go to the indicated DTCs troubleshooting.

NOTE: If DTC U1280 is stored, troubleshoot DTC U1280 first.

How to Clear DTCs with the HDS

1. Connect the HDS to the data link connector (DLC)

2. Clear the DTCs with the HDS.

3. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the DLC.

B-CAN Circuit Troubleshooting Information

1. Connect the HDS to the data link connector (DLC) .

2. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS. Check that the electronic

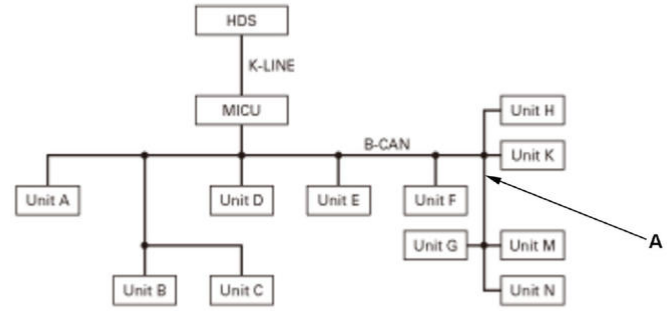
control units (ECU) are communicating with the HDS.

3. Check that the electronic control units (ECU) are communicating with the HDS.

NOTE:

- **If an ECU is communicating with the HDS, "DETECT" will be displayed.**
- **If an ECU is not communicating, or the vehicle is not equipped with that ECU, "NOT AVAILABLE" will be displayed.**

4. If a control unit is not communicating, confirm which ECUs are communicating, then refer to the B-CAN Communication Line from the Electrical Wiring Diagrams to find the malfunction point. For example, when unit "K" is communicating, but units "G", "M", and "N" are not communicating, that will direct you to the malfunction point (A).



Loss of Communication DTC Cross-Reference Chart

When an ECU on the CAN circuit is unable to communicate with other ECUs on the CAN circuit, the other control units will set loss of communication DTCs. Use this chart to find the ECU that is not communicating with the other ECUs on the CAN circuit.

1. Find the Transmitting Control Unit that is in the same row as all of the loss of communication DTCs that you retrieved.

2. Do the input test for the transmitting control unit.

CHECK

PARASITIC DRAW CHECK

Special Tools Required

LH41 AC/DC low current clamp meter, FLULH41A**: Available through the Honda Tool and Equipment Program, 888-424-6857

1. Parasitic draw check 1

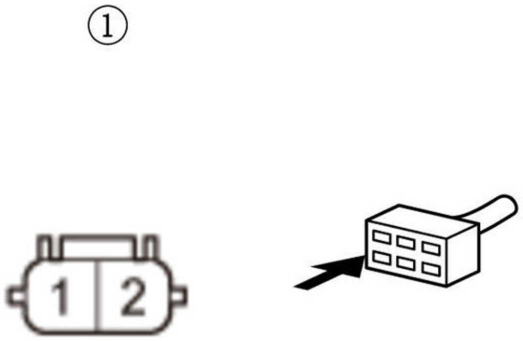
   -1. Make sure the 12 volt battery is fully charged, and that all the vehicle's electrical accessories are turned off.

   -2. Disconnect the following connectors.

Hood latch switch 2P connector (with hood latch switch)

-3. With hood latch switch: Order to recognize that the hood is closed, connect terminals A and B with a jumper wire.

Terminals A	Hood latch switch 2P connector (female terminals) No. 1: ①
Terminals B	Hood latch switch 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Get out of the vehicle, and close all doors and tailgate securely.

-7. Lock the doors with the keyless remote/transmitter.

-8. Make sure the individual map lights are turned off, and the security alarm system is armed (with security).

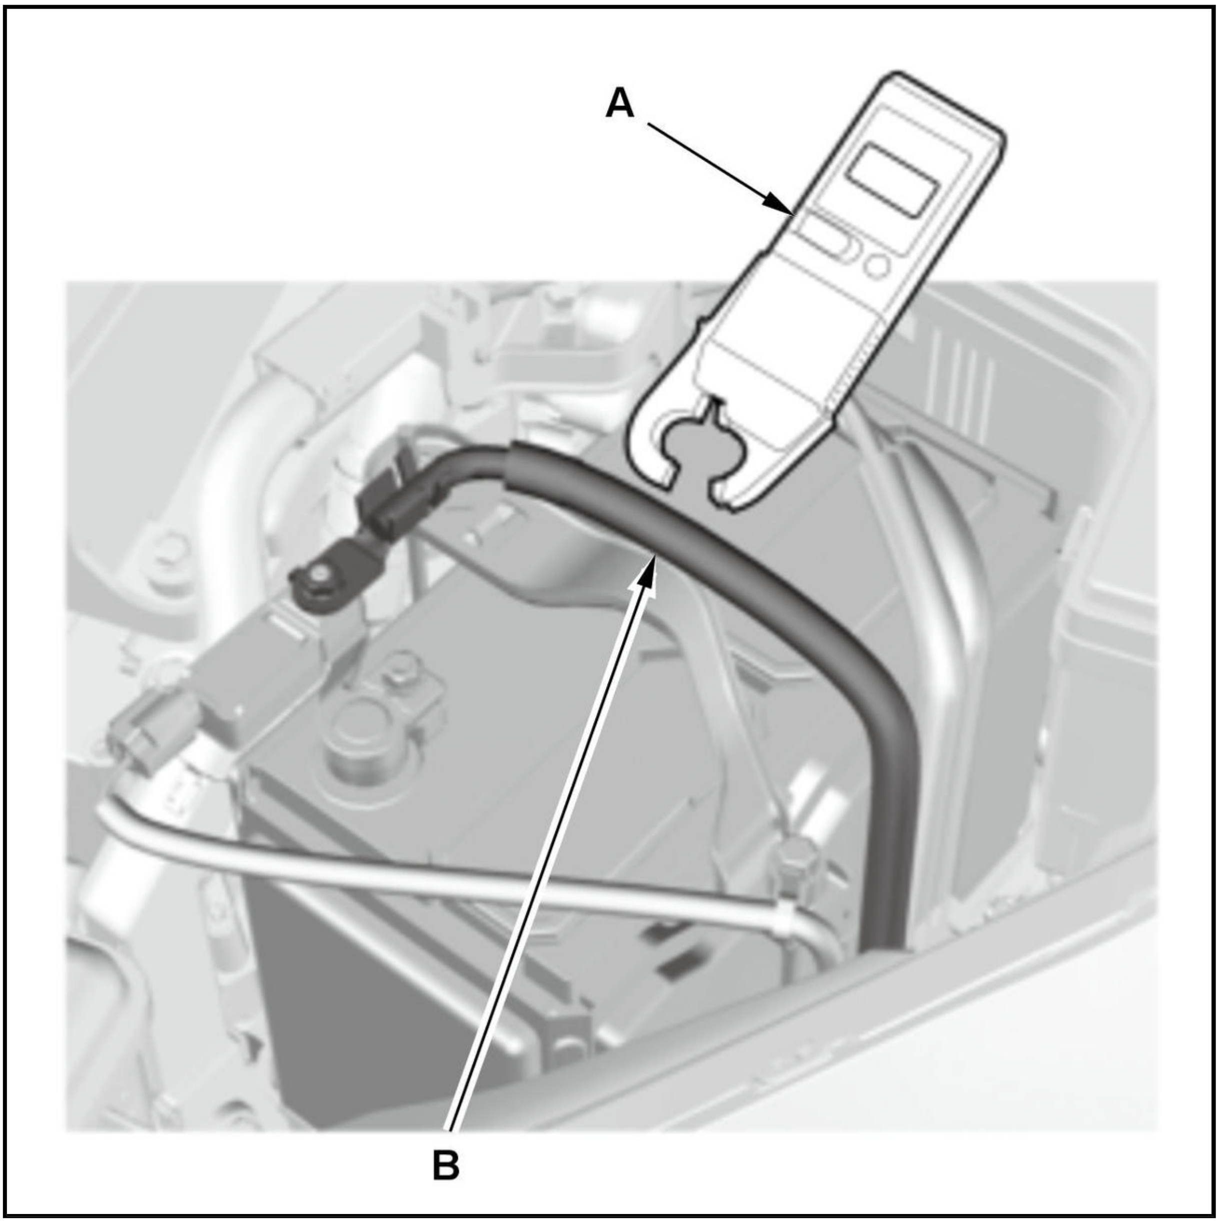
-9. Wait for at least 20 minutes.

-10.

Attach the LH41 AC/DC low current clamp meter (A) to the 12 volt battery ground cable (B). Follow the equipment manufacturer's instructions, then measure the parasitic draw.

NOTE: If you are using a digital multimeter: go to step 2.

Threshold of the parasitic draw
27.0 mA



Is the measured valued less than the threshold?

YES

Intermittent failure, the system is normal at this time.

NO

Go to step 3.

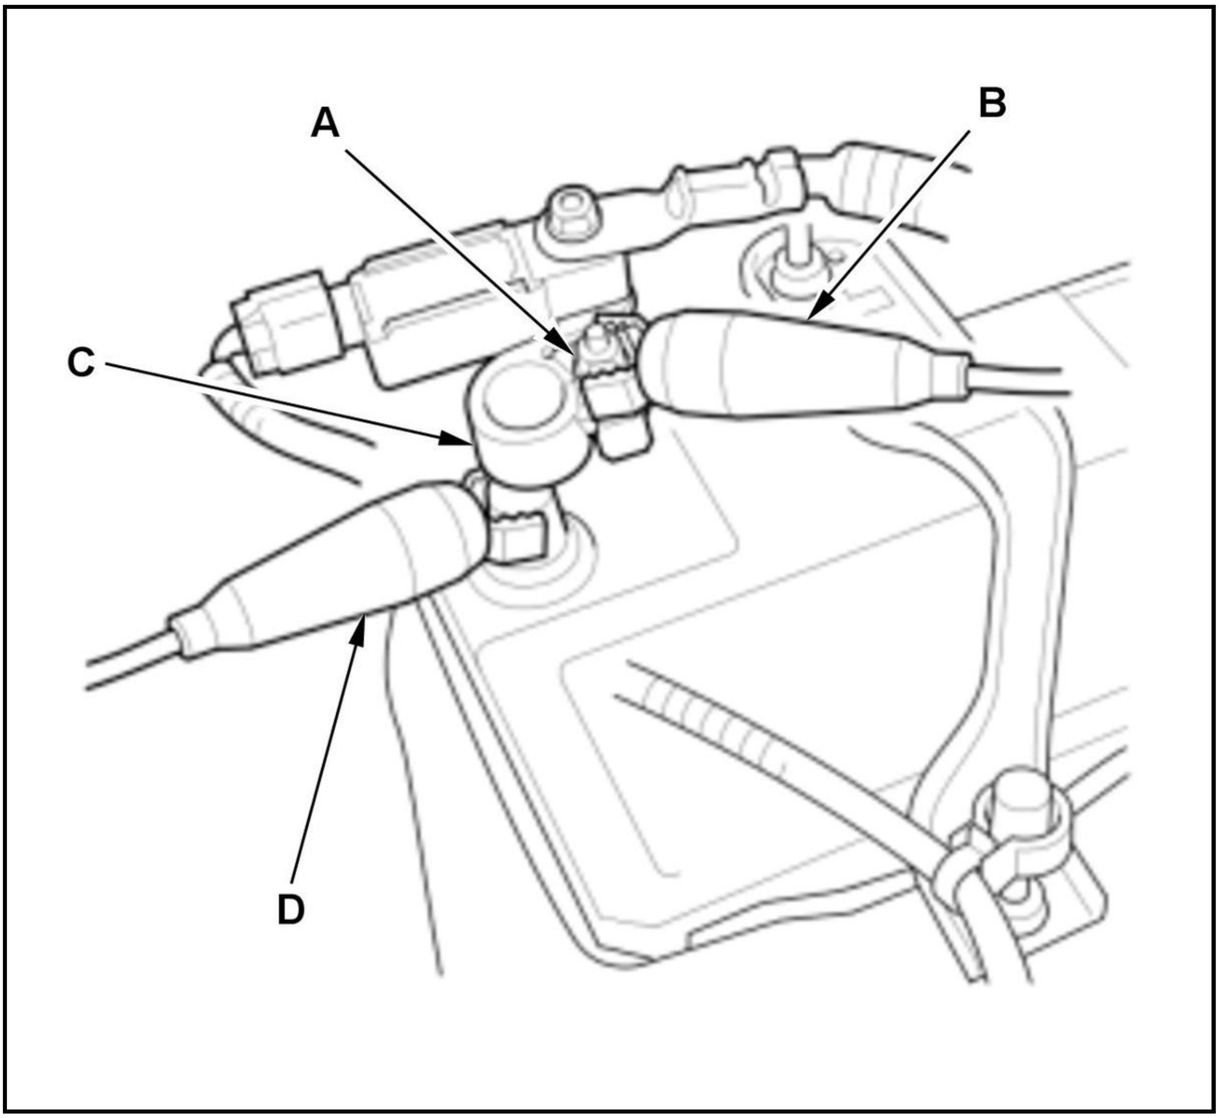
2. Parasitic draw check 2:

Check the following items before measuring:

- Set the multimeter dial to the DCA (direct current amps) range.
- Plug the red test probe into the red A (Amps) jack, and plug the black test probe into the COM jack.
- To avoid blowing an input fuse, start by setting the range above 10 A.

-2. Loosen the nut (A) on the 12 volt battery negative terminal.

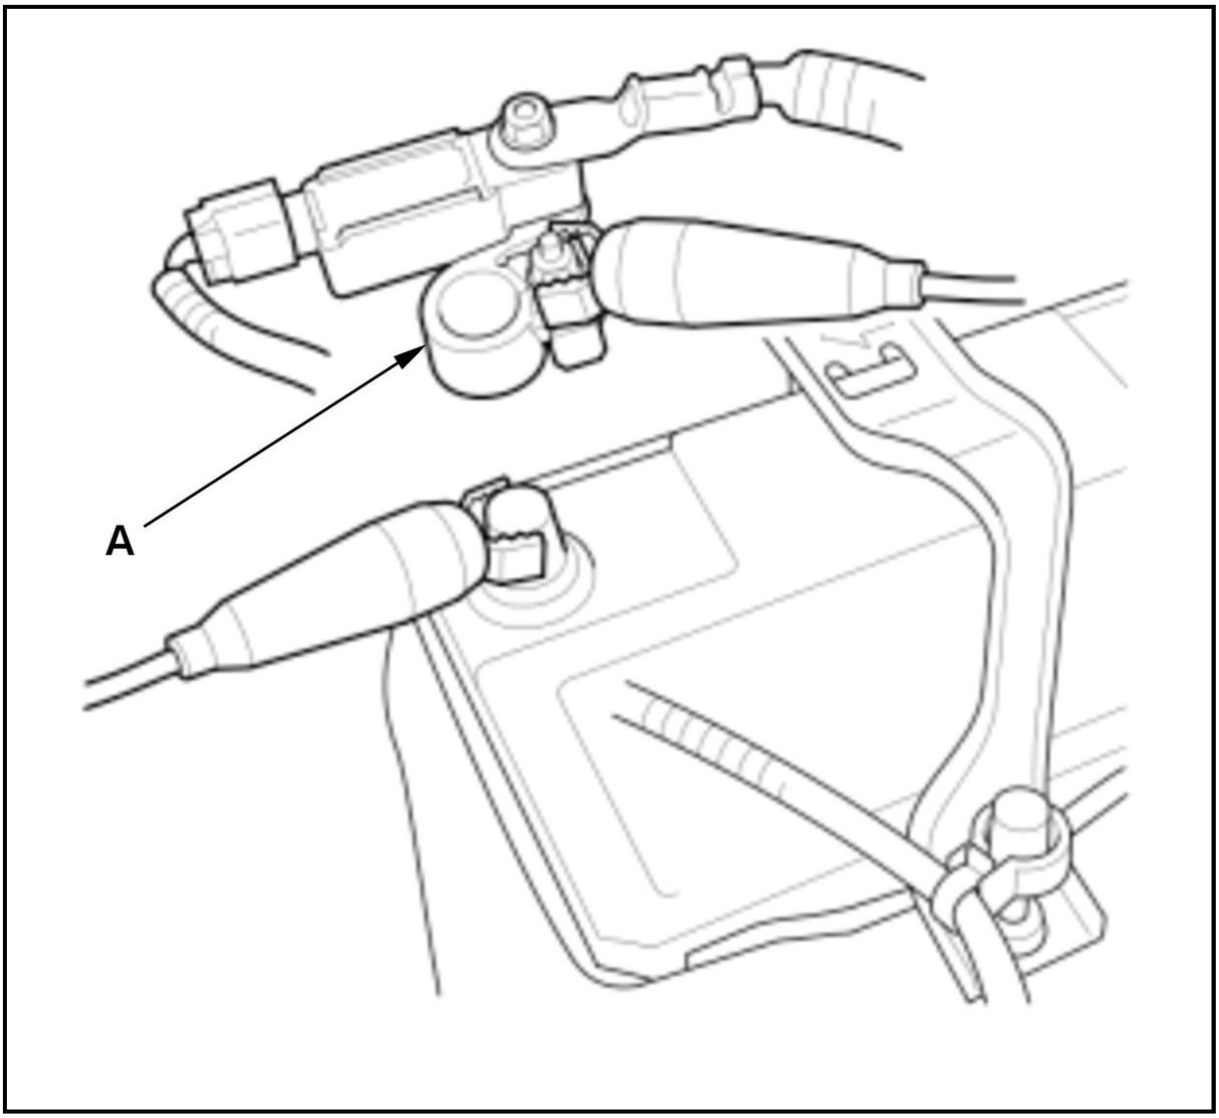
NOTE: Follow the instructions exactly to avoid disconnecting the 12 volt battery ground cable terminal from the 12 volt battery negative terminal.



-3. Connect the red (+) test lead (B) to the 12 volt battery ground cable terminal (C).

-4. Carefully slide the 12 volt battery ground cable terminal upwards from the 12 volt battery negative terminal post to maintain contact and avoid disconnection. Then connect the black (-) test lead (D) to the 12 volt battery negative terminal post.

-5. Disconnect the 12 volt battery ground cable terminal (A) from the 12 volt battery negative terminal.



-6. Measure the parasitic draw.

NOTE: If the measured value is over the threshold, wait 10 minutes and recheck.

Threshold of the parasitic draw
27.0 mA

Is the measured valued less than the threshold?

YES

Intermittent failure, the system is normal at this time.

NO

Go to step 3.

3. Electrical equipment check

-1. Check if there are any aftermarket electrical accessories installed on the vehicle.

Are there any aftermarket electrical accessories installed?

YES

Remove any installed aftermarket accessories and do parasitic draw tests again.

NO

Go to step 4.

4. Parasitic draw check 3

-1. Remove the BACK UP fuse while the test leads are connected, and measure the parasitic draw.

Threshold of the parasitic draw
14.0 mA

Is the measured valued less than the threshold?

YES

Go to step 5.

NO

Go to step 6.

5. Parasitic draw check 4

-1. Install the BACK UP fuse.

-2. Short the B-CAN_H line to B-CAN_L line with a jumper wire while the test leads are connected.

-3. Turn the vehicle to the ON mode and then the OFF (LOCK) mode.

-4. Get out of the vehicle, and close all doors and tailgate securely.

-5. Wait for at least 40 seconds.

-6. Measure the parasitic draw.

Threshold of the parasitic draw
27.0 mA

Is the measured valued less than the threshold?

YES

Disconnect the control units from the B-CAN circuit one at a time, perform step 3-6 above, then measure the parasitic draw. Do the input test for the control unit that reduced the parasitic draw to less than the threshold when disconnected.

NO

Disconnect the control units from the back-up fuse circuit one at a time, perform step 3-6 above, then measure the parasitic draw. Replace the control unit that reduced the parasitic draw to less than the threshold when disconnected.

6. Parasitic draw check 4

-1. Remove the IG MAIN fuses while the test leads are connected.

-2. Turn the vehicle to the ON mode and then the OFF (LOCK) mode.

-3. Get out of the vehicle, and close all doors and tailgate securely.

-4. Wait for at least 40 seconds.

-5. Measure the parasitic draw.

Threshold of the parasitic draw
27.0 mA

Is the measured valued less than the threshold?

YES

Go to step 7.

NO

Remove the fuse(s) one at a time, and identify the parts which excessively consume current.

NO

If all electrical circuits are OK, check the starter system circuit.

NO

Perform the starter performance test.

7. Parasitic draw check 5

-1. Install the IG MAIN fuses.

-2. Disconnect under-dash fuse/relay box connector C (27P) while the test leads are connected, and measure the parasitic draw.

Threshold of the parasitic draw
27.0 mA

Is the measured valued less than the threshold?

YES

Replace the under-dash fuse/relay box .

NO

Repair a short to ground in the +B IG MAIN wire.

NO

Repair a short to ground in the +B IG MAIN2 wire.

Fuse Number	Amps	Component(s) or Circuit(s) Protected	Feature
A1-1	40 A	No. E5, No. E7, and No. E8 fuses in the auxiliary under-dash fuse box	B
A1-2	40 A	Electric servo brake control unit/pedal feel simulator	B
A1-3	40 A	VSA modulator-control unit	B
A1-4	30 A	Relay control module	B
A1-5	30 A	Via IG1B relay circuit (built into the under-dash fuse/relay box): Body control module, No. D3, No. D4, No. D5, No. D6, No. D7, and No. D17 fuses in the under-dash fuse/relay box Via IG2 relay circuit (built into the under-dash fuse/relay box): Body control module, No. D9 and No. D22 fuses in the under-dash fuse/relay box	B
A1-6	30 A	Relay control module	B

Fuse Number	Amps	Component(s) or Circuit(s) Protected	Feature
A1-7	150 A	DC-DC converter (built into the PCU), No. A3-1, No. A3-2, No. A3-3, No. A3-4, No. A3-5, No. A3-6, No. A4-1* 1, No. A4-2, No. A4-3, No. A4-4, No. A18, No. A19, No. A20* 2, No. A22, No. A23, and No. A24 fuses in the under-hood fuse/relay box	*1: With power tailgate *2: With stereo amplifier
A2-1	70 A	EPS control unit	B
A2-2	30 A	Via IG1A relay circuit (built into the under-dash fuse/relay box): Body control module, No. D8, No. D20, No. D21, No. D34, and No. D35 fuses in the under-dash fuse/relay box Via ACC relay circuit (built into the under-dash fuse/relay box): No. D1 and No. D2 fuses in the under-dash fuse/relay box	B
A2-3	40 A	No. D18* 1, No. D19* 2, No. D31* 3, No. D32* 4, and No. D33* 3 fuses in the under-dash fuse/relay box	*1: With power lumbar support *2: With moonroof *3: With driver's power seat *4: With front seat heater
A2-4	60 A	No. D15, No. D16, No. D28, No. D29, and No. D30 fuses in the under-dash fuse/relay box, Power window relay Via power window relay: No. D14 and No. D27 fuses in the under-dash fuse/relay box	B
A2-5	30 A	Windshield wiper control unit/motor	B
A2-6	30 A	Park pawl actuator relay, Park pawl actuator (via park pawl actuator relay)	B
A3-1	40 A	Blower motor (via front blower motor relay)	B
A3-2	40 A	Not used	B
A3-3	40 A	VSA modulator-control unit	B
A3-4	40 A	No. D10, No. D23*, No. D24, No. D36, and No. D37 fuses in the under-dash fuse/relay box	*: With wireless charger and USB charger unit
A3-5	30 A	Not used	B
A3-6	40 A	Rear window defogger (via rear window defogger relay)	B
A4-1*	40 A	Power tailgate control unit	*: With power tailgate
A4-2	40 A	No. E1* 1, No. E2* 2, and No. E3* 2 fuses in the auxiliary under-dash fuse box	*1: With power tailgate *2: With front passenger's power seat
A4-3	20 A	Real time AWD control unit	B
A4-4	20 A	High voltage battery module fan (via battery fan relay)	B

Fuse Number	**Amps**	**Component(s) or Circuit(s) Protected**	**Feature**
A5	---	Not used	B
A6	15 A	Relay control module	B
A7	15 A	PGM-FI main relay 1 circuit (built into the relay circuit board) Via PGM-FI main relay 1 circuit (built into the relay circuit board): Injectors, PCM, PGM-FI main relay 2	B
A8	15 A	PGM-FI subrelay circuit (built into the relay circuit board) Via PGM-FI subrelay circuit (built into the relay circuit board): No. A11 fuse in the under-hood fuse/relay box, PCM	B
A9	10 A	Via brake light relay circuit (built into the relay circuit board): Electric servo brake control unit/pedal feel simulator, High mount brake light, Left taillight (left brake light), Right taillight (right brake light) Via brake pedal position switch: Body control module, PCM Via brake pedal position switch and brake light relay circuit (built into the relay circuit board): Electric servo brake control unit/pedal feel simulator, High mount brake light, Left taillight (left brake light), Right taillight (right brake light)	B
A10	10 A	IGHLD1 relay Via IGHLD1 relay: Battery condition monitor module, PCU electric coolant pump relay, Motor control module (built into the PCU)	B
A11	7.5 A	A/F sensor (SENSOR 1), Canister charge over valve, EVAP canister purge valve 1, EVAP canister purge valve 2	B
A12	10 A	Park pawl actuator driver unit, PCM	B

Fuse Number	Amps	Component(s) or Circuit(s) Protected	Feature
A13	10 A	PCU electric coolant pump (via PCU electric coolant pump relay)	B
A14	10 A	Body control module	B

Fuse Number	Amps	Component(s) or Circuit(s) Protected	Feature
D1	10 A	Audio-navigation unit* 1, Audio unit* 2, Console accessory power socket relay, SBW shifter control module, USB charger unit* 3, USB port light (USB port A), USB port light (USB port B)* 4	*1: With navigation *2: Without navigation *3: With USB charger *4: Display audio type
D2	5 A	Body control module, Wireless charger*	*: With wireless charger
D3	5 A	Battery condition monitor module	B
D4	5 A	Electric servo brake control unit/pedal feel simulator, Rear window wiper motor	B
D5	10 A	Automatic dimming inside mirror, Brake light relay circuit (built into the relay circuit board), BSI radar units* 1, Front seat heater control unit* 2, Millimeter wave radar, Multipurpose camera unit, Power seat control unit* 3,	*1: With BSI *2: With front seat heater *3: With DPMS

Fuse Number	Amps	Component(s) or Circuit(s) Protected	Feature
		RDM switch, SBW shifter control module	
D6	10 A	Climate control panel, Front passenger's airbag cutoff indicator, Park pawl actuator driver unit, RFC unit	B
D7	10 A	ANC/active sound control unit, Audio-navigation unit* 1, Audio unit* 2, CAN gateway, Electrical compass unit* 3, Gauge control module, Parking and back-up sensor control unit* 4, Parking and back-up sensor switch* 4, Power tailgate control unit* 5, Real time AWD control unit, Relay control module, Reverse relay circuit (built into the under-dash fuse/relay box) Via reverse relay circuit (built into the under-dash fuse/relay box): Audio-navigation unit* 1, Audio unit* 2, Automatic dimming inside mirror, Body control module, Left inner taillight (left back-up light), Right inner taillight (right back-up light)	*1: With navigation *2: Display audio type without navigation *3: With electric compass *4: With parking and back-up sensor control unit *5: With power tailgate
D8	15 A	Body control module, Fuel pump (via PGM-FI main relay 2), No. D11 fuse in the under-dash fuse/relay box	B
D9	10 A	Climate control panel, Climate control unit, Electric heater coolant pump relay circuit (built into the relay circuit board),	*1: With front seat heater *2: With heated steering wheel

Fuse Number	Amps	Component(s) or Circuit(s) Protected	Feature
		Front blower motor relay, Front seat heater relay circuit (built into the under-dash fuse/relay box)* 1, Heated steering wheel relay* 2, Power mirror switch, Power window master switch, PTC heater B relay, PTC heater D relay, Rear window defogger relay	
D10	20 A	Console accessory power socket (via console accessory power socket relay)	B
D11	5 A	PCM	B
D12	10 A	Front passenger's door lock actuator, Right rear door lock actuator	B
D13	10 A	Left rear door lock actuator	B
D14	20 A	Left rear power window motor (via left rear power window switch)	B
D15	20 A	Front passenger's power window switch	B
D16	20 A	No. D12, No. D25, and No. D38 fuses in the under-dash fuse/relay box (via power door lock relay circuit (LOCK) (built into the under-dash fuse/relay box)), No. D13 and No. D26 fuses in the under-dash fuse/relay box (via power door lock relay circuit (UNLOCK) (built into the under-dash fuse/relay box)), No. D39 fuse in the under-dash fuse/relay box (via power door lock relay circuit (DR UNLOCK)) (built into the under-dash fuse/relay box)), Power door lock relay circuit (LOCK) (built into the under-dash fuse/relay box), Power door lock relay circuit (UNLOCK) (built into the under-dash fuse/relay box), Tailgate release actuator (via tailgate release actuator relay circuit (built into the under-dash fuse/relay box))*, Tailgate release actuator relay circuit (built into the under-dash fuse/relay box)*	*: Without power tailgate

Fuse Number	Amps	Component(s) or Circuit(s) Protected	Feature
D17	10 A	PCM	B
D18*	10 A	Via power lumbar support switch: Power lumbar support motor A, Power lumbar support motor B	*: With power lumbar support
D19*	20 A	Moonroof motor-control unit	*: With moonroof
D20	10 A	Not used	B
D21	10 A	Electric A/C compressor, MAF sensor, PCM (via brake pedal position switch), Secondary HO2S (SENSOR 2)	B
D22	10 A	Body control module	B
D23*	7.5 A	USB charger unit	*: With wireless charger and USB charger unit
D24	5 A	Audio remote-HFL switch (via cable reel)	B
D25	10 A	Driver's door lock actuator	B
D26	10 A	Front passenger's door lock actuator, Right rear door lock actuator	B
D27	20 A	Right rear power window motor (via right rear power window switch)	B
D28	20 A	Power window master switch	B
D29	20 A	Not used	B
D30	10 A	Body control module, Power switch	B
D31* 1	20 A	Power seat control unit* 2 Via driver's power seat adjustment switch* 3: Rear UP-DOWN motor, Recline motor	*1: With driver's power seat *2: With DPMS *3: Without DPMS
D32*	20 A	Front seat heater control unit (via front seat heater relay circuit (built into the under-dash fuse/relay box))	*: With front seat heater
D33* 1	20 A	Power seat control unit* 2 Via driver's power seat adjustment switch* 3: Front UP-DOWN motor, Slide motor	*1: With driver's power seat *2: With DPMS *3: Without DPMS
D34	10 A	Acoustic vehicle alerting control unit, EPS control unit, VSA modulator-control unit	B

2020-22 ELECTRICAL

Engine Electrical - CR-V (Hybrid)

ENGINE ELECTRICAL

Item	Measurement	Qualification	Standard or New	Service Limit
Ignition coil	Firing order	B	1-3-4-2	
Spark plug	Gap	B	1.0-1.1 mm (0.039-0.043 in)	-
Ignition timing	At idle Check the red mark	In N or P	20+/-2B° BTDC	

STANDARDS AND SERVICE LIMITS (2020-21)

ENGINE ELECTRICAL (2020-2021)

Item	Measurement	Qualification	Standard or New	Service Limit
Ignition coil	Firing order	B	1-3-4-2	
Spark plug	Gap	B	0.70-0.75 mm (0.0276-0.0295 in)	-
Ignition timing	At idle Check the red mark	In N or P	4 +/-2 deg. BTDC	
Drive belt	Tension	B	Auto-tensioner	
Alternator	Brush length	B	10.5 mm (0.413 in)	1.5 mm (0.059 in)
Starter (KX)	Commutator mica depth	B	0.40-0.50 mm (0.0157-0.0197 in)	0.15 mm (0.0059 in)
	Commutator runout	B	0.02 mm (0.0008 in) max.	0.05 mm (0.0020 in)
	Commutator O.D.	B	28.0-28.1 mm (1.102-1.106 in)	27.5 mm (1.083 in)
	Brush length	B	11.1-11.5 mm (0.437-0.453 in)	4.3 mm (0.169 in)

DTC TROUBLESHOOTING

DTC B1051

DTC B1051 : Relay control module internal (CPU) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1051 Relay control module internal (CPU) error	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1051 Relay control module internal (CPU) error	B

Is DTC B1051 indicated?

YES

Replace the relay control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1052

DTC B1052 : Relay control module internal (EEPROM) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1052 Relay control module internal (EEPROM) error	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1052 Relay control module internal (EEPROM) error	B

Is DTC B1052 indicated?

YES

Replace the relay control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1075

DTC B1075 : Headlight switch malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1075 Headlight switch malfunction	B

DTC (Relay Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Turn the headlight switch ON position.

-4. Wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B1075 Headlight Switch Malfunction	B

Is DTC B1075 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for body control module and relay control module DTCs with the HDS.

Body Control Module

DTC Description	DTC
B1275 Head light OFF position Circuit Malfunction	B
B1276 Headlight Switch Parking (Small) Position Circuit Malfunction	B
B1277 Head light AUTO position Circuit Malfunction	B
B1278 Head light ON position Circuit Malfunction	B

Relay Control Module

DTC Description	DTC
B1080 Power supply circuit (IG1 line) input error for Relay Control Module and MICU	B

Are any DTCs indicated?

YES

Go to indicated DTCs troubleshooting.

NO

Go to step 3.

3. Relay control module H/L_ON_SW line check 1

-1. Turn the combination light switch OFF position.

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (BACK-UP)	B	B

Is the information indicator OFF?

YES

Go to step 4.

NO

Go to step 6.

4. Relay control module H/L_ON_SW line check 2

-1. Turn the combination light switch ON position.

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (BACK-UP)	B	B

Is the information indicator ON?

YES

Replace the relay control module .

NO

Go to step 5.

5. Open wire check (H/L_ON_SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Relay control module connector C (18P) No. 10**
Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (BACK-UP)	B	B

Is the information indicator ON?

YES

Repair an open or high resistance in the wire.

NO

Replace the relay control module .

6. Shorted wire check (H/L_ON_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Combination light switch 12P connector Relay control module connector C (18P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected Relay control module connector C (18P): disconnected
Test point 1	**Relay control module connector C (18P) No. 10**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the relay control module .

NO

Repair a short to ground in the wire.

DTC B1080

DTC B1080 : Power supply circuit (IG1 line) input error for Relay Control Module and MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1080 Power supply circuit (IG1 line) input error for Relay Control Module and MICU	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1080 Power supply circuit (IG1 line) input error for Relay Control Module and MICU	B

   Is DTC B1080 indicated?

   YES

   Repair an open or high resistance in the IG1_METER wire.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1085

DTC B1085 : Head Light Low Beam Power Source Abnormality

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1085 Head Light Low Beam Power Source Abnormality	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the combination light switch to the ON position.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1085 Head Light Low Beam Power Source Abnormality	B

Is DTC B1085 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Headlight operation check

-1. Turn the combination light switch ON position then check the status of the headlights.

Does one side of headlight go off?

YES

Go to step 3.

NO

Go to step 4.

3. Headlight check

-1. **Swap the left headlight and the right headlight** .

Are the symptoms swapped left and right?

YES

Replace the failure headlight .

NO

Replace the relay control module .

4. Shorted wire check (H/L_LO_SIG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Relay control module connector B (10P) Left headlight 8P connector Right headlight 8P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Relay control module connector B (10P): disconnected Left headlight 8P connector: disconnected Right headlight 8P connector: disconnected
Test point 1	**Relay control module connector B (10P) No. 9**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the relay control module .

NO

Repair a short to ground in the wire.

DTC B108A, B108B, B108C, B108D, B108E, B108F, B1090, B1091, B1092

DTC B108A : Right Side Parking Light Circuit Shorted

DTC B108B : Left Side Parking Light Circuit Shorted

DTC B108C : Right Side Head Light Low Beam Circuit Shorted

DTC B108D : Left Side Head Light Low Beam Circuit Shorted

DTC B108E : Right Side Head Light High Beam Circuit Shorted

DTC B108F : Left Side Head Light High Beam Circuit Shorted

DTC B1090 : Illumination Circuit Shorted

DTC B1091 : DRL Circuit Shorted

DTC B1092 : Interior Light Cut Circuit Shorted

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- These DTC is stored when the relay control module detects ground fault of the harness and controls the circuit in a cutoff state inside the relay control module.

DTC Description	DTC
B108A Right Side Parking Light Circuit Shorted	B
B108B Left Side Parking Light Circuit Shorted	B
B108C Right Side Head Light Low Beam Circuit Shorted	B
B108D Left Side Head Light Low Beam Circuit Shorted	B
B108E Right Side Head Light High Beam Circuit Shorted	B
B108F Left Side Head Light High Beam Circuit Shorted	B
B1090 Illumination Circuit Shorted	B
B1091 DRL Circuit Shorted	B
B1092 Interior Light Cut Circuit Shorted	B

DTC (Relay Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B108A Right Side Parking Light Circuit Shorted	B
B108B Left Side Parking Light Circuit Shorted	B

DTC Description	DTC
B108C Right Side Head Light Low Beam Circuit Shorted	B
B108D Left Side Head Light Low Beam Circuit Shorted	B
B108E Right Side Head Light High Beam Circuit Shorted	B
B108F Left Side Head Light High Beam Circuit Shorted	B
B1090 Illumination Circuit Shorted	B
B1091 DRL Circuit Shorted	B
B1092 Interior Light Cut Circuit Shorted	B

Are any DTCs indicated?

YES

Refer to the DTC shown on the display, then repair a short to body ground in the wire based on the instructions (see table), or **replace the relay control module** .

DTC	Operation for failure wire
B108A	PARKING_R
B108B	PARKING_L
B108C	R_H/L_LO
B108D	L_H/L_LO
B108E	R_H/L_HI
B108F	L_H/L_HI
B1090	ILLUMI+
B1091	DRL_RLY_OUT, DRL_RLY_OUT2
B1092	INTR_LT_CUT_RLY_OUT1, INTR_LT_CUT_RLY_OUT2

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1280 (RELAY CONTROL MODULE)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Relay Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281, U128D (RELAY CONTROL MODULE)

DTC U1281 : Relay control module lost communication with MICU (MICU frame)

DTC U128D : Relay control module lost communication with gauge control module (VSP/NE frame)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Relay control module lost communication with MICU (MICU frame)	B
U128D Relay control module lost communication with gauge control module (VSP/NE frame)	B

DTC (Relay Control Module)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Relay control module lost communication with MICU (MICU frame)	B
U128D Relay control module lost communication with gauge control module (VSP/NE frame)	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Relay control module connector A (6P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Relay control module connector A (6P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	**Relay control module connector A (6P)**	No. 2	**Body control module connector B (36P)**	No. 20
	B-CAN_L		No. 3		No. 21
U128D	B-CAN_H	**Relay control module connector A (6P)**	No. 2	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 3		No. 31

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	**Body control module**
U128D	**Gauge control module**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B1051

DTC B1051 : Relay control module internal (CPU) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1051 Relay control module internal (CPU) error	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1051 Relay control module internal (CPU) error	B

   Is DTC B1051 indicated?

   YES

   Replace the relay control module .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1052

DTC B1052 : Relay control module internal (EEPROM) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1052 Relay control module internal (EEPROM) error	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1052 Relay control module internal (EEPROM) error	B

Is DTC B1052 indicated?

YES

Replace the relay control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1075

DTC B1075 : Headlight switch malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1075 Headlight switch malfunction	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Turn the headlight switch ON position.

   -4. Wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B1075 Headlight Switch Malfunction	B

Is DTC B1075 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Check for body control module and relay control module DTCs with the HDS.

Body Control Module

DTC Description	DTC
B1275 Head light OFF position Circuit Malfunction	B
B1276 Head light switch parking (small) position Circuit Malfunction	B
B1277 Head light AUTO position Circuit Malfunction	B
B1278 Head light ON position Circuit Malfunction	B

Relay Control Module

DTC Description	DTC
B1080 Power supply circuit (IG1 line) input error for Relay Control Module and MICU	B

Are any DTCs indicated?

YES

Go to indicated DTCs troubleshooting.

NO

Go to step 3.

3. Relay control module H/L ON SW line check 1

-1. Turn the combination light switch OFF position.

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (BACK-UP)	B	B

Is the information indicator OFF?

YES

Go to step 4.

NO

Go to step 6.

4. Relay control module H/L ON SW line check 2

-1. Turn the combination light switch ON position.

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (BACK-UP)	B	B

Is the information indicator ON?

YES

Replace the relay control module .

NO

Go to step 5.

5. Open wire check (H/L ON SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Relay control module connector C (18P) No. 10**
Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (BACK-UP)	B	B

Is the information indicator ON?

YES

Repair an open or high resistance in the wire.

NO

Replace the relay control module .

6. Shorted wire check (H/L ON SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Combination light switch 12P connector Relay control module connector C (18P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected Relay control module connector C (18P): disconnected
Test point 1	**Relay control module connector C (18P) No. 10**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

Replace the relay control module .

DTC B1080

DTC B1080 : Power supply circuit (IG1 line) input error for Relay Control Module and MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1080 Power supply circuit (IG1 line) input error for Relay Control Module and MICU	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1080 Power supply circuit (IG1 line) input error for Relay Control Module and MICU	B

   Is DTC B1080 indicated?

   YES

   Repair an open or high resistance in the IG1 METER wire.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1085

DTC B1085 : Head Light Low Beam Power Source Abnormality

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1085 Head Light Low Beam Power Source Abnormality	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the combination light switch to the ON position.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1085 Head Light Low Beam Power Source Abnormality	B

   Is DTC B1085 indicated?

   YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Headlight operation check

-1. Turn the combination light switch ON position then check the status of the headlights.

Does one side of headlight go off?

YES

Go to step 3.

NO

Go to step 4.

3. Headlight check

-1. **Swap the left headlight and the right headlight** .

Are the symptoms swapped left and right?

YES

Replace the failure headlight .

NO

Replace the relay control module .

4. Shorted wire check (H/L LO SIG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Relay control module connector B (10P)Left headlight 8P connector Right headlight 8P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Relay control module connector B (10P): disconnected Left headlight 8P connector: disconnected Right headlight 8P connector: disconnected
Test point 1	**Relay control module connector B (10P) No. 9**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

Replace the relay control module .

DTC B108A, B108B, B108C, B108D, B108E, B108F, B1090, B1091, B1092

DTC B108A : Right Side Parking Light Circuit Shorted

DTC B108B : Left Side Parking Light Circuit Shorted

DTC B108C : Right Side Head Light Low Beam Circuit Shorted

DTC B108D : Left Side Head Light Low Beam Circuit Shorted

DTC B108E : Right Side Head Light High Beam Circuit Shorted

DTC B108F : Left Side Head Light High Beam Circuit Shorted

DTC B1090 : Illumination Circuit Shorted

DTC B1091 : DRL Circuit Shorted

DTC B1092 : Interior Light Cut Circuit Shorted

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- These DTC is stored when the relay control module detects ground fault of the harness and controls the circuit in a cutoff state inside the relay control module.

DTC Description	DTC
B108A Right Side Parking Light Circuit Shorted	B
B108B Left Side Parking Light Circuit Shorted	B
B108C Right Side Head Light Low Beam Circuit Shorted	B
B108D Left Side Head Light Low Beam Circuit Shorted	B
B108E Right Side Head Light High Beam Circuit Shorted	B
B108F Left Side Head Light High Beam Circuit Shorted	B
B1090 Illumination Circuit Shorted	B
B1091 DRL Circuit Shorted	B
B1092 Interior Light Cut Circuit Shorted	B

DTC (Relay Control Module)

1. Problem verification

    -1. Clear the DTCs with the HDS.

    -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

    -3. Check for DTCs with the HDS.

DTC Description	DTC
B108A Right Side Parking Light Circuit Shorted	B
B108B Left Side Parking Light Circuit Shorted	B
B108C Right Side Head Light Low Beam Circuit Shorted	B
B108D Left Side Head Light Low Beam Circuit Shorted	B
B108E Right Side Head Light High Beam Circuit Shorted	B
B108F Left Side Head Light High Beam Circuit Shorted	B
B1090 Illumination Circuit Shorted	B

DTC Description	DTC
B1091 DRL Circuit Shorted	B
B1092 Interior Light Cut Circuit Shorted	B

Are any DTCs indicated?

YES

Refer to the DTC shown on the display, then repair a short to body ground in the wire based on the instructions (see table), or **replace the relay control module** .

DTC	Operation for failure wire
B108A	PARKING R
B108B	PARKING L
B108C	R H/L LO
B108D	L H/L LO
B108E	R H/L HI
B108F	L H/L HI
B1090	ILLUMI+
B1091	DRL RLY OUT, DRL RLY OUT2
B1092	INTR LT CUT RLY OUT1, INTR LT CUT RLY OUT2

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1280(RELAY CONTROL MODULE)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Relay Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281, U128D (RELAY CONTROL MODULE)

DTC U1281 : Relay control module lost communication with MICU(MICU frame)

DTC U128D : Relay control module lost communication with gauge control module(VSP/NE frame)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Relay control module lost communication with MICU(MICU frame)	B
U128D Relay control module lost communication with gauge control module(VSP/NE frame)	B

DTC (Relay Control Module)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Relay control module lost communication with MICU(MICU frame)	B
U128D Relay control module lost communication with gauge control module (VSP/NE frame)	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the receiving control unit connector.

Relay control module connector A (6P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Relay control module connector A (6P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	**Relay control module connector A (6P)**	No. 2	**Body control module connector B (36P)**	No. 20
	B-CAN_L		No. 3		No. 21
U128D	B-CAN_H	**Relay control module connector A (6P)**	No. 2	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 3		No. 31

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	**Body control module**
U128D	**Gauge control module**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B22A0

DTC B22A0 : Wireless charger unit failure

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B22A0 Wireless charger unit failure	B

DTC (Wireless Charger)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B22A0 Wireless charger unit failure	B

Is DTC B22A0 indicated?

YES

Replace the wireless charger .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B22A1

DTC B22A1 : Wireless charger unit ACC input circuit failure

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B22A1 Wireless charger unit ACC input circuit failure	B

DTC (Wireless Charger)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B22A1 Wireless charger unit ACC input circuit failure	B

Is DTC B22A1 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (ACC_KEYLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Wireless charger 7P connector

-3. Turn the vehicle to the ACCESSORY mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ACCESSORY modeWireless charger 7P connector: disconnected

Test point 1	**Wireless charger 7P connector No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the wireless charger .

NO

Repair an open or high resistance in the wire.

DTC U1280 (WIRELESS CHARGER)

DTC U1280 : Communication bus line Error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 Communication bus line Error (BUS-OFF)	B

DTC (Wireless Charger)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Communication bus line Error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281, U1286, U128D, U128E (WIRELESS CHARGER)

DTC U1281 : Wireless charger unit lost communication with MICU

DTC U1286 : Wireless charger unit lost communication with Keyless Access Control Unit

DTC U128D : Wireless charger unit lost communication with Gauge control module

DTC U128E : Wireless charger unit lost communication with Audio-Navigation Unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Wireless charger unit lost communication with MICU	B
U1286 Wireless charger unit lost communication with Keyless Access Control Unit	B
U128D Wireless charger unit lost communication with Gauge control module	B
U128E Wireless charger unit lost communication with Audio-Navigation Unit	B

DTC (Wireless Charger)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Wireless charger unit lost communication with MICU	B
U1286 Wireless charger unit lost communication with Keyless Access Control Unit	B
U128D Wireless charger unit lost communication with Gauge control module	B
U128E Wireless charger unit lost communication with Audio-Navigation Unit	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Wireless charger 7P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U1286	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)
U128E	Audio unit connector A (24P) (display audio type without navigation) Audio-navigation unit connector A (24P) (with navigation)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) modeWireless charger 7P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	Wireless charger 7P connector	No. 3	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 2		No. 21
U1286	B-CAN_H	Wireless charger 7P connector	No. 3	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 2		No. 21
U128D	B-CAN_H	Wireless charger 7P connector	No. 3	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 2		No. 31

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128E	B-CAN_H	Wireless charger 7P connector	No. 3	Audio unit connector A (24P) (display audio type without navigation) Audio-navigation unit connector A (24P) (with navigation)	No. 14
	B-CAN_L		No. 2		No. 24

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	Body control module
U1286	Body control module
U128D	Gauge control module
U128E	Audio unit (display audio type without navigation) Audio-navigation unit (with navigation)

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B22A0 (2020 2021)

DTC B22A0 : Wireless charger unit failure

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B22A0 Wireless charger unit failure	B

DTC (Wireless Charger)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B22A0 Wireless charger unit failure	B

   Is DTC B22A0 indicated?

   YES

   Replace the wireless charger .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B22A1 (2020 2021)

DTC B22A1 : Wireless charger unit ACC input circuit failure

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B22A1 Wireless charger unit ACC input circuit failure	B

DTC (Wireless Charger)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B22A1 Wireless charger unit ACC input circuit failure	B

Is DTC B22A1 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (ACC KEYLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Wireless charger 7P connector

-3. Turn the vehicle to the ACCESSORY mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ACCESSORY mode Wireless charger 7P connector: disconnected

Test point 1	**Wireless charger 7P connector No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the wireless charger .

NO

Repair an open or high resistance in the wire.

DTC U1280 (WIRELESS CHARGER) (2020 2021)

DTC U1280 : Communication bus line Error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 Communication bus line Error (BUS-OFF)	B

DTC (Wireless Charger)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Communication bus line Error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281, U1286, U128D, U128E (WIRELESS CHARGER) (2020 2021)

DTC U1281 : Wireless charger unit lost communication with MICU

DTC U1286 : Wireless charger unit lost communication with Keyless Access Control Unit

DTC U128D : Wireless charger unit lost communication with Gauge control module

DTC U128E : Wireless charger unit lost communication with Audio-Navigation Unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Wireless charger unit lost communication with MICU	B
U1286 Wireless charger unit lost communication with Keyless Access Control Unit	B
U128D Wireless charger unit lost communication with Gauge control module	B
U128E Wireless charger unit lost communication with Audio-Navigation Unit	B

DTC (Wireless Charger)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Wireless charger unit lost communication with MICU	B
U1286 Wireless charger unit lost communication with Keyless Access Control Unit	B
U128D Wireless charger unit lost communication with Gauge control module	B
U128E Wireless charger unit lost communication with Audio-Navigation Unit	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Wireless charger 7P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U1286	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)
U128E	Audio unit connector A (24P) (display audio type without navigation) Audio-navigation unit connector A (24P) (with navigation)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Wireless charger 7P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	Wireless charger 7P connector	No. 3	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 2		No. 21
U1286	B-CAN_H	Wireless charger 7P connector	No. 3	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 2		No. 21
U128D	B-CAN_H	Wireless charger 7P connector	No. 3	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 2		No. 31

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128E	B-CAN_H	Wireless charger 7P connector	No. 3	Audio unit connector A (24P) (display audio type without navigation) Audio-navigation unit connector A (24P) (with navigation)	No. 14
	B-CAN_L		No. 2		No. 24

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	Body control module
U1286	Body control module
U128D	Gauge control module
U128E	Audio unit (display audio type without navigation) Audio-navigation unit (with navigation)

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

2020-22 ENGINE

Cooling System Service Specifications - CR-V (Hybrid)

COOLING SYSTEM

Item	Measurement	Qualification	Standard or New	Service Limit
Radiator	Coolant capacity (including coolant reservoir)	Engine overhaul	6.9 L (1.82 US gal)	-
		Coolant change	5.6 L (1.48 US gal)	-
	Coolant type	B	Use Honda Long Life Antifreeze/Coolant Type 2, and add Honda Extreme Cold Weather Antifreeze/Coolant Type 2. **NOTE:** If the vehicle is regularly driven in very low temperatures (below -22B°F (-30B°C)), a 60% concentration of coolant should be used.	
Coolant reservoir	Coolant capacity	B	0.7 L (0.18 US gal)	-
Radiator cap	Opening pressure	B	93-123 kPa (0.95-1.25 kgf/cm 2, 13.5-17.8 psi)	-
Thermostat	Opening temperature	Begins to open	176-183B°F (80-84B°C)	-
		Fully open	203B°F (95B°C)	-
	Valve lift at fully open	B	8.0 mm (0.315 in) min.	-

INSPECTION

CYLINDER HEAD INSPECTION FOR WARPAGE (1.5 L ENGINE)

Inspection

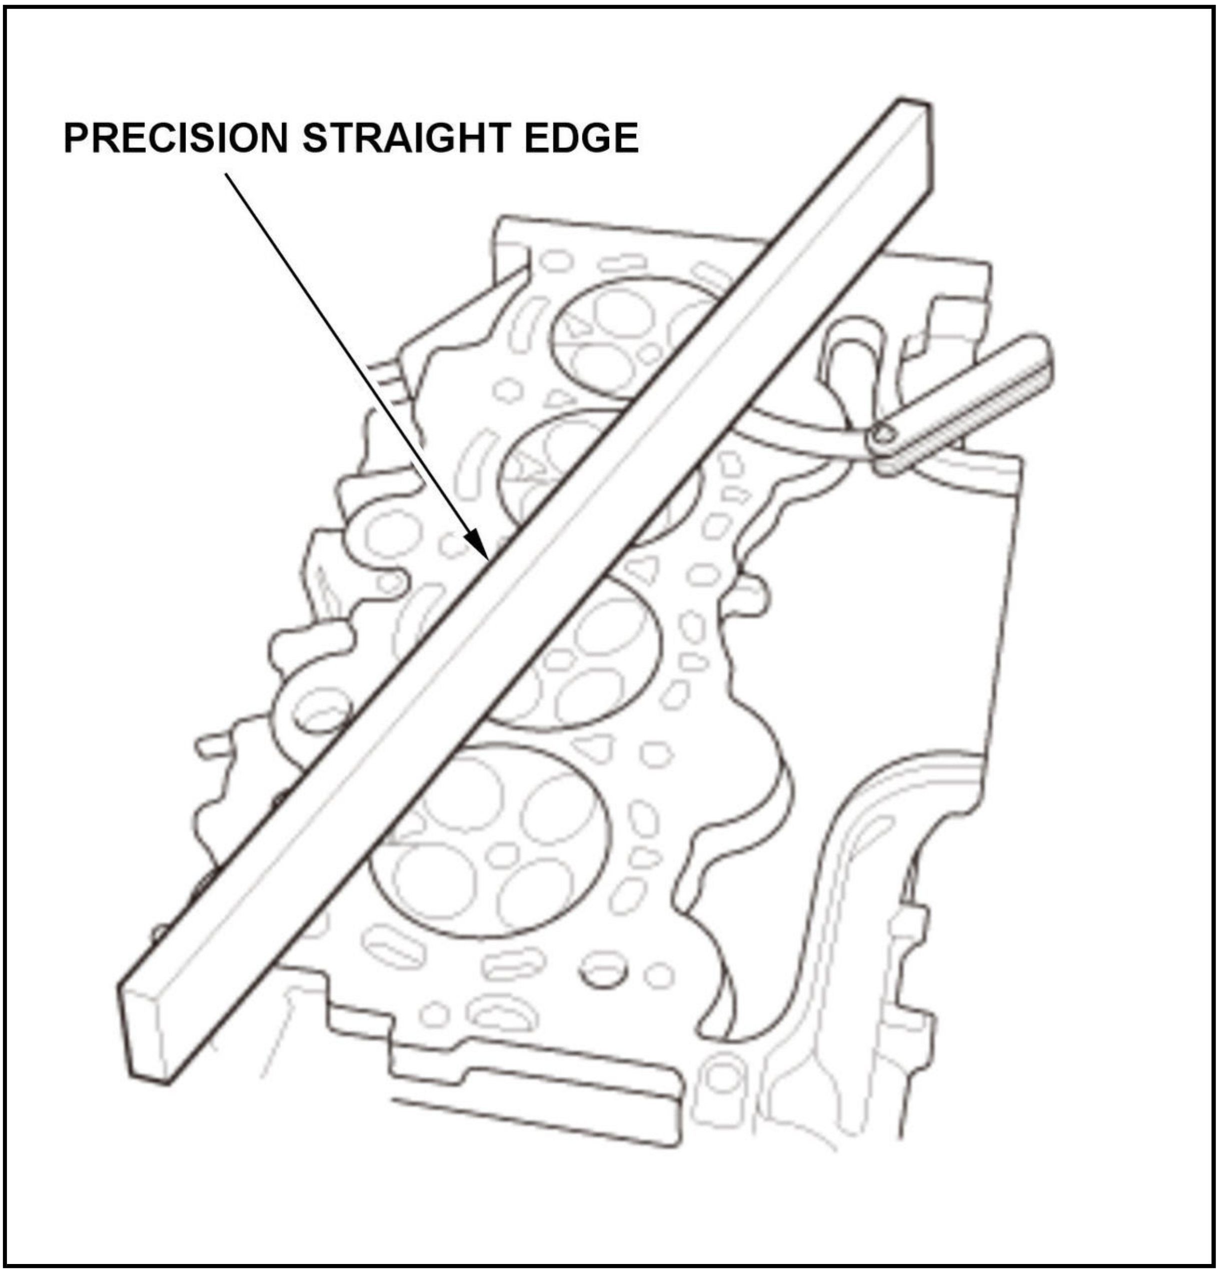
1. Cylinder Head - Remove
2. Cylinder Head Warpage - Inspect

    1. Check the cylinder head for warpage. Measure along the edges, and three ways across the center:

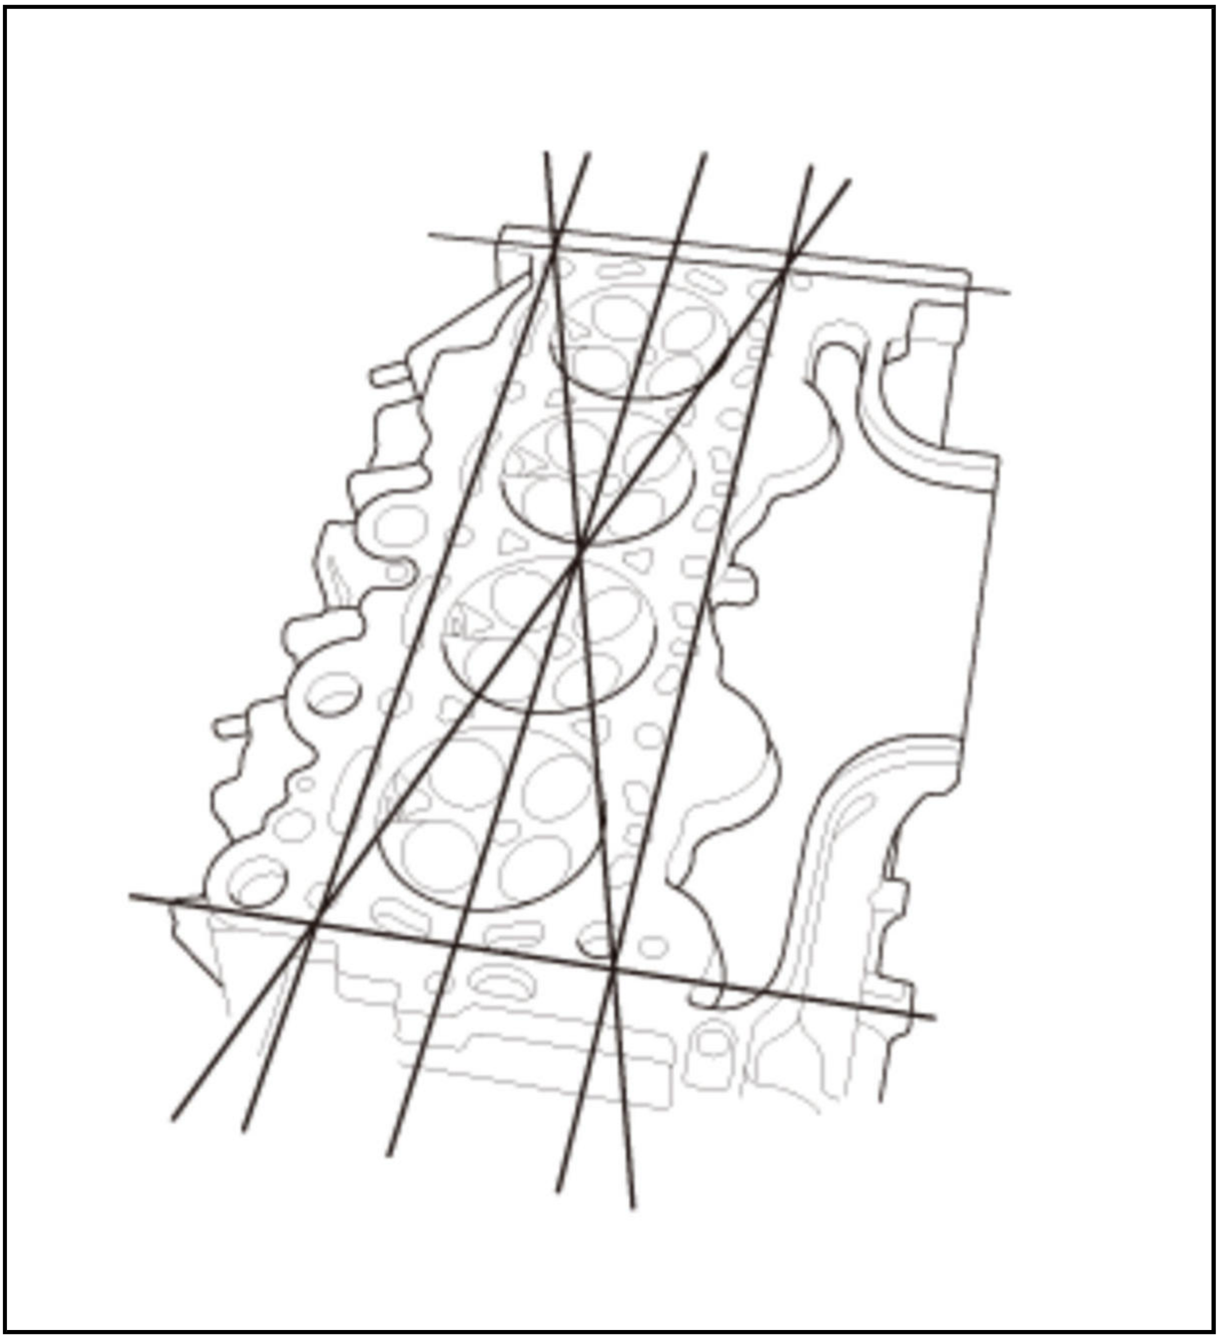
        - If warpage is less than 0.08 mm (0.003 in) cylinder head resurfacing is not required.
        - Maximum resurface limited to the cylinder head height standard as shown.

Warpage	
Standard (New):	**0.08 mm (0.003 in) max.**

Cylinder Head Height	
Standard (New):	**126.95-127.05 mm (4.9980-5.0020 in)**



PRECISION STRAIGHT EDGE



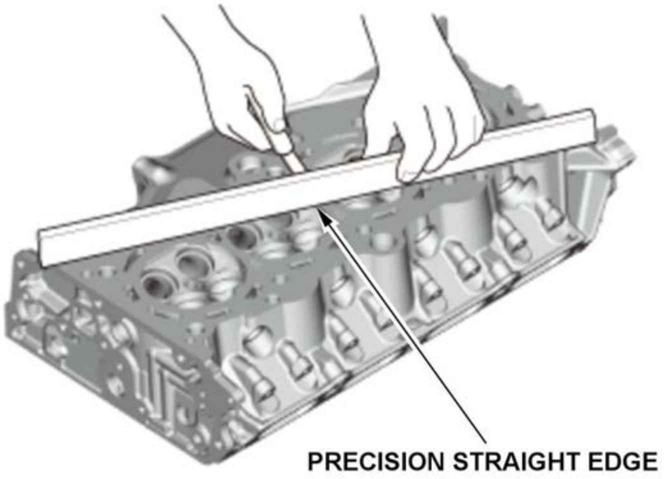
3. All Removed Parts - Install

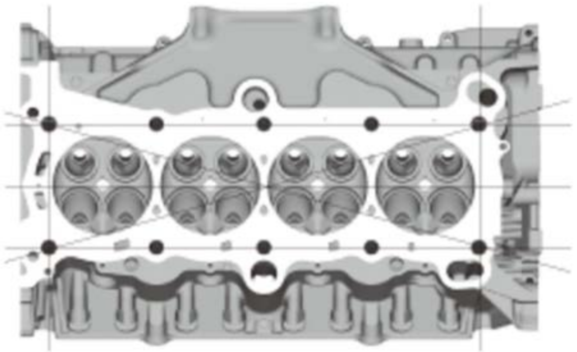
   1. Install the parts in the reverse order of removal.

CYLINDER HEAD INSPECTION FOR WARPAGE (2.4 L ENGINE) (2017 2018 2019)

Inspection

1. Cylinder Head - Remove
2. Cylinder Head Warpage - Inspect





1. Check the cylinder head for warpage. Measure along the edges, and three ways across the center:

- If warpage is less than 0.05 mm (0.002 in) cylinder head resurfacing is not required.
- Maximum resurface limited to the cylinder head height standard as shown.

Cylinder Head Height	
Standard (New):	**111.95-112.05 mm (4.4075-4.4114 in)**

Cylinder Head Warpage	
Standard (New):	**0.05 mm (0.002 in) max.**

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

	Valve Guide Driver, 5.35 x 9.7 mm 07742-0010100
	Camshaft Lock Pin Set 07AAB-RWCA120

Removal

WARNING: **The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.**

CAUTION: **Please carefully read "Precaution for Handling Sodium-Filled Valves" and follow the instructions as the exhaust valves contain metal sodium .**

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain **service precautions** before doing repairs or service.

NOTE:

- Connect the HDS to the DLC, and monitor ECT SENSOR 1. To avoid damaging the cylinder head, wait until the engine coolant temperature drops below 100B°F (38B°C) before loosening the cylinder head bolts.
- Keep the cam chain away from magnetic fields.
- Identify the valves and the valve springs as they are removed so that each item can be reinstalled in its original position.
- When removing the cam shaft, turn the crankshaft to align No. 1 position at top dead center (TDC).
- The No. 1 journal is on the crankshaft pulley side.
- Make sure that the removed parts, such as valves and valve springs, are free from rust when storing.

Cylinder Head Cover, CMP Pulse Plate, VTC Actuator, Exhaust Camshaft Sprocket, Camshaft, and Rocker Arm Assembly

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

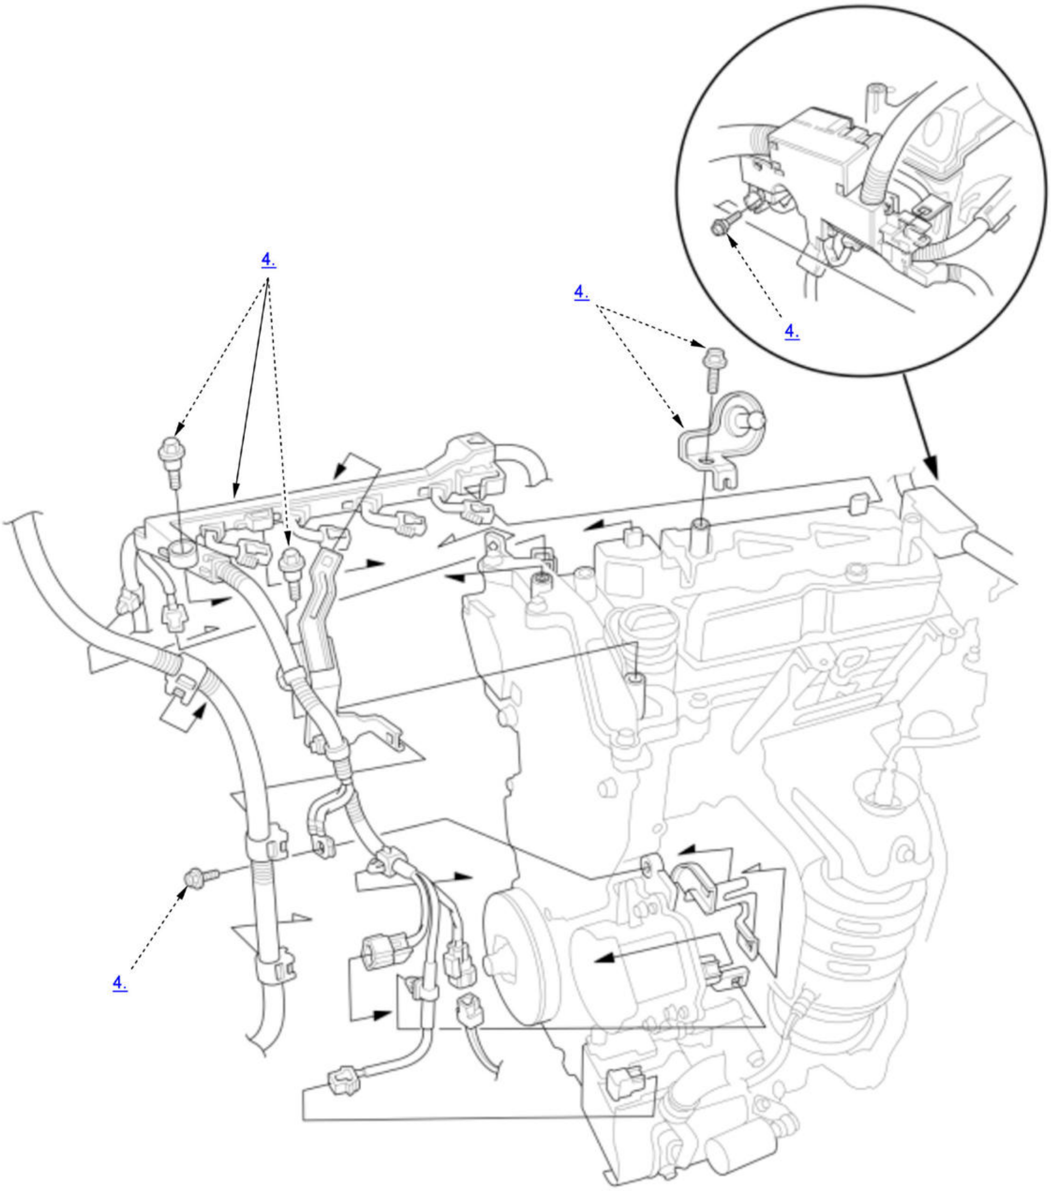

Fig. 1: Exploded View Of Cylinder Head Cover, CMP Pulse Plate, VTC Actuator, Exhaust Camshaft Sprocket, Camshaft, and Rocker Arm Assembly Components (1 Of 3)
Courtesy of HONDA, U.S.A., INC.

NOTE: Numbered call-outs in figure pertain to list numbers in following procedure.

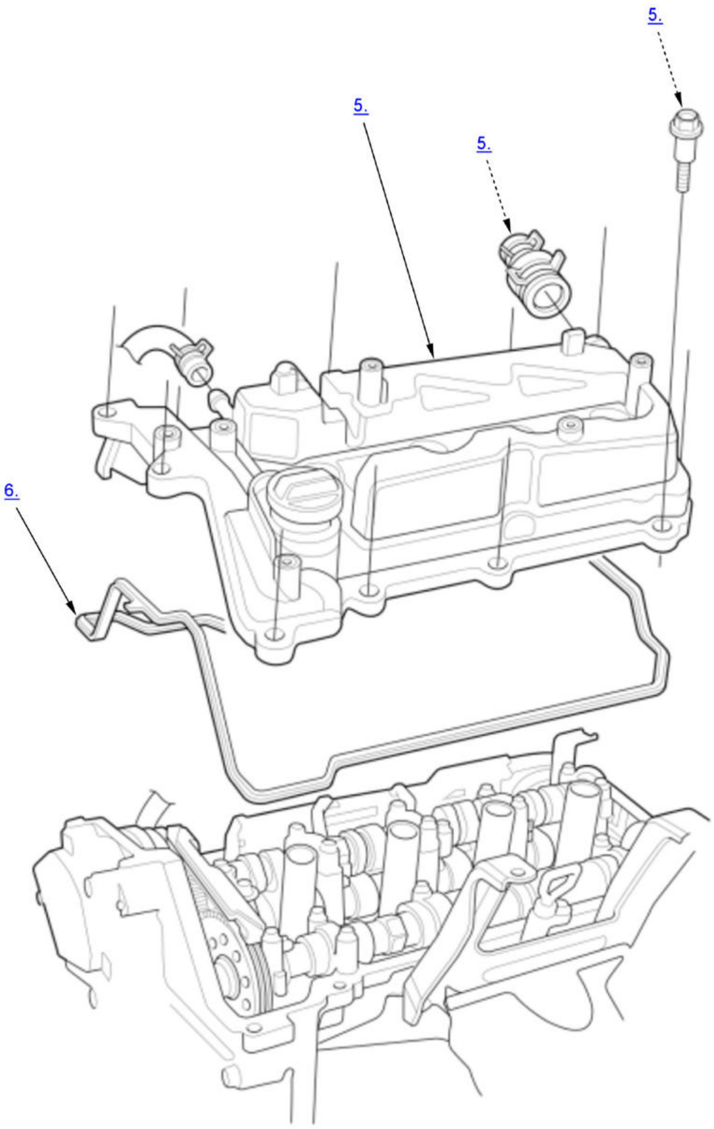

Fig. 2: Exploded View Of Cylinder Head Cover, CMP Pulse Plate, VTC Actuator, Exhaust Camshaft Sprocket, Camshaft, and Rocker Arm Assembly Components (2 Of 3)
Courtesy of HONDA, U.S.A., INC.

NOTE: Numbered call-outs in figure pertain to list numbers in following procedure.

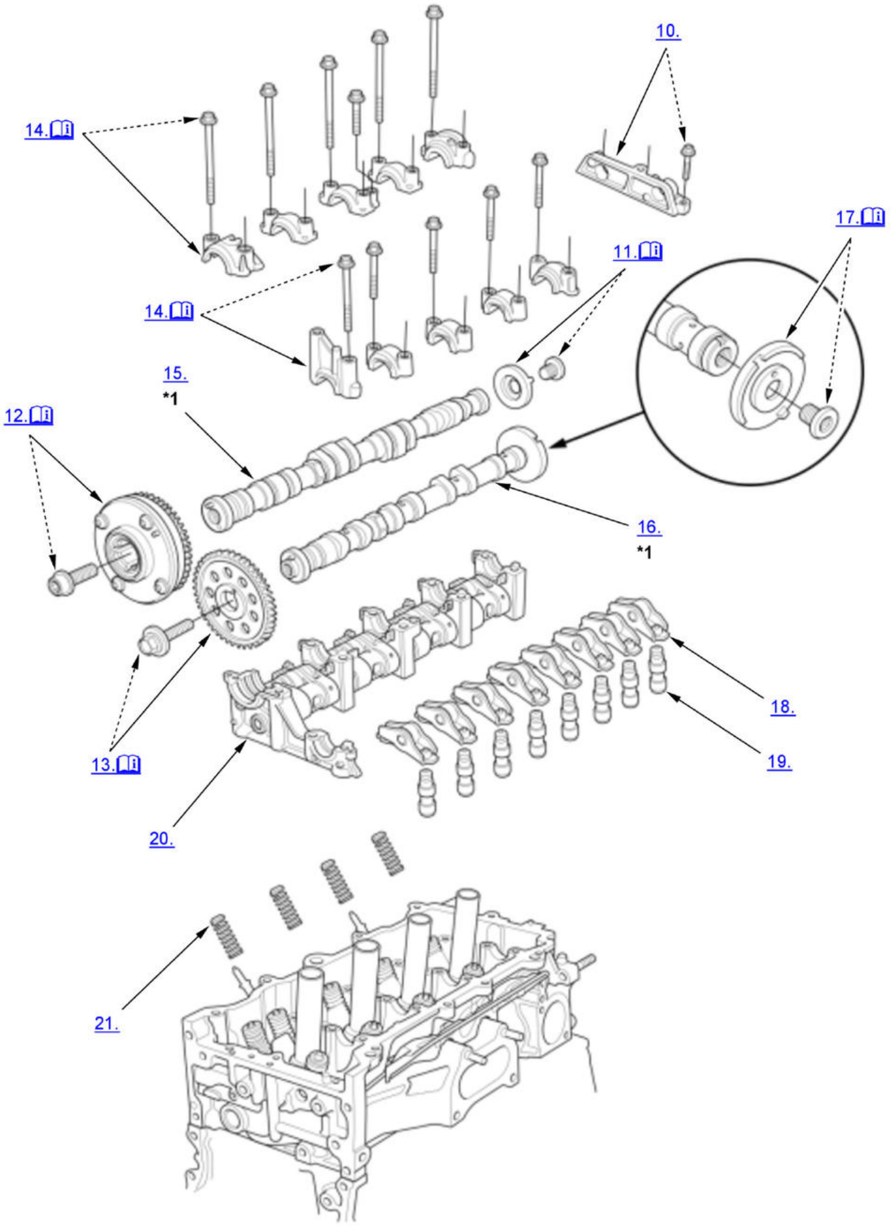

Fig. 3: Exploded View Of Cylinder Head Cover, CMP Pulse Plate, VTC Actuator, Exhaust Camshaft Sprocket, Camshaft, and Rocker Arm Assembly Components (3 Of 3)
Courtesy of HONDA, U.S.A., INC.

*1	These parts have inspection items

1. Intake Air Resonator - Remove
2. Air Cleaner - Remove
3. Ignition Coil - Remove
4. Engine Wire Harness - Move
5. Cylinder Head Cover - Remove
6. Head Cover Gasket - Remove
7. CMP Sensor B - Remove
8. CMP Sensor A - Remove
9. Cam Chain - Remove

	1. Loosen the rocker arm adjusting screws (A). 2. **Remove the cam chain** .

10. CMP Sensor Holder - Remove
11. CMP Pulse Plate A - Remove

	1. Hold the intake camshaft with an open-end wrench, then loosen the CMP pulse plate A mounting bolt. 2. Remove CMP pulse plate A.

12. VTC Actuator - Remove

	1. Hold the intake camshaft with an open-end wrench, then loosen the VTC actuator mounting bolt. 2. Remove the VTC actuator.

13. Exhaust Camshaft Sprocket - Remove

	1. Hold the exhaust camshaft with an open-end wrench, then loosen the exhaust camshaft sprocket mounting bolt. 2. Remove the exhaust camshaft sprocket.

14. Camshaft Holder - Remove

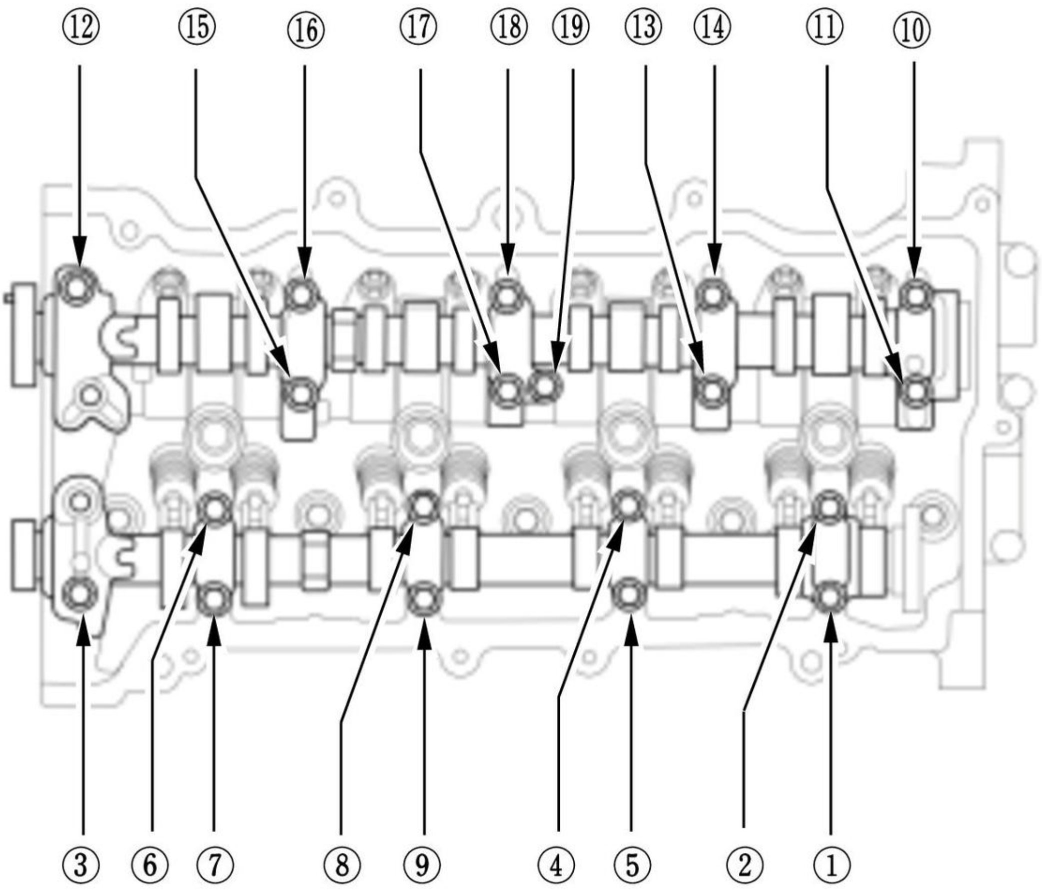

Fig. 4: Camshaft Holder Bolts With Loosening Sequence
Courtesy of HONDA, U.S.A., INC.

1. Remove the camshaft holder bolts. To prevent damaging the camshafts, loosen the bolts, in sequence, two turns at a time.

15. Intake Camshaft - Remove
16. Exhaust Camshaft - Remove
17. CMP Pulse Plate B - Remove

	1. Secure the exhaust camshaft in a vise with wood blocks, then loosen the CMP pulse plate B mounting bolt. **NOTE:** After this procedure, remove wood chips that may be stuck to the exhaust camshaft. 2. Remove CMP pulse plate B.

18. Exhaust Rocker Arm - Remove
19. Hydraulic Tappet - Remove
20. Intake Rocker Arm Assembly - Remove
21. Lost Motion - Remove

Intake Rocker Arm Assembly Disassembly

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

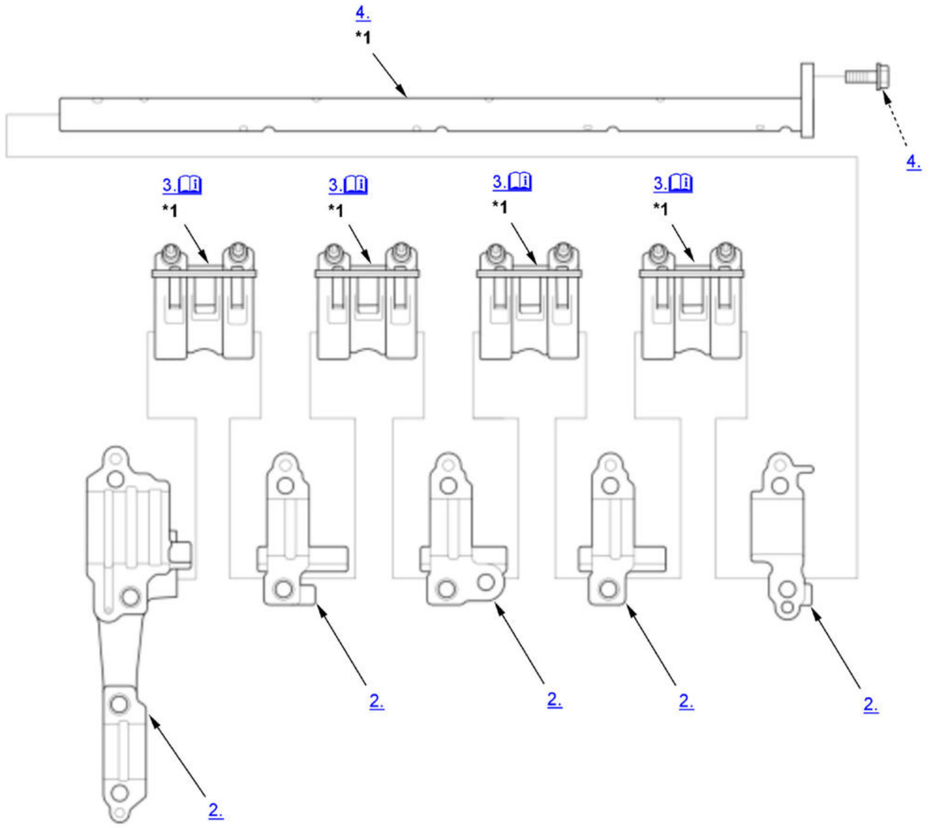

Fig. 5: Intake Rocker Arm Assembly Disassembly Components
Courtesy of HONDA, U.S.A., INC.

*1	These parts have inspection items

1. Intake Rocker Arm Assembly - Remove
2. Rocker Shaft Holder - Remove
3. Intake Rocker Arm Assembly - Remove

   NOTE:

   - Identify parts as they are removed so they can be reinstalled in its original locations.
   - If reused, the rocker arms must be installed in their original location.
   - Bundle the intake rocker arms with rubber bands to keep them together as a set, and remove the bands after the intake rocker arms have been installed.
   - When replacing the intake rocker arm assembly, remove the fastening hardware from the new intake rocker arm assembly.
4. Intake Rocker Shaft - Remove

Cylinder Head, Valve, Valve Spring, Valve Seal, and Valve Guide

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

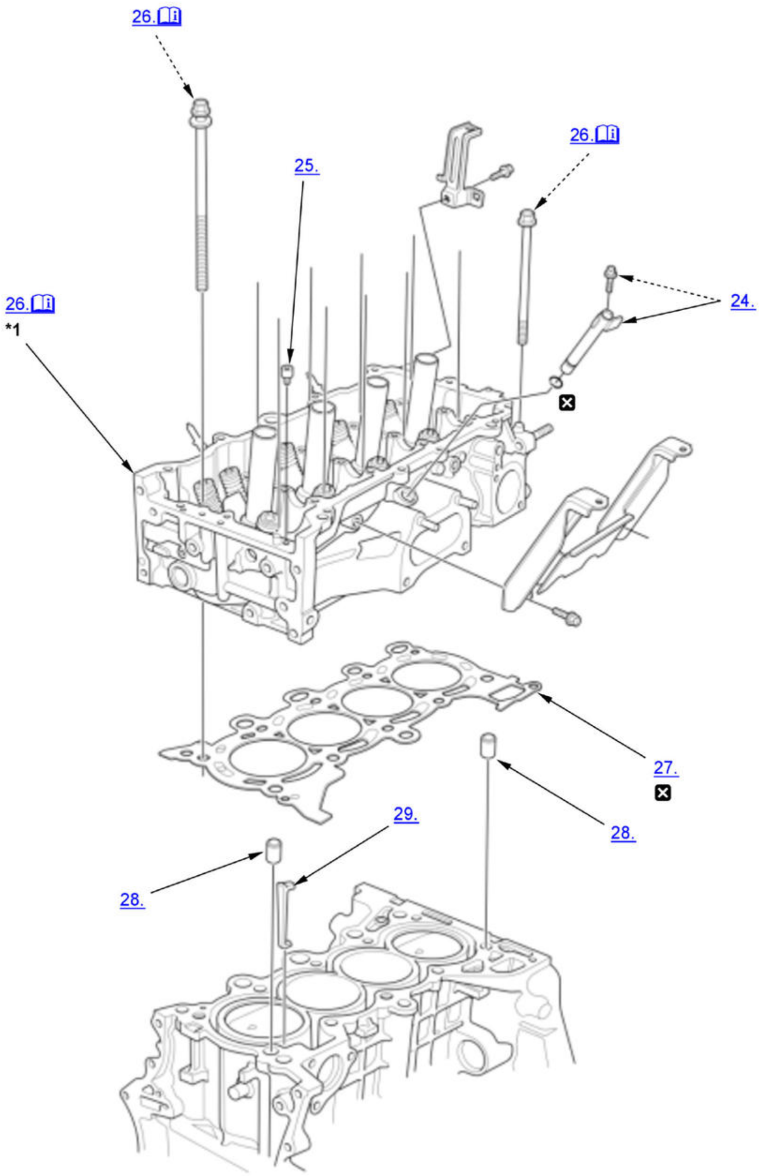

Fig. 6: Exploded View Of Cylinder Head, Valve, Valve Spring, Valve Seal, And Valve Guide Components (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

☒	Replace
*1	These parts have inspection items

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

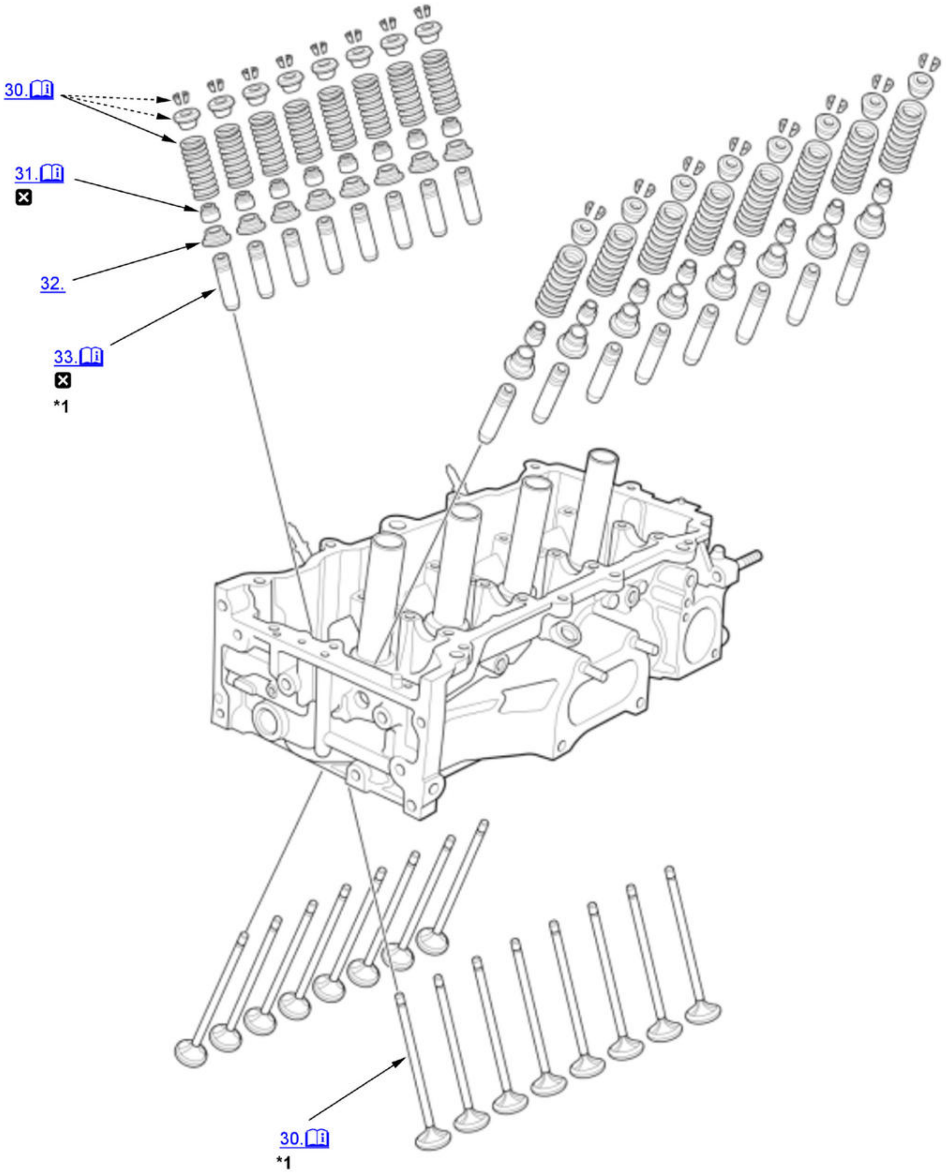

Fig. 7: Exploded View Of Exploded View Of Cylinder Head, Valve, Valve Spring, Valve Seal, And Valve Guide Components (2 Of 2)
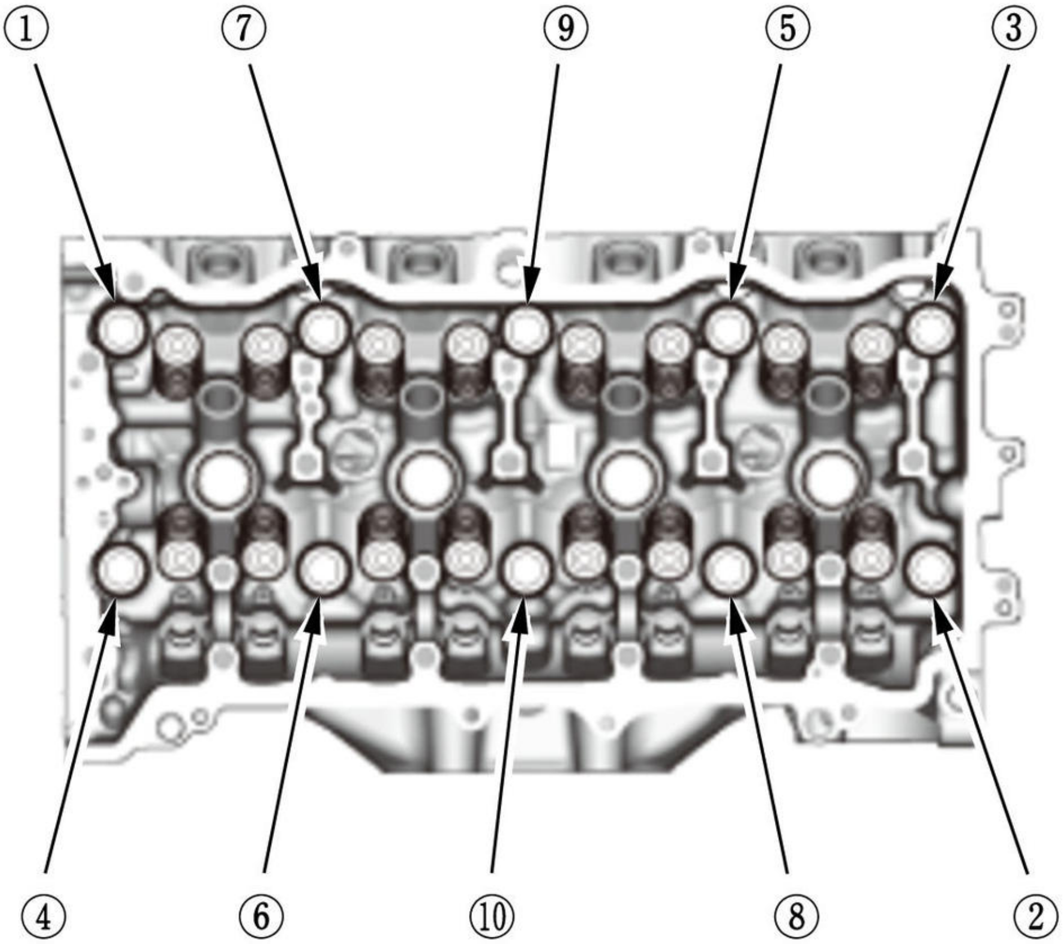
Courtesy of HONDA, U.S.A., INC.

☒	Replace
*1	These parts have inspection items

1. Fuel Pressure - Relieve
2. Service Plug - Turn Off
3. Engine Coolant - Drain
4. 12 Volt Battery - Remove
5. PCU Coolant - Drain
6. Intake Air Resonator - Remove
7. Air Cleaner - Remove
8. PCU - Remove
9. Rocker Arm Oil Control Valve Assembly - Remove
10. Fuel Rail and Injector - Remove
11. Intake Manifold - Remove

12. **Water Outlet - Remove**
13. **Thermostat - Remove**
14. **CMP Sensor A - Remove**
15. **CMP Sensor B - Remove**
16. **TWC Assembly - Remove**
17. Cylinder Head Cover - Remove
18. **Dipstick - Remove**
19. **Cam Chain - Remove**
20. Intake Camshaft - Remove
21. Exhaust Camshaft - Remove
22. Intake Rocker Arm Assembly - Remove
23. Exhaust Rocker Arm - Remove
24. Oil Level Pipe - Remove (if necessary)
25. Oil Control Orifice - Remove (if necessary)
26. Cylinder Head - Remove

	1. Remove the cylinder head mounting bolt (A).

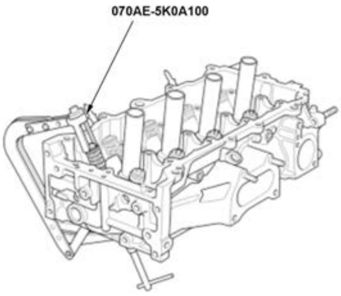


2. Remove the cylinder head bolts. To prevent warpage, loosen the bolts in sequence, 1/3 turn at a time, repeat the sequence until all bolts are loosened.

3. Remove the cylinder head.

27. Cylinder Head Gasket - Remove
28. Dowel Pin - Remove
29. Coolant Separator - Remove
30. Valve and Valve Spring - Remove

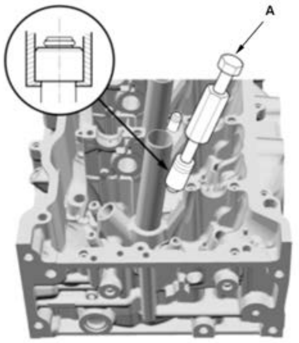
	1. Using an appropriate-sized socket (A) and a plastic mallet (B), lightly tap the spring retainer to loosen the valve cotters.



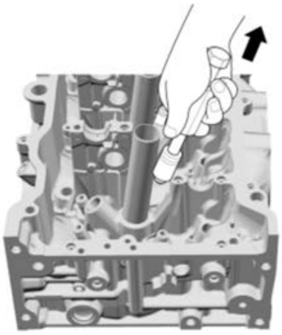
2. Install the valve spring compressor attachment and the valve spring compressor. Compress the valve spring, and remove the valve cotters.

3. Remove the valve spring compressor and the valve spring compressor attachment, then remove the spring retainer, the valve spring, and the valve.

31. Valve Seal - Remove



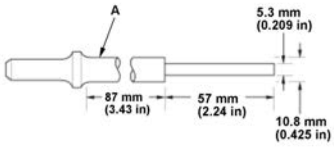
1. Install the valve guide seal remover (A).



2. Remove the valve seal.

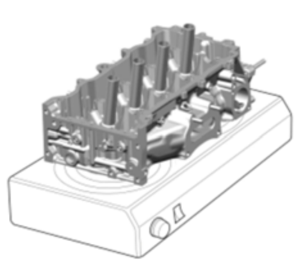
32. Valve Spring Seat - Remove

33. Valve Guide - Remove

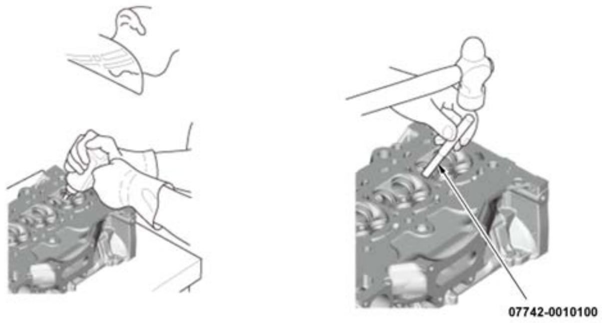


1. Use a commercially available air-impact valve guide driver (A) modified to fit the diameter of the valve guides. In most cases, the same procedure can be done using the valve guide driver, 5.35 x 9.7 mm and a conventional hammer.

2. Select the proper replacement valve guides, and chill them in the freezer section of a refrigerator for at least an hour.



3. Use a hot plate or an oven to evenly heat the cylinder head to 302B°F (150B°C). Monitor the temperature with a cooking thermometer. Do not get the head hotter than 302B°F (150B°C); excessive heat may loosen the valve seats.



4. Working from the camshaft side, use the valve guide driver and an air hammer to drive the valve guide about 2 mm (0.08 in) towards the combustion chamber. This will knock off some of the carbon and make removal easier. Hold the air hammer directly in line with the valve guide to prevent damaging the driver. Wear safety goggles or a face shield.

5. Turn the cylinder head over, and drive the valve guide out toward the camshaft side of the cylinder head.

6. If a valve guide will not move, drill it out with an 8 mm (5/16 in) drill bit, then try again.

NOTE: Drill guides only in extreme cases; you could damage the cylinder head if the valve guide breaks.

Installation

WARNING: **The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.**

CAUTION: **Please carefully read "Precaution for Handling Sodium-Filled Valves" and follow the instructions as the exhaust valves contain metal sodium .**

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain service precautions before doing repairs or service.

NOTE:

- Keep the cam chain away from magnetic fields.
- The No. 1 journal is on the crankshaft pulley side.
- If tighten the specified angle, using a commercially available angle gauge.

Cylinder Head, Valve, Valve Spring, Valve Seal, and Valve Guide

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	These parts have inspection items

1. Valve Guide - Install

	1. Take out the valve guide(s) from the freezer, one at a time, as you need them. 2. Apply a thin coat of new engine oil to the outside of a valve guide. 3. Install the valve guide from the camshaft side of the head; use the valve guide driver to drive the valve guide in to the specified installed height (A) of the valve guide (B). If you have all 16 valve guides to do, you may have to reheat the head.

Valve Guide Installed Height	
Intake:	**17.35-17.85 mm (0.6831-0.7028 in)**
Exhaust:	**17.25-17.75 mm (0.6791-0.6988 in)**

	4. Coat both the valve guide reamer, 5.525 mm and the valve guide with cutting oil. 5. Rotate the reamer clockwise the full length of the valve guide bore. 6. Continue to rotate the reamer clockwise while removing it from the bore. 7. Thoroughly wash the valve guide in detergent and water to remove any cutting residue.

2. Valve Spring Seat - Install
3. Valve Seal - Install

	1. Coat the valve stems with new engine oil. Install the valves in the valve guides. 2. Check that the valves move up and down smoothly, then remove the valves. 3. Install the valve seals (A) with the stem seal driver. **NOTE:** The exhaust valve seal (C) has a black spring (D), and the intake valve seal (E) has a white or silver spring (F); they are not interchangeable.

4. Valve and Valve Spring - Install

	1. Install the valve, the valve spring, and the spring retainer. Place the end of the valve spring with the closely wound coils toward the cylinder head. 2. Install the valve spring compressor attachment and the valve spring compressor. Compress the valve spring, and install the valve cotters. 3. Remove the valve spring compressor and the valve spring compressor attachment.

	4. Lightly tap the end of each valve stem two or three times with a plastic mallet (A) to ensure proper seating of the valve and the valve cotters. Tap the valve stem only along its axis so you do not bend the stem. **NOTE:** Be sure to raise the cylinder head off the work bench so the valve is not possibly damaged.

5. Coolant Separator - Install

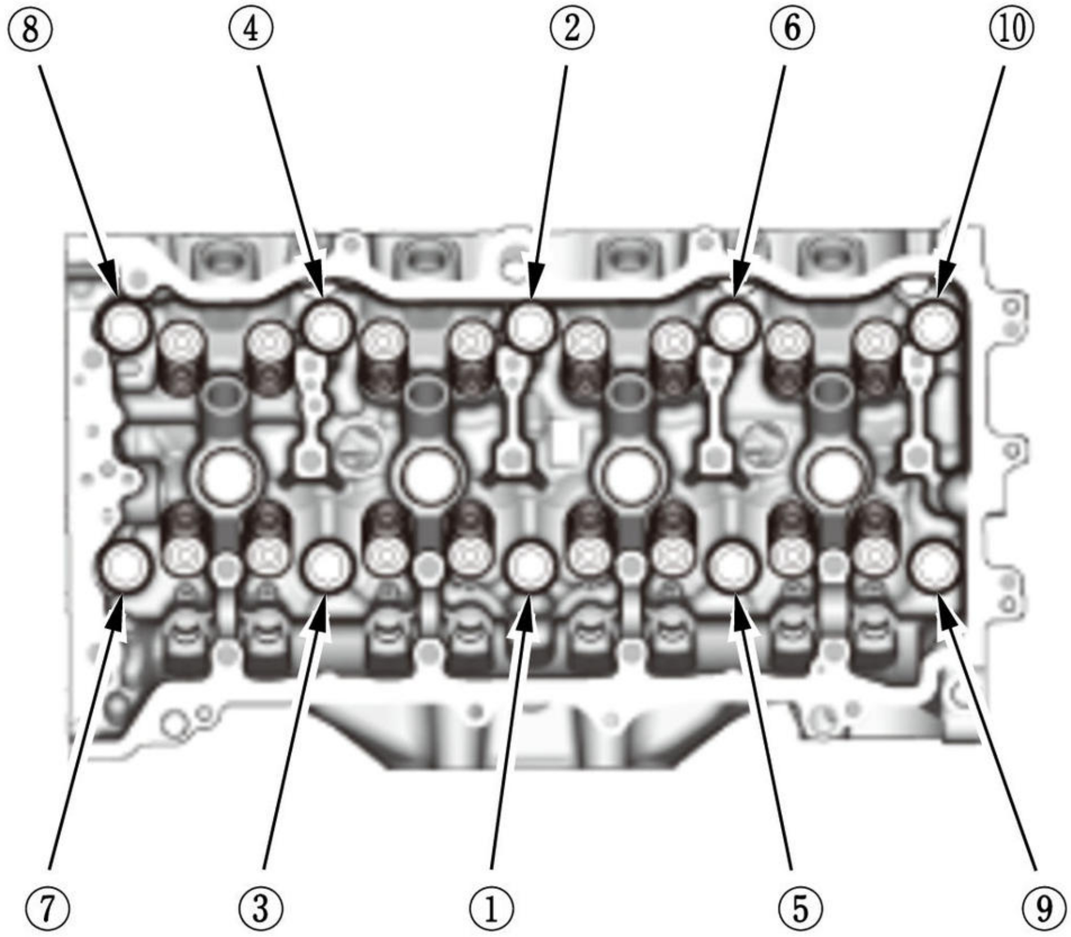
   NOTE: Install a new coolant separator in the engine block whenever the engine block is replaced.

6. Cylinder Head Gasket - Install

   NOTE: Clean the cylinder head and engine block surfaces.

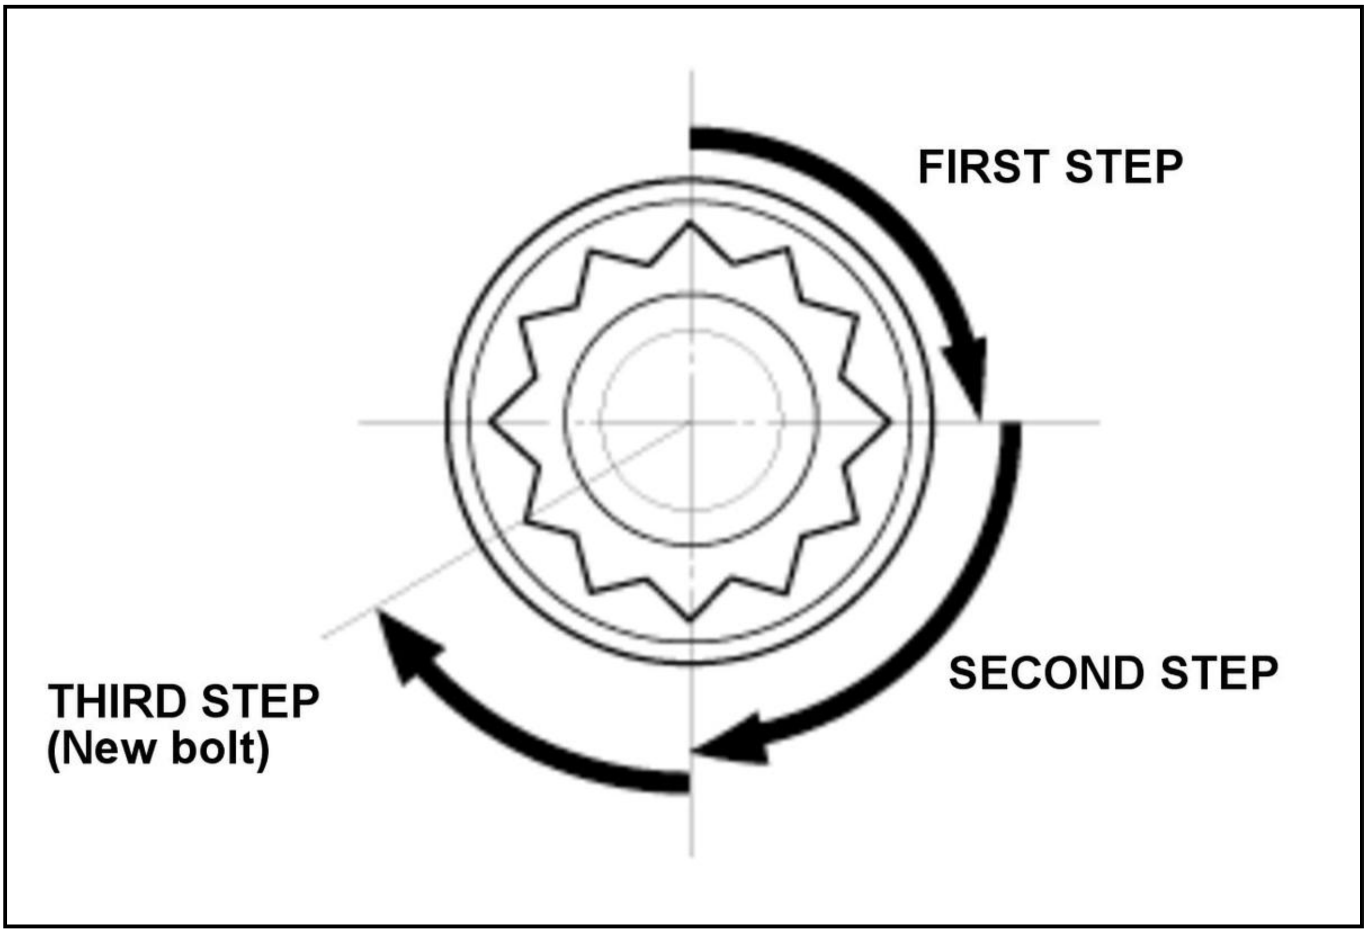
7. Dowel Pin - Install
8. Cylinder Head - Install

	1. Measure the diameter of each cylinder head bolt at point A and point B. 2. If either diameter is less than 10.6 mm (0.417 in), replace the cylinder head bolt.



3. Apply new engine oil to the threads and under the bolt heads of all cylinder head bolts.

4. Torque the cylinder head bolts in sequence to 40 N.m (4.1 kgf.m, 30 lbf.ft). Use a beam-type torque wrench. When using a preset click-type torque wrench, be sure to tighten slowly and do not overtighten. If a bolt makes any noise while you are torquing it, loosen the bolt and retighten it from the first step.



5. After torquing, tighten all cylinder head bolts in two steps (90B° per step using the sequence shown in step 4). If you are using a new cylinder head bolt, tighten the bolt an extra 60B°.
NOTE: Remove the cylinder head bolt if you tightened it beyond the specified angle, and go back to step 1 of the procedure. Do not loosen it back to the specified angle.

	6. Tighten the cylinder head mounting bolt (A) to the specified torque.

9. Oil Control Orifice - Install (if necessary)
10. Oil Level Pipe - Install (if necessary)
11. Exhaust Rocker Arm - Install
12. Intake Rocker Arm Assembly - Install
13. Exhaust Camshaft - Install
14. Intake Camshaft - Install
15. Cam Chain - Install
16. Valve Clearance - Adjust
17. Dipstick - Install
18. Cylinder Head Cover - Install
19. TWC Assembly - Install
20. CMP Sensor B - Install
21. CMP Sensor A - Install

22. Thermostat - Install
23. Water Outlet - Install
24. Intake Manifold - Install
25. Fuel Rail and Injector - Install
26. Rocker Arm Oil Control Valve Assembly - Install
27. PCU - Install
28. Air Cleaner - Install
29. Intake Air Resonator - Install
30. After Installation - Check

    1. After installation, check that all tubes, hoses, and connectors are installed correctly.

31. Service Plug - Turn On
32. 12 Volt Battery - Install
33. PCU Coolant - Refill
34. Engine Coolant - Refill
35. Fuel Leak - Check

    1. Turn the vehicle to the ON mode, but do not turn the READY TO DRIVE mode. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three time, then check for fuel leakage.

36. CKP Pattern - Clear/Learn
37. Idle Speed - Inspect
38. Ignition Timing - Inspect

Intake Rocker Arm Assembly Reassembly

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

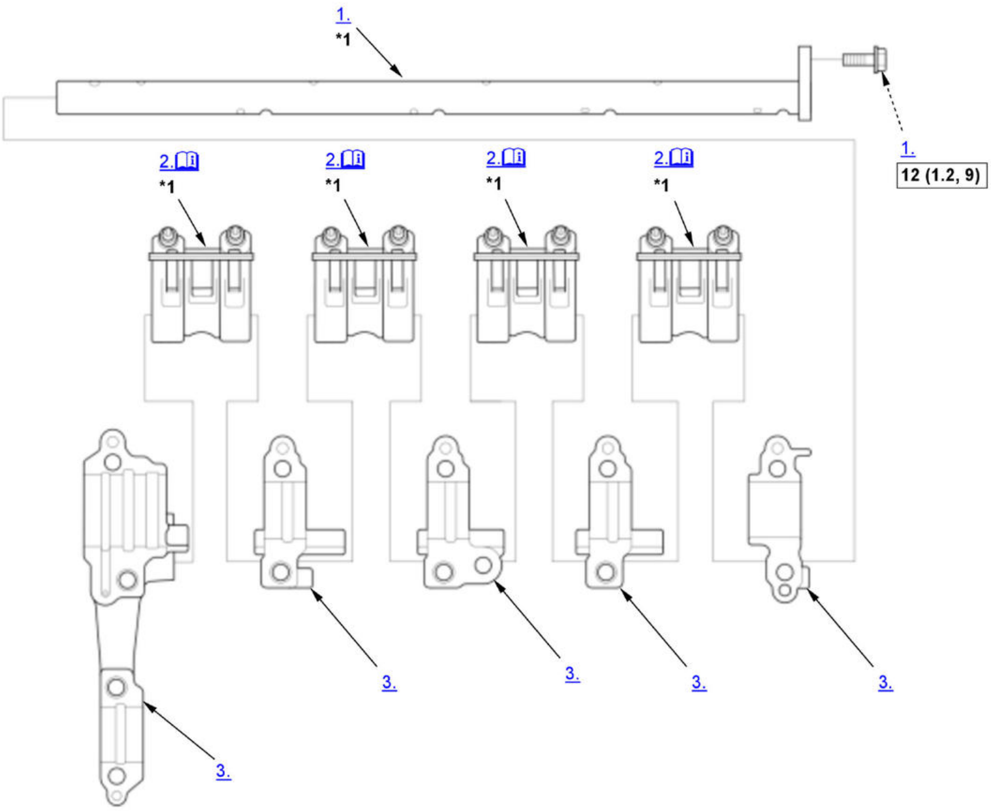


Fig. 10: Intake Rocker Arm Assembly Reassembly Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
*1	These parts have inspection items

1. Intake Rocker Shaft - Install
2. Intake Rocker Arm Assembly - Install

   NOTE:

   - If reused, the rocker arms must be installed in their original locations.
   - Bundle the intake rocker arms with rubber bands to keep them together as a set, and remove the bands after the intake rocker arms have been installed.
   - Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to all contact points and the bearing surface.
   - When replacing the intake rocker arm assembly, remove the fastening hardware from the new intake rocker arm assembly.
3. Rocker Shaft Holder - Install
4. Intake Rocker Arm Assembly - Install

Cylinder Head Cover, CMP Pulse Plate, VTC Actuator, Exhaust Camshaft Sprocket, Camshaft, and Rocker Arm Assembly

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

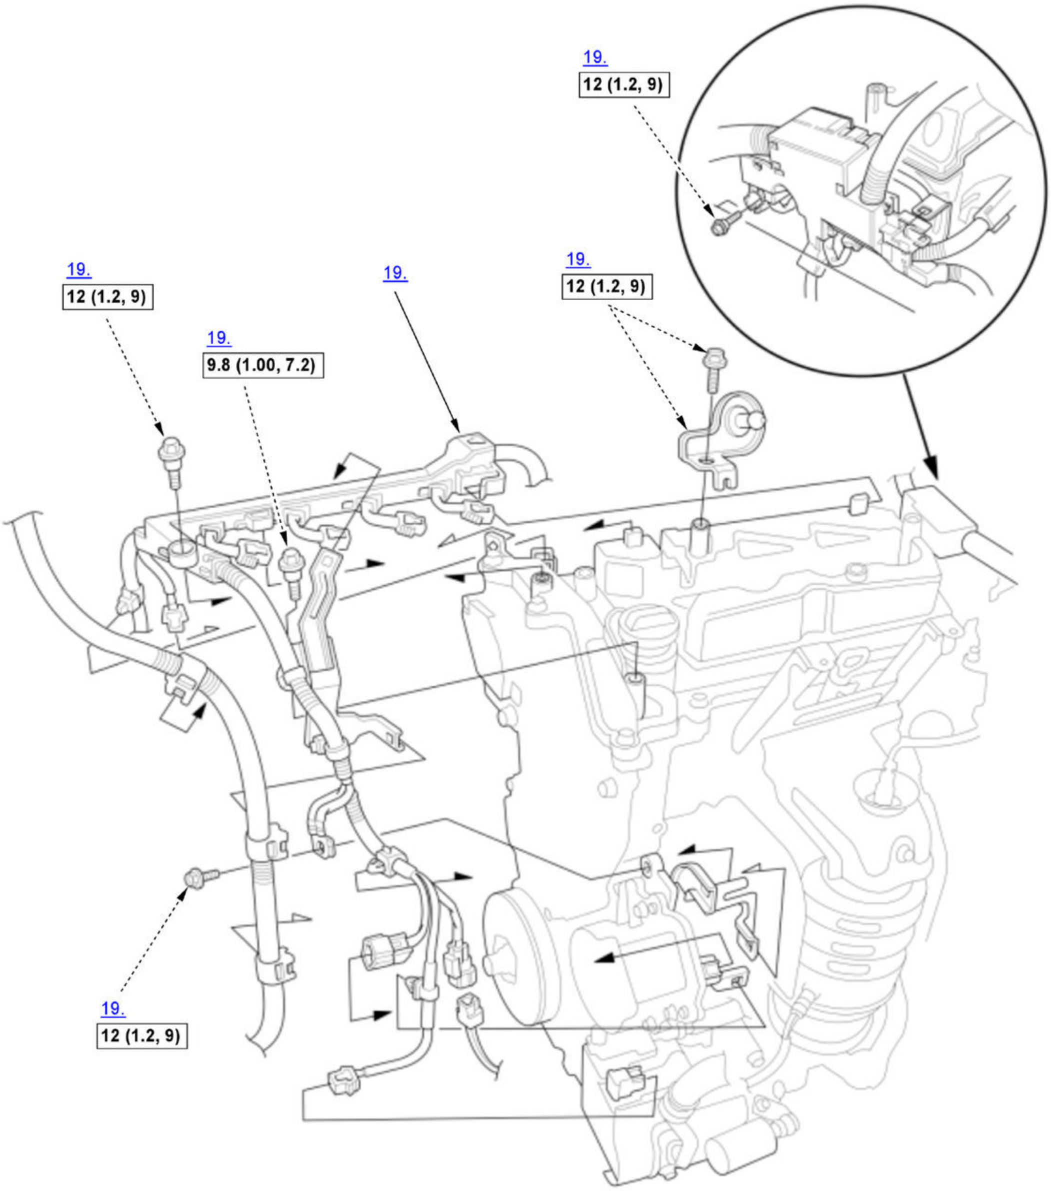

Fig. 13: Exploded View Of Cylinder Head Cover, CMP Pulse Plate, VTC Actuator, Exhaust Camshaft Sprocket, Camshaft, And Rocker Arm Assembly Components With Torque Specifications (3 Of 3)
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. Lost Motion - Install

   NOTE: Apply new engine oil to the lost motion.

2. Hydraulic Tappet - Air Bleeding and Install

	1. Fill a container with new recommended engine oil , and place the hydraulic tappet (A) in it. Press down on the check ball (B) with a thin wire (C). Bleed the hydraulic tappet of air by pumping the plunger (D) slowly until no bubbles come out of the hydraulic tappet.

	2. Install the hydraulic tappet.

3. Exhaust Rocker Arm - Install
4. Intake Rocker Arm Assembly - Install
5. CMP Pulse Plate B - Install

	1. Secure the exhaust camshaft in a vise with wood blocks, then install CMP pulse plate B. **NOTE:** After this procedure, remove wood chips that may be stuck to the exhaust camshaft. 2. Tighten the CMP pulse plate B mounting bolt to the specified torque.

6. Exhaust Camshaft - Install

NOTE: Apply new engine oil to the journals and cam lobes.

7. Intake Camshaft - Install

NOTE: Apply new engine oil to the journals and cam lobes.

8. Camshaft Holder - Install

	1. Apply new engine oil to the threads of the camshaft holder bolts. 2. Set the camshaft holders in place. 3. To hold the intake camshaft and the exhaust camshaft, insert a camshaft lock pin set (A) into the maintenance hole in the camshaft and the No. 1 camshaft holder (B).

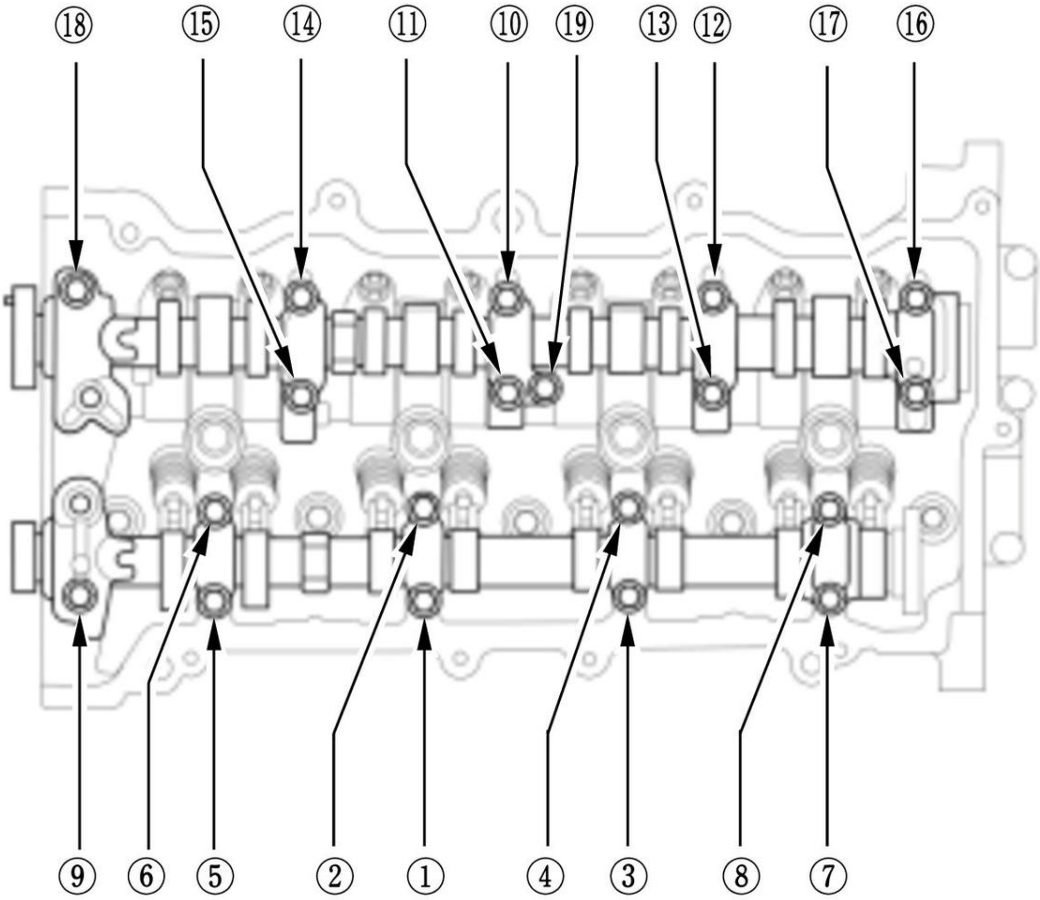

Fig. 14: Camshaft Holder Bolts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

4. Tighten the camshaft holder bolts, in sequence, to the specified torque. 5. Remove the camshaft lock pin set.

9. Exhaust Camshaft Sprocket - Install

	1. Install the exhaust camshaft sprocket. 2. Apply new engine oil to the threads of the exhaust camshaft sprocket mounting bolt, then loosely install it. 3. Hold the exhaust camshaft with an open-end wrench, then tighten the exhaust camshaft sprocket mounting bolt to the specified torque.

10. VTC Actuator - Install

	1. Install the VTC actuator. 2. Apply new engine oil to the threads of the VTC actuator mounting bolt, then loosely install it. 3. Hold the intake camshaft with an open-end wrench, then tighten the VTC actuator mounting bolt to the specified torque.

11. CMP Pulse Plate A - Install

	1. Install CMP pulse plate A. 2. Hold the intake camshaft with an open-end wrench, then tighten the mounting bolt to the specified torque.

12. CMP Sensor Holder - Install

    NOTE: Apply liquid gasket to the cylinder head mating surface of the CMP sensor holder and to the inside edge of the threaded bolt holes.

13. Cam Chain - Install
14. Valve Clearance - Adjust
15. CMP Sensor B - Install
16. CMP Sensor A - Install
17. Head Cover Gasket - Install

    1. Thoroughly clean the head cover gasket and the groove of the cylinder head cover.

    NOTE: Check and, if necessary, replace the head cover gasket.

    2. Install the head cover gasket in the groove of the cylinder head cover. Make sure the head cover gasket is seated securely.

18. Cylinder Head Cover - Install

    1. Check the spark plug seals for damage. If any seals are damaged, replace the cylinder head cover.

    2. Apply liquid gasket to the oil pump, the CMP sensor holder, and the cylinder head mating areas.

    3. Place the cylinder head cover on the cylinder head, then slide the cover slightly back and forth to seat the head cover gasket.

    4. Tighten the bolts in two steps. In the final step, torque all bolts, in sequence as shown, to the specified torque.

19. Engine Wire Harness - Install
20. **Ignition Coil - Install**
21. **Air Cleaner - Install**
22. **Intake Air Resonator - Install**

Inspection

Camshaft Inspection

1. VTC Actuator - Remove
2. Exhaust Camshaft Sprocket - Remove
3. Intake Camshaft - Remove
4. Exhaust Camshaft - Remove
5. CMP Pulse Plate B - Remove
6. Exhaust Rocker Arm - Remove
7. Intake Rocker Arm Assembly - Remove
8. Intake Rocker Arm Assembly - Disassemble
9. Camshaft - Inspect

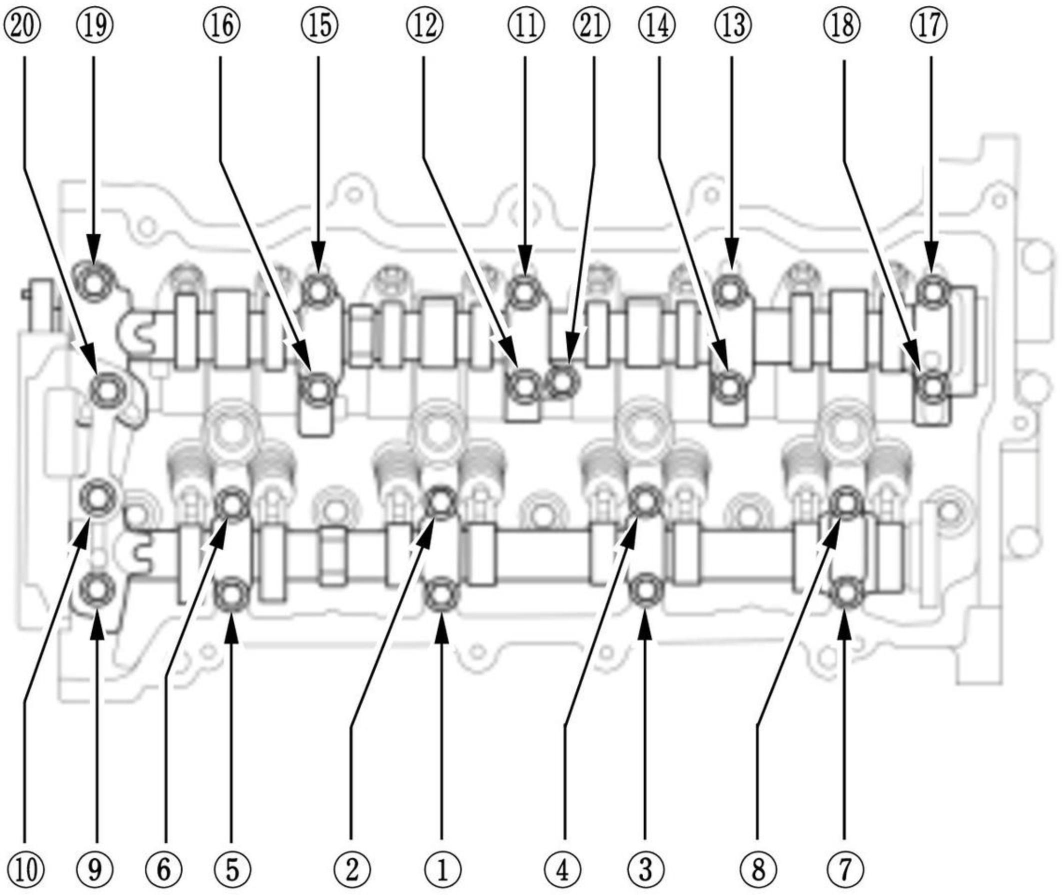

Fig. 15: Camshaft Holder Bolts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

1. Apply new engine oil to the threads of the camshaft holder bolts.

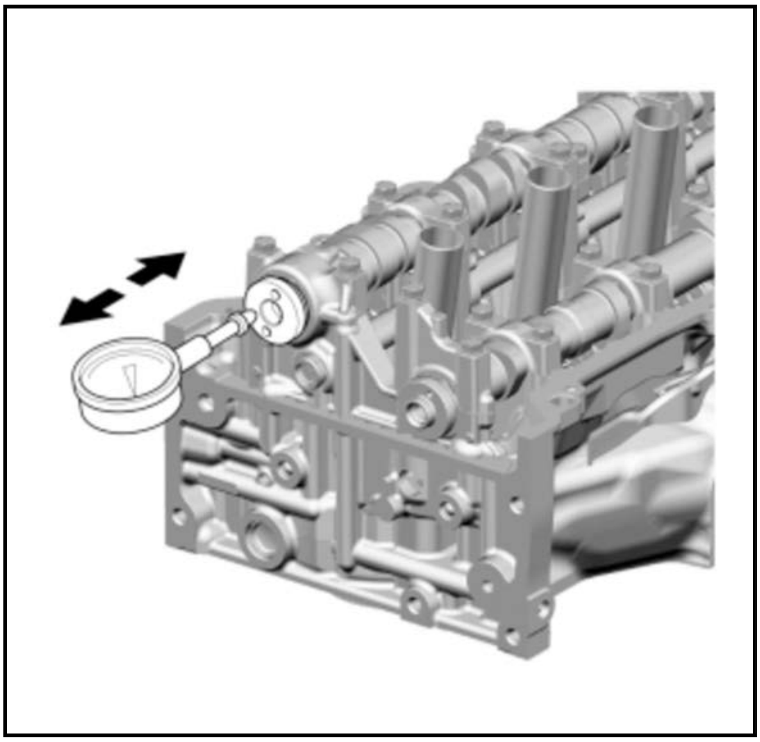
2. Put the rocker shaft holders, the camshafts, the camshaft holders, and cam chain guide B on the cylinder head, then tighten the camshaft holder bolts, in sequence, to the specified torque.

Specified Torque	
① - ⑳ :	**15 N.m (1.5 kgf.m, 11 lbf.ft)**
㉑ :	**12 N.m (1.2 kgf.m, 9 lbf.ft)**

3. Zero the dial indicator against the end of the camshaft, then push the camshaft back and forth, and read the end play. If the end play is beyond the service limit, replace the cylinder head and recheck. If it is still beyond the service limit, replace the camshaft.

NOTE: Do not rotate the camshaft during inspection.

Camshaft End Play	
Standard (New):	**0.05-0.25 mm (0.0020-0.0098 in)**
Service Limit:	**0.40 mm (0.0157 in)**

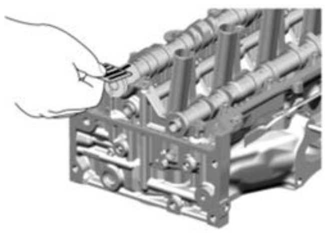


4. Loosen the camshaft holder bolts two turns at a time, in a crisscross pattern. Then remove the camshaft holders from the cylinder head.

5. Lift the camshafts out of the cylinder head, and wipe them clean, then inspect the lift ramps. Replace the camshaft if any lobes are pitted, scored, or excessively worn.

6. Clean the camshaft journal surfaces in the cylinder head, then set the camshafts back in place. Place a plastigage strip across each journal.

7. Install the camshaft holders, then tighten the camshaft holder bolts to the specified torque as shown in step 2.



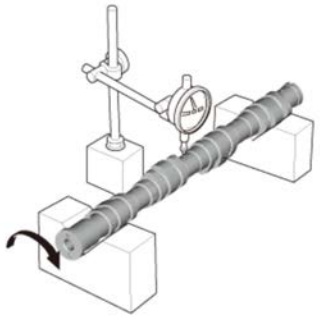
8. Remove the camshaft holders. Measure the widest portion of plastigage on each journal:

- If the camshaft-to-holder clearance is within the service limits, go to step 10.
- If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has been replaced, replace the cylinder head.
- If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has not been replaced, go to step 9.

Exhaust Camshaft-to-Holder Oil Clearance	
Standard (New):	B
No. 1 and No. 2 Journals:	**0.064-0.099 mm (0.00252-0.00390 in)**
No. 3, No. 4, and No. 5 Journals:	**0.060-0.099 mm (0.00236-0.00390 in)**
Service Limit:	**0.150 mm (0.00591 in)**

No. 2 Journal:	**0.064-0.099 mm (0.00252-0.00390 in)**
No. 3, No. 4, and No. 5 Journals:	**0.060-0.099 mm (0.00236-0.00390 in)**
Service Limit:	**0.150 mm (0.00591 in)**

Intake Camshaft-to-Holder Oil Clearance	
Standard (New):	
No. 1 Journal:	**0.034-0.069 mm (0.00134-0.00272 in)**



9. Check the total runout with the camshaft supported on V-blocks:

- If the total runout of the camshaft is within the standard, replace the cylinder head.
- If the total runout is beyond the standard, replace the camshaft and recheck the camshaft-to-holder oil clearance. If the oil clearance is still beyond the standard, replace the cylinder head.

Camshaft Total Runout	
Standard (New):	**0.03 mm (0.0012 in) max.**

	10. Measure cam lobe height. **Cam Lobe Height Standard (New):**

PRI: Primary	MID: Mid	SEC: Secondary
C/C: Cam Chain		B

B	**INTAKE**	**EXHAUST**
PRI	**35.555 mm (1.39980 in)**	**35.095 mm (1.38169 in)**
MID	**35.874 mm (1.41236 in)**	
SEC	**35.555 mm (1.39980 in)**	

Rocker Arm-to-Shaft Clearance Inspection

1. Rocker Arm and Shaft - Inspect

	1. Measure the diameter of the shaft at the first rocker location.

	2. Zero the gauge (A) to the shaft diameter.

3. Measure the inside diameter of the rocker arm, and check it for an out-of-round condition.

Rocker Arm-to-Shaft Clearance	
Standard (New):	
Intake:	**0.018-0.059 mm (0.00071-0.00232 in)**
Service Limit:	**0.080 mm (0.00315 in)**

   4. Repeat for all rocker arms and both shafts. If the clearance is beyond the service limit, replace the rocker shaft and all out of service limit rocker arms. If any VTEC rocker arm needs replacement, replace the rocker arms (primary, mid, and secondary), as a set.

2. VTEC Rocker Arm - Inspect

	1. Inspect the rocker arm pistons (A). Push on each piston manually. If it does not move smoothly, replace the rocker arm set. **NOTE:** Apply new engine oil to the rocker arm pistons when reassembling.

Valve Inspection

1. Valve - Inspect

   1. Measure the valve in these areas.

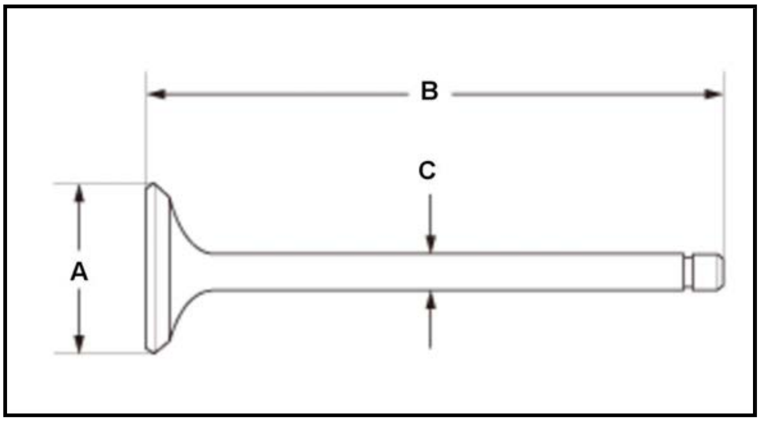
Intake Valve Dimensions

A Standard (New):	**32.85-33.15 mm (1.2933-1.3051 in)**
B Standard (New):	**109.45-110.05 mm (4.3090-4.3327 in)**
C Standard (New):	**5.475-5.490 mm (0.21555-0.21614 in)**
C Service Limit:	**5.450 mm (0.21457 in)**

Exhaust Valve Dimensions

A Standard (New):	**25.90-26.10 mm (1.0197-1.0276 in)**
B Standard (New):	**95.50-95.90 mm (3.7598-3.7756 in)**
C Standard (New):	**5.450-5.460 mm (0.21457-0.21496 in)**

C Service Limit:	**5.420 mm (0.21339 in)**



Valve Stem-to-Guide Clearance Inspection

1. Valve Stem-to-Guide Clearance - Inspect

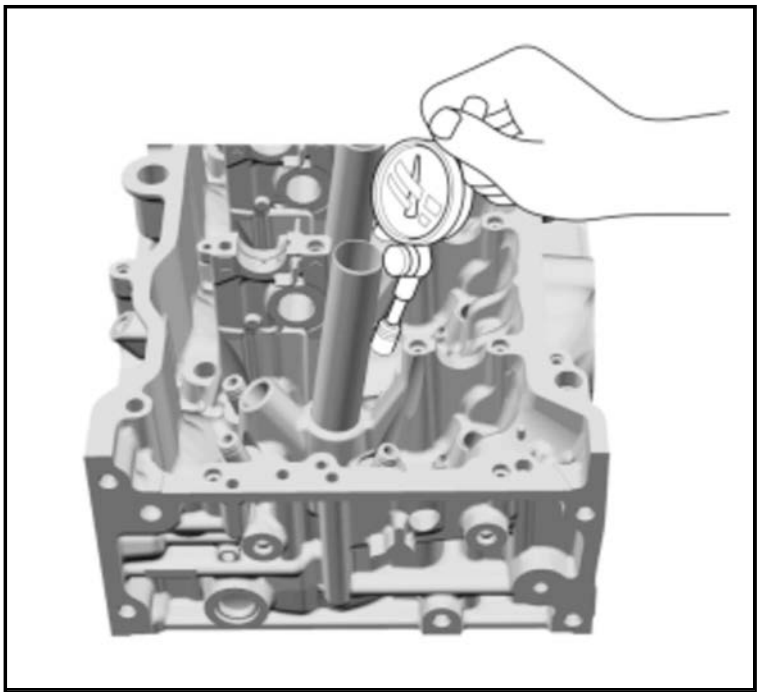
   1. Subtract the O.D. of the valve stem, measured with a micrometer, from the I.D. of the valve guide, measured with an inside micrometer or ball gauge. Take the measurements in three places along the valve stem and three places inside the valve guide. The difference between the largest valve guide measurement and the smallest valve stem measurement should not exceed the service limit.

   Intake Valve Stem-to-Guide Clearance

Standard (New):	**0.020-0.055 mm (0.00079-0.00217 in)**
Service Limit:	**0.080 mm (0.00315 in)**

   Exhaust Valve Stem-to-Guide Clearance

Standard (New):	**0.050-0.080 mm (0.00197-0.00315 in)**
Service Limit:	**0.110 mm (0.00433 in)**



Cylinder Head Inspection for Warpage

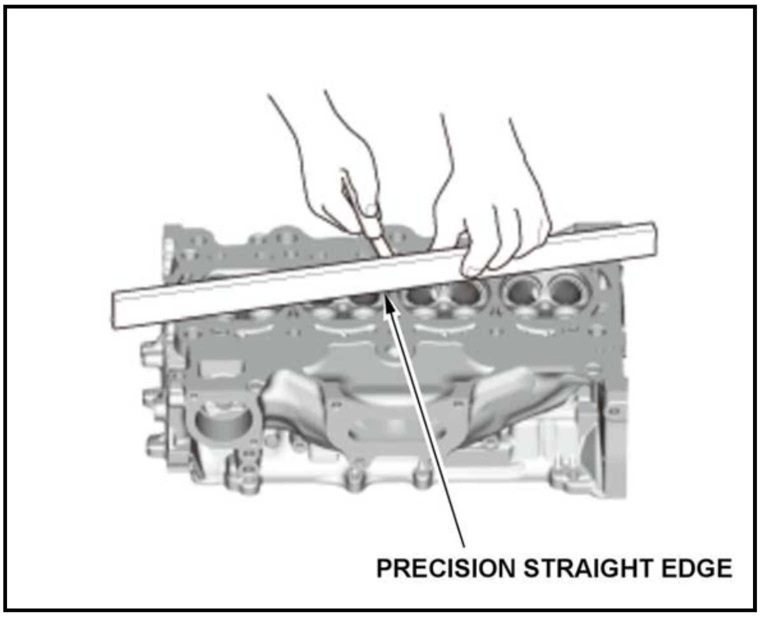
1. Cylinder Head Warpage - Inspect

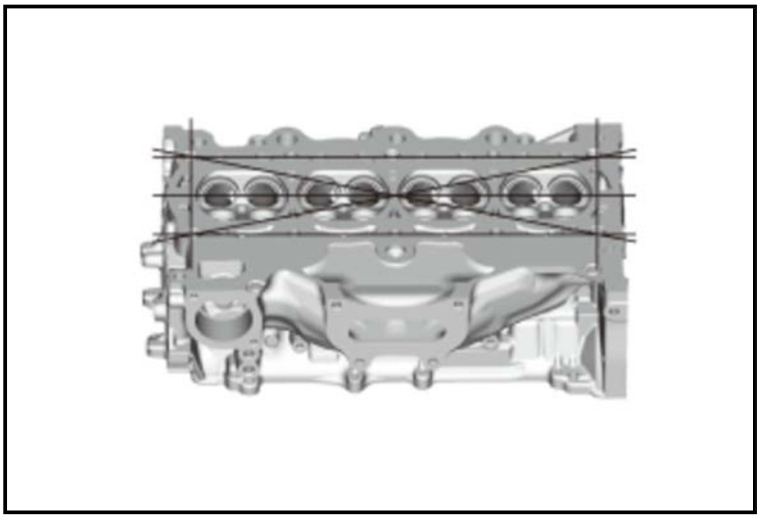
   1. Check the cylinder head for warpage. Measure along the edges, and three ways across the center:

- If warpage is less than 0.05 mm (0.0020 in) cylinder head resurfacing is not required.
- Maximum resurface limited to the cylinder head height standard as shown.

Cylinder Head Warpage	
Standard (New):	**0.05 mm (0.0020 in) max.**

Cylinder Head Height	
Standard (New):	**120.95-121.05 mm (4.7618-4.7657 in)**





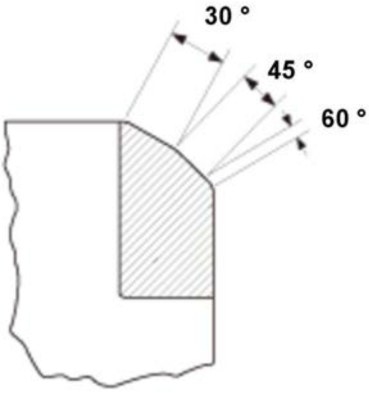
Reconditioning

1. Valve Seat - Reconditioning

	1. Inspect valve stem-to-guide clearance. If the valve guides are worn, replace them before cutting the valve seats. 2. Renew the valve seats in the cylinder head using a valve seat cutter. 3. Carefully cut a 45B° seat, removing only enough

	material to ensure a smooth and concentric seat.

4. Bevel the upper and lower edges at the angles shown in the illustration. Check the width of the seat and adjust accordingly.



5. Make one more very light passes with the 45B° cutter to remove any possible burrs caused by the other cutters.

Valve Seat Width

Intake:	
Standard (New):	**0.85-1.15 mm (0.0335-0.0453 in)**
Service Limit:	**1.60 mm (0.0630 in)**
Exhaust:	
Standard (New):	**1.25-1.55 mm (0.0492-0.0610 in)**
Service Limit:	**2.00 mm (0.0787 in)**

<table>
<tr>
<td></td>
<td>6. After resurfacing the seat, inspect for even valve seating: Apply Prussian Blue compound (A) to the valve face. Insert the valve in its original location in the head, then lift it and snap it closed against the seat several times.
7. The actual valve seating surface (B), as shown by the blue compound, should be centered on the seat:
If it is too high (closer to the valve stem), you must make a second cut with the 60B° cutter to move it down, then one more cut with the 45B° cutter to restore seat width.
If it is too low (close to the valve edge), you must make a second cut with the 30B° cutter to move it up, then make one more cut with the</td>
</tr>
</table>

	45B° cutter to restore seat width. **NOTE:** The final cut should always be made with the 45B° cutter.

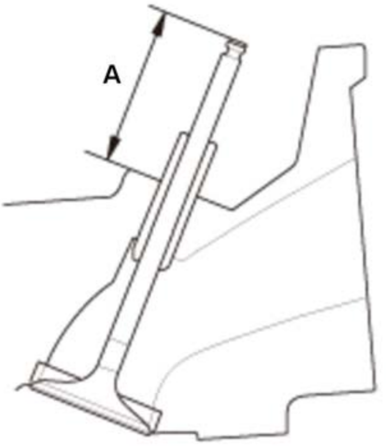
8. Insert the intake and exhaust valves in the head, and measure valve stem installed height (A).

Intake Valve Stem Installed Height

Standard (New):	**48.65-49.35 mm (1.9154-1.9429 in)**
Service Limit:	**49.68 mm (1.9559 in)**

Exhaust Valve Stem Installed Height

Standard (New):	**44.90-45.60 mm (1.7677-1.7953 in)**
Service Limit:	**45.93 mm (1.8083 in)**



9. If valve stem installed height is over the service limit, replace the valve and recheck. If it is still over the service limit, replace the cylinder head; the valve seat in the head is too deep.

REMOVAL AND INSTALLATION

CYLINDER HEAD COVER REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal

1. **Ignition Coil - Remove**
2. Turbocharger Water Return Pipe - Remove

	1. Remove the resonator bracket (A). 2. Remove the cylinder head cover heat insulator (B) and the turbocharger water return pipe (C).

3. Breather Hose, PCV Hose, and Harness Holder - Remove

 *1: With break head band	1. Disconnect the connectors (A). 2. Remove the harness clips (B) and the harness holders (C). 3. Disconnect the breather hose (D) and the PCV hose (E). **NOTE:** **(With break head band) Use commercially available cutting pliers as necessary to cut the band off the hose while avoiding damage to the hose.**

4. Turbocharger Bypass Control Valve Solenoid Pipe - Remove

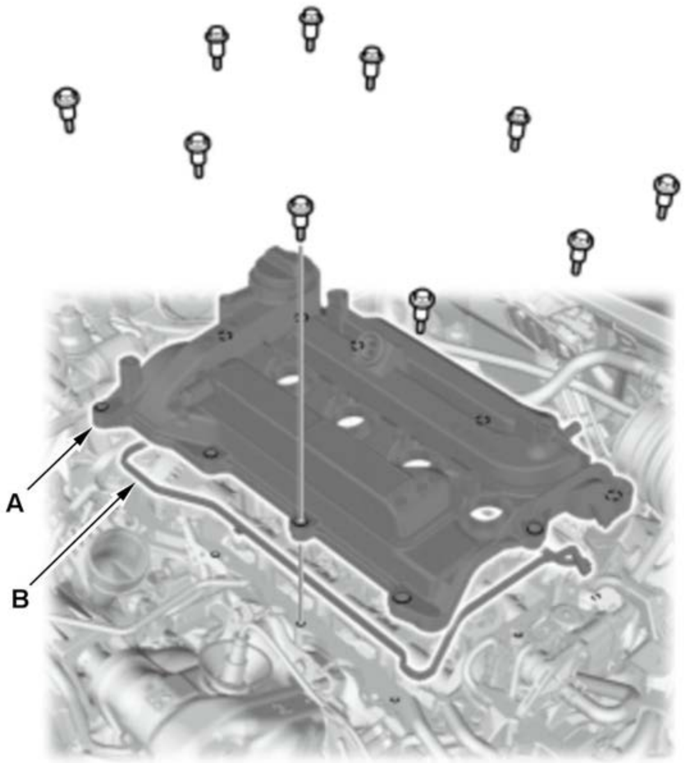
 	1. Disconnect the hoses (A). 2. Remove the turbocharger bypass control valve solenoid pipe (B).

5. PCV Valve - Remove

1. If necessary, remove the PCV valve.

6. Cylinder Head Cover - Remove

<table>
<tr>
<td>



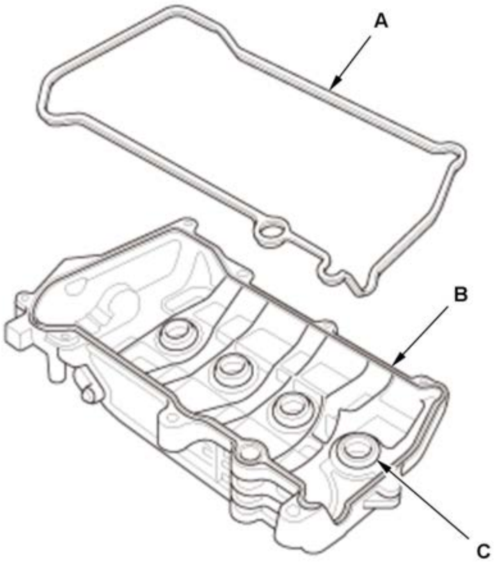
</td>
<td>1. Remove the cylinder head cover (A) and the head cover gasket (B).</td>
</tr>
</table>

Installation

NOTE: How to read the torque specifications .

1. Cylinder Head Cover - Install

<table>
<tr>
<td>



</td>
<td>
1. Thoroughly clean the head cover gasket (A) and the groove of the cylinder head cover (B).

NOTE:

Check and, if necessary, replace the head cover gasket.

2. Check the spark plug seals (C) for damage. If any seals are damaged, replace the cylinder head cover.

3. Install the head cover gasket in the groove of the cylinder head cover. Make sure the head cover gasket is seated securely.
</td>
</tr>
</table>

	4. **Apply liquid gasket** to the cam chain case, the high pressure fuel pump base, and the cylinder head mating areas. 5. Apply a light coat of new engine oil to the lip of the spark plug seals (A). 6. Set the spark plug seals on the spark plug tubes. Place the cylinder head cover (B) on the cylinder head, then slide the cylinder head cover slightly back and forth to seat the head cover gasket. 7. Inspect the spark plug seals for damage.

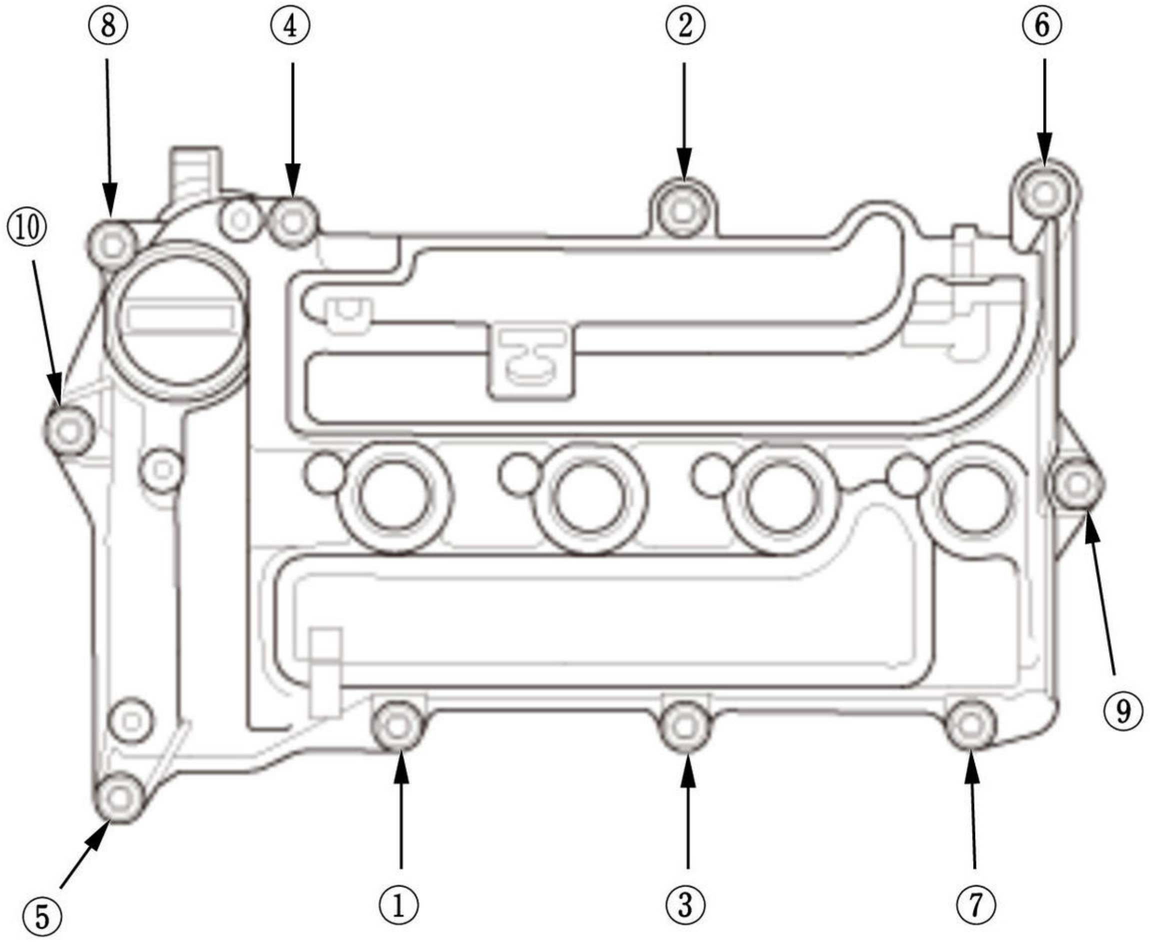


Fig. 1: Cylinder Head Cover Bolts In Sequence
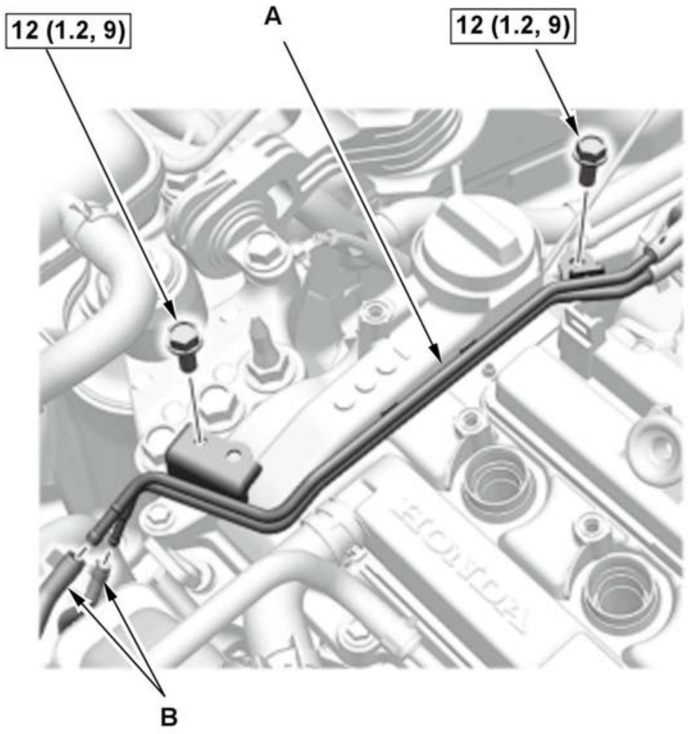
Courtesy of HONDA, U.S.A., INC.

8. Tighten the bolts in two steps. In the final step, torque all bolts in sequence to 7.0 N.m (0.71 kgf.m, 5.2 lbf.ft).

2. PCV Valve - Install

1. If the PCV valve was removed, **install the PCV valve.**

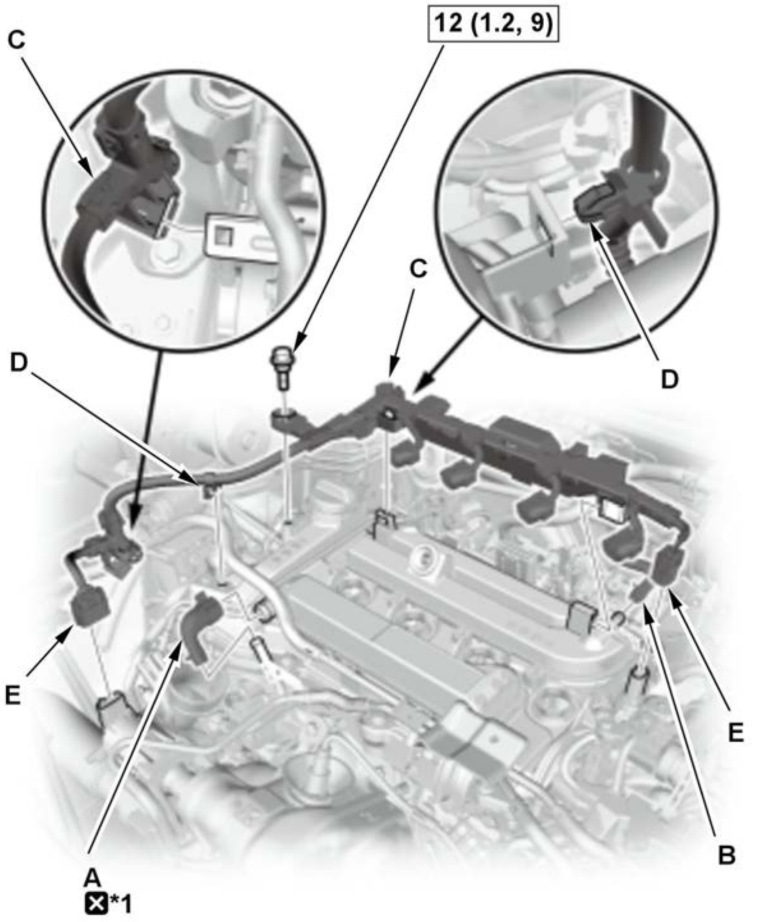
3. Turbocharger Bypass Control Valve Solenoid Pipe - Install



1. Install the turbocharger bypass control valve solenoid pipe (A).

2. Connect the hoses (B).

4. Breather Hose, PCV Hose, and Harness Holder - Install



*1: With break head band

1. Connect the breather hose (A) and the PCV hose (B).

2. Install the harness holders (C) and the harness clips (D).

3. Connect the connectors (E).

	**NOTE (with break head band):** When installing a new break head band, do the following procedures. 4. Tighten the break head bolt until the bolt head (A) is twisted off completely. **NOTE:** **Do not use an air tool.** 5. Make sure the stopper end (B) contacts to the housing end (C) after tightening the break head bolt.

5. Turbocharger Water Return Pipe - Install

	1. Install the turbocharger water return pipe (A) and the cylinder head cover heat insulator (B). 2. Install the air cleaner stay (C).

6. **Ignition Coil - Install**

CYLINDER HEAD COVER REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal

1. **12 Volt Battery Terminal - Disconnect**
2. **Ignition Coil - Remove**
3. Breather Hose and PCV Hose - Disconnect

	1. Disconnect the breather hose (A) and the PCV hose (B).

4. Harness Holder - Remove

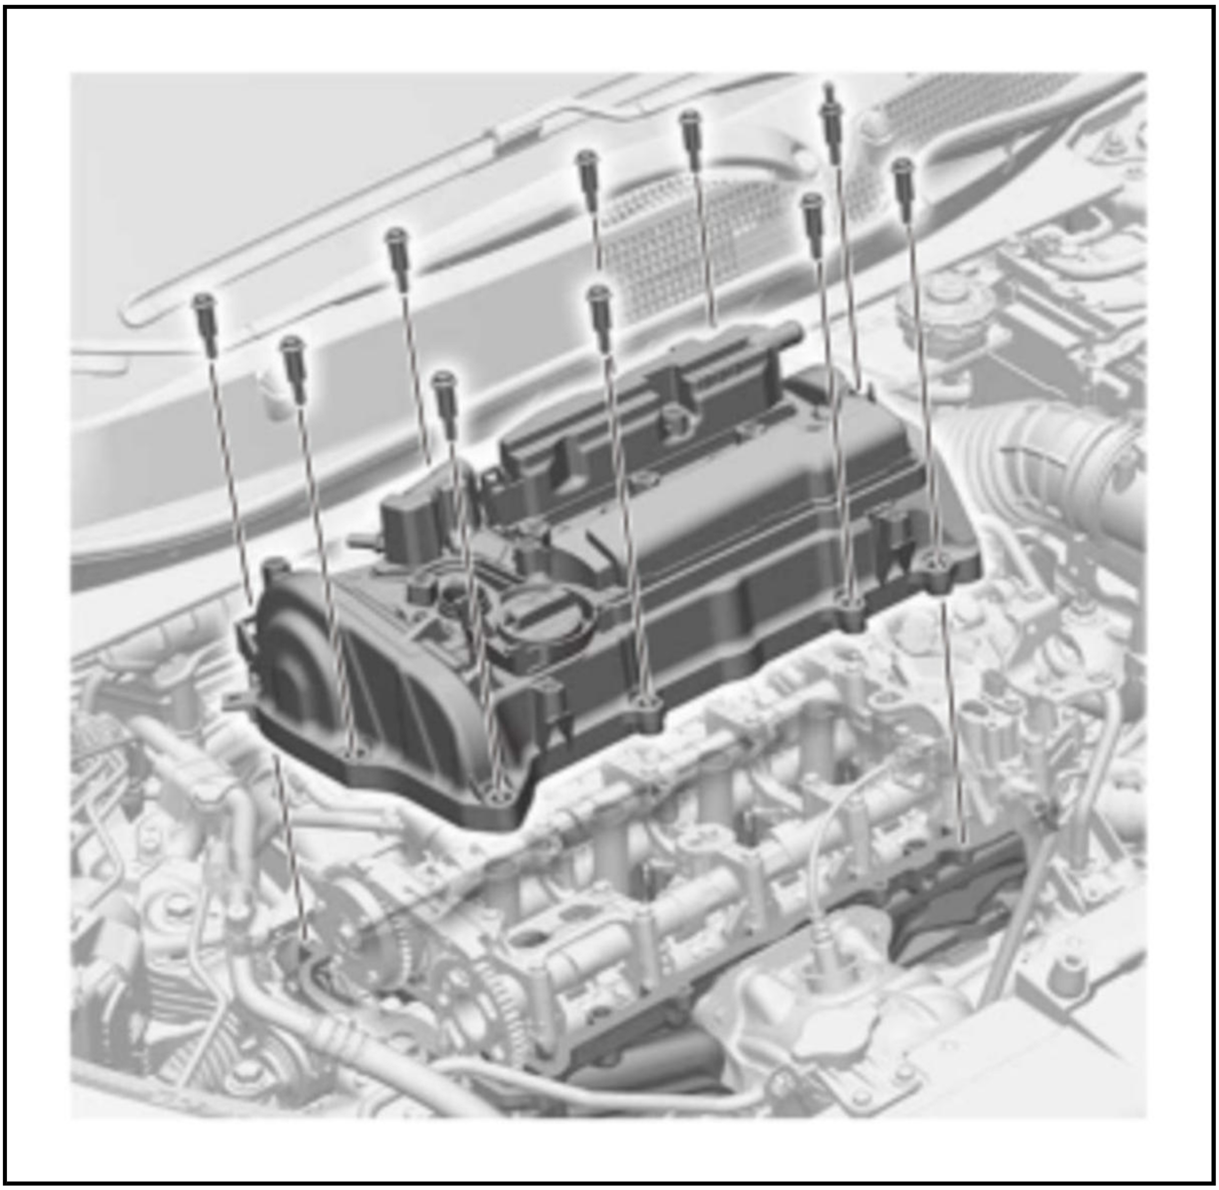
	1. Remove the harness clamps (A). 2. Disconnect the connectors (B) and the positive alternator cable (C).

	3. Remove the harness clamps (A).

	4. Remove the connector clamp (A) and the harness holder (B).

5. **High Pressure Fuel Pump Cover - Remove**

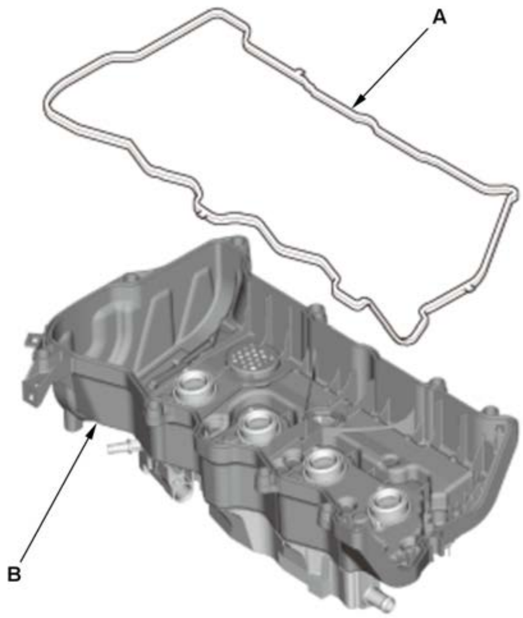
6. Cylinder Head Cover - Remove



Installation

NOTE: **How to read the torque specifications** .

1. Cylinder Head Cover - Install



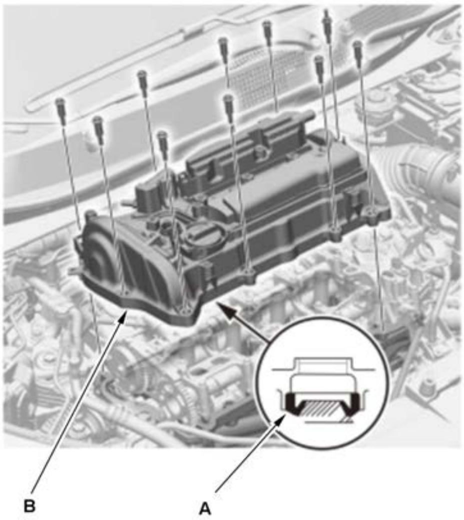
1. Check the spark plug seals for damage. If any seals are damaged, replace it.

2. Thoroughly clean the head cover gasket (A) and the groove of the cylinder head cover (B).

NOTE:

Check and, if necessary, replace the head cover gasket.

3. Install the head cover gasket in the groove of the cylinder head cover. Make sure the head cover gasket is seated securely.



4. Apply liquid gasket

, on the chain case and the high pressure fuel pump base or the side cover mating areas.

5. Set the spark plug seals (A) on the spark plug tubes. Place the cylinder head cover (B) on the cylinder head, then slide the cover slightly back and forth to seat the head cover gasket.

6. Inspect the spark plug seals for damage.

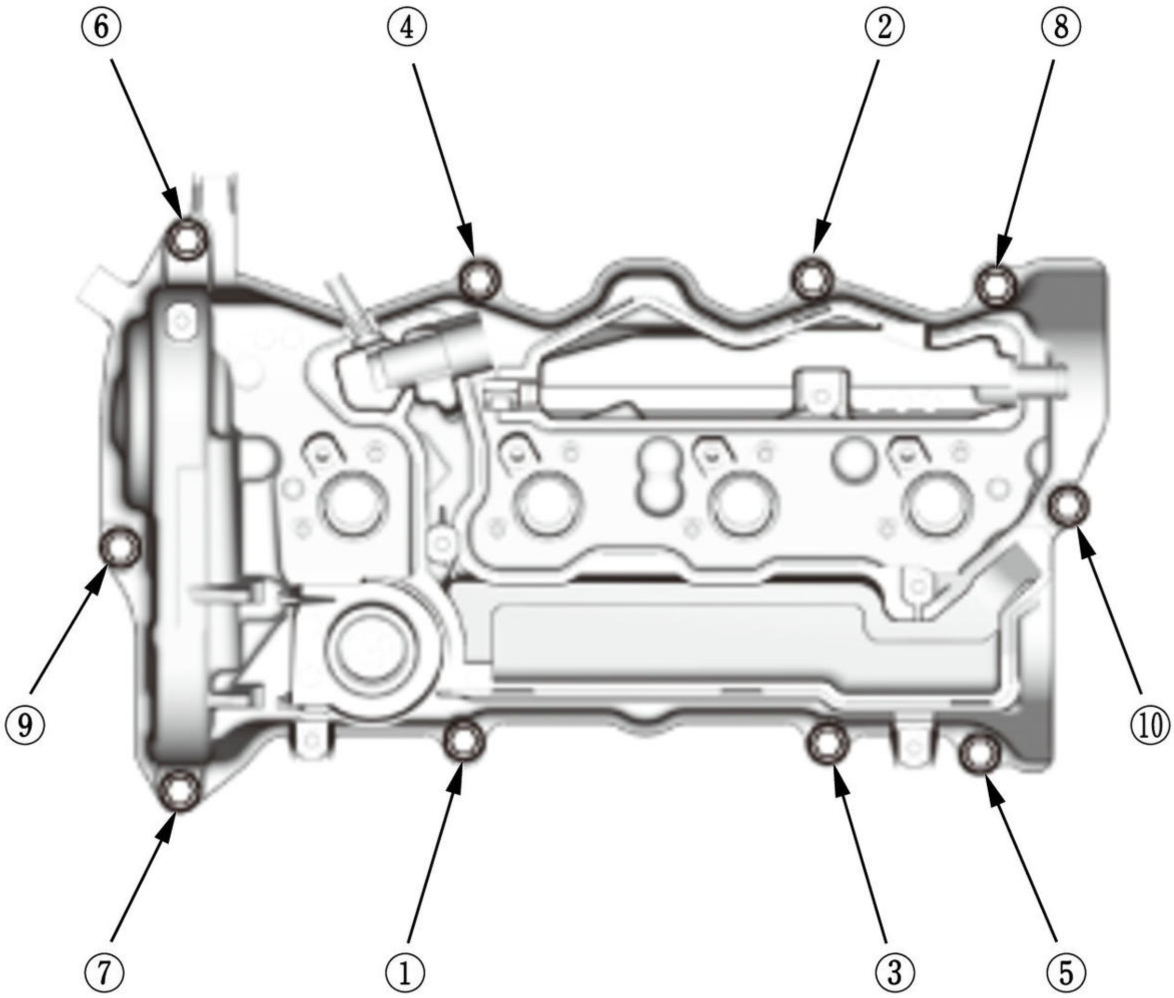


Fig. 2: Tightening Cylinder Head Cover Bolts In Sequence
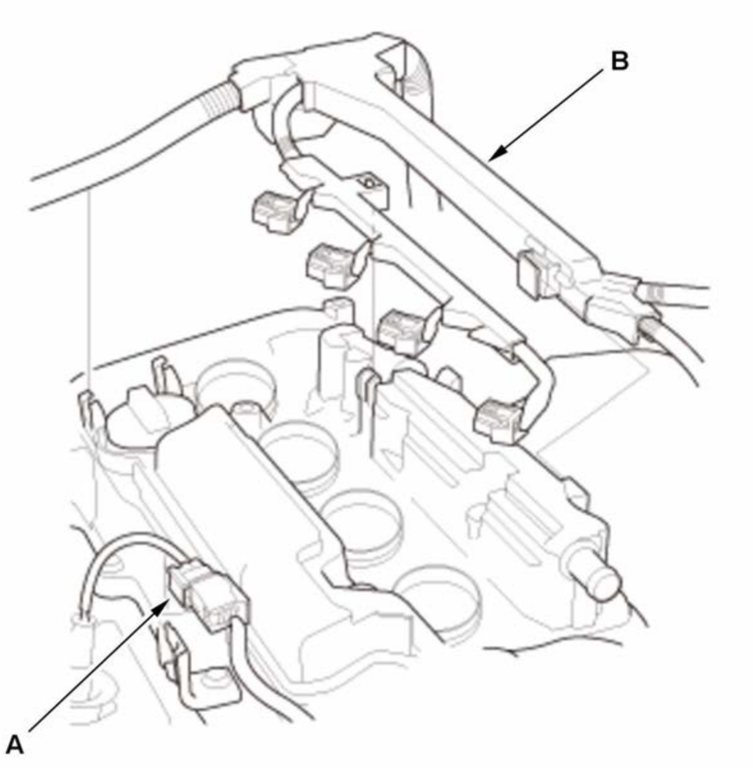
Courtesy of HONDA, U.S.A., INC.

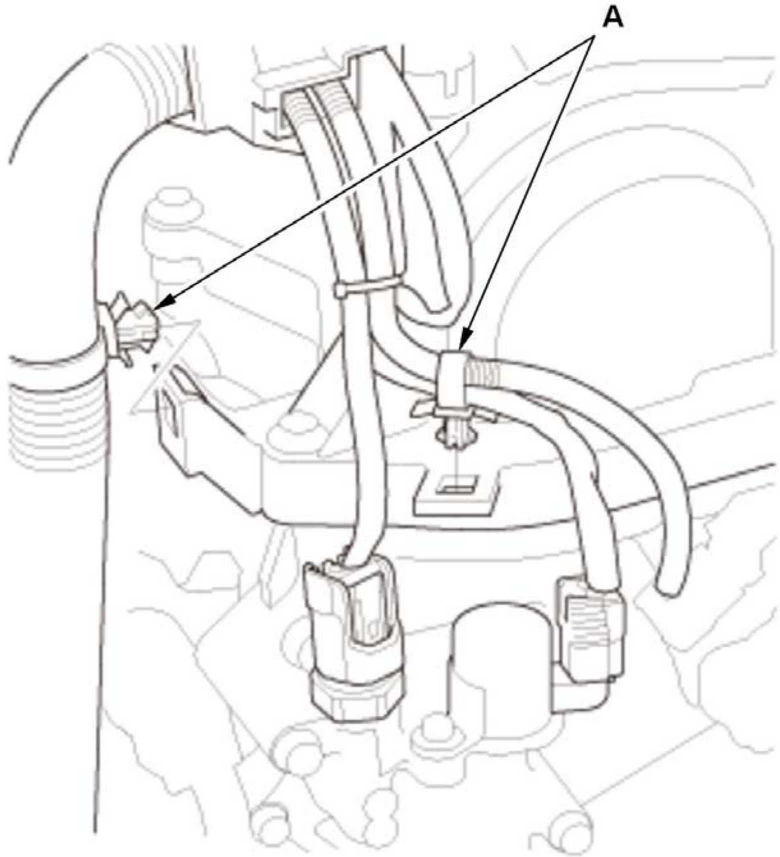
7. Tighten the bolts in two steps. In the final step torque bolts, in sequence, to 7.0 N.m (0.71 kgf.m, 5.2 lbf.ft).**NOTE:**

- Wait at least 30 minutes before filling the engine with oil.
- Do not run the engine for at least 3 hours after installing the head cover.

2. **High Pressure Fuel Pump Cover - Install**
3. Harness Holder - Install



1. Install the connector clamp (A) and the harness holder (B).



2. Install the harness clamps (A).

	3. Connect the connectors (A) and the positive alternator cable (B). Make sure the crimped side of the ring terminal faces away from the alternator when you connect it. 4. Install the harness clamps (C).

4. Breather Hose and PCV Hose - Connect

	1. Connect the breather hose (A) and the PCV hose (B).

5. **Ignition Coil - Install**
6. **12 Volt Battery Terminal - Connect**

CYLINDER HEAD REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal

WARNING:

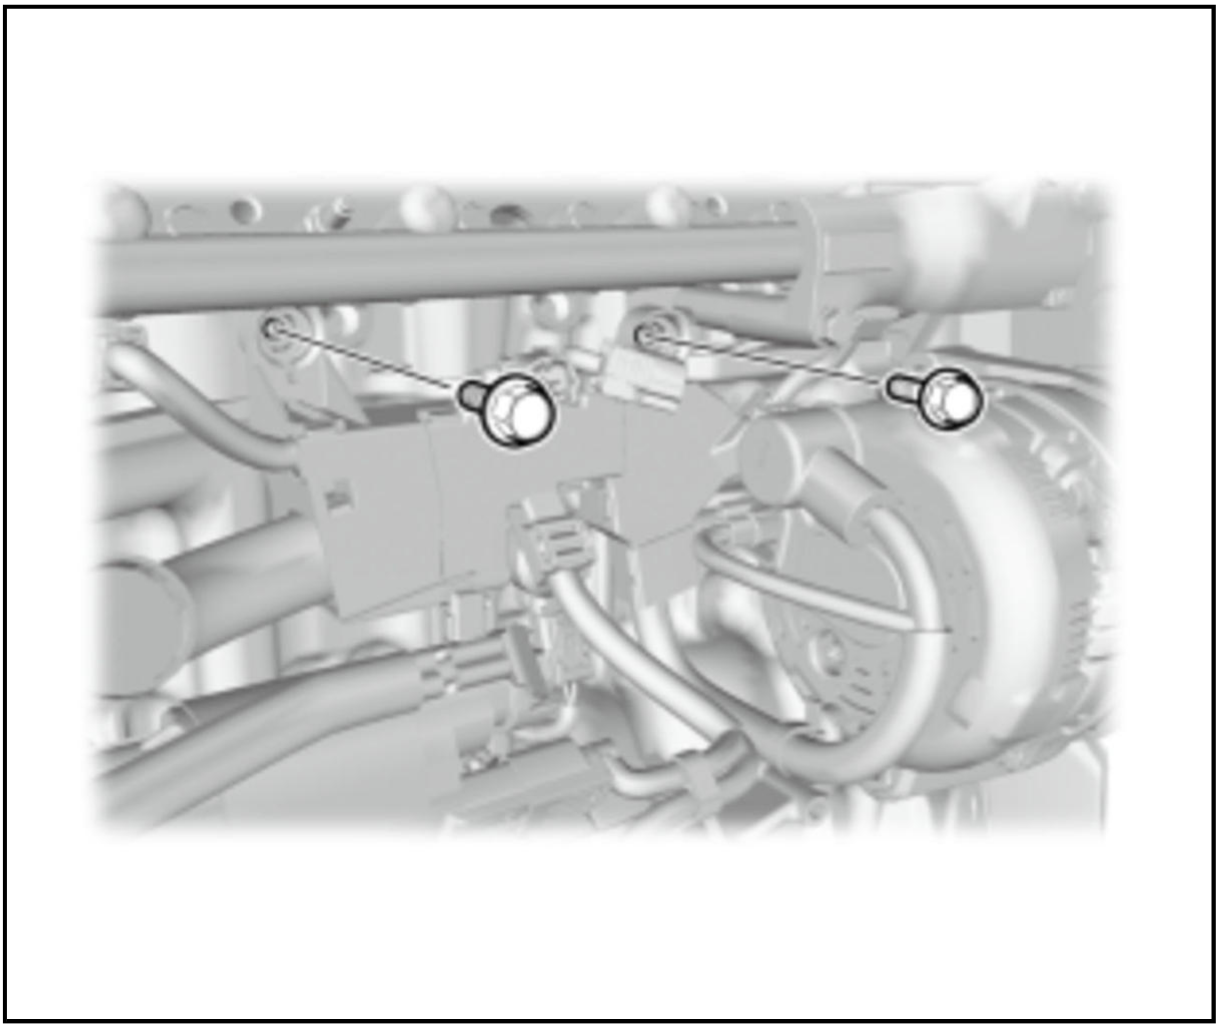
Please carefully read "Precaution for Handling Sodium-Filled Valves" and follow the instructions as the exhaust valves contain metal sodium .

NOTE:

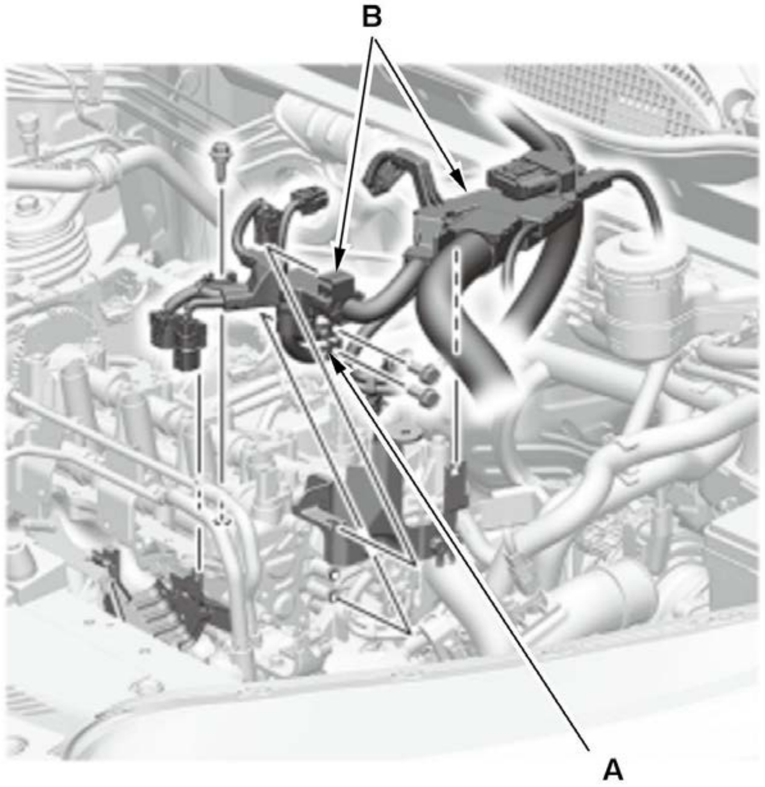
- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.
- **Connect the HDS to the DLC** , and monitor ECT SENSOR 1. To avoid damaging the cylinder head, wait until the engine coolant temperature drops below 100B°F (38B°C) before loosening the cylinder head bolts.

- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.
- Keep the cam chain away from magnetic fields.

1. **Fuel Pressure - Relieve**
2. **Engine Coolant - Drain**
3. **Air Cleaner - Remove**
4. **TWC Assembly - Remove**
5. **Turbocharger - Remove**
6. **VTC Oil Control Solenoid Valve B - Remove**
7. **Intake Manifold - Remove**
8. **High Pressure Fuel Pump - Remove**
9. **Injector - Remove**
10. Harness Holder Mounting Bolt - Remove

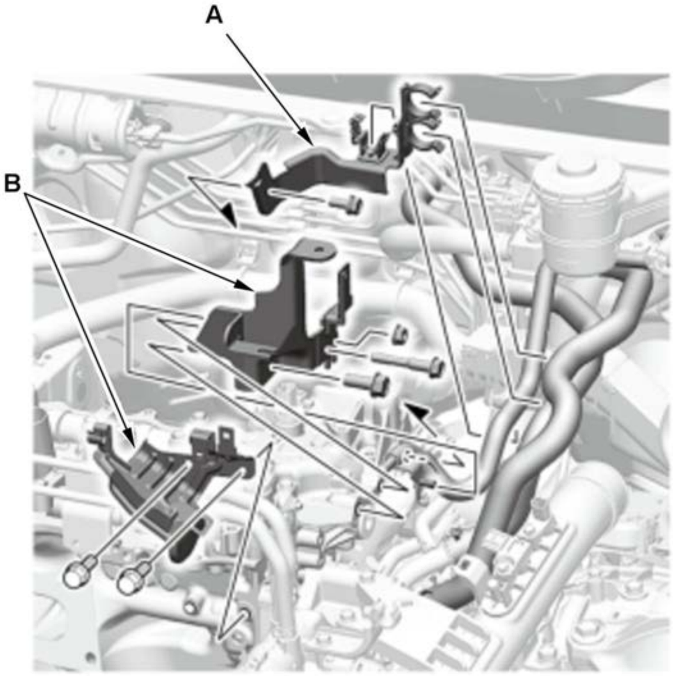


11. **Cylinder Head Cover - Remove**
12. **EVAP Canister Purge Valve - Remove**
13. **CMP Sensor A/B - Remove**
14. High Pressure Fuel Pump Base - Remove



1. Remove the ground cables (A).

2. Remove the harness holders (B).



3. Remove the heater hose bracket (A) and the harness holder brackets (B).

	4. Remove the cam holder cover (A).
	5. Remove the high pressure fuel pump base (A).

15. Thermostat Housing - Remove
16. Cam Chain - Remove
17. Camshaft - Remove
18. Rocker Arm Assembly - Remove
19. Cylinder Head - Remove

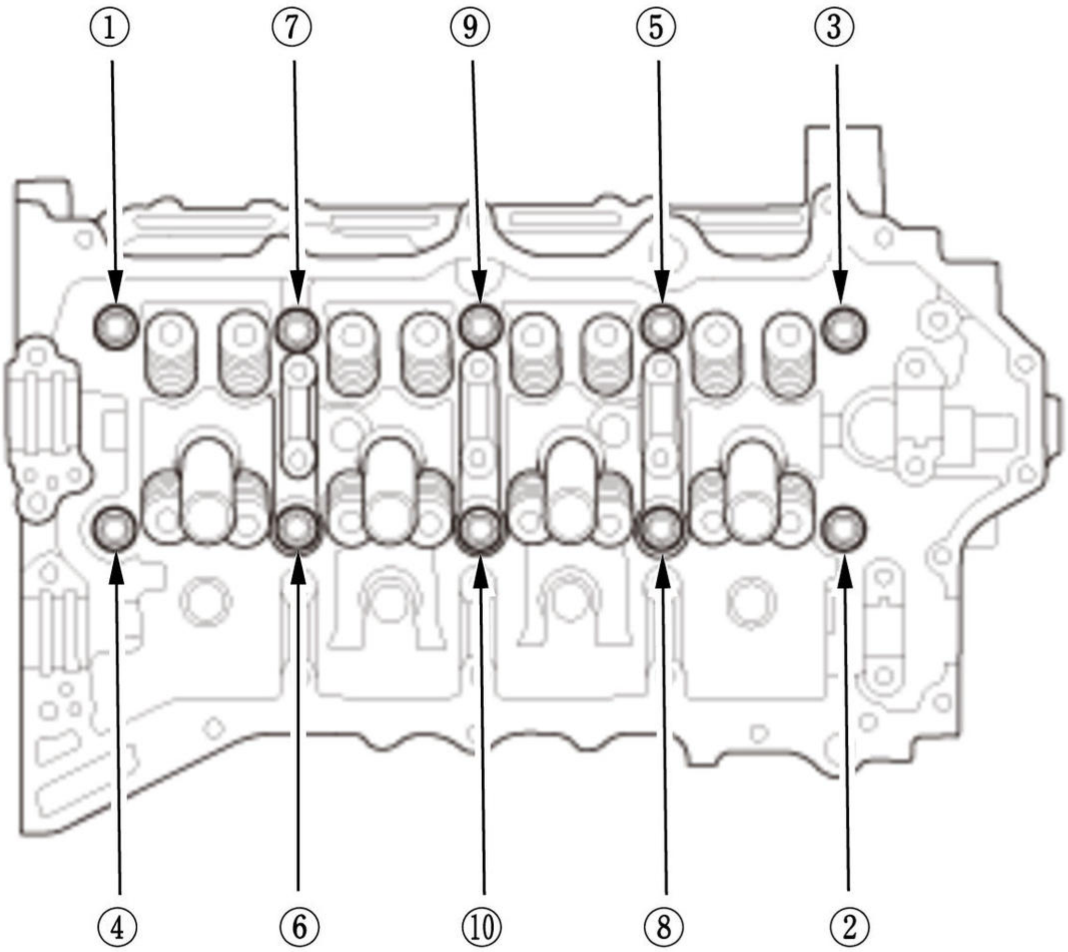


Fig. 3: Removing Cylinder Head Bolts In Sequence
Courtesy of HONDA, U.S.A., INC.

1. Remove the cylinder head bolts. To prevent warpage, loosen the bolts in sequence, 1/3 turn at a time, repeat the sequence until all bolts are loosened. 2. Remove the cylinder head.

Installation

NOTE: How to read the torque specifications .

1. Cylinder Head - Install

 	1. Clean the cylinder head and engine block surfaces. 2. Install a new coolant separator (A) in the engine block whenever the engine block is replaced. 3. Install the new cylinder head gasket (B) and the dowel pins (C) on the engine block. Always use a new cylinder head gasket. 4. Install the cylinder head on the engine block.

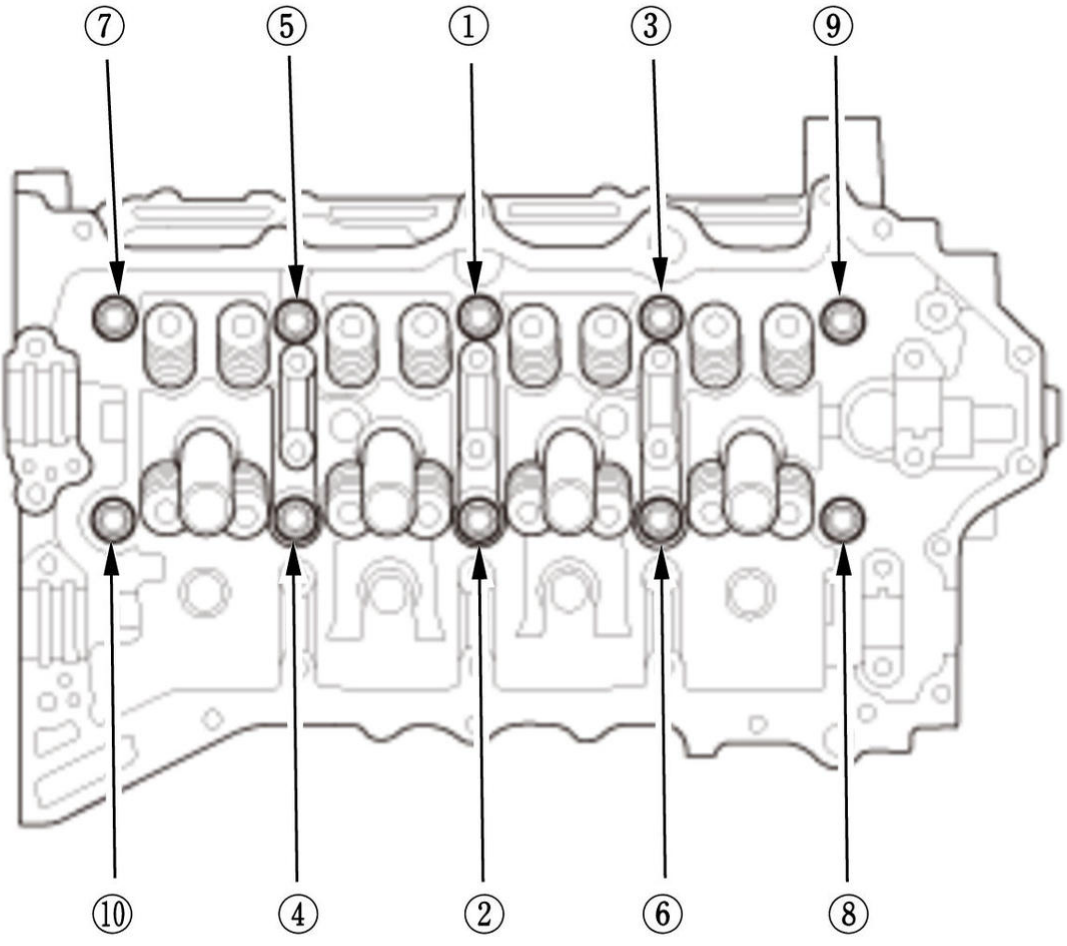

Fig. 4: Tightening Cylinder Head Bolts In Sequence
Courtesy of HONDA, U.S.A., INC.

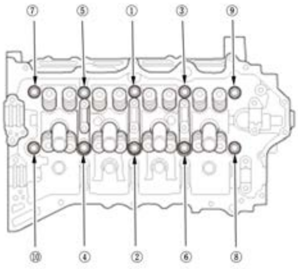
When the new cylinder head bolt is installed
5. Apply new engine oil to the threads and under the bolt heads of all cylinder head bolts.

6. Torque the cylinder head bolts in sequence to 30 N.m (3.1 kgf.m, 22 lbf.ft) with a beam-type torque wrench if possible. When using a preset click-type torque wrench, be sure to tighten slowly and do not overtighten. If a bolt makes any noise while you are torquing it, loosen the bolt and go back to step 5.

7. After torquing, tighten all cylinder head bolts an additional 165B°, in the numbered sequence shown.

NOTE:

- **Tighten the cylinder head bolts to the specified angle, using a commercially available angle gauge.**
- **Remove the cylinder head bolt if you tightened it beyond the specified angle and go back to step 5 of the procedure. Do not loosen it back to the specified angle.**



When the cylinder head bolt is reused

8. Apply new engine oil to the threads and under the bolt heads of all cylinder head bolts.

9. Torque the cylinder head bolts in sequence to 30 N.m (3.1 kgf.m, 22 lbf.ft) with a beam-type torque wrench if possible. When using a preset click-type torque wrench, be sure to tighten slowly and do not overtighten. If a bolt makes any noise while you are torquing it, loosen the bolt and go back to step 8.

10. After torquing, tighten all cylinder head bolts an additional 140B°, in the numbered sequence shown.

NOTE:

- **Tighten the cylinder head bolts to the specified**

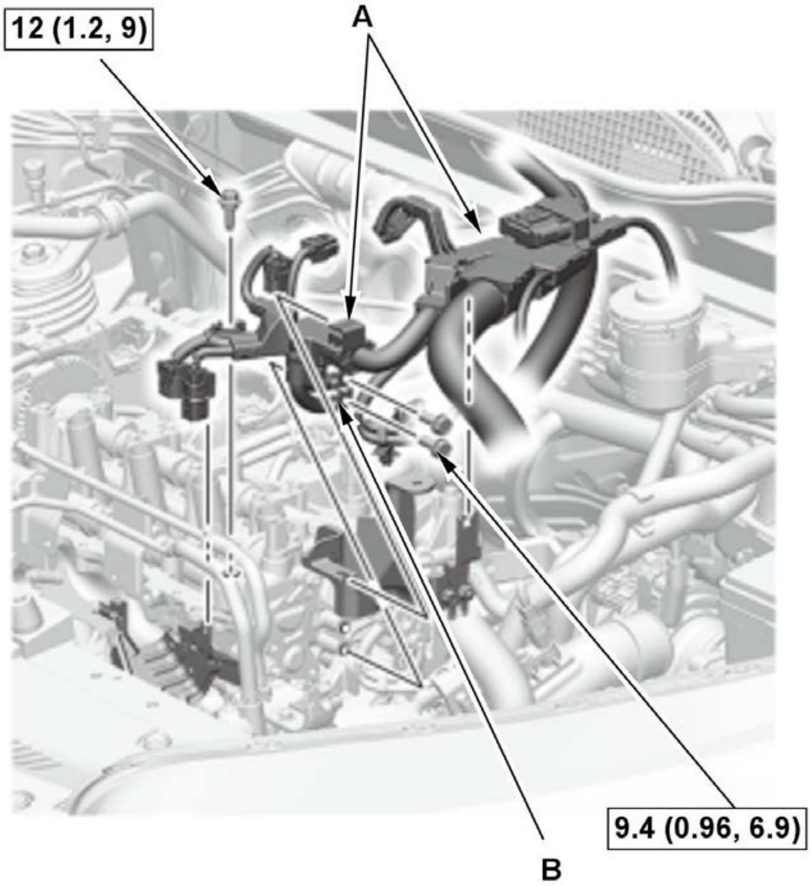
	angle, using a commercially available angle gauge. • Remove the cylinder head bolt if you tightened it beyond the specified angle and go back to step 8 of the procedure. Do not loosen it back to the specified angle.

2. Rocker Arm Assembly - Install
3. Camshaft - Install
4. Cam Chain - Install
5. Valve Clearance - Adjust
6. Thermostat Housing - Install
7. High Pressure Fuel Pump Base - Install

	1. Apply liquid gasket to the cylinder head mating surface of the high pressure fuel pump base and to the inside edge of the threaded bolt holes. 2. Install the high pressure fuel pump base (A).

 12 (1.2, 9) 12 (1.2, 9) A	3. **Apply liquid gasket** to the cylinder head and the high pressure fuel pump base mating surface of the cam holder cover and to the inside edge of the threaded bolt holes. 4. Install the cam holder cover (A).

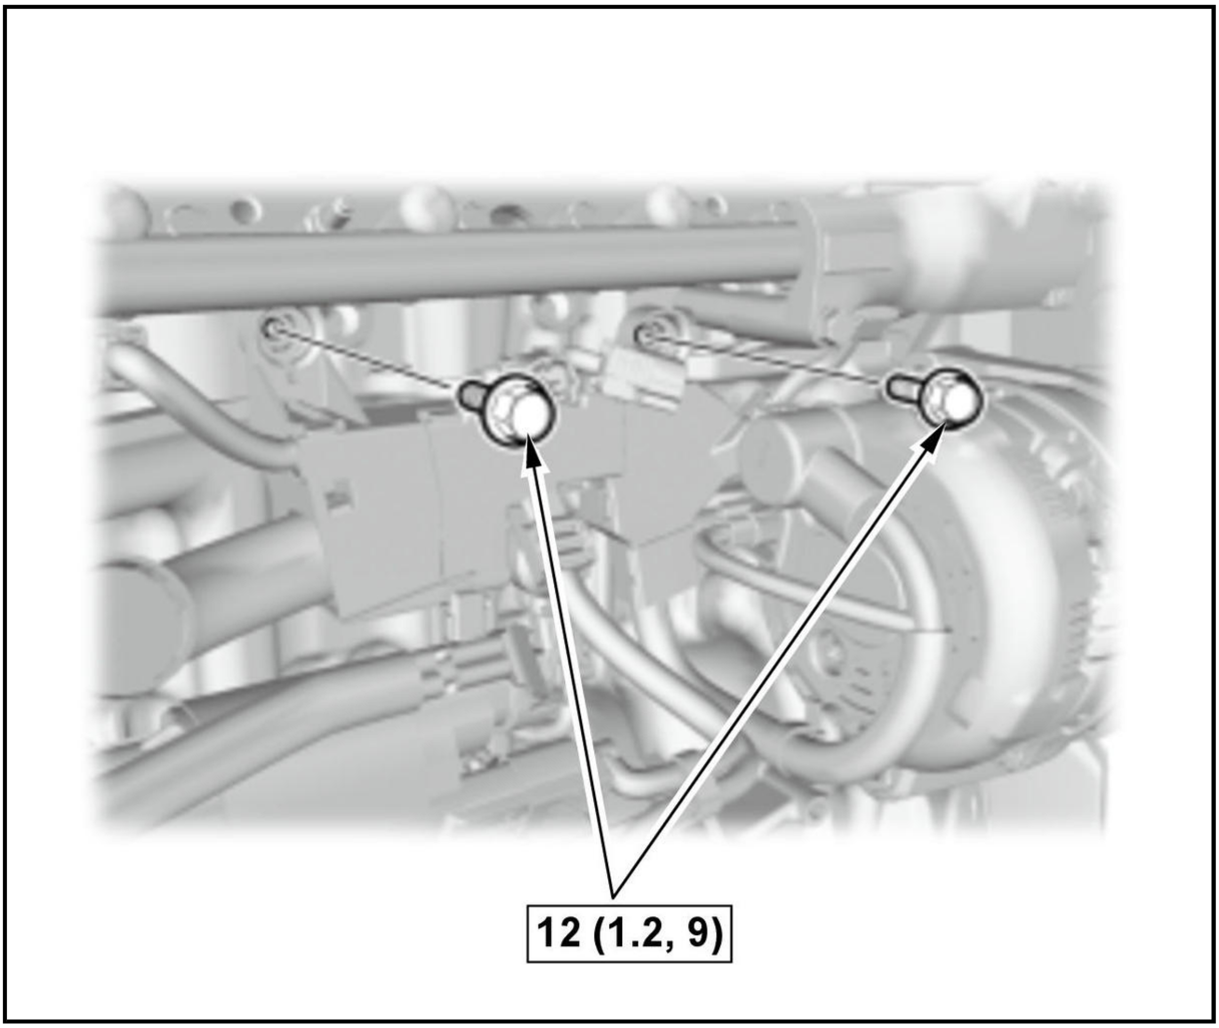
 9.8 (1.00, 7.2) B 12 (1.2, 9) A 12 (1.2, 9) 24 (2.4, 18)	5. Install the harness holder bracket (A) and the heater hose brackets (B).



6. Install the harness holders (A).

7. Install the ground cables (B).

8. **CMP Sensor A/B - Install**
9. **EVAP Canister Purge Valve - Install**
10. **Cylinder Head Cover - Install**
11. Harness Holder Mounting Bolt - Install



12. Injector - Install
13. High Pressure Fuel Pump - Install
14. Intake Manifold - Install
15. VTC Oil Control Solenoid Valve B - Install
16. Turbocharger - Install
17. TWC Assembly - Install
18. Air Cleaner - Install
19. After Installation - Check

1. After installation, check that all tubes, hoses, and connectors are installed correctly.

20. Engine Coolant - Refill
21. Fuel Leak (Low Pressure Side) - Check

1. Turn the vehicle to the ON mode, but do not start the engine. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three time, then check for fuel leakage.

22. Fuel Leak (High Pressure Side) - Check
23. Idle Speed - Inspect
24. Ignition Timing - Inspect

CYLINDER HEAD REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal

NOTE:

- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.
- Connect the HDS to the DLC , and monitor ECT SENSOR 1. To avoid damaging the cylinder head, wait until the engine coolant temperature drops below 100B°F (38B°C) before loosening the cylinder head bolts.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Fuel Pressure - Relieve
2. 12 Volt Battery Terminal - Disconnect
3. Engine Coolant - Drain
4. Intake Manifold - Remove
5. Fuel Rail and Injector - Remove
6. Warm Up TWC - Remove
7. High Pressure Fuel Pump - Remove
8. Cylinder Head Cover - Remove
9. Thermostat Housing - Remove
10. Cam Chain - Remove
11. Rocker Arm Assembly - Remove
12. Cylinder Head - Remove

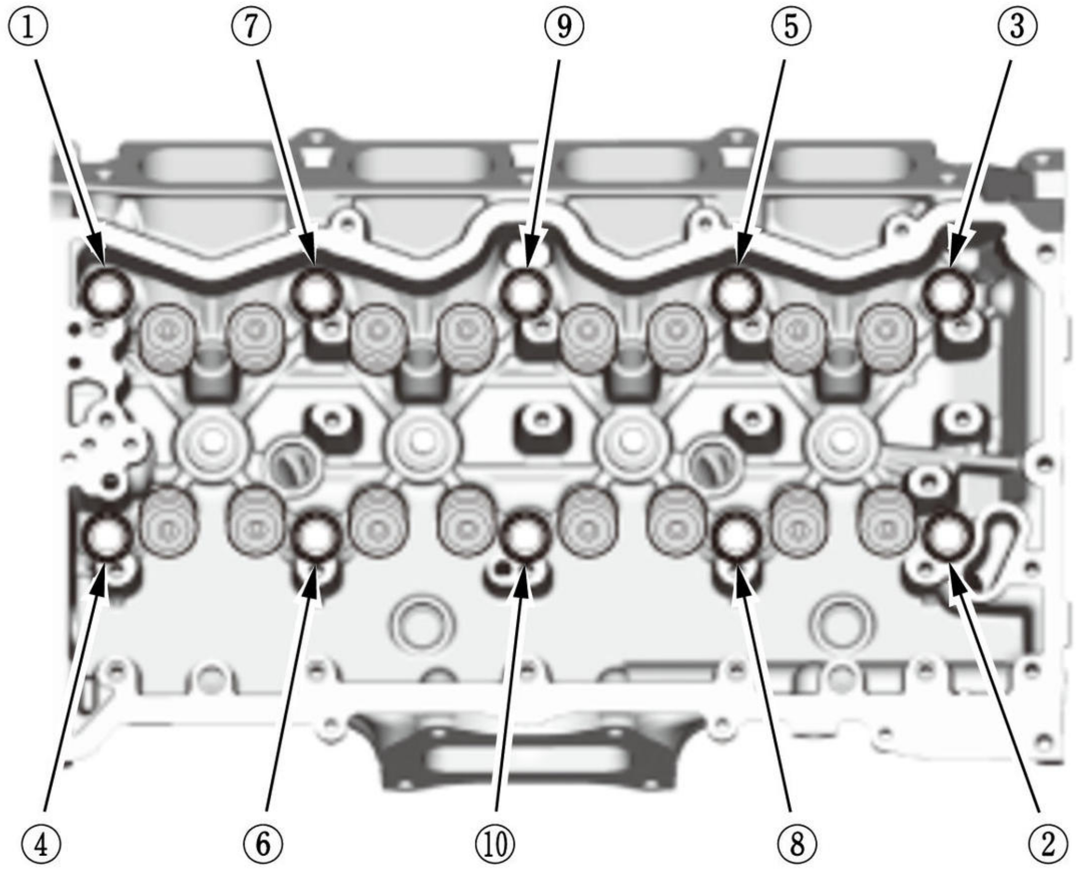


Fig. 5: Removing Cylinder Head Bolts In Sequence
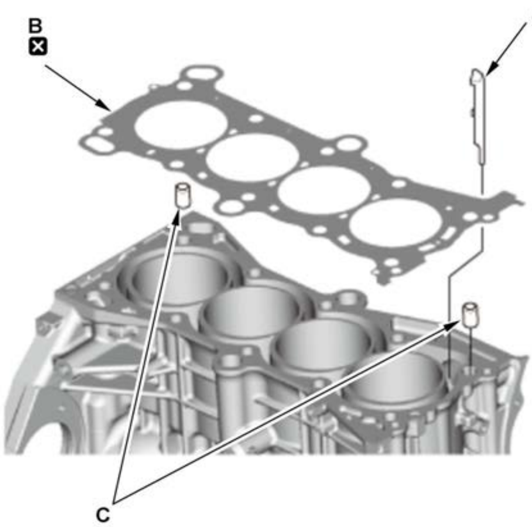
Courtesy of HONDA, U.S.A., INC.

1. Remove the cylinder head bolts. To prevent warpage, loosen the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.

2. Remove the cylinder head.

Installation

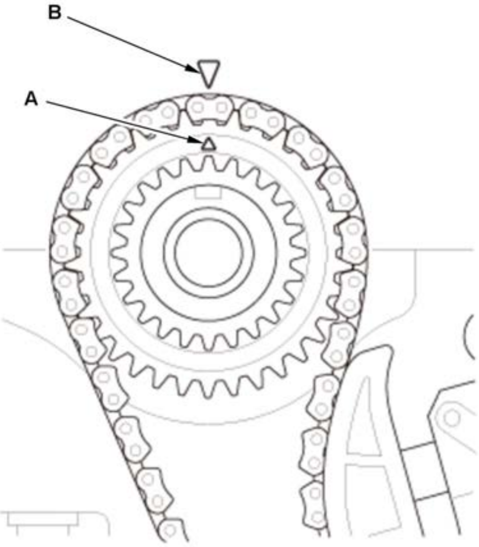
1. Cylinder Head - Install



1. Clean the cylinder head and the engine block surface.

2. Install a new coolant separator (A) in the engine block whenever the engine block is replaced.

3. Install a new cylinder head gasket (B) and the dowel pins (C) on the engine block. Always use a new cylinder head gasket.



4. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the engine block.

5. Install the cylinder head on the engine block.

6. Measure the diameter of each cylinder head bolt at point A and point B.

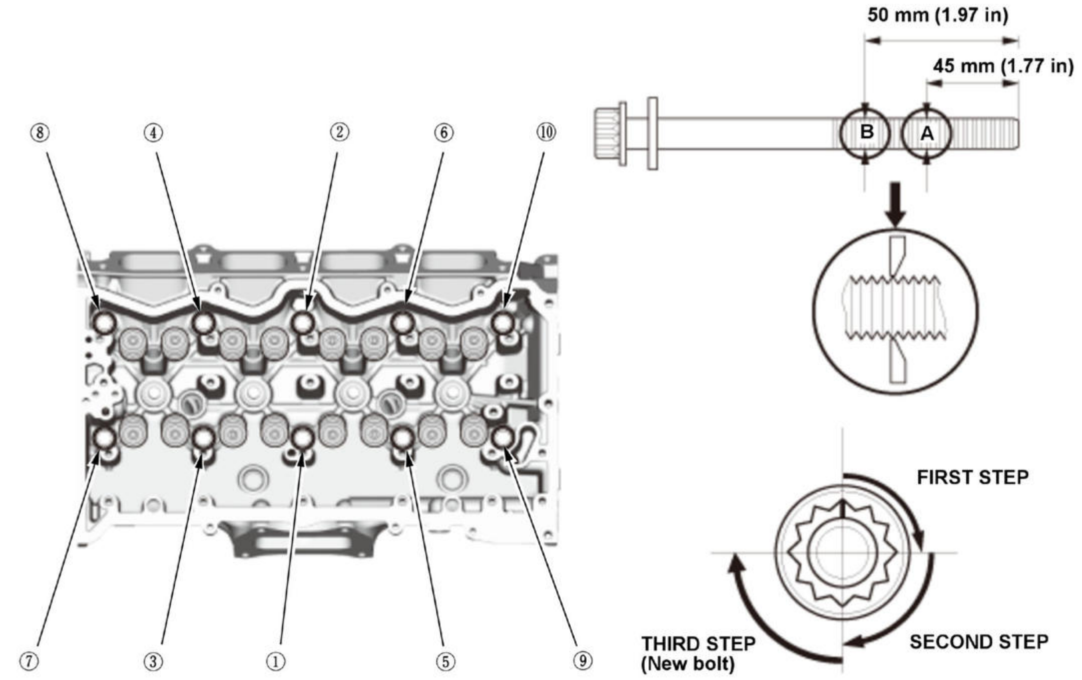


Fig. 6: Tightening Cylinder Head In Sequence
Courtesy of HONDA, U.S.A., INC.

7. If either diameter is less than 10.6 mm (0.417 in), replace the cylinder head bolt.

8. Apply new engine oil to the threads and under the bolt heads of all cylinder head bolts.

9. Torque the cylinder head bolts in sequence to 40 N.m (4.1 kgf.m, 30 lbf.ft). Use a beam-type torque wrench. When using a preset click-type torque wrench, be sure to tighten slowly and do not overtighten. If a bolt makes any noise while you are torquing it, loosen the bolt and retighten it from the first step.

10. After torquing, tighten all cylinder head bolts in two steps (90B° per step) using the sequence shown in step 9. If you are using a new cylinder head bolt, tighten the bolt an extra 90B°

NOTE: **Remove the cylinder head bolt if you tightened it beyond the specified angle, and go back to step 6 of the procedure. Do not loosen it back to the specified angle.**

2. Rocker Arm Assembly - Install
3. Cam Chain - Install
4. Valve Clearance - Adjust
5. Thermostat Housing - Install
6. Cylinder Head Cover - Install
7. High Pressure Fuel Pump - Install
8. Warm Up TWC - Install
9. Fuel Rail and Injector - Install
10. Intake Manifold - Install
11. After Installation - Check

1. After installation, check that all tubes, hoses, and connectors are installed correctly.

12. **12 Volt Battery Terminal - Connect**
13. Fuel Leak (Low Pressure) - Check

1. Turn the vehicle to the ON mode, but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail will be pressurized. Repeat this two or three times, then check for fuel leakage.

14. **Fuel Leak (High Pressure) - Check**
15. **Engine Coolant - Refill**
16. **CKP Pattern - Clear/Learn**
17. **Idle Speed - Inspect**
18. **Ignition Timing - Inspect**

Electric Powertrain Cooling System Service Specifications - CR-V (Hybrid)

ELECTRIC POWERTRAIN

Item	Measurement	Qualification	Standard or New	Service Limit
Radiator	Coolant capacity (including expansion tank)	PCU coolant change	0.93 L (0.246 US gal)	-
		PCU removal	1.60 L (0.423 US gal)	-
	Coolant type	B	Use Honda Long Life Antifreeze/Coolant Type 2, and add Honda Extreme Cold Weather Antifreeze/Coolant Type 2. **NOTE:** If the vehicle is regularly driven in very low temperatures (below -22B°F (-30B°C)), a 60 % concentration of coolant should be used.	
Expansion tank	Coolant capacity	B	0.31 L (0.082 US gal)	-
Expansion tank cap	Opening pressure	B	34.3-63.7 kPa (0.350-0.650 kgf/cm 2, 4.97-9.24 psi)	-

2020-22 ENGINE

Engine Assembly Service Specifications - CR-V (Hybrid)

ENGINE ASSEMBLY

Item	Measurement	Qualification	Standard or New	Service Limit
Compression	Pressure	Minimum	-	880 kPa (8.97 kgf/cm 2, 127.6 psi)
		Maximum variation	-	200 kPa (2.04 kgf/cm 2, 29.0 psi)

CYLINDER HEAD

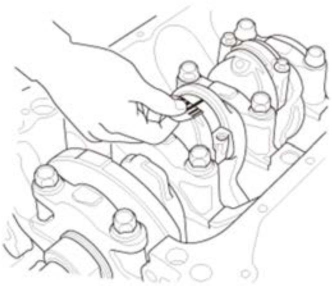
REPLACEMENT

CONNECTING ROD BEARING REPLACEMENT (1.5 L ENGINE)

Replacement

1. Engine - Remove
2. Transmission - Remove
3. Drive Plate - Remove
4. Cylinder Head - Remove
5. Oil Pan - Remove
6. Oil Strainer - Remove
7. Connecting Rod Cap and Bearing Half - Remove
8. Connecting Rod Bearing Clearance - Inspect



1. Clean the connecting rod journal and the bearing half with a clean shop towel.

2. Place plastigage across the rod journal.

3. Reinstall the bearing half and the connecting rod cap, then torque the bolts to 13 N.m (1.3 kgf.m, 10 lbf.ft) +90 deg..

NOTE:

- Apply new engine oil to the bolt threads and flanges.
- Do not rotate the crankshaft during inspection.

4. Remove the connecting rod cap and the bearing half, and measure the widest part of the plastigage.

5. If the plastigage measures too wide or too narrow, remove the connecting rod cap, and the upper half of the bearing. Install a new, complete bearing with the appropriate color code, and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.

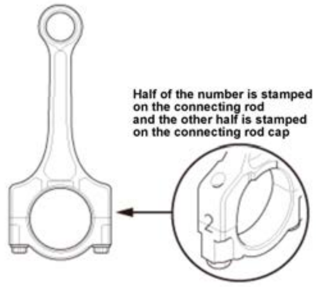
6. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check the clearance again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft

and start over.

Connecting Rod Bearing-to-Journal Oil Clearance	
Standard (New):	**0.020-0.038 mm (0.00079-0.00150 in)**

9. Connecting Rod Bearing - Select

Connecting Rod Big End Bore Code Locations



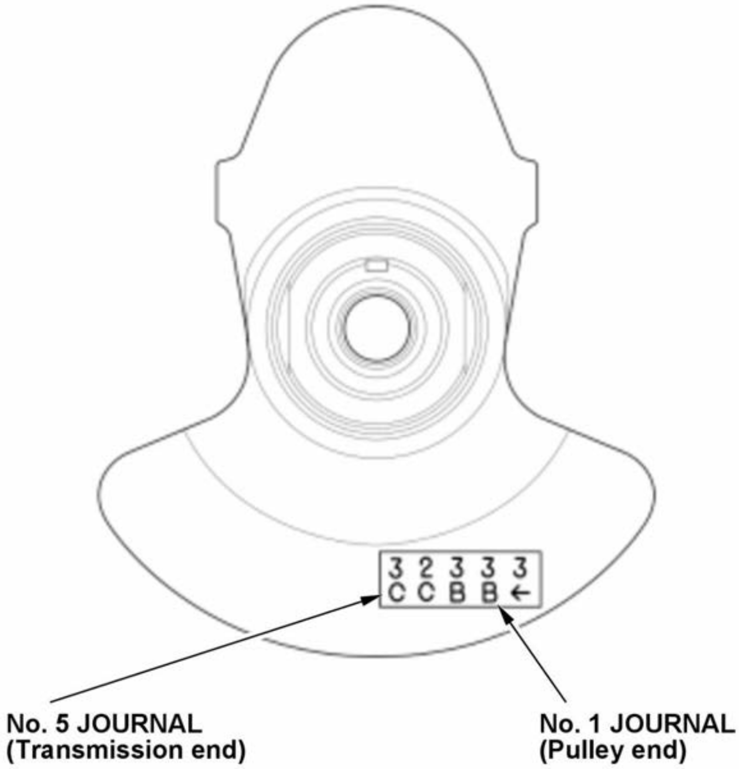
Half of the number is stamped on the connecting rod and the other half is stamped on the connecting rod cap
2

1. Inspect each connecting rod for cracks and heat damage.

2. Each connecting rod has a tolerance range from 0 to 0.024 mm (0.00094 in), in 0.006 mm (0.00024 in) increments, depending on the size of its big end bore. It's then stamped with a number (1, 2, 3, or 4) indicating the range. You may find any combination of numbers in any engine. (Half the number is stamped on the connecting rod cap, the other half is on the connecting rod.) If you cannot read the code because of an accumulation of oil and varnish, do not scrub it with a wire brush or scraper. Clean it only with solvent or detergent.

Big End Bore Size:	**43.0 mm (1.693 in)**

Connecting Rod Journal Code Location



3 2 3 3 3
C C B B ←
No. 5 JOURNAL
(Transmission end)
No. 1 JOURNAL

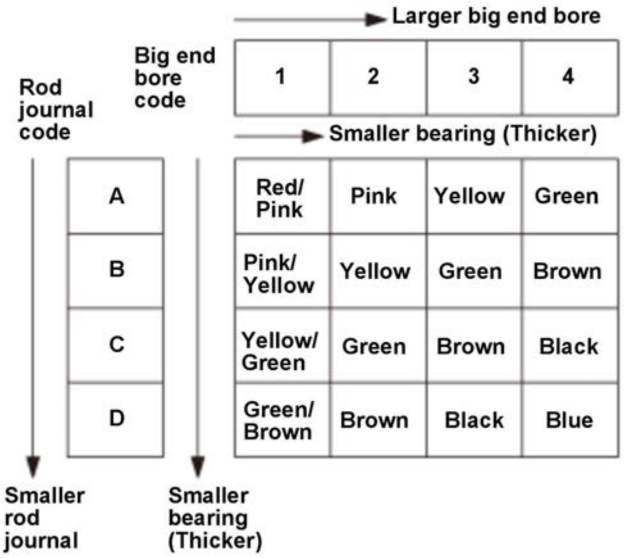
3. The connecting rod journal codes are stamped on the crankshaft in either location.

Bearing Identification



Larger big end bore
Big end bore code
Smaller bearing (Thicker)
Smaller rod journal
Smaller bearing (Thicker)

Rod journal code	1	2	3	4
A	Red/ Pink	Pink	Yellow	Green
B	Pink/ Yellow	Yellow	Green	Brown
C	Yellow/ Green	Green	Brown	Black
D	Green/ Brown	Brown	Black	Blue

4. Use the big end bore codes and the rod journal codes to select appropriate replacement bearings from the following table.

NOTE:

- Color code is on the edge of the bearing.
- When using bearing halves of different colors, it does not matter which color is used in the top or bottom.

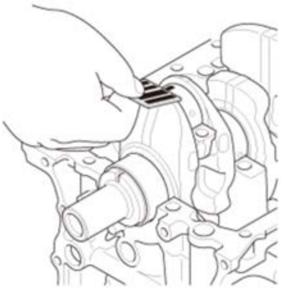
10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.**NOTE:** **Inspect the diameter of each connecting rod bolt** when you install the connecting rod caps.

CONNECTING ROD BEARING REPLACEMENT (2.4 L ENGINE) (2017 2018 2019)

Replacement

1. **Engine - Remove**
2. **Transmission - Remove**
3. **Drive Plate - Remove**
4. **Cylinder Head - Remove**
5. **Oil Pump - Remove**
6. **Baffle Plate - Remove**
7. **Connecting Rod Cap and Bearing Half - Remove**
8. Connecting Rod Bearing Clearance - Inspect



1. Clean the connecting rod journal and the bearing half with a clean shop towel.

2. Place plastigage across the connecting rod journal.

3. Reinstall the bearing half and the connecting rod cap, then torque the bolts to 41 N.m (4.2 kgf.m, 30 lbf.ft) + 120 deg..

NOTE:

- Apply new engine oil to the bolt threads and flanges.
- Do not rotate the crankshaft during inspection.

4. Remove the connecting rod cap and the bearing half, and measure the widest part of the plastigage.

5. If the plastigage measures too wide or too narrow, remove the cap, and the upper half of the bearing. Install a new, complete bearing with the appropriate color code (s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.

6. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check the clearance again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, **replace the crankshaft**

and start over.

Connecting Rod Bearing-to-Journal Oil Clearance

10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CRANKSHAFT MAIN BEARING REPLACEMENT (1.5 L ENGINE)

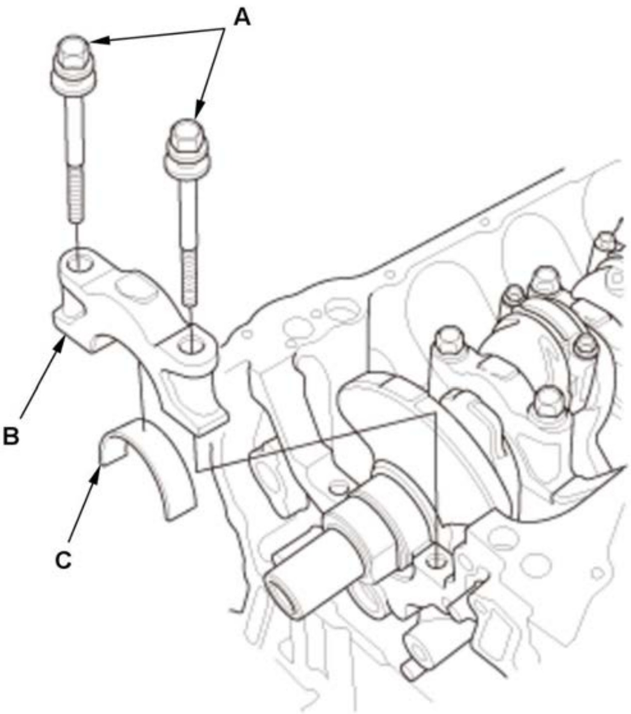
Replacement

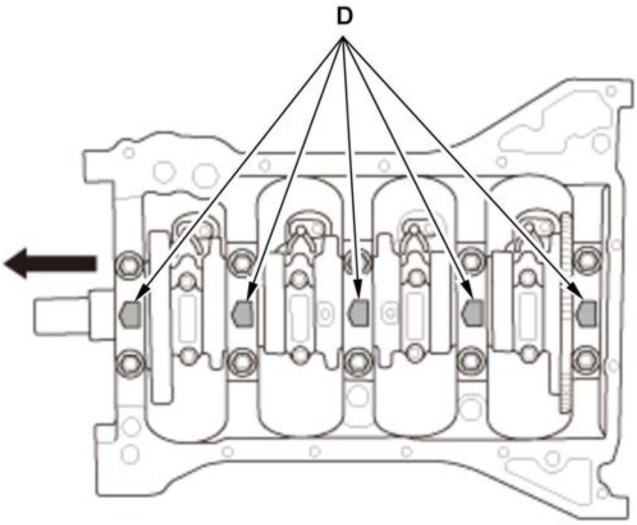
1. Engine - Remove
2. Transmission - Remove

3. Drive Plate - Remove
4. Cylinder Head - Remove
5. Cam Chain Drive Sprocket - Remove

 	1. Remove the key (A) and the cam chain drive sprocket (B).**NOTE:** Check the direction of the key. When the key is installed, install the key as same direction of the original one.

6. Oil Pan - Remove
7. Oil Pump - Remove
8. Oil Seal Case - Remove
9. Main Bearing Cap and Bearing Half - Remove
10. Crankshaft Main Bearing Clearance - Inspect





1. Clean each main journal and the bearing half with a clean shop towel.

2. Place one strip of plastigage across each main journal.

3. Apply new engine oil to the bearing cap bolts (A) threads and flanges.

4. Install the bearing cap bolts to the main bearing cap (B).

5. Set the bearing halves (C), the main bearing caps, and the bearing cap bolts in place. Then loosely tighten the bearing cap bolts.

NOTE:

- Install the main bearing caps aligning the arrows (D) with the direction to the cam chain case.
- When loosely tightening the bearing cap bolts, do not sit the bolts on the bearing caps.

6. Lightly tap the main bearing caps with a plastic mallet until the main bearing caps sit on the engine block.

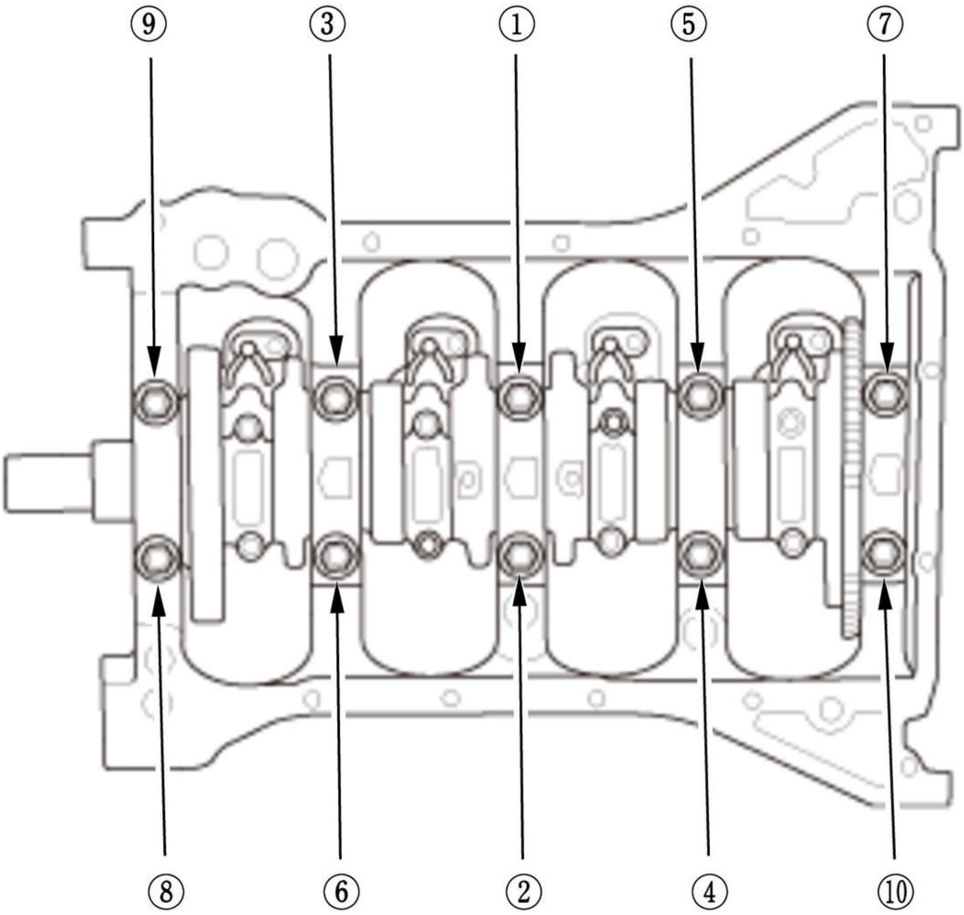


Fig. 1: Bearing Cap Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

B	7. Tighten the bearing cap bolts, in the numbered sequence shown, to the specified torque. **NOTE:** Do not rotate the crankshaft during inspection.

Specified Torque:
30 N.m (3.1 kgf.m, 22 lbf.ft)

 	8. Tighten the bearing cap bolts an additional 40 deg..

	9. Remove the main bearing cap and the bearings again, and measure the widest part of the plastigage. 10. If the plastigage measures too wide or too narrow, remove the crankshaft, and remove the upper half of the bearing. Install a new, complete bearing with the appropriate color code (s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance. 11. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, **replace the crankshaft** and start over.

4. Transmission End Crankshaft Oil Seal - Install

	1. Clean and dry the transmission end crankshaft oil seal housing. 2. Apply a light coat of new engine oil to the crankshaft and to the lip of the transmission end crankshaft oil seal. 3. Use the driver handle, 15 x 135L and the oil seal driver attachment, 92 mm to drive a transmission end crankshaft oil seal (A) squarely into the oil seal case to the specified installed height. 4. Clean the excess oil off the crankshaft, and check that the oil seal lip is not distorted.

	5. Measure the distance between the oil seal case (A) and the transmission end crankshaft oil seal (B).

Oil Seal Installed Height:
0.75-1.25 mm (0.0295-0.0492 in)

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

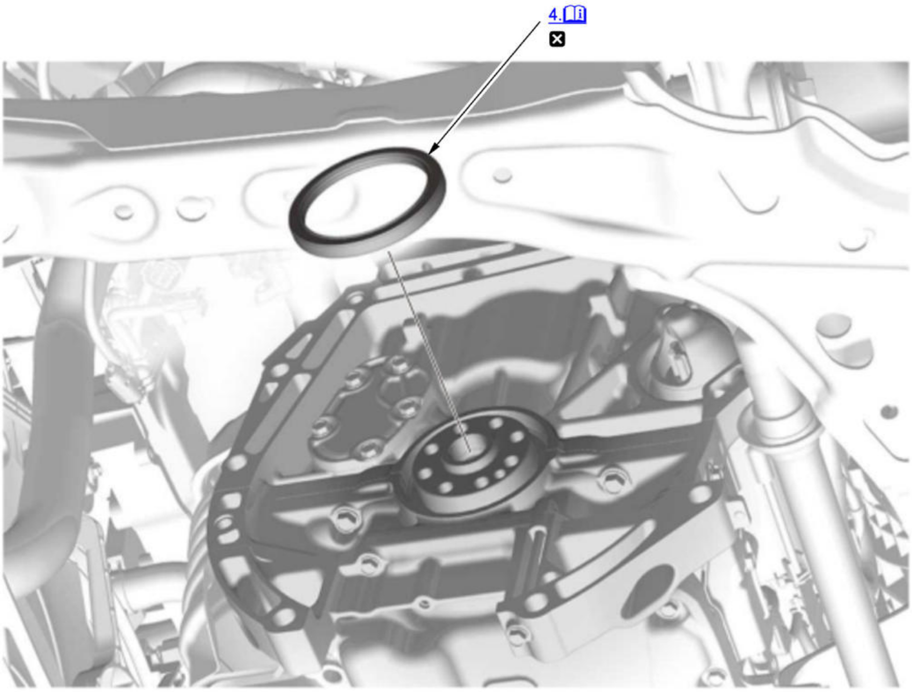
TRANSMISSION END CRANKSHAFT OIL SEAL REPLACEMENT - IN CAR (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000
	Oil Seal Driver Attachment, 96 mm 07ZAD-PNAA100

Replacement

NOTE: ℹ Where icon is shown, further information shown below.



ℹ	Detailed information, notes, and precautions
☒	Replace

1. **Transmission - Remove**

2. **Drive Plate - Remove**
3. Transmission End Crankshaft Oil Seal - Remove
4. Transmission End Crankshaft Oil Seal - Install

	1. Clean and dry the transmission end crankshaft oil seal housing. 2. Apply a light coat of new engine oil to the lip of the transmission end crankshaft oil seal. 3. Using the driver handle, 15 x 135L and the oil seal driver attachment, 96 mm, to drive a new transmission end crankshaft oil seal (A) squarely into the engine block to the specified installed height.

	4. Measure the distance between the engine block (A) and the transmission end crankshaft oil seal (B). **Oil Seal Installed Height:**

0.2-1.2 mm (0.008-0.047 in)

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

VALVE GUIDE REPLACEMENT (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Valve Guide Driver, 5.35 x 9.7 mm 07742-0010100
	Valve Guide Reamer, 5.5 mm 07HAH-PJ7A100

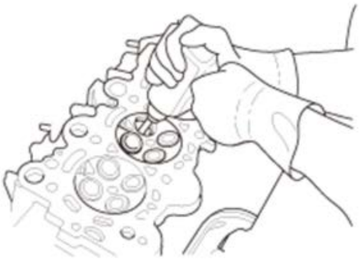
Replacement

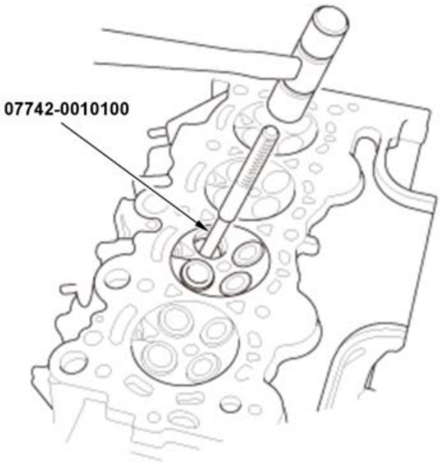
WARNING: **Please carefully read "Precaution for Handling Sodium-Filled Valves" and follow the instructions as the exhaust valves contain metal sodium .**

1. **Valve Seal and Valve Spring Seat - Remove**
2. **Valve Stem-to-Guide Clearance - Inspect**
3. Valve Guide - Remove

 A 5.3 mm (0.209 in) 87 mm (3.43 in) 57 mm (2.24 in) 10.8 mm (0.425 in)	1. As illustrated, use a commercially available air-impact valve guide driver (A) modified to fit the diameter of the valve guides. In most cases, the same procedure can be done using the valve guide driver, 5.35 x 9.7 mm and a conventional hammer. 2. Select the proper replacement guides, and chill them in the freezer section of a refrigerator for at least an hour.

	3. Use a hot plate or oven to evenly heat the cylinder head to 300 deg. F (150 deg. C). Monitor the temperature with a cooking thermometer. Do not get the head hotter than 300 deg. F (150 deg. C); excessive heat may loosen the valve seats.





4. Working from the camshaft side, use the driver and an air hammer to drive the guide about 2 mm (0.08 in) towards the combustion chamber. This will knock off some of the carbon and make removal easier. Hold the air hammer directly in line with the valve guide to prevent damaging the driver. Wear safety goggles or a face shield.

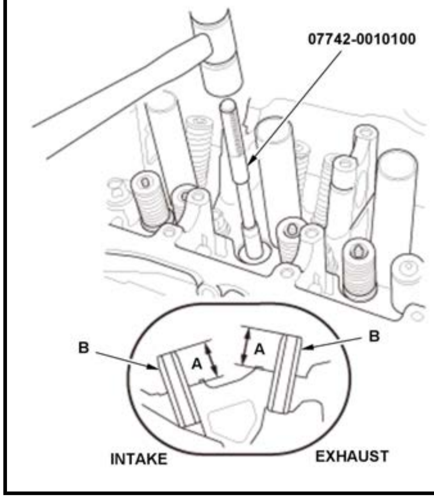
5. Turn the cylinder head over, and drive the guide out toward the camshaft side of the cylinder head.

6. If a valve guide will not move, drill it out with an 8 mm (5/16 in) drill bit, then try again.

NOTE:

Drill guides only in extreme cases; you could damage the cylinder head if the guide breaks.

4. Valve Guide - Install



1. Take out the new valve guide (s) from the freezer, one at a time, as you need them.

2. Apply a thin coat of new engine oil to the outside of the new valve guide.

3. Install the guide from the camshaft side of the head; use the valve guide driver, 5.35 x 9.7 to drive the guide into the specified installed height (A) of the guide (B). If you have all 16 valve guides to do, you may have to reheat the head.

Valve Guide Installed Height:	
Intake:	**21.25-21.75 mm (0.8366-0.8563 in)**
Exhaust:	**19.75-20.25 mm (0.7776-0.7972 in)**

	4. Coat both the valve guide reamer, 5.5 mm and the valve guide with cutting oil. 5. Rotate the valve guide reamer clockwise the full length of the valve guide bore. 6. Continue to rotate the reamer clockwise while drawing it from the bore. 7. Thoroughly wash the guide in detergent and water to remove any cutting residue.

5. Valve Stem-to-Guide Clearance - Inspect
6. Valve Seat - Inspect
7. Valve Seal and Valve Spring Seat - Install

VALVE GUIDE REPLACEMENT (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

Image	Description/Tool Number
	Valve Guide Driver, 5.35 x 9.7 mm 07742-0010100
	Valve Guide Reamer, 5.5 mm 07HAH-PJ7A100

Replacement

1. Valve Seal and Valve Spring Seat - Remove
2. Valve Guide - Remove

 A 5.3 mm (0.209 in) 87 mm (3.43 in) 57 mm (2.24 in) 10.8 mm (0.425 in)	1. As illustrated below, use a commercially available air-impact valve guide driver (A) modified to fit the diameter of the valve guides. In most cases, the same procedure can be done using the valve guide driver, 5.35 x 9.7 mm and a conventional hammer. 2. Select the proper replacement valve guides, and chill them in the freezer section of a refrigerator for at least an hour.

	3. Use a hot plate or an oven to evenly heat the cylinder head to 300 deg. F (150 deg. C). Monitor the temperature with a cooking thermometer. Do not get the head hotter than 300 deg. F (150 deg. C); excessive heat may loosen the valve seats.

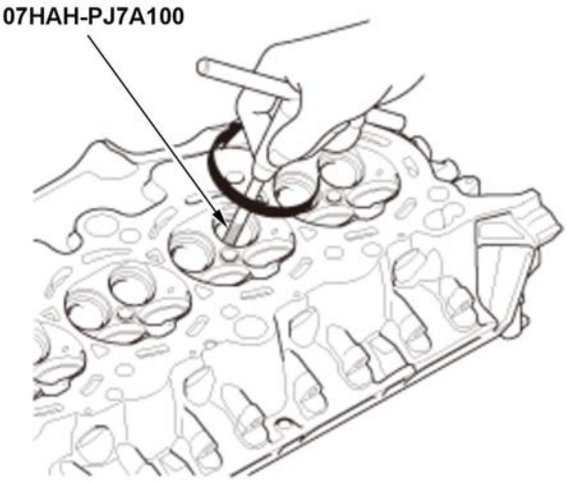
 	4. Working from the camshaft side, use the valve guide driver and an air hammer to drive the valve guide about 2 mm (0.08 in) towards the combustion chamber. This will knock off some of the carbon and make removal easier. Hold the air hammer directly in line with the valve guide to prevent damaging the driver. Wear safety goggles or a face shield. 5. Turn the head over, and drive the valve guide out toward the camshaft side of the head. 6. If a valve guide will not move, drill it out with an 8 mm (0.31 in) drill bit, then try again. **NOTE:** Drill guides only in extreme cases; you could damage the cylinder head if the valve guide breaks.

3. Valve Guide - Install

	1. Take out the new valve guide (s) from the freezer, one at a time, as you need them. 2. Apply a thin coat of new engine oil to the outside of a new valve guide. 3. Install the valve guide from the camshaft side of the head; use the valve guide driver to drive the valve guide in to the specified installed height (A) of the valve guide (B). If you have all 16 valve guides to do, you may have to reheat the head.

Valve Guide Installed Height

Intake:	**21.2-22.2 mm (0.835-0.874 in)**
Exhaust:	**19.6-20.6 mm (0.772-0.811 in)**



4. Coat both the valve guide reamer, 5.525 mm and the valve guide with cutting oil.

5. Rotate the reamer clockwise the full length of the valve guide bore.

6. Continue to rotate the reamer clockwise while removing it from the bore.

7. Thoroughly wash the valve guide in detergent and water to remove any cutting residue.

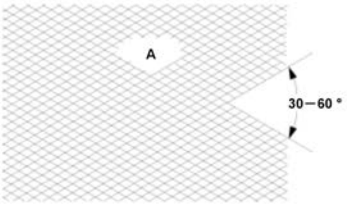
4. Valve Stem-to-Guide Clearance - Inspect
5. Valve Seat - Inspect
6. Valve Seal and Valve Spring Seat - Install

REPAIR REGENERATION

CYLINDER BORE HONING (1.5 L ENGINE)

Honing

1. Oil Jet - Remove
2. Cylinder Bore - Honing



1. Measure the cylinder bores

If the engine block is to be reused, hone the cylinders and re-measure the bores. Only scored or scratched cylinder bore must be honed.

2. Hone the cylinder bores with honing oil and a fine (400 grit) stone.

NOTE:

- Use only a rigid hone with 400 grit or finer stone such as Sunnen, Ammco, or equivalent.
- Do not use stones that are worn or broken.

3. When honing is complete, thoroughly clean the engine block of all metal particles. Wash the cylinder bores with hot soapy water, then dry and oil them immediately to prevent rusting.

NOTE:

Never use solvent, it will only redistribute the grit on the cylinder walls.

4. If scoring or scratches are still present in the cylinder bores after to the service limit, rebore the engine block. Some light vertical scoring and scratching is acceptable if it is not deep enough to catch your fingernail, and does not run the full length of the bore.

Honing Pattern:	**Within 30-60 degree cross-hatch pattern (A)**

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CYLINDER BORE HONING (2.4 L ENGINE) (2017 2018 2019)

Honing

1. Oil Jet - Remove
2. Cylinder Bore - Honing

	1. Measure the cylinder bores If the engine block is to be reused, hone the cylinders and remeasure the bores. Only scored or scratched cylinder bore must be honed. 2. Hone the cylinder bores with honing oil and a fine (400 grit) stone. **NOTE:** - Use only a rigid hone with 400 grit or finer stone such as Sunnen, Ammco, or equivalent. - Do not use stones that are worn or broken. 3. When honing is complete, thoroughly clean the engine block of all metal particles. Wash the cylinder bores with hot soapy water, then dry and oil them immediately to prevent rusting. **NOTE:** Never use solvent, it will only redistribute the grit on the cylinder walls. 4. If scoring or scratches are still present in the cylinder bores after honing to the service limit, rebore the engine block. Some light vertical scoring and scratching is acceptable if it is not deep enough to catch your fingernail, and does not run the full length of the bore.

Honing Pattern:	**Within 30-60 degree cross-hatch pattern (A)**

3. All Removed Parts - Install

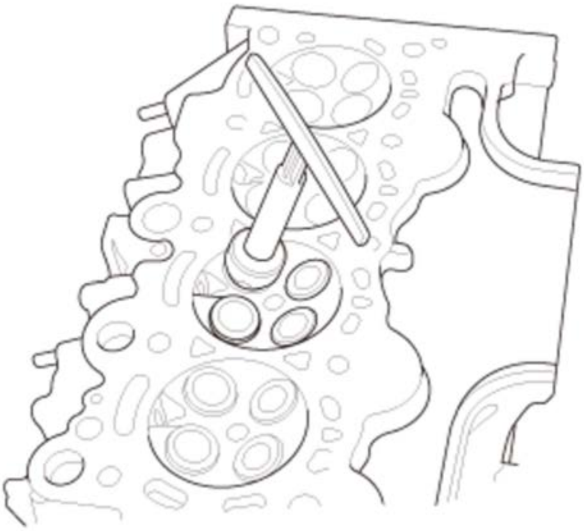
1. Install the parts in the reverse order of removal.

VALVE SEAT RECONDITIONING (1.5 L ENGINE)

Reconditioning

WARNING: Please carefully read "Precaution for Handling Sodium-Filled Valves" and follow the instructions as the exhaust valves contain metal sodium .

1. Valve Seat - Reconditioning

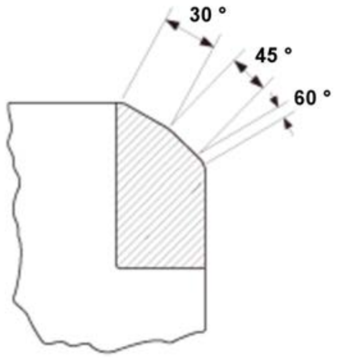


1. **Inspect valve stem-to-guide clearance**. If the valve guides are worn, **replace them**

before cutting the valve seats.

2. Renew the valve seats in the cylinder head using a valve seat cutter.

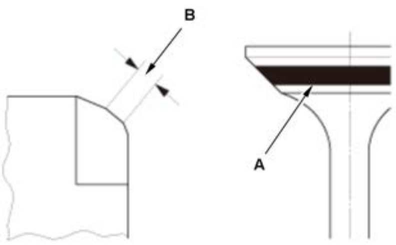
3. Carefully cut a 45 deg. seat, removing only enough material to ensure a smooth and concentric seat.



4. Bevel the upper and lower edges at the angles shown in the illustration. Check the width of the seat and adjust accordingly.

5. Make one more very light passes with the 45 deg. cutter to remove any possible burrs caused by the other cutters.

Valve Seat Width (Intake/Exhaust)	
Standard (New):	**1.25-1.55 mm (0.0492-0.0610 in)**
Service Limit:	**2.00 mm (0.0787 in)**

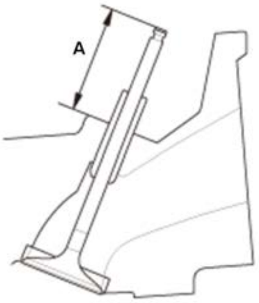


6. After resurfacing the seat, inspect for even valve seating: Apply Prussian Blue compound (A) to the valve face. Insert the valve in its original location in the head, then lift it and snap it closed against the seat several times.

7. The actual valve seating surface (B), as shown by the blue compound, should be centered on the seat:

- If it is too high (closer to the valve stem), you must make a second cut with the 60 deg. cutter to move it down, then one more cut with the 45 deg. cutter to restore seat width.
- If it is too low (close to the valve edge), you must make a second cut with the 30 deg. cutter to move it up, then make one more cut with the 45 deg. cutter to restore seat width.

NOTE: The final cut should always be made with the 45 deg. cutter.



8. Insert the intake and exhaust valves in the cylinder head, and measure the valve stem installed height (A).

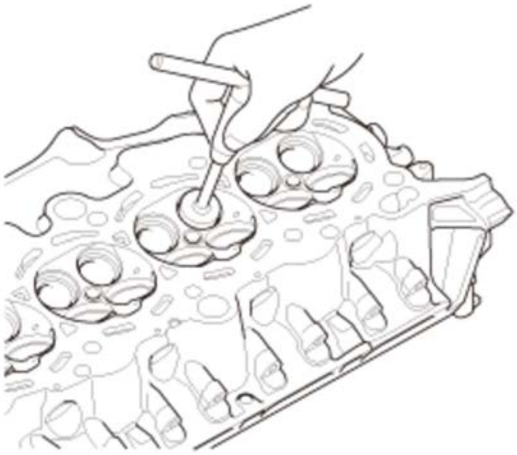
9. If the valve stem installed height is over the service limit, replace the valve and recheck. If it is still over the service limit, replace the cylinder head; the valve seat in the head is too deep.

Intake Valve Stem Installed Height	
Standard (New):	53.40-54.40 mm (2.1024-2.1417 in)
Service Limit:	54.60 mm (2.1496 in)
Exhaust Valve Stem Installed Height	
Standard (New):	45.90-46.90 mm (1.8071-1.8465 in)
Service Limit:	47.10 mm (1.8543 in)

VALVE SEAT RECONDITIONING (2.4 L ENGINE) (2017 2018 2019)

Reconditioning

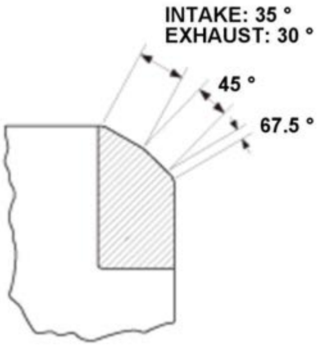
1. Valve Seat - Reconditioning



1. Inspect valve stem-to-guide clearance. If the valve guides are worn, replace them before cutting the valve seats.

2. Renew the valve seats in the cylinder head using a valve seat cutter.

3. Carefully cut a 45 deg. seat, removing only enough material to ensure a smooth and concentric seat.

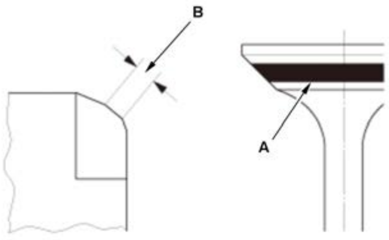


4. Bevel the upper and lower edges at the angles shown in the illustration. Check the width of the seat and adjust accordingly.

5. Make one more very light passes with the 45 deg. cutter to remove any possible burrs caused by the other cutters.

Valve Seat Width

Intake:	B
Standard (New):	1.25-1.55 mm (0.0492-0.0610 in)
Service Limit:	1.90 mm (0.0748 in)
Exhaust:	B
Standard (New):	1.25-1.55 mm (0.0492-0.0610 in)
Service Limit:	2.00 mm (0.0787 in)

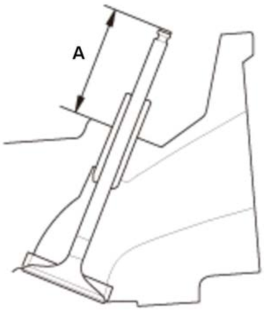


6. After resurfacing the seat, inspect for even valve seating: Apply Prussian Blue compound (A) to the valve face. Insert the valve in its original location in the head, then lift it and snap it closed against the seat several times.

7. The actual valve seating surface (B), as shown by the blue compound, should be centered on the seat:

- If it is too high (closer to the valve stem), you must make a second cut with the 55 deg. cutter (intake side) or the 60 deg. (exhaust side) cutter to move it down, then one more cut with the 45 deg. cutter to restore seat width.
- If it is too low (close to the valve edge), you must make a second cut with the 30 deg. cutter to move it up, then make one more cut with the 45 deg. cutter to restore seat width.

NOTE: The final cut should always be made with the 45 deg. cutter.



8. Insert the intake and exhaust valves in the head, and measure valve stem installed height (A).

Intake Valve Stem Installed Height

Exhaust Valve Stem Installed Height

9. If valve stem installed height is over the service limit, replace the valve and recheck. If it is still over the service limit, replace the cylinder head; the valve seat in the head is too deep.

Standard (New):	**51.40-52.30 mm (2.0236-2.0591 in)**
Service Limit:	**52.40 mm (2.0630 in)**

Standard (New):	**52.75-53.65 mm (2.0768-2.1122 in)**
Service Limit:	**53.75 mm (2.1161 in)**

DESCRIPTION & OPERATION

AUTO IDLE STOP SYSTEM DESCRIPTION - OPERATION CONDITIONS (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Conditions for Auto Idle Stop and Engine Restart

Available Conditions for Auto Idle Stop and Engine Restart Conditions After Auto Idle Stop

Determination Items	Available Conditions for Auto Idle Stop	Engine Restart Conditions After Auto Idle Stop	HDS Parameter [Menu]
Related Systems	Normal (no DTCs are stored)	Related system malfunction occurred (DTCs are stored). Some conditions will prevent restart* 1	--
Idle Stop Off Switch	OFF (system is not cancelled on purpose)	ON (system is cancelled on purpose)	IDLE STOP INHIBIT (IDLE STOP CANCEL SWITCH) [PGM FI]
Hood	Closed* 2	Not a condition* 1	IDLE STOP INHIBIT (HOOD OPEN) [PGM FI]
Driver's Seat Belt	Buckled	Unbuckled	IDLE STOP INHIBIT (SEAT BELT UNFASTENED) [PGM FI]
Incline	No-sloping	Not a condition	IDLE STOP INHIBIT (INCLINED STATE) [PGM

Determination Items	Available Conditions for Auto Idle Stop	Engine Restart Conditions After Auto Idle Stop	HDS Parameter [Menu]
			FI]
Vehicle Speed Record	The vehicle speed exceeds more than 3 mph (5 km/h) (or 9.3 mph (15 km/h)) *3 after its last engine restart.	Not a condition	VEHICLE SPEED [PGM FI] VEHICLE SPEED [AT] LEFT FRONT WHEEL SPEED [ABS/VSA] RIGHT FRONT WHEEL SPEED [ABS/VSA] LEFT REAR WHEEL SPEED [ABS/VSA] RIGHT REAR WHEEL SPEED [ABS/VSA]
Vehicle Speed	0 mph (0 km/h)	Exceed 0 mph (0 km/h)	
Vehicle Stop Record	20 seconds or more has elapsed after the last vehicle stop.	Not a condition	
Steering Wheel Operation	Unmoved	Moved	IDLE STOP INHIBIT (EPS UNIT) [PGM FI]
Shift Position	D Position If the shift lever is moved from D to the P position during auto idle stop activation, auto idle stop will continue.	Except D->N operation - If the shift lever moves from P to any other position, the engine will restart. - If the shifter is in the D or N position and is shifted to P, the engine can restart depending on the inclination angle. - If the shifter is in the P position and if the vehicle moves, the engine will restart.	A/T D SWITCH [AT]
Transmission Fluid Temperature	77 deg. F (25 deg. C) - 239 deg. F (115 deg. C)	Except 77 deg. F (25 deg. C) - 239 deg. F (115 deg. C)	CVTF Temperature [AT]
CVT Ratio	Not a condition	Not a condition	--
Auxiliary Transmission Fluid Pump	During a not protection control	160 sec. has elapsed after the pump starts.	--
Correction of Inclination Sensor Learn Procedure	Not a condition	Not a condition	--

Condition			FI]
12 Volt Battery Deteriorated Determination	Not detected	Not a condition	Idle Stop Inhibit (Battery Management System) [PGM FI] IDLE STOP INHIBIT (BATTERY DETERIORATION) [PGM FI]
Automatic Brake Hold Switch	Not a condition	ON *9	--
Driving Support System	ON *4	If the system meets the following conditions (cooperative control of the driving support system and the auto idle stop system): • Detects the preceding vehicle starting • RES/+ or SET/- button, or accelerator pedal is pressed • ACC system is turned off	--
DC-DC Converter	No temperature failure/internal failure/input voltage failure (no DTC is stored)	When the failure is confirmed	IDLE STOP INHIBIT (DC-DC CONVERTER) [PGM FI]
Smart Parking Assist System	Nonfunctional	Assist start	--
Electric Brake Booster	Not a condition	Malfunction is detected* 7	--
Starting Assist Brake Function (controlled by PGM-FI system and VSA system)	Related system is normal	Related system malfunction occurs.	Idle Stop Inhibit (Starting Assist Brake) [PGM FI]
Barometric Pressure	**The elevation is lower than 9, 842 ft (3, 000 m)**	Not a condition* 1	BARO SENSOR [PGM FI]

*1: Refer to Disable Conditions for the Engine Restart After Auto Idle Stop.

*2: Except in case of the engine started with the hood opened (safety for the service technician).

*3: When the auto idle stop is activated repeatedly (more than 2 times) within 20 seconds.

*4: When the ACC/LSF system is activated.

*5: When the ECON mode is on.

*6: When the climate control system is turned on.

*7: When the transmission is D, the engine is restarted. When the ACC/LSF system and the automatic brake hold system is activated, and the transmission is N, the engine is not restarted.

*8: When the automatic brake hold system is not activated.

*9: While the automatic brake hold is activated, the engine is restarted by pressing the accelerator pedal which also releases the brake hold function.

Disable Conditions for the Engine Restart After Auto Idle Stop

The Disable Conditions for the Engine Restart After Auto Idle Stop have priority over an Engine Restart Conditions After Auto Idle Stop. During auto idle stop, if any of the below conditions are met, engine restart is prohibited.

- The hood is opened.
- Engine cranks for 5 seconds or more.
- Engine does not crank.
- DC-DC converter has a temperature failure/internal failure/input voltage failure.

AUTO IDLE STOP SYSTEM DESCRIPTION (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Overview

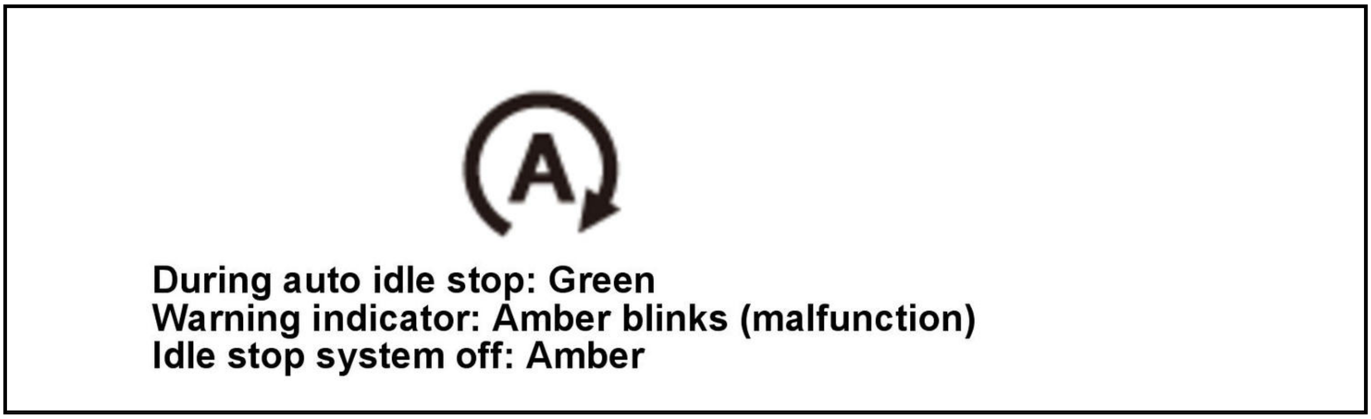
System Description

The auto idle stop system is a system that stops and restarts the engine automatically to help maximize fuel economy depending on environmental and vehicle operating conditions. The system can help reduce fuel consumption, idling noise and any emissions. Conditions such as driver's operation, vehicle state and the environment determine if the vehicle can enter auto idle stop.

Basic System Operations

- When the brake pedal is depressed, the vehicle stops and auto idle stop is activated (if conditions are met). During auto idle stop, the auto idle stop indicator (green) indicator turns on in the gauge control module. When you release the brake pedal, the engine starts automatically (if conditions are met).
- The auto idle stop system is executed when the certain conditions are met. Refer to the Available Conditions for Auto Idle Stop.
- If one of the conditions are met, the engine restarts automatically. However, there are conditions that will prohibit the engine to start automatically. Refer to Engine Restart Conditions After Auto Idle Stop and Disable Conditions for the Engine Restart After Auto Idle Stop.
- The driver can cancel the auto idle stop system from operating with the auto idle stop off switch.
- When the system is off, the auto idle stop indicator (amber) in the gauge control module turns on.

Auto Idle Stop Indicator

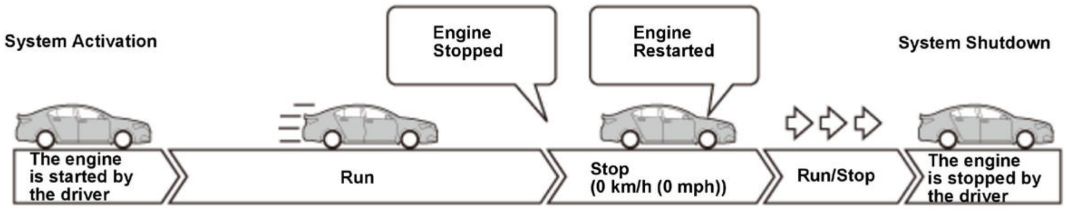


During auto idle stop: Green
Warning indicator: Amber blinks (malfunction)
Idle stop system off: Amber

System Determination Pattern

After the vehicle is turned to the ON mode, the system is activated and starts a constant monitor of various conditions. The system then determines if a auto idle stop or an engine restart (after the engine has stopped) can be executed.

Auto idle stop at full stop (vehicle speed is 0 km/h (0 mph))



NOTE: This illustration is an example of the system operation and does not include include related controls such as the automatic brake hold and the driving support system.

Auto Idle Stop Control Signal

The PCM monitors signals from control units, sensors and switches to determine if the vehicle can execute/continue an auto idle stop or if it can restart the engine. When the PCM determines that the auto idle stop can executed, it stops the fuel injection and stops the engine. When it determines an engine restart, it operates the starter and resumes fuel injection to start the engine. If the PCM receives a malfunction signal from a control unit or the conditions are not met, the auto idle stop is not executed.

Transmitting and Received Signals to/from the PCM

Detail Information of the Control or Communication Signal

System Malfunction Signal

If a malfunction in the following systems that are related to the auto idle stop have occurred, a warning indicator is turned on or flashes, and the auto idle stop is prohibited. A warning indicator is displayed on the gauge control module (multi-information display), and informs the malfunction to the driver.

System malfunction indications for prohibiting the auto idle stop

System	Warning indicator	Remarks
Auto idle stop system		Possible cause: - DC-DC converter - 12 volt battery sensor - Alternator - Climate control unit - Brake system (electric brake booster system information)

System	Warning indicator	Remarks
Charging system		Possible cause: - Alternator - Power generation abnormality (Auto idle stop indicator is OFF)
Starter system		B

System	Warning indicator	Remarks
PGM-FI system		Even if this indicator is displayed, the auto idle stop system may be enabled according to the contents of malfunction.
CVT control system		All segments blink.

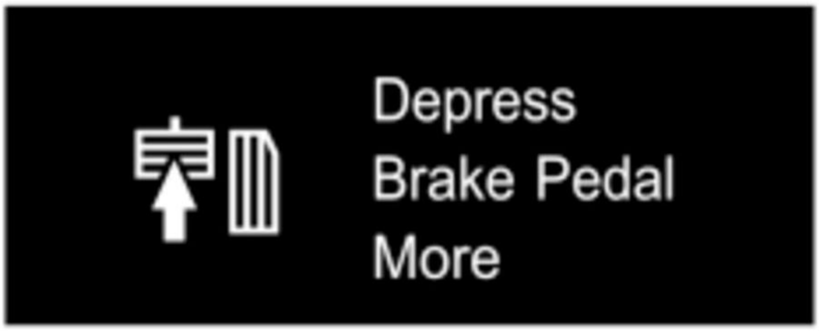
System	Warning indicator	Remarks
EPS control system		B
VSA system (ABS)		Even if this indicator is displayed, the auto idle stop system may be enabled according to the contents of malfunction.

System	Warning indicator	Remarks
VSA system		Even if this indicator is displayed, the auto idle stop system may be enabled according to the contents of malfunction.
Brake system	 (Red)	Even if this indicator is displayed, the auto idle stop system may be enabled according to the contents of malfunction.
Electric brake booster system		Electric brake booster system malfunction

System	Warning indicator	Remarks
Automatic brake hold system	 (Amber)	Even if this indicator is displayed, the auto idle stop system may be enabled according to the contents of malfunction.
SRS system		Even if this indicator is displayed, the auto idle stop system may be enabled according to the contents of malfunction.

Master Cylinder Fluid Pressure Information (lack of brake pedal force)

The master cylinder fluid pressure information is transmitted to the PCM via the VSA modulator-control unit. If the brake pedal force by the driver is insufficient, and if the master cylinder fluid pressure is less than specified value, the auto idle stop is prohibited. In this case, a message is displayed in the multi-information display to inform the driver.



Depress
Brake Pedal
More

Idle Stop Permission Signal from the Climate Control System

To maintain cabin comfort, the climate control unit transmits the auto idle stop activate, prohibit or engine restart judgment to the PCM based on sensors and switches. When a engine restart request is received from during idle stop, the auto idle stop indicator is turned off and the engine restarts. If the climate control unit malfunctions, the malfunction information is sent to the PCM, and the auto idle stop system warning indicator (orange) blinks.

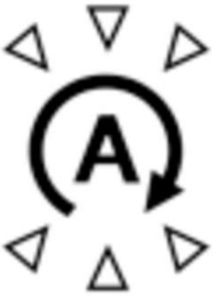
Transmitting and received signals to/from climate control unit

Target unit, sensor and switch	Transmitting Signal	Received Signal
ECON switch	ECON ON/OFF mode selection signal	-
Engine coolant temperature (ECT) sensor	Engine warm-up information	-
Windshield defrost button/switch	Windshield defrost on/off signal	-
Temperature and fan control button/switch (climate control unit)	Cabin temperature and air volume setting information	-

Target unit, sensor and switch	Transmitting Signal	Received Signal
Outside air temperature sensor	Outside air temperature information	-
Evaporator temperature sensor/in-car temperature sensor	Air temperature adjustments made before and after	-
Humidity sensor	Humidity information in the cabin	-
Sunlight sensor	Sunlight information	-
PCM	-	Auto idle stop implementation/prohibition determination information from the climate control system.

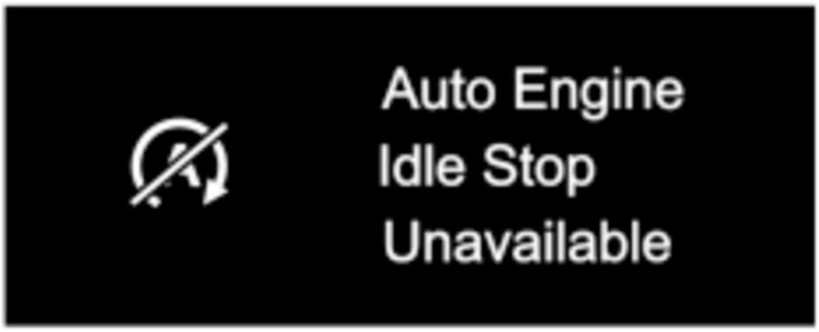
Starter Operating Command Signal

The PCM counts the number of times that the start operates and if it exceeds a specified number, prohibits auto idle stop operation. In this case, the indicator on the gauge control module blinks (except when the system is turned off by the driver manually). The starter and the starter cut relay operation number are memorized in the PCM.



12 Volt Battery Status Information

The PCM receives the 12 volt battery status signal and determines the state of quality and its amount of deterioration. When a malfunction is detected, the auto idle stop operation is prohibited and a message is displayed in the multi-information to alert the driver (when the battery is deteriorated).

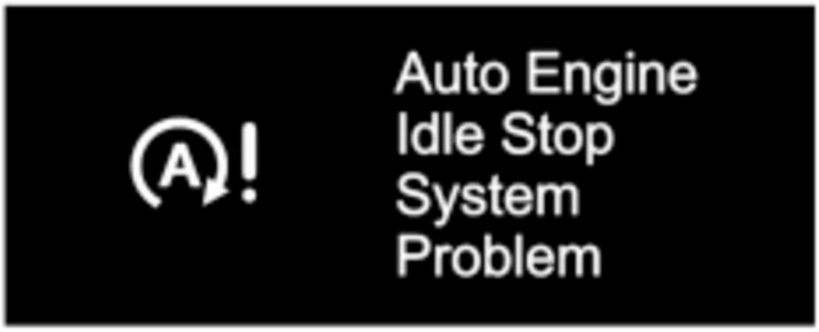


Auto Engine
Idle Stop
Unavailable

NOTE: The message is not displayed on the multi-information display in the factory default setting.

MID (auto engine idle stop system problem)

If there is a malfunction in the auto idle system and related systems, the auto idle stop indicator will turn on with a message on the multi-information display.

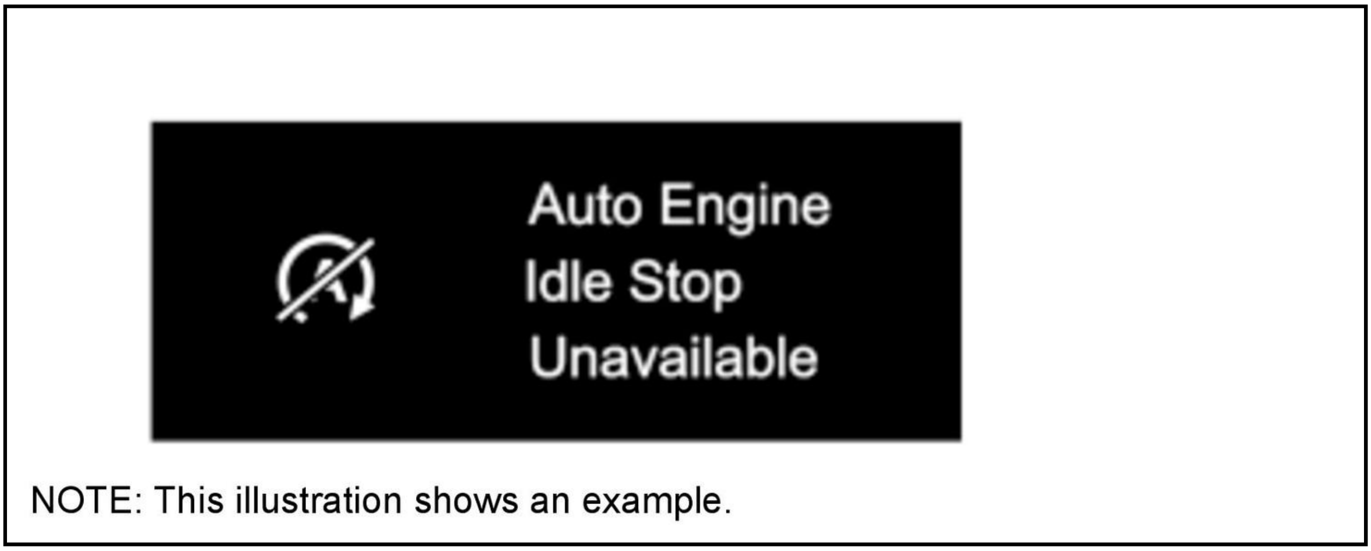


Auto Engine
Idle Stop
System
Problem

NOTE: This illustration shows an example.

MID (auto engine idle stop unavailable)

If the auto idle system and related systems are normal but auto idle stop operation is prohibited by the system, the following message will be displayed in the multi-information display.

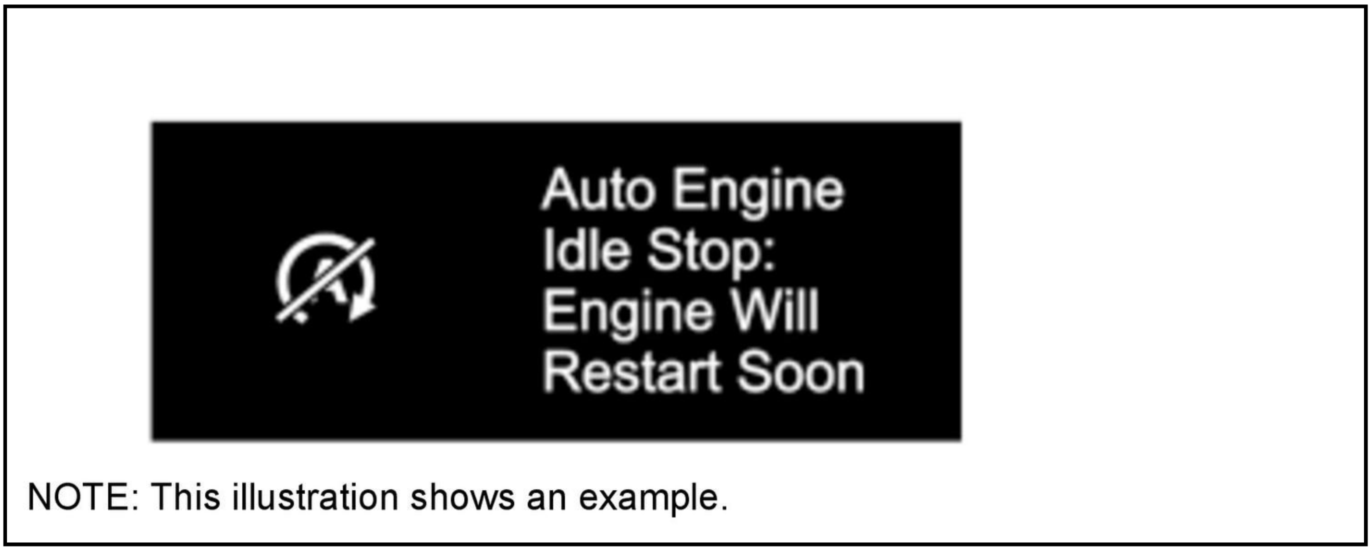


Auto Engine
Idle Stop
Unavailable

NOTE: This illustration shows an example.

MID (auto engine idle stop: engine will restart soon)

The following message with be displayed right before the engine is restarted by the system when the auto idle stop system is in operation.



Auto Engine
Idle Stop:
Engine Will
Restart Soon

NOTE: This illustration shows an example.

DC-DC Converter Unit Quality Information

The DC-DC converter supplies stable power to the vehicle when the battery voltage drops during engine restart. If there is a malfunction in the DC-DC converter, a signal is sent to the PCM and either prohibits the auto idle stop operation or engine restart. If the DC-DC converter malfunctions during engine restart, the starter operation continues but the stable power that the vehicle would have received from the DC-DC converter is not supplied.

CATALYTIC CONVERTER SYSTEM DESCRIPTION

The three way catalytic converter (TWC) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to carbon dioxide (CO 2), nitrogen (N 2), and water vapor.

The TWC is attached to the turbocharger.

EVAP SYSTEM DESCRIPTION

For locations of each component on vehicle, refer to Component Location Index

The evaporative emission (EVAP) controls minimize the amount of fuel vapor escaping to the atmosphere. Vapor from the fuel tank is temporarily stored in the EVAP canister until it can be purged from the canister into the engine and burned. The EVAP canister is purged by drawing fresh air through it and into a port on the intake manifold. The purging vacuum is controlled by the EVAP canister purge valve. When vapor pressure in the fuel tank is higher than the set value of the EVAP two way valve, the valve opens and regulates the flow of fuel vapor to the EVAP canister (Mexico models). Also attached to the EVAP canister are the EVAP leak check module (1.5 L engine (USA and Canada models)) or the EVAP canister vent shut valve and the fuel tank pressure (FTP) sensor (2.4 L engine (USA models)).

Operation (2.4 L engine (USA models))

When fuel tank pressure increases because of heat and fuel vapor generation, evaporated fuel vapors are sent to the EVAP canister where they are stored. When the engine coolant is hot enough, the PCM opens the EVAP canister purge valve to draw the stored fuel vapor in the EVAP canister into the intake manifold to be burned. To regulate the amount of fuel vapor drawn into the engine, the PCM varies the EVAP canister purge valve opening using duty cycle control. When the outside air or other factor cools the fuel tank inside, the fuel tank pressure decreases. The EVAP canister vent shut valve is normally open and allows outside air to enter the fuel tank through the EVAP canister. If there is a system malfunction or blockage in the vent hose, a pressure valve on the fuel fill port opens and allows outside air to enter preventing system damage. The PCM uses the FTP sensor and EVAP canister vent shut valve to check for leaks in the system. When the enabling conditions are met, the EVAP canister vent shut valve is closed, the PCM monitors for changes in the FTP sensor.

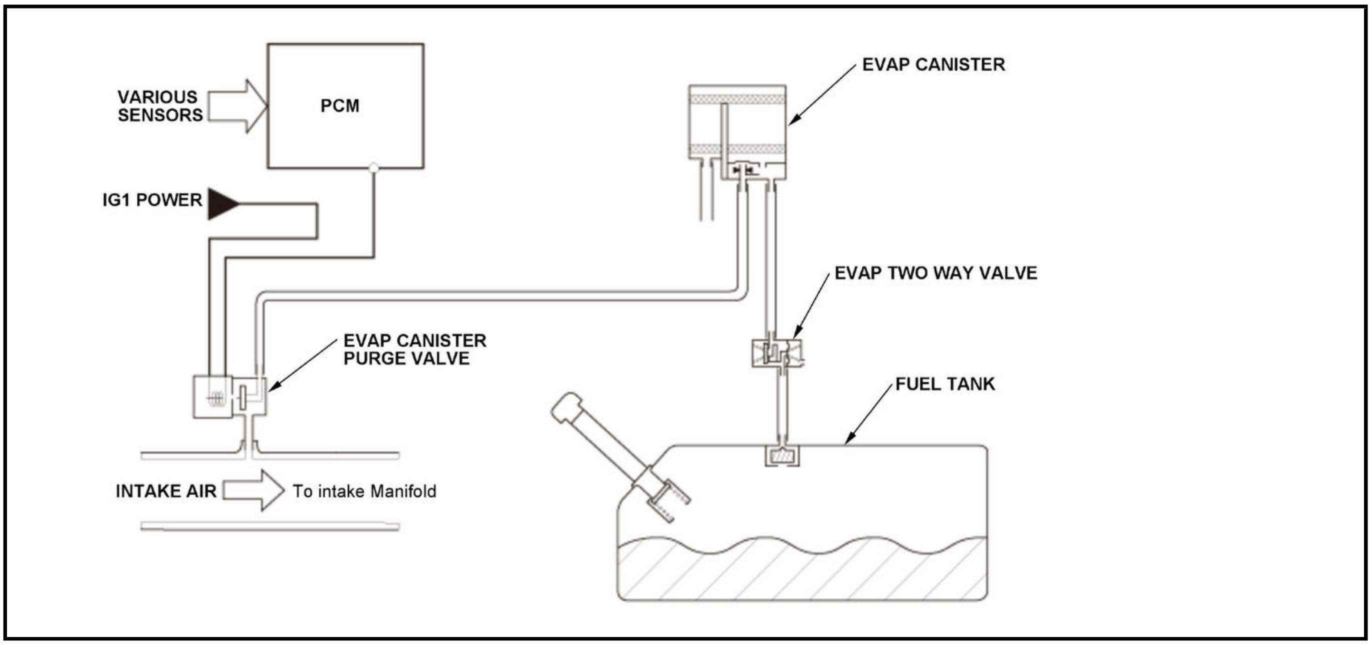
EVAP CANISTER
IG1 POWER
EVAP CANISTER PURGE VALVE
FUEL TANK
INTAKE AIR
To intake Manifold

Operation (Mexico models)

The evaporated fuel vapors in the fuel tank increases the inside pressure of fuel tank. The increased pressure causes the positive pressure valve to open when the pressure is over the preset value for the two way valve. The evaporated fuel vapors which passed the two way valve are sent to the EVAP canister where they are stored. When the engine coolant is hot enough, the powertrain control module (PCM) opens the EVAP canister purge valve to draw the stored fuel vapor in the EVAP canister into the intake manifold to be burned. To regulate the amount of fuel vapor drawn into the engine, the PCM varies the EVAP canister purge valve opening using duty cycle control. When the outside air or other factor cools the fuel tank inside, the tank pressure decreases. The decreased pressure is negative and opens the negative pressure valve when the pressure is over the preset value for two way valve. Low pressure may deform the fuel tank. Therefore, outside air is inhaled into the evaporative canister through its intake. The inhaled outside air and evaporative emission in the evaporative emission canister are returned into the fuel tank. If there is a system malfunction or blockage in the vent hose, a pressure valve on the fuel fill port opens and allows outside air to enter preventing system damage.



Joint of Intake Air Line (1.5 L engine)

The purge air from the EVAP canister is drawn into the intake air at the merge point where more strong suction force. Therefore, the merge point is variable by the engine condition with the turbocharger boost pressure.

Mid Load	Rising-up from Zero	Open	Open	Point 1 and Point 2
High Load	High	Close	Open	Point 1

EVAP Leak Check Module (1.5 L engine (USA and Canada models))

The EVAP leak check module is a small vacuum pump used to leak check the EVAP system to create a vacuum in the system and is mounted on a bracket to the side of the EVAP canister. Inside of the module has a EVAP leak check module pressure sensor and a canister changeover valve. The canister changeover valve is normally open when not energized. When open the valve allows air to flow in and out of the canister. When energized the valve seals the canister side of the system from the atmosphere.

ELECTRONIC THROTTLE CONTROL SYSTEM DESCRIPTION

For locations of each component on vehicle, refer to Component Location Index

Overview

The electronic throttle control system (ETCS) opens and closes the throttle valve by electronic control. This system consists of a throttle actuator built into the throttle body, throttle valve and throttle position (TP) sensor A/B, accelerator pedal position (APP) sensor A/B, ETCS driver built into the powertrain control module (PCM).

ETCS is a system that opens and closes the throttle valve electronically, it has various functions such as:

- Idle Control Function
- Accelerator Control Function
- Fail-Safe Function
- Relationship Action with Other Systems

Control

When the accelerator pedal is operated, APP sensors are driven and the accelerator pedal position is detected. The accelerator pedal position is delivered to the PCM, and the PCM drives the throttle actuator in the throttle body based on the delivered throttle pedal position to open or close the throttle valve. Throttle position is detected by the TP sensors in the throttle body and delivered to the PCM. The PCM drives the throttle actuator to control the throttle position during idling, during various system control, and when necessary, as well as based on the signals from the APP sensors.

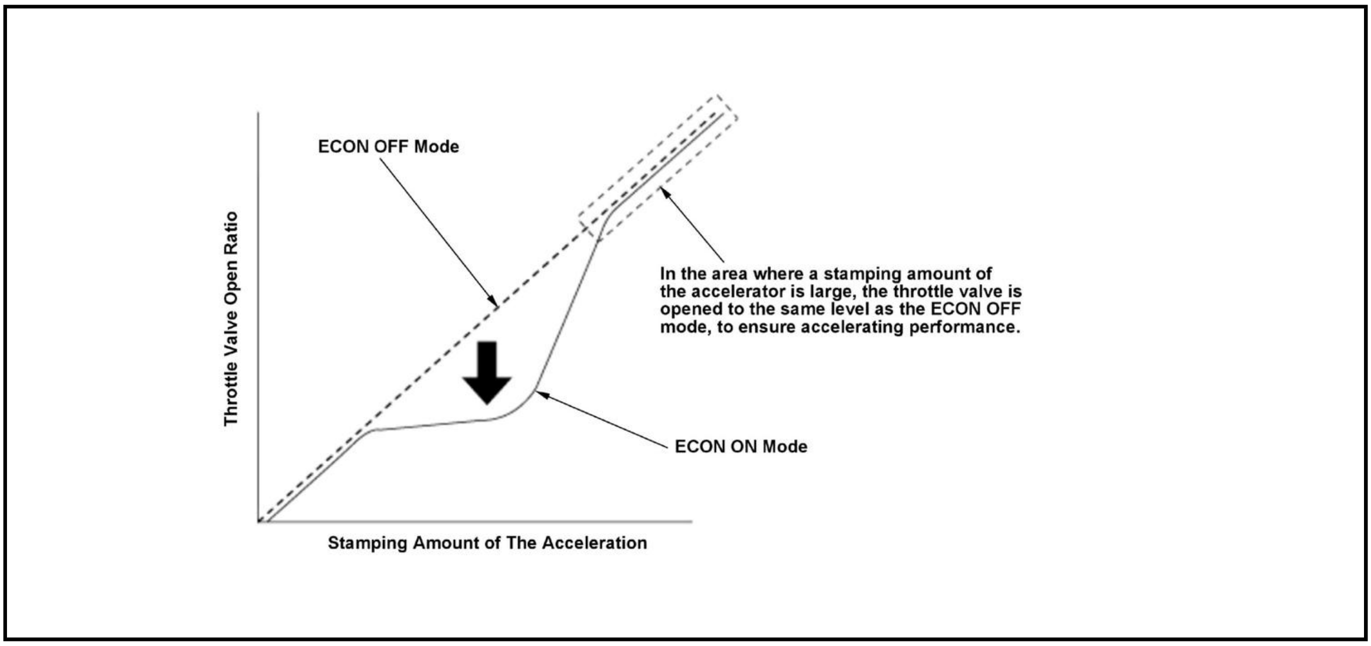
Change of ETCS system control (with ECON)

The ECON ON mode softens throttle valve control to reduce fuel consumption when the accelerator pedal is roughly depressed. Also, throttle opening becomes slow in comparison with the ECON OFF mode. However, if the accelerator pedal is depressed more than a certain level, control automatically becomes equivalent to the ECON OFF mode in order to ensure the acceleration.



PCV SYSTEM DESCRIPTION

Some of the unburned gases in the combustion chamber will leak past the gap between the pistons and cylinders into the crankcase. The blow-by gases that include the unburned gases are returned through the positive crankcase ventilation (PCV) valve and are burned. This prevents the blow-by gases from flowing into the atmosphere.

Electronic Control

The powertrain control module (PCM) consists of a CPU memory (storage unit) and inputs/outputs that control the fuel injection, injection timing, and electronic throttle control system (ETCS).

Fail-Safe Function

When a malfunction occurs in the signal from a sensor or from another control unit, the PCM ignores that signal and substitutes a pre-programmed value that allows the engine to continue running. This causes a Confirmed DTC to be stored and the MIL to come on.

Updated Function

The PCM has a rewritable ROM. The ROM can acquire the latest software version.

MIL Indicator Check

When the vehicle is turned to the ON mode, the PCM turns on the MIL via the F-CAN circuit for about 15 to 20 seconds to check the indicator condition.

Self Shut Down (SSD) Mode

After the vehicle is turned to the OFF (LOCK) mode, the PCM stays on for up to an hour. If a PCM connector is disconnected during this time, the PCM may be damaged. To cancel the SSD, jump the SCS line with the HDS after the vehicle is turned to the OFF (LOCK) mode.

Two Drive Cycle Detection Method

The DTCs are detected with the one or two driving cycle method in the PCM. Specific DTCs which are considered as a not intermittent failure apply the two driving cycle method. When a malfunction occurs in the signal from a sensor or from another control unit in the first drive cycle, the PCM stores a pending DTC. The MIL does not come on at this time. If the failure continues in the second drive cycle, the PCM stores a confirmed DTC and turns on the MIL.

Engine Start Conditions

When any of the following conditions are met, the engine starts.

- Vehicle is stop and shift position/mode is P.
- Vehicle is stop, shift position/mode is N, and vehicle fixed condition (vehicle is stop and electric parking brake system is operated).
- Vehicle is running and brake pedal is not pressed.

Injection Control

Fuel injection controls include fuel injection amount control, fuel cut control, and fuel pump control. Adaptive PGM-FI (programmed-fuel injection) technology enables accurate fuel controls, which contributes to increasing engine power and decreasing fuel consumption.

Fuel Injection

The fuel injection is determined by adding correction values to a basic injection. The powertrain control module (PCM) controls the amount of fuel injection by the length of time the injector is energized.

Fuel Injection Timing

The fuel injection timing is determined by the PCM, which calculates the injection time for each cylinder based on the signals from the crankshaft position (CKP) sensor and camshaft position (CMP) sensor A. The PCM then controls the time to energize the injector. Therefore, the fuel injection control will vary depending on the state of the vehicle. In addition, the fully sequential injection system is adopted as a fuel injection system.

Fuel Injector

The fuel injectors use multiple nozzles to inject high pressure fuel into the combustion chamber. Providing few injection ports promotes a finer fuel spray and improved fuel consumption by reducing fuel adherence to the top surface of the piston, reduction of hydrocarbons (HC) discharge, and higher engine performance.

A/F Sensor/HO2S Feedback Air/Fuel Ratio Control

Air fuel ratio control is part of fuel injection control and comprises the steps of:

- Calculating basic injection amount from intake air flow amount and engine speed
- Calculating air fuel ratio correction value from the oxygen density in the exhaust gas and reflecting the calculated values to the injection amount

Air fuel ratio control stops feedback under the following conditions in order to maintain operational performance and catalytic protection.

- When starting the engine or during fuel increase after the engine is started
- While the engine coolant is cold
- During fuel increase under high load
- During fuel increase at high engine speed
- During fuel cut-off at deceleration

Fuel Cut-off Control

Fuel Cut-off Control

After warming up, during deceleration with the throttle valve slightly opened from the fully closed position, the powertrain control module (PCM) stops the fuel injection when the engine speed is over the specified value to improve fuel efficiency.

Fuel cut-off at high engine speed

To prevent engine damage, the PCM stops the fuel injection when the engine speed is in the limited area (red zone). PCM stops fuel injection while the vehicle is driven and while at a stop. Engine speed fuel cut is lower when stopped compared to when driven.

Engine Type	When the vehicle is being driven	When the vehicle is stopped

2.4 L engine	7, 000 rpm	4, 000 rpm

At High Speed Driving

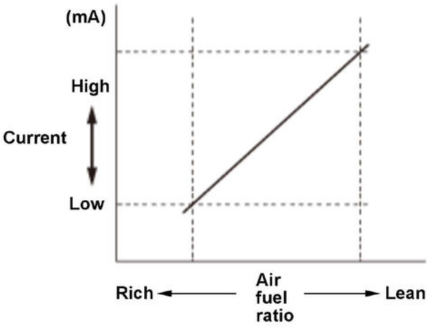
PCM stops fuel injection when the vehicle speed is over than the listed speed in the following chart.

High speed driving
118 mph (190 km/h) and over

PGM-FI SYSTEM DESCRIPTION - COMPONENTS

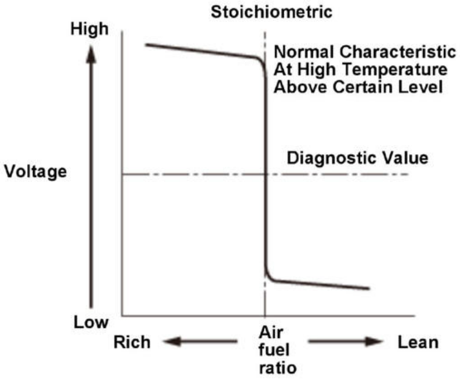
Air Fuel Ratio (A/F) Sensor (Sensor 1)

Air fuel ratio control performs fuel injection control based on the oxygen density detected in exhaust gas in order to bring the intake mixture in the vicinity of a target air fuel ratio. This high-precision air fuel ratio control is realized by detecting a correction value with an air fuel ratio (A/F) sensor (Sensor 1) and then applying further correction with a secondary heated oxygen sensor (secondary HO2S) (Sensor 2). The powertrain control module (PCM) supplies a current to the A/F sensor (Sensor 1), and monitors the current value which varies with the oxygen density in the measuring chamber of the sensor. The current value is proportional to the air fuel ratio, therefore the PCM can calculate the air fuel ratio from the value of the current.



Secondary HO2S (Sensor 2)

The secondary heated oxygen sensor (secondary HO2S) (Sensor 2) detects the oxygen density in the exhaust gas passing through the catalyst and outputs it to the powertrain control module (PCM) to enable the high-precision air fuel ratio control, which cannot be realized only with an A/F sensor (Sensor 1). A ceramic heater is equipped inside the element in order to shorten sensor reaction time and to enable output that is constantly stable.



CKP Sensor

Regularly continuous teeth except for the one position on the CKP pulse plate passes over the CKP sensor, a pulse signal is delivered to the PCM.

CMP Sensor A

Every time one of the three protrusions of the pulse plate attached to the intake camshaft passes over camshaft position (CMP) sensor A, a pulse signal is delivered.

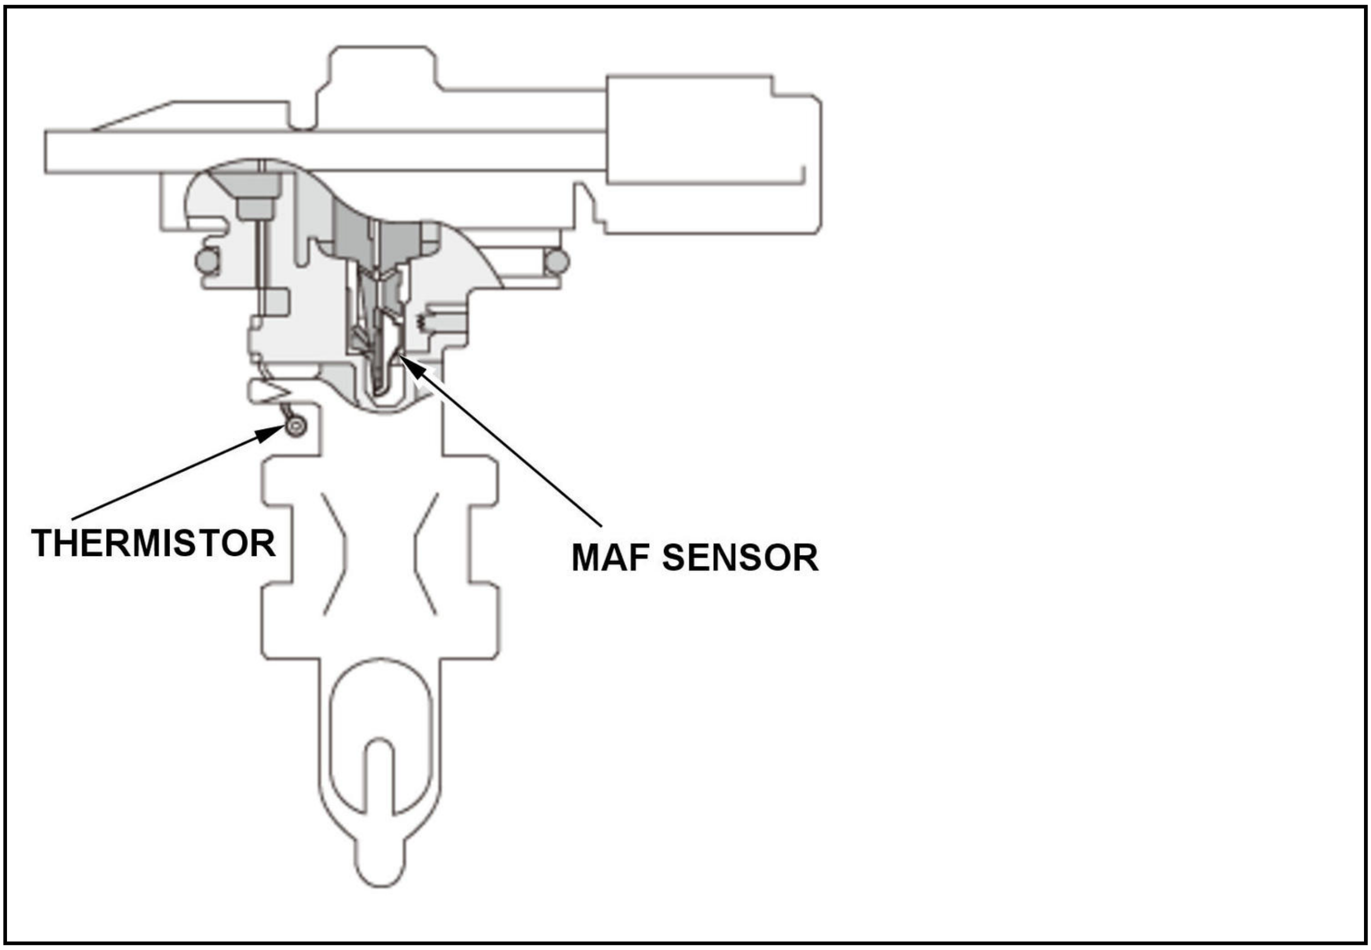
MAF Sensor/IAT Sensor 1

1.5 L engine:The mass air flow (MAF) sensor/intake air temperature (IAT) sensor has the MAF sensor contains a heater and two temperature sensors that are located on both sides of the heater at a very close distance. The heater is supplied current to the heating control at a constant temperature. The sensors upstream side and downstream side detect the mass air flow and the direction of air flow from the temperature difference due to heat conduction of air. The MAF sensor outputs the signal using a frequency (Hz).



THERMISTOR
MAF SENSOR

2.4 L engine:The mass air flow (MAF) sensor/intake air temperature (IAT) sensor 1 contains a hot wire sensor, a cold wire sensor, and a thermistor. The sensor is in the intake air passage. The resistance of the hot wire, the cold wire, and the thermistor changes due to intake air temperature and air flow. The control circuit in the MAF sensor controls the current to keep the hot wire at a set temperature. The current is converted to voltage in the control circuit, then sent as an input to the PCM.

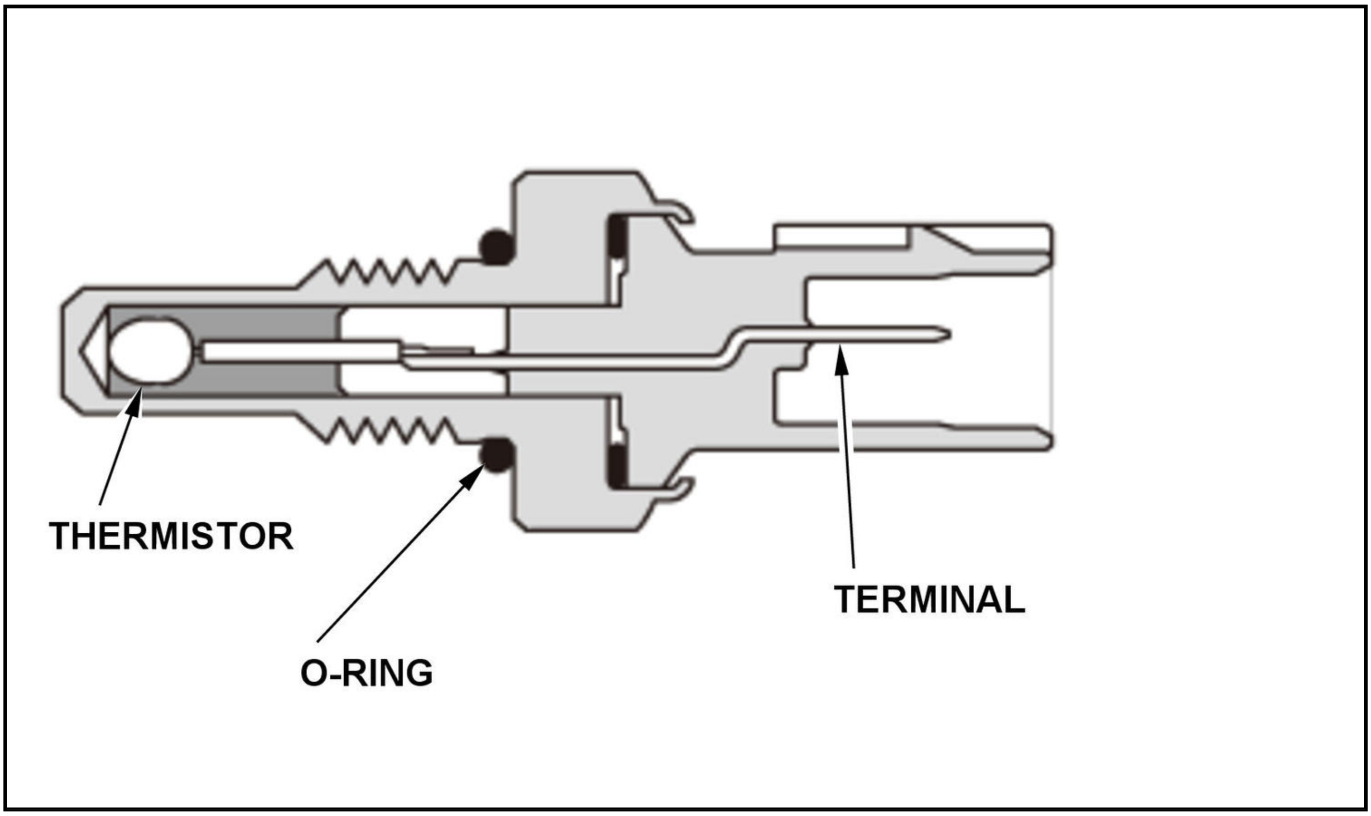
ECT sensors 1 and 2 are temperature dependent resistors (thermistors). The resistance decreases as the engine coolant temperature increases.



PGM-FI SYSTEM DESCRIPTION - ON-BOARD SNAPSHOT

Overview

For an easy analysis of problems caused by engine stalls and starting problems, the powertrain control module (PCM) uses an on-board snapshot to record the operational conditions at the time of engine stalls and engine starting problems.

There are three types of on-board snapshots: the on-board snapshot when DTC is stored, the on-board snapshot when engine stalls, and the on-board snapshot when engine does not start.

Basically the latest on-board snapshot data is memorized into the PCM. Therefore, a data memorized before is overwritten and cleared by a new one. However, because an on-board snapshot data has a priority which must be memorized into the PCM, the on-board snapshot which means the engine is hard to start cannot be memorized when the on-board snapshot which does the engine stalls is stored in advance. The data of the on-board snapshots can be checked with the HDS. Make sure to clear each type of on-board snapshots after checking it.

Control

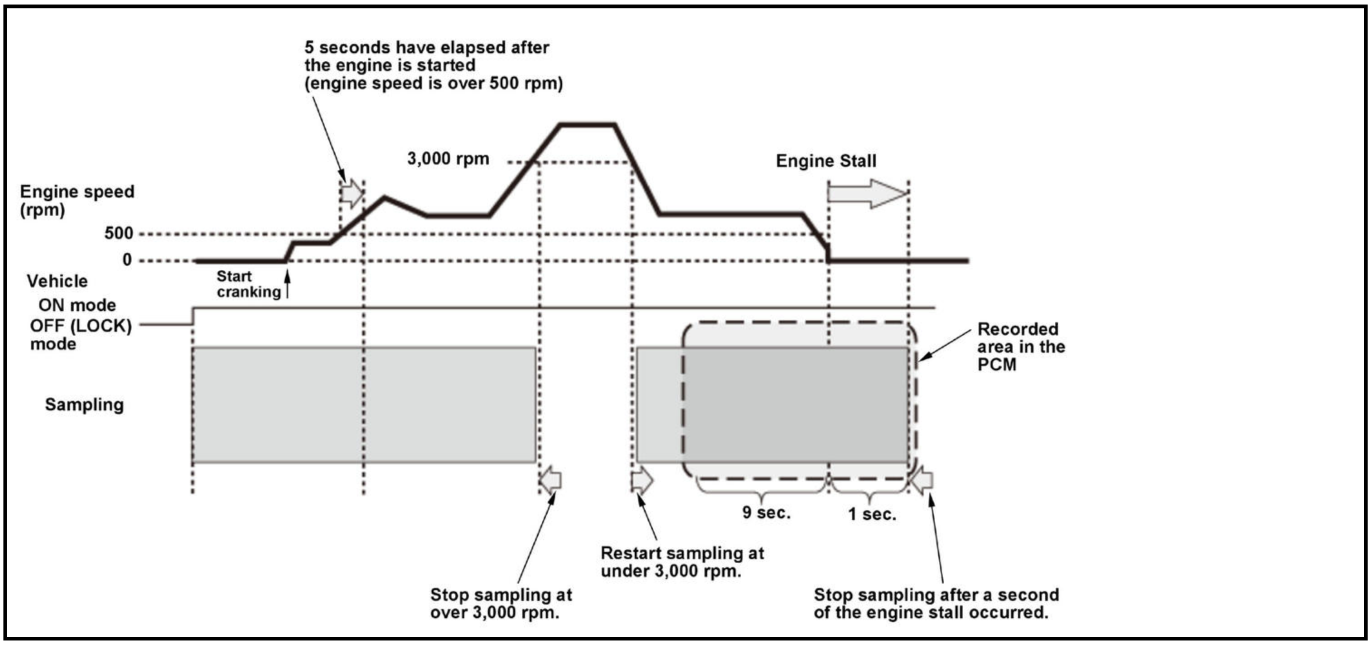
On-board snapshot when engine stalls

The preconditions for recording an on-board snapshot when the engine stalls are shown below. When an engine stall occurs under these preconditions, the parameters related to the engine stall are stored in the PCM - for a time span extending for 9 seconds before the engine stall and 1 second after the engine stall - covering a total of 10 seconds.

The precondition is:

- 5 seconds have elapsed after engine start (engine speed 500 rpm or higher) (In case of an engine stall within 5 seconds after the engine started, this is memorized on the side of the on-board snapshot when engine does not start (engine starts but stalls immediately))
- Engine speed at the time of an engine stall below 3, 000 rpm
- After 1 drive cycle, after PCM reset, or 12 volt battery terminal disconnection.
- Not during SCS short

*: In case of an engine stall for a vehicle with manual transmission at a vehicle speed of 3.1 mph (5 km/h) or lower, the on-board snapshot is not memorized.



5 seconds have elapsed after the engine is started (engine speed is over 500 rpm)

Stop sampling after a second of the engine stall occurred.

On-board snapshot when engine does not start

The three types of 'engine is hard to start', 'engine will not start', and 'engine start but stalls immediately' are set for an on-board snapshot at the time of engine starting problems.

The preconditions for recording an on-board snapshot when engine does not start are as shown below, and when engine starting problems occur under these preconditions, the parameters related to the engine starting problems are memorized in the PCM.

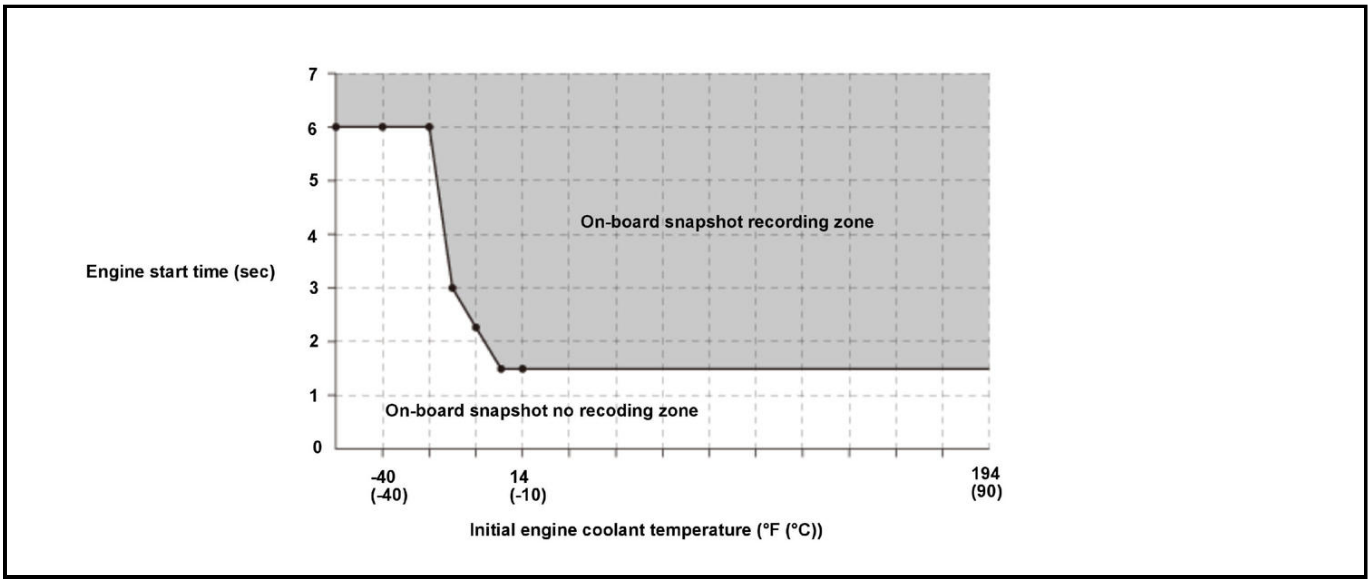
The precondition is:

- After 1 drive cycle, after PCM reset, or 12 volt battery terminal disconnection.
- On-board snapshot of Engine stalls is not stored.
- Not during SCS short

The on-board snapshot when engine does not start has the timer for the evaluation of starting problems as a factor is variable, and it depends on the engine coolant temperature when the engine starts, the relation between the engine coolant temperature and the engine start time; as it is shown below.

Initial engine coolant temperature (deg. F (deg. C))	-40 (-40)	-22 (-30)	-13 (-25)	-4 (-20)	5 (-15)	14 (-10)	194 (90)
Engine start time (sec)	6.00	6.00	3.00	2.25	1.50	1.50	1.50

On-board Snapshot Recording Zone (except R20Z9 engine)



The on-board snapshot when engine does not start functions during the first cranking after the vehicle ON mode, though it is nonfunctional when cranking the second and later in the same vehicle ON mode. If the on-board snapshot goes back to a state of possible recording again, it needs to go through once the vehicle OFF (LOCK) mode.

On-board snapshot of "engine is hard to start" and "engine will not start":

An on-board snapshot is taken when an engine does not start or when an engine is hard to start. The snapshot is taken when cranking (engine speed 500 rpm) or lower takes longer than the specified time (timer for the evaluation of starting problems: variable according to the conditions at the time of start). If it is determined that a starting problem exists, the parameters related to the starting problem (for 9 seconds before the evaluation of the starting problem and 1 second after the evaluation of starting problem) are stored in the PCM, covering a total of 10 seconds.

TURBOCHARGER CONTROL SYSTEM DESCRIPTION (1.5 L ENGINE)

Outline

The turbine in the turbocharger is turned by the exhaust gas, compresses the fresh intake air with the compressor mounted coaxially with the turbine, and discharges the air into the intercooler. The fresh intake air gets hot when compressed, is cooled in the intercooler, then enter the cylinders. The turbocharger equips with the turbocharger wastegate control valve and the turbocharger bypass control valve to control the system pressure and gas flow rate. The turbocharger wastegate control valve is actuated by an electric actuator.

THROTTLE VALVE
INTERCOOLER
COMPRESSOR
INTAKE MANIFOLD
TURBINE
AIR CLEANER
TURBOCHARGER WASTEGATE CONTROL ACTUATOR
TURBOCHARGER WASTEGATE CONTROL VALVE
To Catalytic Converter

Operation

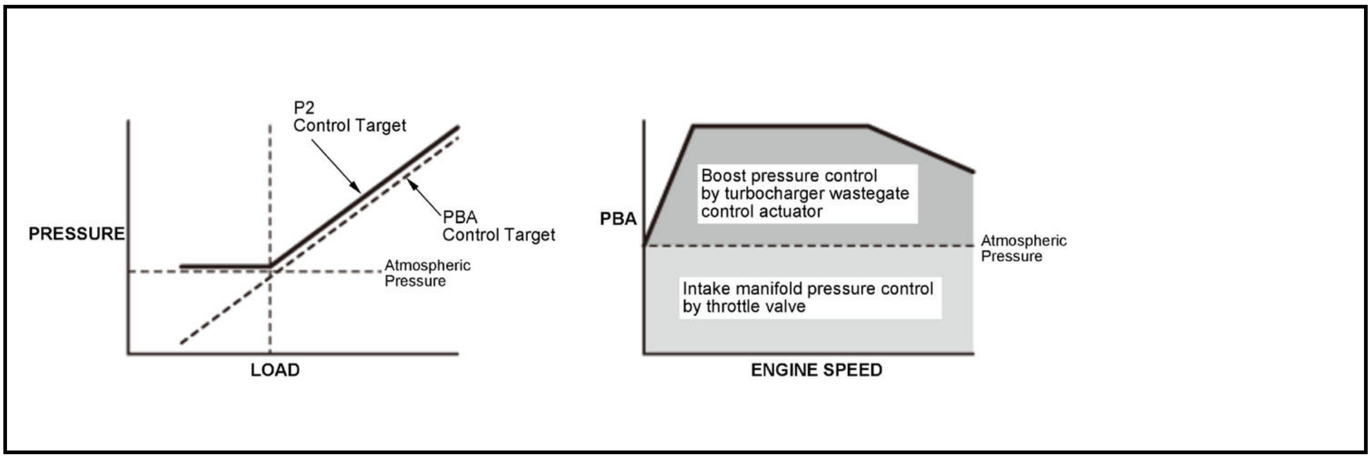
To control the boost pressure, the PCM changes the turbocharger wastegate control valve open ration using the duty control of the stroke of the turbocharger wastegate control actuator. When the turbocharger wastegate control valve closes, all the exhaust gas flows from the exhaust manifold to the turbine and serves the driving force for turning the turbine. This increases the turbine shaft speed and increases the compression pressure of the fresh intake air, causing the boost pressure to increase. When the turbocharger wastegate control valve opens, some of the exhaust gas bypasses the turbine and flows directly into the catalytic converter mounted downstream of the turbocharger. This decreases the turbine shaft speed, causing the boost pressure to decrease. This mechanism prevents the boost pressure from increasing excessively, and protects the engine and turbocharger.

The turbocharger bypass control valve consists of a diaphragm, a return spring, and a valve and is connected to the turbocharger bypass control solenoid valve for control. Normally, the turbocharger bypass control solenoid valve is kept ON by the PCM. Because equal pressure is applied to the both sides of the diaphragm, the turbocharger bypass control valve is kept closed by the return spring. When the throttle valve is closed from the supercharged condition, the PCM turns OFF the turbocharger bypass control solenoid valve. At this time, the negative pressure in the downstream of the throttle valve, which has passed through the solenoid valve, is applied to the solenoid side of the diaphragm, causing a pressure difference between the both sides of the diaphragm. The differential pressure overcomes the return spring force and the valve opens, causing the fresh intake air which has passed through the compressor to leak into the upstream of the compressor. This adjusts the system internal pressure and at the same time prevents the intake air drag in the compressor from increasing and the turbine shaft speed from decreasing, which provides improved response at the time of re-acceleration.

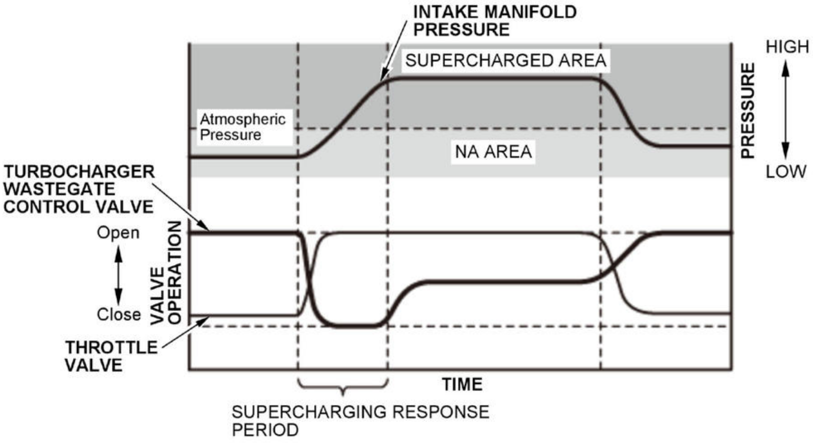
Engine Output Control

The turbocharger wastegate control actuator is an electric type, which enables flexible and precise control of the turbocharger wastegate control valve open ratio regardless of the operating condition of the engine. This enables the turbocharger wastegate control valve to function as an engine output control device in cooperation with the throttle valve.

In the area where the intake manifold absolute pressure (PBA) is below the atmospheric pressure (NA area), the engine output is controlled by changing the throttle valve open ratio. In the NA area, the turbocharger wastegate control valve is opened to keep the pressure in the upstream of the throttle valve (P2) to almost the atmospheric pressure, which prevents the exhaust pressure increasing by the turbine operation and reduces exhaust loss. In the area where the PBA is at or above the atmospheric pressure (supercharged area), the engine output is controlled by changing the turbocharger wastegate control valve open ratio to control the boost pressure.



In the supercharging response period, where the target PBA increases with the required torque to the engine and the internal pressure of the intake manifold increases from the NA area into the supercharged area, the throttle valve open ratio increases, the PBA increases, and the turbocharger wastegate control valve starts to close to ensure sufficient responsiveness. When the PBA reaches around the atmospheric pressure, the throttle valve is fixed in the fully-open position to minimize the air flow drag at the throttle valve. In the supercharged area, the turbocharger wastegate control valve open ratio is controlled so that the target PBA is achieved. After that, when the required torque to the engine decreases, the throttle valve closes and the turbocharger wastegate control valve opens to reduce the exhaust loss.

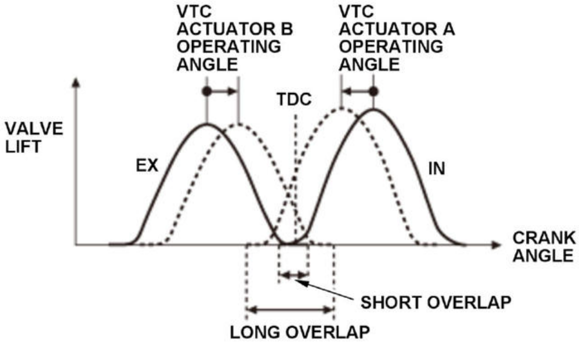


VTEC/VTC SYSTEM DESCRIPTION - VTC (1.5 L ENGINE)

For locations of each component on vehicle, refer to Component Location Index

Overview

The VTC system makes continuous intake and exhaust valve timing changes depending on the engine speed, the engine load, and the vehicle speed.



Construction

VTC Actuator

The VTC actuator is composed of the vane, the lock pin, the pin spring, and the housing with the timing gear. It is installed at the end of the camshaft. When the VTC actuator vane rotates to advance or retard position, the intake camshaft timing is changed. When the engine stops, the vane is locked in the initial position by the lock pin so that the engine will start smoothly. After the engine starts, the vane turns freely because the lock pin is pushed back against the spring tension by oil pressure.

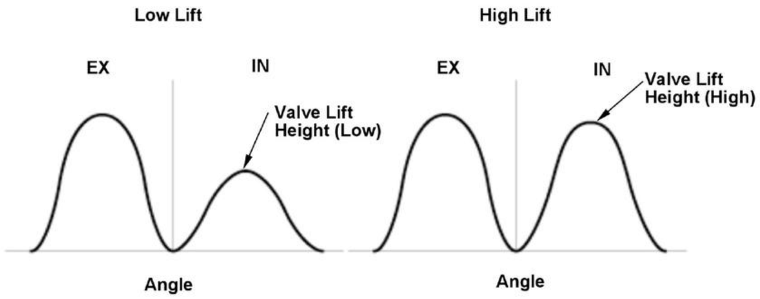
VTEC/VTC SYSTEM DESCRIPTION (2.4 L ENGINE) (2017 2018 2019)

Overview

This system improves fuel efficiency and reduces exhaust emissions at all engine speeds, vehicle speeds, and engine loads. The powertrain control module (PCM) switches the low and high lift cam depending on the engine speed and load in order to optimize the fuel efficiency and the engine output. The rocker arm oil control solenoid switches the intake valve side of the VTEC system on and off; the solenoid is controlled by the PCM.

Valve Timing Operation Image

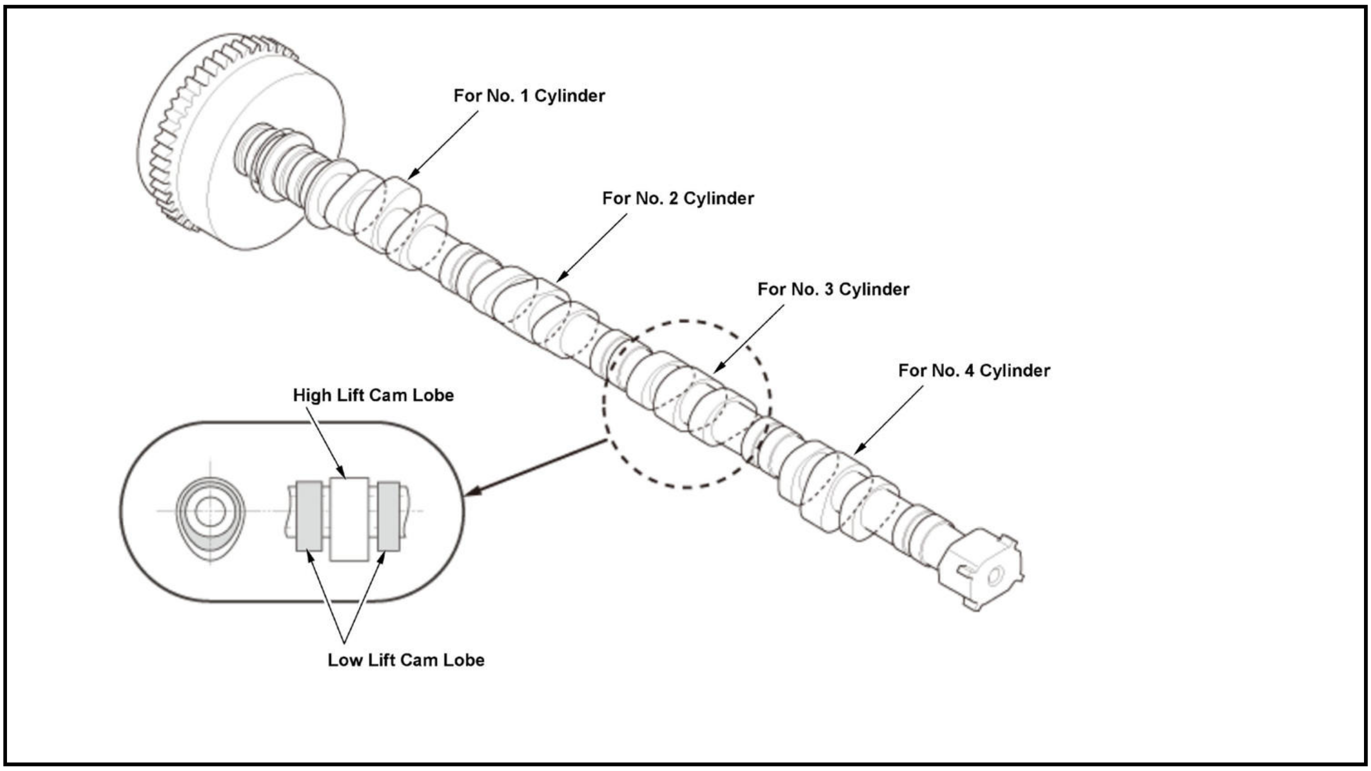


Construction

VTEC is composed of the VTEC camshaft, the VTEC rocker arm, and the rocker arm oil control valve.

VTEC Camshaft

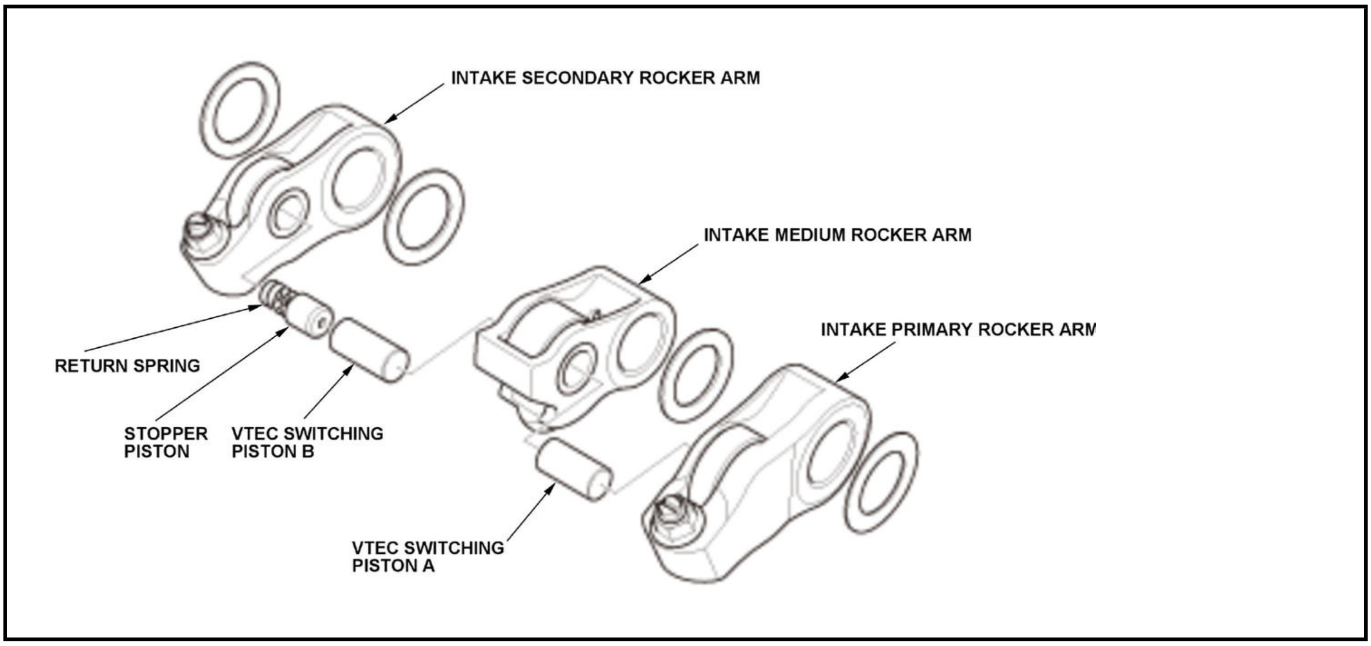
The intake camshaft is structured so that each cylinder has a separate low lift cam lobe and a high lift cam lobe.



For No. 1 Cylinder
For No. 2 Cylinder
For No. 3 Cylinder
For No. 4 Cylinder
High Lift Cam Lobe
Low Lift Cam Lobe

VTEC Rocker Arm

The intake rocker arm is composed of the primary, the medium, and the secondary rocker arms. The inner side of the intake primary rocker arm and the intake medium rocker arm have a VTEC switching piston in each rocker arm. The inner side of the intake secondary rocker arm has a stopper piston and a return spring.



INTAKE SECONDARY ROCKER ARM

Rocker Arm Oil Control Valve

The rocker arm oil control valve is integrated with the rocker arm oil control solenoid and the valve, it is installed on the cylinder head. When the rocker arm oil control solenoid turns on or off depending on a signal from the PCM, the hydraulic pressure subjects the valve to an ON/OFF control. By switching the ON/OFF of the valve, the hydraulic pressure applied to the VTEC switching piston in the rocker arms is controlled.

Control

Based on the vehicle speed signal, engine speed signal, engine load signal, throttle position signal, and engine coolant signal sent from various sensors, the PCM determines the lift amount and controls the ON/OFF of the rocker arm oil control solenoid. The PCM generates and determines the control amount based on signals from various sensors to subject the rocker arm oil control solenoid to a feedback control.

For locations of each component on vehicle, refer to Component Location Index

Rocker Arm Oil Control Solenoid

Operation

At low engine speed

At low engine speed, the rocker arm oil control solenoid is turned off by the PCM. Oil pressure from the rocker arm oil control valve does not enter the intake rocker shaft. The primary and the secondary intake rocker arms are lifted by the low lift cam lobe.

INTAKE SECONDARY ROCKER ARM
INTAKE MEDIUM ROCKER ARM

At high engine speed/high load operation

At high engine speed, the rocker arm oil control solenoid is turned on by the PCM. Oil pressure from the rocker arm oil control solenoid enters the intake primary rocker arm via the intake rocker shaft, and it moves the VTEC switching piston in the rocker arm. This causes the VTEC switching piston to slide into the intake medium rocker arm, locking the intake secondary and medium rocker arms together. Both intake rocker arms are lifted by the high lift cam lobe.

Terminal number	Terminal name	Description
1	INJ RLY OUT (INJECTOR POWER SOURCE)	Power source for PCM (injector driver)

Terminal number	Terminal name	Description
2	INJ RLY OUT (INJECTOR POWER SOURCE)	Power source for PCM (injector driver)
3	+B VBACT (TURBOCHARGER WASTEGATE CONTROL ACTUATOR POWER SOURCE)	Power source for PCM (Turbocharger wastegate control actuator)
4	SO2HT (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S) (SENSOR 2) HEATER CONTROL)	Drives secondary HO2S (Sensor 2) heater
5	FI MAIN RLY CL- (PGM-FI MAIN RELAY 1)	Drives PGM-FI main relay 1, injector relay, ignition coil relay
6 *1	CCV (EVAP LEAK CHECK VALVE)	Drives EVAP leak check valve
7	+B BACKUP FI-ECU (VOLTAGE BACK UP)	Power source for PCM memory
8	FI MAIN RLY OUT (POWER SOURCE)	Power source for PCM
9	Not used	B
10	LIN (BATT SENSOR) (LOCAL INTERCONNECT NETWORK)	Sends and receives communication signal
11	FUEL PUMP RLY CL- (FUEL PUMP RELAY)	Drives PGM-FI main relay 2
12	Not used	B
13	FI ECU GND (GROUND)	Ground for PCM
14 *2	DCDC STS	Output DC-DC converter operation signal
15	ST CUT RLY1 CL- (STARTER CUT RELAY 1)	Drives starter cut relay 1

*1: USA and Canada models*2: With auto idle stop system*3: Without keyless access system

Terminal number	Terminal name	Description
16	FI SUB RLY OUT (POWER SOURCE)	Power source for PCM
17	FAN LO SIGNAL (RADIATOR FAN CONTROL)	Drives radiator fan relay
18	FAN HI SIGNAL (RADIATOR FAN CONTROL)	Drives A/C condenser fan relay and fan control relay
19	START DIAG (STARTER SIGNAL LOAD)	Detects starter signal
20	TM-CAN L (TM-CAN COMMUNICATION SIGNAL LOW)	Sends and receives communication signal for TCM
21	TM-CAN H (TM-CAN COMMUNICATION SIGNAL HIGH)	Sends and receives communication signal for TCM
22	Not used	B
23	ST CUT RLY2 CL- (STARTER CUT RELAY 2)	Drives starter cut relay 2
24 *3	ACC/IG2 CUT RELAY CL- (ACC/IG2 CUT RELAY)	Drive ACC cut relay and IG2 cut relay
25	FI SUB RLY CL- (PGM-FI SUBRELAY)	Drives PGM-FI subrelay
26	STOP SW (BRAKE PEDAL POSITION SWITCH)	Detects brake pedal position switch signal
27	SCS (SERVICE CHECK SIGNAL)	Detects service check signal
28	STS (STARTER SWITCH SIGNAL)	Detects starter switch signal
29	Not used	B
30	Not used	B
31	Not used	B
32	APS1 (ACCELERATOR PEDAL POSITION (APP) SENSOR A)	Detects APP sensor A signal
33	PD SENSOR (A/C PRESSURE SENSOR)	Detects A/C pressure sensor signal
34	APS2 (ACCELERATOR PEDAL POSITION (APP) SENSOR B)	Detects APP sensor B signal
35	VSP (VEHICLE SPEED SIGNAL OUTPUT)	Sends vehicle speed signal
36	F-CAN A L (CAN COMMUNICATION A SIGNAL LOW)	Sends and receives communication signal
37	F-CAN A H (CAN COMMUNICATION A SIGNAL HIGH)	Sends and receives communication signal

Terminal number	Terminal name	Description
38	F-CAN B L (CAN COMMUNICATION B SIGNAL LOW)	Sends and receives communication signal
39	F-CAN B H (CAN COMMUNICATION B SIGNAL HIGH)	Sends and receives communication signal
40	S-NET (SERIAL COMMUNICATION FOR IMMOBILIZER)	Sends serial communication signal
41	Not used	B
42 *1	ELCMPA (EVAP LEAK CHECK MODULE PRESSURE SENSOR)	Detects EVAP leak check module pressure sensor signal
43	SG5 (SENSOR GROUND)	Sensor ground
44	VCC5 (SENSOR VOLTAGE)	Provides sensor reference voltage
45	VCC4 (SENSOR VOLTAGE)	Provides sensor reference voltage
46	SG4 (SENSOR GROUND)	Sensor ground
47	SO2 (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S) (SENSOR 2))	Detects secondary HO2S (Sensor 2) signal
48	SO2 SG (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S) (SENSOR 2) SENSOR GROUND)	Sensor ground for secondary HO2S (Sensor 2)
49	BKSWNC (BRAKE PEDAL POSITION SWITCH)	Detects brake pedal position switch signal
50	Not used	B

Terminal number	Terminal name	Description
25	WGMTR2 (-) (TURBOCHARGER WASTEGATE CONTROL ACTUATOR - SIDE)	Drives turbocharger wastegate control actuator
26	WGMTR1 (+) (TURBOCHARGER WASTEGATE CONTROL ACTUATOR + SIDE)	Drives turbocharger wastegate control actuator
27	MTR1 (THROTTLE ACTUATOR)	Drives throttle actuator
28	MTR2 (THROTTLE ACTUATOR)	Drives throttle actuator
29	Not used	B
30	Not used	B
31	ACC (A/C COMPRESSOR CLUTCH RELAY)	Drives A/C compressor clutch relay
32	CAM EX (CAMSHAFT POSITION (CMP) SENSOR B)	Detects CMP sensor B signal
33	Not used	B
34	KSGND (KNOCK SENSOR GROUND)	Sensor ground for knock sensor
35	KS (KNOCK SENSOR)	Detects knock sensor signal
36	IG1 (MONI) (IGNITION SIGNAL)	Detects ignition signal
37	IGN01 (No. 1 IGNITION COIL PULSE)	Drives No. 1 ignition coil
38	IGN02 (No. 2 IGNITION COIL PULSE)	Drives No. 2 ignition coil
39	IGN03 (No. 3 IGNITION COIL PULSE)	Drives No. 3 ignition coil
40	IGN04 (No. 4 IGNITION COIL PULSE)	Drives No. 4 ignition coil
41	Not used	B
42	Not used	B
43	TDCAM (CAMSHAFT POSITION (CMP) SENSOR A)	Detects CMP sensor A signal
44	CRKP (CRANKSHAFT POSITION (CKP) SENSOR)	Detects CKP sensor signal
45	SG6 (SENSOR GROUND)	Sensor ground
46	VTC (EX) (VTC OIL CONTROL SOLENOID VALVE B)	Drives VTC oil control solenoid valve B
47 *1	ELCMP (EVAP LEAK CHECK MODULE VACUUM PUMP)	Drives EVAP leak check module vacuum pump

Terminal number	Terminal name	Description
48	IP (AIR FUEL RATIO (A/F) SENSOR (SENSOR 1) IP CELL)	Detects A/F sensor (Sensor 1) pump cell
49	Not used	B
50	THL1 (THROTTLE POSITION (TP) SENSOR A)	Detects TP sensor A signal
51	THL2 (THROTTLE POSITION (TP) SENSOR B)	Detects TP sensor B signal
52	TW (ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1)	Detects ECT sensor 1 signal
53	ITA1 (TA) (INTAKE AIR TEMPERATURE (IAT) SENSOR 1)	Detects IAT sensor 1 signal
54	TW2 (ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2)	Detects ECT sensor 2 signal
55	ITA2 (INTA) (INTAKE AIR TEMPERATURE (IAT) SENSOR 2)	Detects IAT sensor 2 signal
56	PB (MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR)	Detects MAP sensor signal
57	P3 (TURBOCHARGER BOOST SENSOR)	Detects turbocharger boost sensor signal
58	ENG OPSW (OIL PRESSURE SWITCH)	Detects oil pressure switch signal
59	Not used	B
60	DCWGL (TURBOCHARGER WASTEGATE CONTROL ACTUATOR POSITION SENSOR)	Detects turbocharger wastegate control actuator position sensor signal
61	FGP (MASS AIR FLOW (MAF) SENSOR PULSE)	Detects MAF sensor signal
62	Not used	B
63	VCC6 (SENSOR VOLTAGE)	Provides sensor reference voltage
64	VTC (IN) (VTC OIL CONTROL SOLENOID VALVE A)	Drives VTC oil control solenoid valve A

3	LC LS (CVT LOCK-UP CLUTCH CONTROL SOLENOID VALVE)	Drives CVT lock-up clutch control solenoid valve
4	DR LS (CVT DRIVE PULLEY PRESSURE CONTROL SOLENOID VALVE)	Drives CVT drive pulley pressure control solenoid valve
5	CPC LS (CVT CLUTCH PRESSURE CONTROL SOLENOID VALVE)	Drives CVT clutch pressure control solenoid valve
6	VTC (VTC OIL CONTROL SOLENOID VALVE)	Drives VTC oil control solenoid valve
7	AFHT (AIR FUEL RATIO (A/F) SENSOR (SENSOR 1) HEATER CONTROL)	Drives A/F sensor (sensor 1) heater
8	GND3 (PCM GROUND)	Ground for PCM
9	SO2 HT (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S) (SENSOR 2) HEATER)	Drives secondary HO2S (sensor 2) heater
10	DN LS (CVT DRIVEN PULLEY PRESSURE CONTROL SOLENOID VALVE)	Drives CVT driven pulley pressure control solenoid valve
11	MTR1 (THROTTLE ACTUATOR -SIDE)	Ground for throttle actuator
12	MTR2 (THROTTLE ACTUATOR +SIDE)	Drives throttle actuator
13	HPUMP H (HIGH PRESSURE FUEL PUMP +)	Drives high pressure fuel pump
14	HPUMP L (HIGH PRESSURE FUEL PUMP -)	Drives high pressure fuel pump
15	Not used	B
16	Not used	B
17	SOL C (SHIFT SOLENOID VALVE O/P)	Drives shift solenoid valve O/P
18	Not used	B
19	SOL B (SHIFT SOLENOID VALVE B)	Drives shift solenoid valve B
20	Not used	B
21	NT (TORQUE CONVERTER TURBINE SPEED SENSOR)	Detects torque converter turbine speed sensor signal

Terminal number	Terminal name	Description
22	Not used	B
23	ATP RVS (TRANSMISSION RANGE SWITCH RVS POSITION)	Detects transmission range switch R position signal
24	ATP N (TRANSMISSION RANGE SWITCH N POSITION)	Detects transmission range switch N position signal

Terminal number	Terminal name	Description
25	ATP D (TRANSMISSION RANGE SWITCH D POSITION)	Detects transmission range switch D position signal
26	ATP FWD (TRANSMISSION RANGE SWITCH FWD POSITION)	Detects transmission range switch FWD position signal
27	ATP R (TRANSMISSION RANGE SWITCH R POSITION)	Detects transmission range switch R position signal
28	KSGND (KNOCK SENSOR GROUND)	Sensor ground for knock sensor
29	KS (KNOCK SENSOR)	Detects knock sensor signal
30	VCC2 (SENSOR VOLTAGE)	Provides sensor reference voltage
31	SG2 (SENSOR GROUND)	Sensor ground
32	VELL DD (CVT SPEED SENSOR)	Detects CVT speed sensor signal
33	NDR DD (CVT DRIVE PULLEY SPEED SENSOR)	Detects CVT drive pulley speed sensor signal
34	ATP P (TRANSMISSION RANGE SWITCH P POSITION)	Detects transmission range switch P position signal
35	Not used	B
36	Not used	B
37	TATF (TRANSMISSION FLUID TEMPERATURE SENSOR)	Detects transmission fluid temperature sensor signal
38	SO2 (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S) (SENSOR 2))	Detects secondary HO2S (sensor 2) signal
39	SO2SG (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (SENSOR 2)) SENSOR GROUND)	Sensor ground for secondary HO2S (sensor 2)
40	Not used	B
41	VCC1 (SENSOR VOLTAGE)	Provides sensor reference voltage
42	SG1 (SENSOR GROUND)	Sensor ground
43	ATP S (TRANSMISSION RANGE SWITCH S POSITION)	Detects transmission range switch S position signal
44	ATP L (TRANSMISSION RANGE SWITCH L POSITION)	Detects transmission range switch L position signal
45	PB (MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR)	Detects MAP sensor signal
46	PF (FUEL RAIL PRESSURE SENSOR)	Detects fuel rail pressure sensor signal
47	AFS- (AIR FUEL RATIO (A/F) SENSOR (SENSOR 1) -SIDE)	Detects A/F sensor (sensor 1) signal
48	AFS+ (AIR FUEL RATIO (A/F) SENSOR (SENSOR 1) +SIDE)	Detects A/F sensor (sensor 1) signal
49	PDN (CVT DRIVEN PULLEY PRESSURE SENSOR)	Detects CVT driven pulley pressure sensor signal
50	Not used	B
51	Not used	B

DTC TROUBLESHOOTING

MIL CIRCUIT TROUBLESHOOTING (1.5 L ENGINE)

MIL Circuit Troubleshooting

1. Gauge control module check

   -1. Turn the vehicle to the ON mode.

   -2. Do the gauge control module self-diagnostic function .

   Does the MIL flash?

   YES

   Go to step 2.

   NO

   Substitute a known-good gauge control module , then recheck. If the symptom/indication goes away with a known-good gauge control module, replace the original gauge control module .

2. PCM check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Connect the HDS to the data link connector.

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
SCS	Short	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 3.

   NO

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

3. Shorted wire check (SCS line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (50P)

   -4. Disconnect the HDS from the data link connector.

   -5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	PCM connector A (50P) No. 27
Test point 2	Body ground

   Is there continuity?

   YES

Repair a short in the SCS wire between the PCM (A27) and the data link connector.

NO

The SCS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

MIL CIRCUIT TROUBLESHOOTING (2.4 L ENGINE) (2017 2018 2019)

MIL Circuit Troubleshooting

1. Gauge control module check

-1. Turn the vehicle to the ON mode.

-2. **Do the gauge control module self-diagnostic function** .

Does the MIL flash?

YES

Go to step 2.

NO

Substitute a known-good gauge control module , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

2. PCM check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Connect the HDS to the data link connector**.

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
SCS	Short	B	B	B

Do the current condition (s) match the threshold?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted wire check (SCS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Disconnect the HDS from the data link connector.

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 48**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the SCS wire between the PCM (A48) and the data link connector.

NO

The SCS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

PCM POWER AND GROUND CIRCUIT TROUBLESHOOTING (1.5 L ENGINE)

PCM Power and Ground Circuit Troubleshooting

1. Engine starting check

   -1. Try to start the engine.

   Does the engine start and idle smoothly?

   YES

   Go to the troubleshooting for CAN gateway system DTC (s) .

   NO

   Go to step 2.

2. Fuse check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A12 (10 A)
Location	Under-hood fuse/relay box

   Is the fuse OK?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Determine possible failure area (+B BACKUP FI-ECU line, others)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   -2. Disconnect the following connector.

PCM connector A (50P)

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected

Test point 1	**PCM connector A (50P) No. 7**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 5.

NO

Repair an open in the +B BACKUP FI-ECU wire between PCM (A7) and the No. A12 (10 A) fuse in the under-hood fuse/relay box.

4. Shorted wire check (+B BACKUP FI-ECU line)

-1. Remove the blown No. A12 (10 A) fuse from the under-hood fuse/relay box.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the +B BACKUP FI-ECU wire between the PCM (A7) and the No. A12 (10 A) fuse in the under-hood fuse/relay box. Also replace the No. A12 (10 A) fuse.

NO

Go to step 5.

5. Fuse check 2

-1. Check the following fuse.

Fuse	No. A7 (15 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 9.

NO

Go to step 6.

6. Shorted wire check (+B IGP line)

-1. Remove the blown No. A7 (15 A) fuse from the under-hood fuse/relay box.

-2. **Remove the injector relay** .

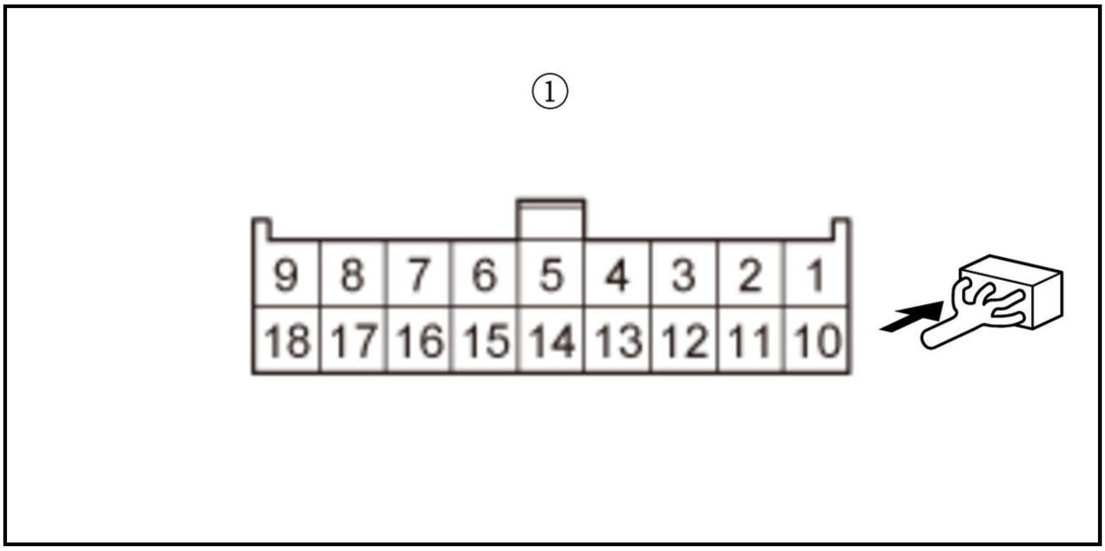
-3. Disconnect the following connector.

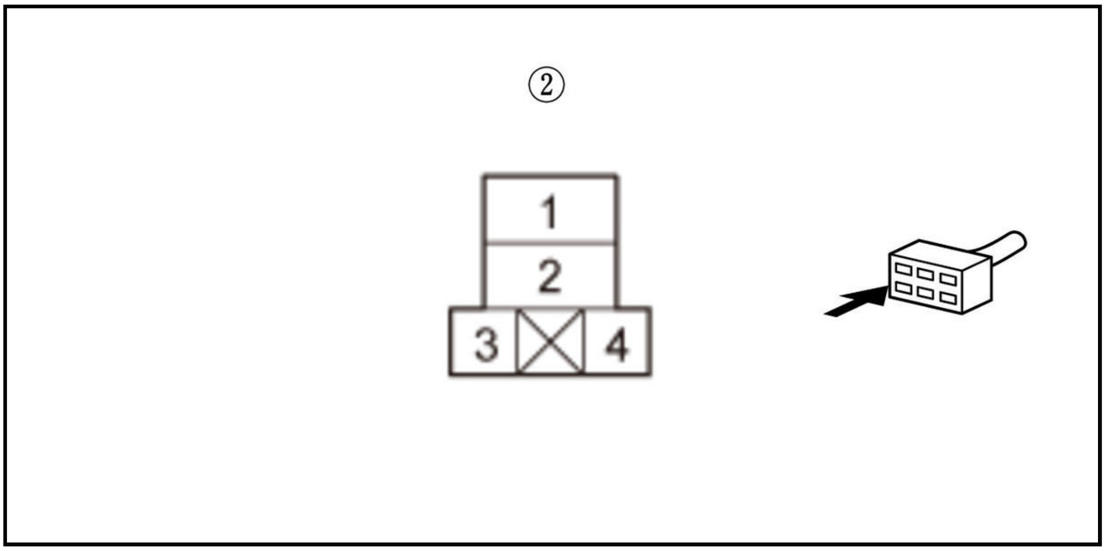
Relay circuit board connector C (18P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board connector C (18P): disconnected
B	PCM connector A (50P): disconnected
B	Injector relay: disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground

Test point 1	Injector relay 4P socket (female terminals) No. 3: ②
Test point 2	Body ground





Is there continuity?

YES

Repair a short in the +B IGP wire between the No. A7 (15 A) fuse and the relay circuit board or the No. A7 (15 A) fuse and the injector relay. If the wire is OK, replace the under-hood fuse/relay box . Also replace the No. A7 (15 A) fuse.

NO

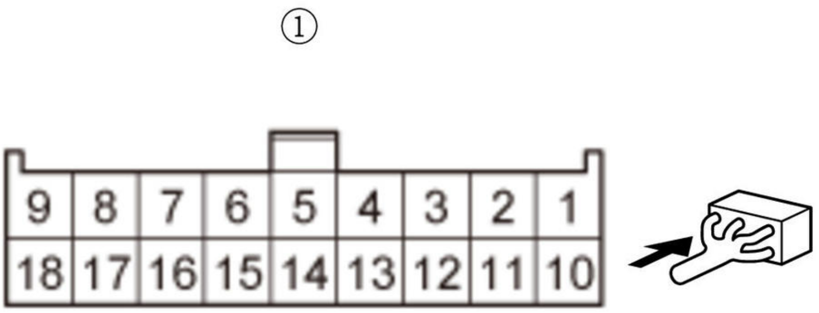
Go to step 7.

7. Part (s) internal circuit check (short in FI MAIN RLY OUT line):

Disconnect each of the parts or connectors below, one at a time, then check for continuity between test points 1 and 2.

- PGM-FI main relay 2
- PCM connector A (50P)

Test condition	Vehicle OFF (LOCK) mode Relay circuit board connector C (18P): disconnected Injector relay: disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	Body ground



Does continuity go away when one of the above components is disconnected?

YES

Replace the part that made the short to body ground go away when it was disconnected. If the part is the PCM, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the symptom/indication goes away and the PCM was substituted, **replace the original PCM** . Also replace the No. A7 (15 A) fuse in the under-hood fuse/relay box.

NO

Parts are OK. Go to step 8.

8. Shorted wire check (FI MAIN RLY OUT line):

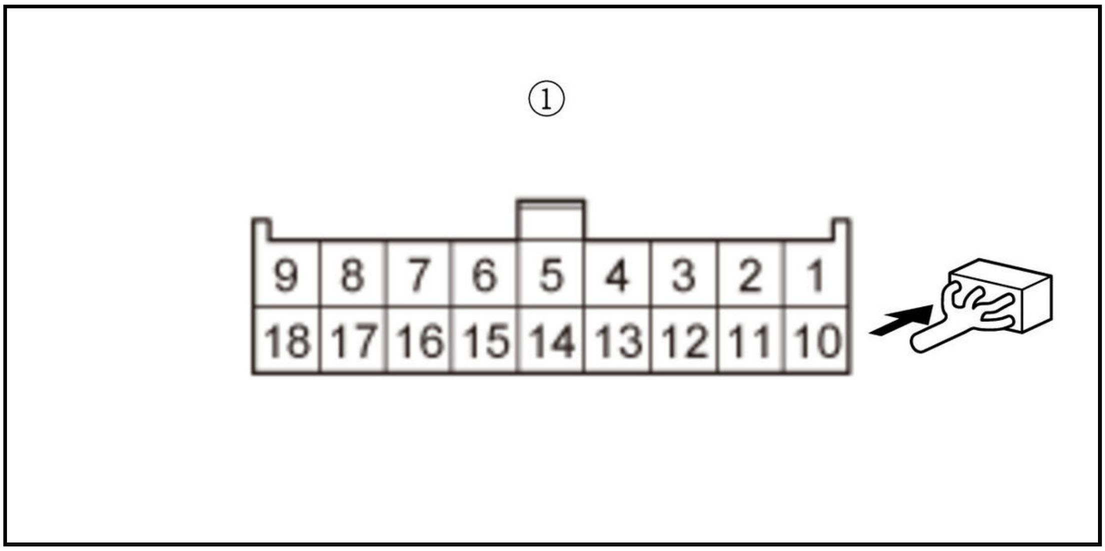
Disconnect the following parts or connectors:

- PGM-FI main relay 2
- PCM connector A (50P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Relay circuit board connector C (18P): disconnected PGM-FI main relay 2: disconnected Injector relay: disconnected PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①

Test point 2	Body ground



Is there continuity?

YES

Repair a short in the FI MAIN RLY OUT wire between the relay circuit board and each part. Also replace the No. A7 (15 A) fuse in the under-hood fuse/relay box.

NO

The FI MAIN RLY OUT wire is OK. **Replace the relay circuit board** . Also replace the No. A7 (15 A) fuse in the under-hood fuse/relay box.

9. Fuse check 3

-1. Check the following fuse.

Fuse	No. D8 (15 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 14.

NO

Go to step 10.

10. Relay check

-1. **Remove PGM-FI main relay 2** .

-2. **Test PGM-FI main relay 2** .

Is the relay OK?

YES

PGM-FI main relay 2 is OK. Go to step 11.

NO

Replace PGM-FI main relay 2. Also replace the No. D8 (15 A) fuse in the under-dash fuse/relay box.

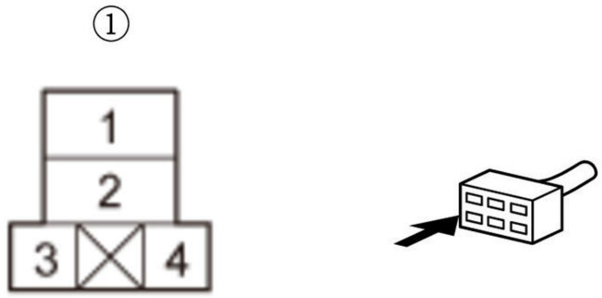
11. Determine possible failure area (IG1 FUEL PUMP line, others)

-1. Remove the blown No. D8 (15 A) fuse from the under-dash fuse/relay box.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PGM-FI main relay 2: disconnected
	PCM connector A (50P): disconnected

Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 12.

NO

Go to step 13.

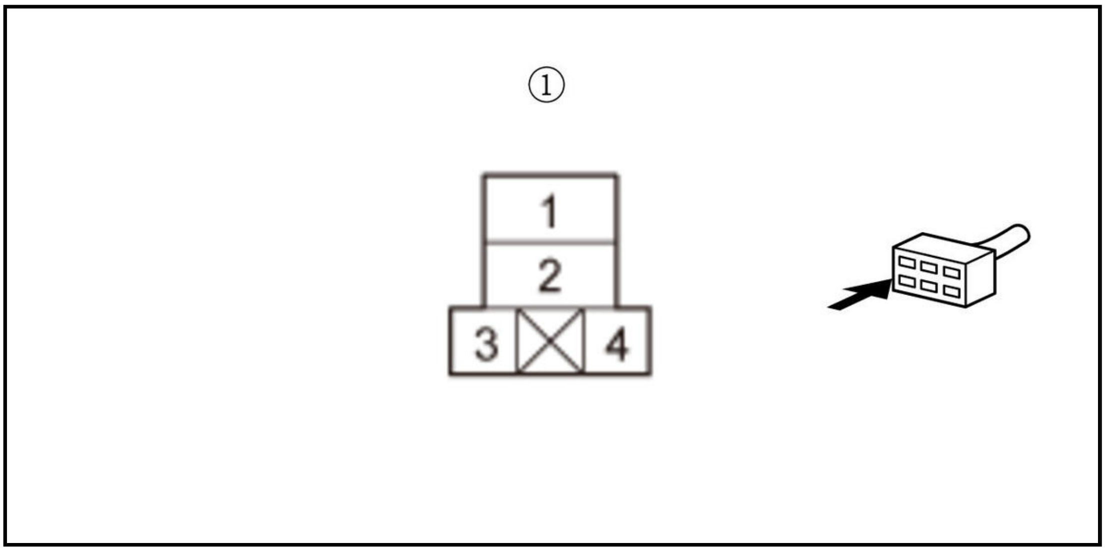
12. Shorted wire check (IG1 FUEL PUMP line)

-1. Disconnect the following connector.

Under-dash fuse/relay box connector C (27P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PGM-FI main relay 2: disconnected
B	Under-dash fuse/relay box connector C (27P): disconnected
B	PCM connector A (50P): disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the IG1 FUEL PUMP wire between PGM-FI main relay 2 and the No. D8 (15 A) fuse in the under-dash fuse/relay box. Also replace the No. D8 (15 A) fuse.

NO

The IG1 FUEL PUMP wire is OK. Replace the No. D8 (15 A) fuse in the under-dash fuse/relay box. If the fuse blown again, **replace the under-dash fuse/relay box** .

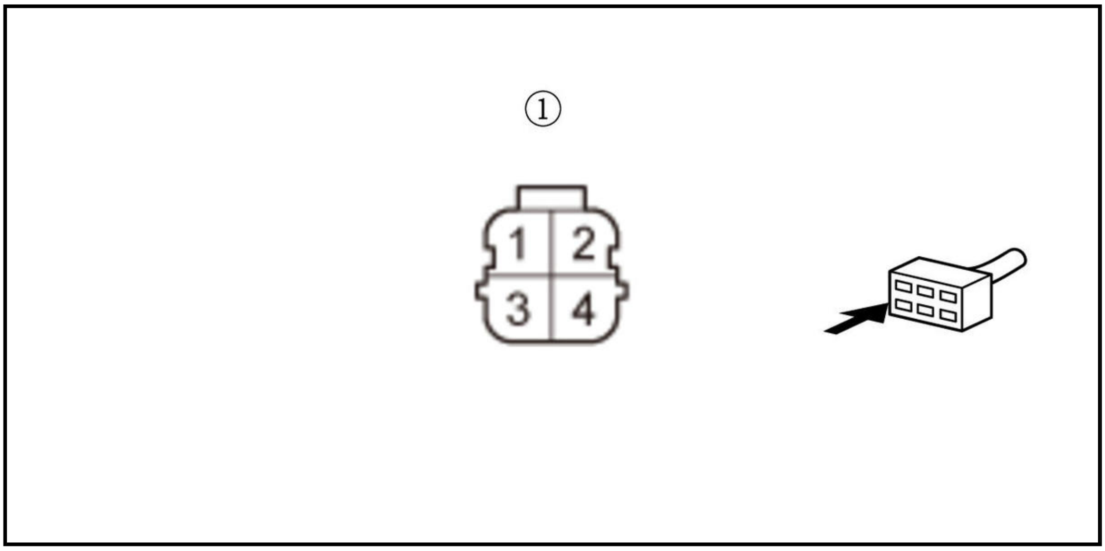
13. Shorted wire check (FUEL PUMP RLY OUT line)

-1. Disconnect the following connector.

Fuel tank unit 4P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PGM-FI main relay 2: disconnected PCM connector A (50P): disconnected Fuel tank unit 4P connector: disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the FUEL PUMP RLY OUT wire between PGM-FI main relay 2 and the fuel tank unit. Also replace the No. D8 (15 A) fuse in the under-dash fuse/relay box.

NO

The FUEL PUMP RLY OUT wire is OK. Check the fuel pump, and **replace it** if needed. Also replace the No. D8 (15 A) fuse in the under-dash fuse/relay box.

14. Open wire check (IG1 FUEL PUMP line)

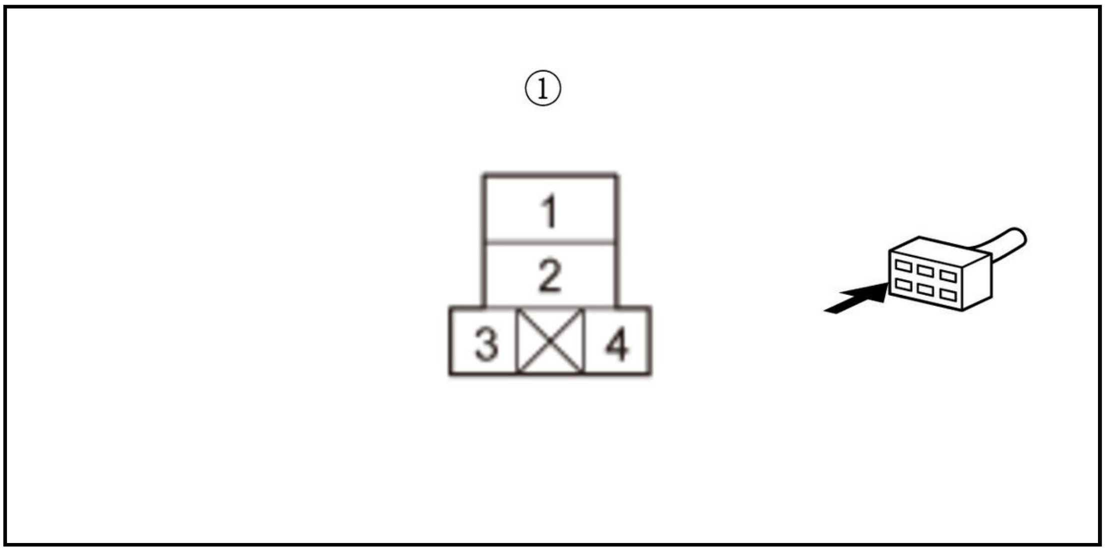
-1. **Remove PGM-FI main relay 2** .

-2. Exit the SCS mode with the HDS.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 FUEL PUMP wire is OK. Go to step 15.

NO

Repair an open in the IG1 FUEL PUMP wire between the No. D8 (15 A) fuse in the under-dash fuse/relay box and PGM-FI main relay 2.

15. Fuse check 4

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D11 (5 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 17.

NO

Go to step 16.

16. Shorted wire check (IG1 (MONI)/IG1 MON line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	PGM-FI main relay 2: disconnected
Test point 1	**PCM connector E (80P) No. 36**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the IG1 (MONI)/IG1 MON wire between the PCM (E36) and the No. D11 (5 A) fuse in the under-dash fuse/relay box. Also replace the No. D11 (5 A) fuse.

NO

The IG1 (MONI)/IG1 MON wire is not shorted. Go to step 18.

17. Open wire check (IG1 (MONI)/IG1 MON line)

-1. Reinstall the No. D11 (5 A) fuse in the under-dash fuse/relay box.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected
	PGM-FI main relay 2: disconnected
Test point 1	**PCM connector E (80P) No. 36**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 (MONI)/IG1 MON wire is OK. Go to step 18.

NO

Repair an open in the IG1 (MONI)/IG1 MON wire between the PCM (E36) and the No. D11 (5 A) fuse in the under-dash fuse/relay box.

18. Determine possible failure area (PGM-FI main relay 1 control circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	PCM connector A (50P) No. 5
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 21.

NO

Go to step 19.

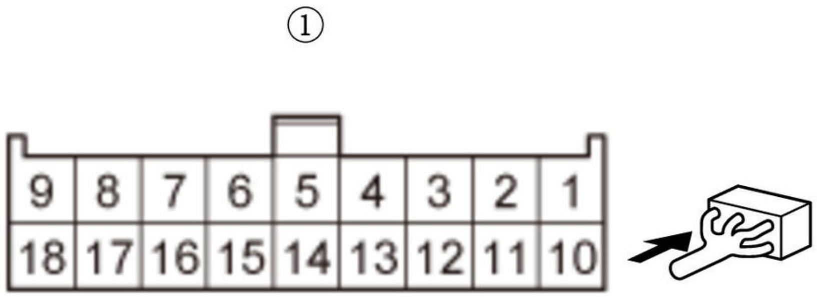
19. Open wire check (+B IGP line)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PCM connector E (80P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 20.

NO

Repair an open in the +B IGP wire between the relay circuit board and the No. A7 (15 A) fuse in the under-hood fuse/relay box.

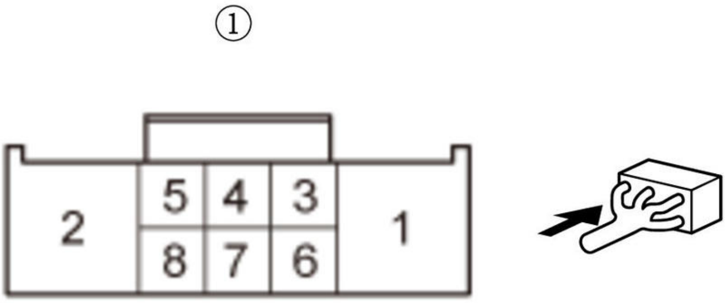
20. Open wire check (FI MAIN RLY CL- line)

-1. Disconnect the following connector.

Relay circuit board connector A (8P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PCM connector E (80P): disconnected
B	Relay circuit board connector A (8P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 7: ①
Test point 2	**PCM connector A (50P) No. 5**



Is there continuity?

YES

The FI MAIN RLY CL- wire is OK. **Remove and test the relay circuit board** . If the relay circuit board is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

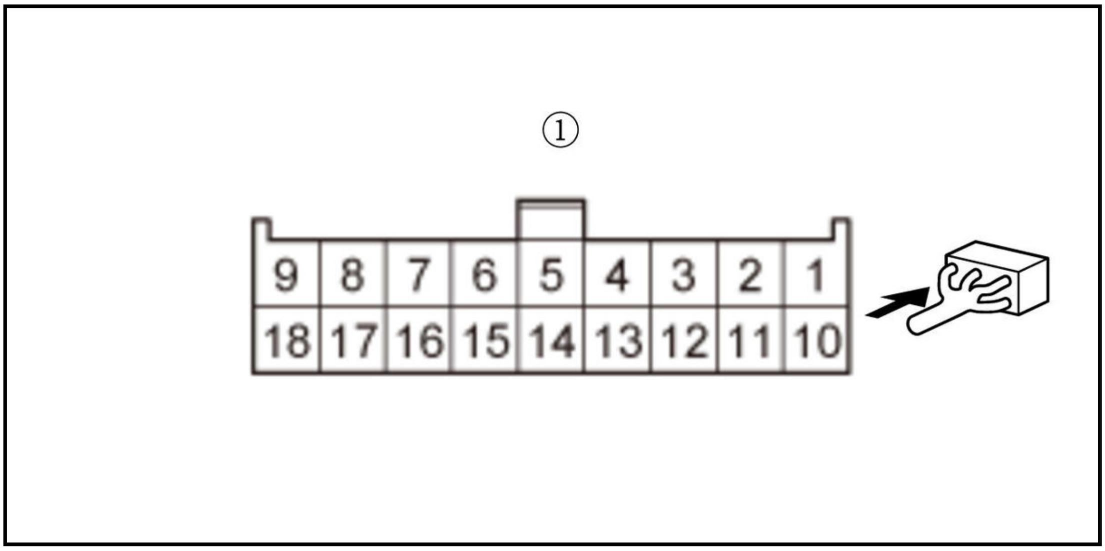
Repair an open in the FI MAIN RLY CL- wire between the PCM (A5) and the relay circuit board.

21. Open wire check (FI MAIN RLY OUT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected

	PCM connector E (80P): disconnected
	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	**PCM connector A (50P) No. 8**



Is there continuity?

YES

The FI MAIN RLY OUT wire is OK. Go to step 22.

NO

Repair an open in the FI MAIN RLY OUT wire between the PCM (A8) and the relay circuit board.

22. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

The relay circuit board is OK. Go to step 23.

NO

Replace the relay circuit board .

23. Open wire check (GND lines)

-1. Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PCM connector E (80P): disconnected
B	Relay circuit board: removed

Connector	Terminal
PCM connector A (50P)	No. 13
PCM connector E (80P)	No. 7
	No. 8
	No. 22
	No. 23
	No. 24

Is there continuity?

YES

The FI ECU GND, INJ GND1, INJ GND2, GND2, GND3, and GND4 wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the FI ECU GND, INJ GND1, or INJ GND2 wire between the PCM (A13, E7, E8) and G102, or an open in the GND2, GND3, or GND4 wire between the PCM (E22, E23, E24) and G101.

PCM POWER AND GROUND CIRCUIT TROUBLESHOOTING (2.4 L ENGINE) (2017 2018 2019)

PCM Power and Ground Circuit Troubleshooting

1. Engine starting check

   -1. Try to start the engine.

   Does the engine start and idle smoothly?

   YES

   Go to the F-CAN circuit troubleshooting .

   NO

   Go to step 2.

2. Fuse check 1

   -1. Check the following fuse.

Fuse	No. A7 (15 A)
Location	Under-hood fuse/relay box

   Is the fuse OK?

   YES

   Go to step 6.

   NO

   Go to step 3.

3. Shorted wire check (+B IGP line)

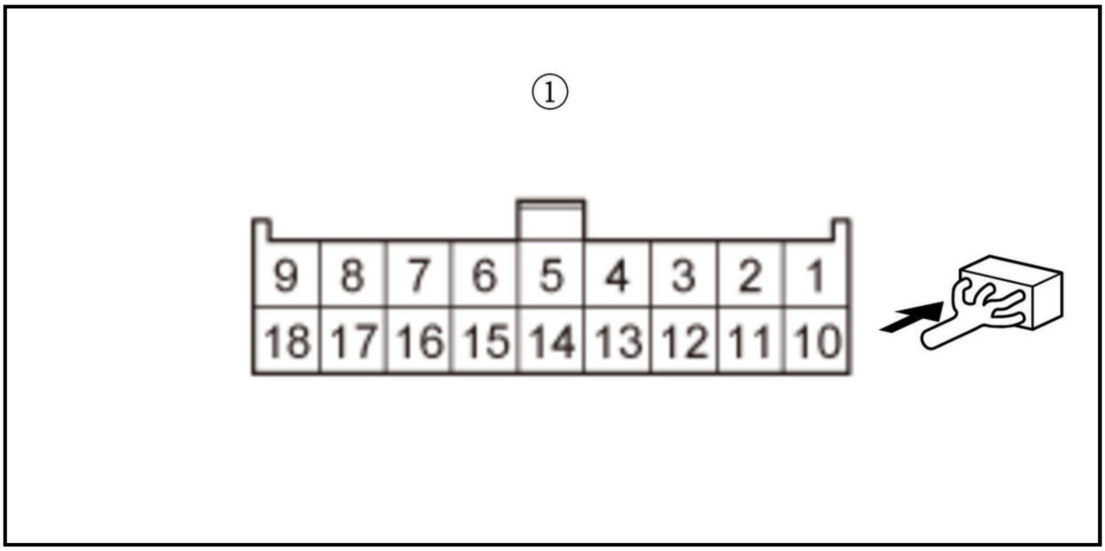
   -1. Remove the blown No. A7 (15 A) fuse from the under-hood fuse/relay box.

   -2. Disconnect the following connector.

Relay circuit board connector C (18P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the +B IGP wire between the No. A7 (15 A) fuse and the relay circuit board. If the wire is OK, **replace the under-hood fuse/relay box** . Also replace the No. A7 (15 A) fuse.

NO

Go to step 4.

4. Part (s) internal circuit check (short in FI MAIN RLY OUT line)

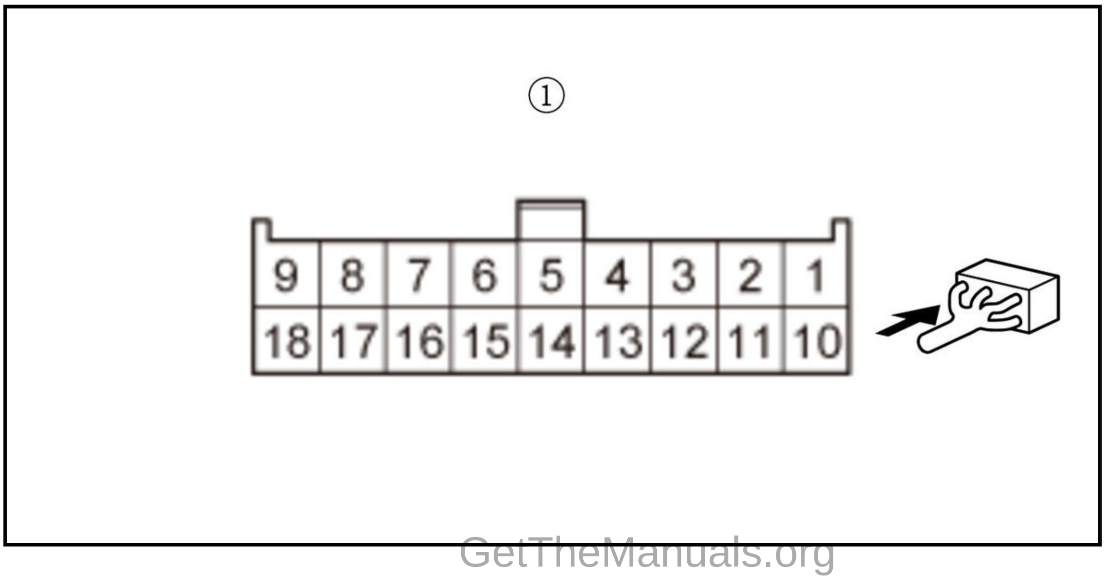
-1. **Remove the injector relay** .

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

Disconnect each of the parts or connectors below, one at a time, then check for continuity between test points 1 and 2.

- PGM-FI main relay 2
- PCM connector A (51P)

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board connector C (18P): disconnected
B	Injector relay: disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	Body ground



Does continuity go away when one of the above components is disconnected?

YES

Replace the part that made the short to body ground go away when it was disconnected. If the part is the PCM, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the symptom/indication goes away and the PCM was substituted, **replace the original PCM** . Also replace the No. A7 (15 A) fuse in the under-hood fuse/relay box.

NO

Parts are OK. Go to step 5.

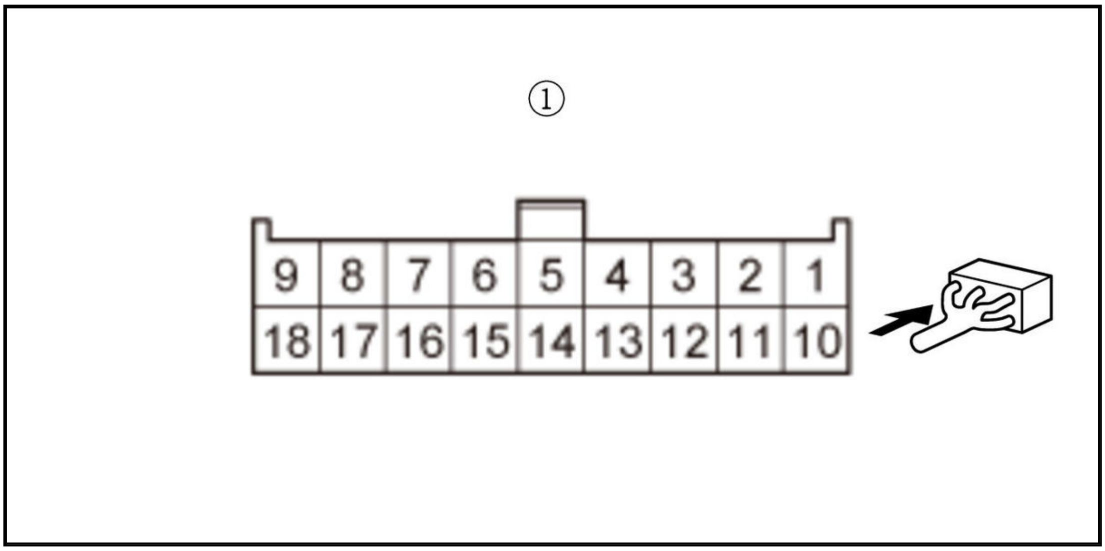
5. Shorted wire check (FI MAIN RLY OUT line):

Disconnect the following parts or connectors:

- PGM-FI main relay 2
- PCM connector A (51P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board connector C (18P): disconnected
	PGM-FI main relay 2: disconnected
	Injector relay: disconnected
	PCM connector A (51P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the FI MAIN RLY OUT wire between the relay circuit board and each part. Also replace the No. A7 (15 A) fuse in the under-hood fuse/relay box.

NO

The FI MAIN RLY OUT wire is OK. **Replace the relay circuit board** . Also replace the No. A7 (15 A) fuse in the under-hood fuse/relay box.

6. Fuse check 2

-1. Check the following fuse.

Fuse	No. D8 (15 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 11.

NO

Go to step 7.

7. Relay check

-1. **Remove PGM-FI main relay 2** .

-2. **Test PGM-FI main relay 2** .

Is the relay OK?

YES

PGM-FI main relay 2 is OK. Go to step 8.

NO

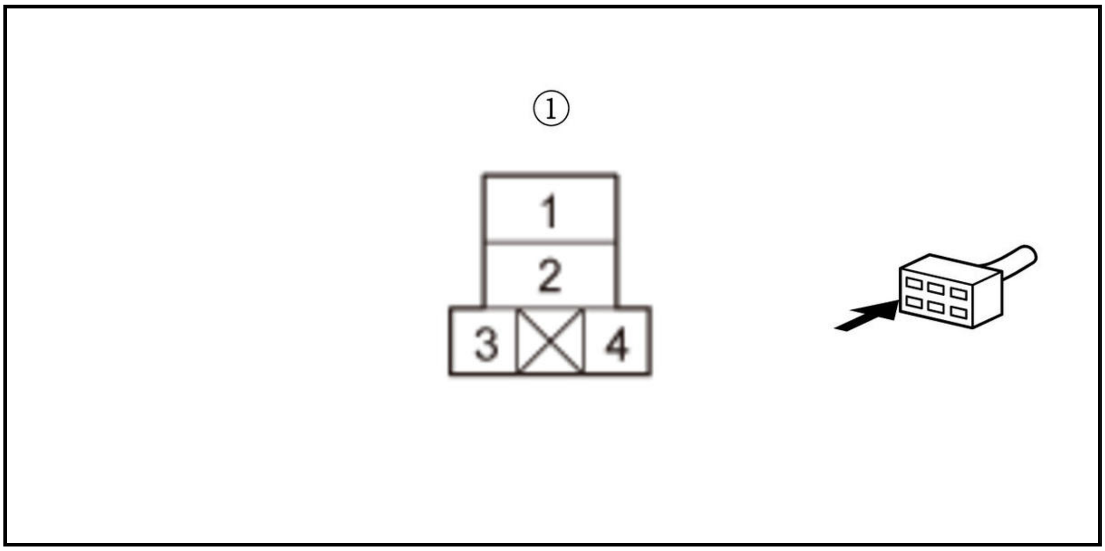
Replace PGM-FI main relay 2. Also replace the No. D8 (15 A) fuse in the under-dash fuse/relay box.

8. Determine possible failure area (IG1 FUEL PUMP line, others)

-1. Remove the blown No. D8 (15 A) fuse from the under-dash fuse/relay box.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 9.

NO

Go to step 10.

9. Shorted wire check (IG1 FUEL PUMP line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

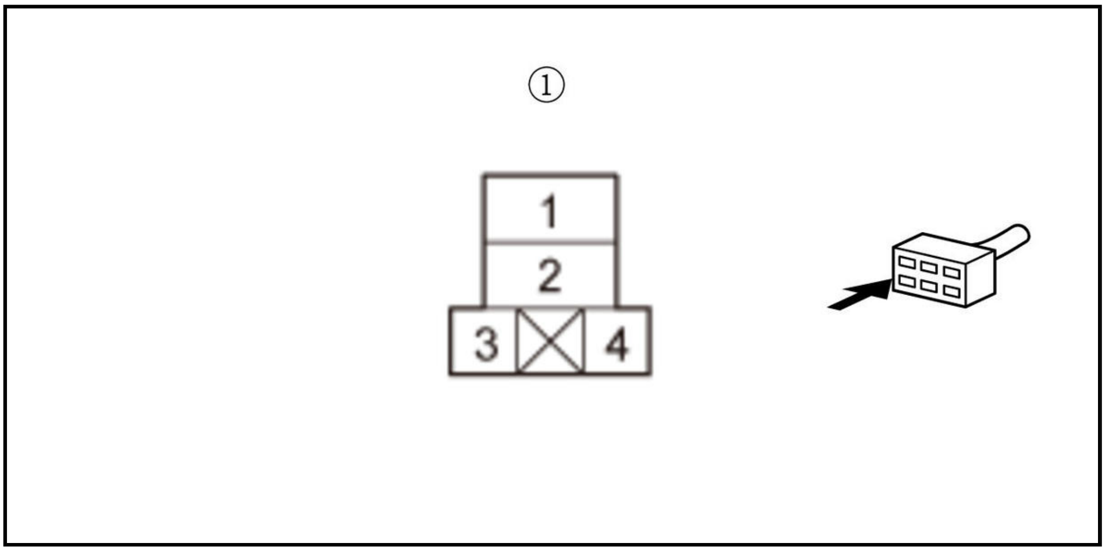
-2. Disconnect the following connector.

PCM connector A (51P)
Under-dash fuse/relay box connector C (27P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PGM-FI main relay 2: disconnected
B	Under-dash fuse/relay box connector C (27P): disconnected
B	PCM connector A (51P): disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	**PCM connector A (51P) No. 4**
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the IG1 FUEL PUMP wire between PGM-FI main relay 2, PCM (A4) and the No. D8 (15 A) fuse in the under-dash fuse/relay box. Also replace the No. D8 (15 A) fuse.

NO

The IG1 FUEL PUMP wire is OK. Replace the No. D8 (15 A) fuse in the under-dash fuse/relay box. If the fuse blown again, **replace the under-dash fuse/relay box** .

10. Shorted wire check (FUEL PUMP RLY OUT line)

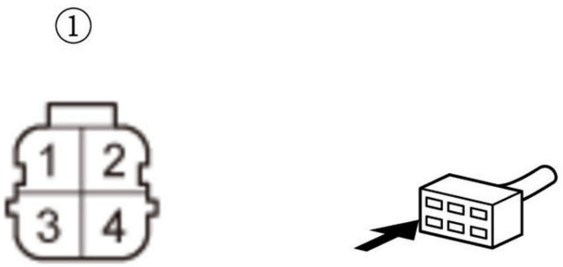
-1. Disconnect the following connector.

Fuel tank unit 4P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PGM-FI main relay 2: disconnected

	PCM connector A (51P): disconnected
	Fuel tank unit 4P connector: disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short in the FUEL PUMP RLY OUT wire between PGM-FI main relay 2 and the fuel tank unit. Also replace the No. D8 (15 A) fuse in the under-dash fuse/relay box.

NO

The FUEL PUMP RLY OUT wire is OK. Check the fuel pump, and **replace it** if needed. Also replace the No. D8 (15 A) fuse in the under-dash fuse/relay box.

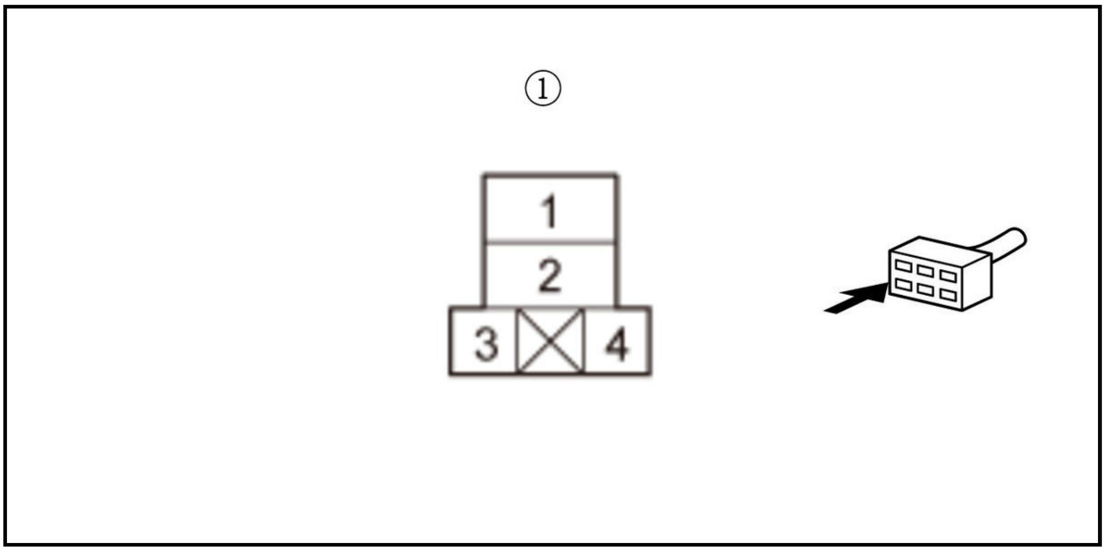
11. Open wire check (IG1 FUEL PUMP line) 1

-1. **Remove PGM-FI main relay 2** .

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 12.

NO

Repair an open in the IG1 FUEL PUMP wire between the No. D8 (15 A) fuse in the under-dash fuse/relay box and PGM-FI main relay 2.

12. Open wire check (IG1 FUEL PUMP line) 2

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (51P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (51P): disconnected
	PGM-FI main relay 2: disconnected
Test point 1	**PCM connector A (51P) No. 4**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 FUEL PUMP wire is OK. Go to step 13.

NO

Repair an open in the IG1 FUEL PUMP wire between the PCM (A4) and the No. D8 (15 A) fuse in the under-dash fuse/relay box.

13. Determine possible failure area (PGM-FI main relay 1 control circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 16.

NO

Go to step 14.

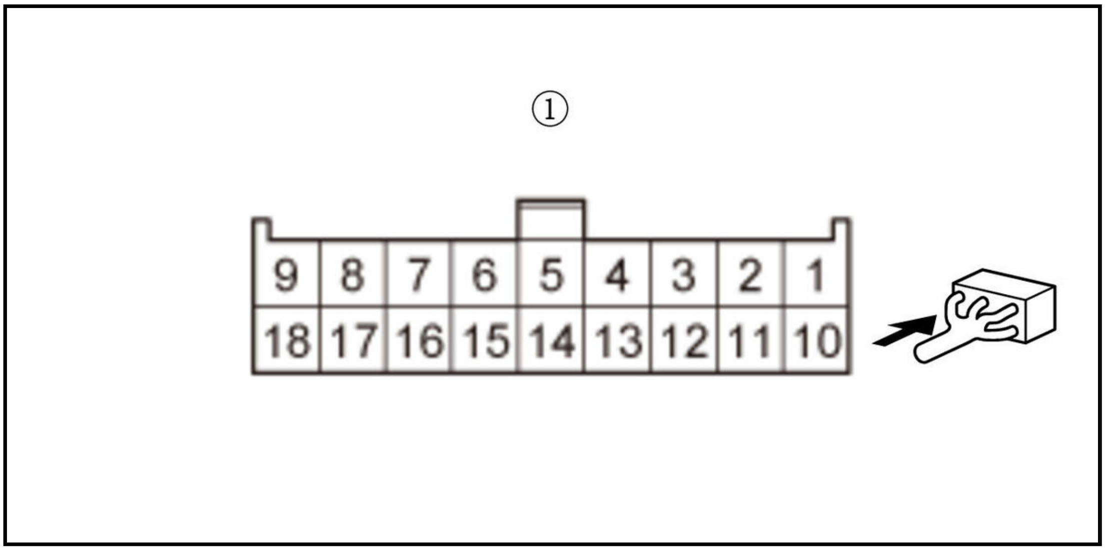
14. Open wire check (+B IGP line)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 15.

NO

Repair an open in the +B IGP wire between the relay circuit board and the No. A7 (15 A) fuse in the under-hood fuse/relay box.

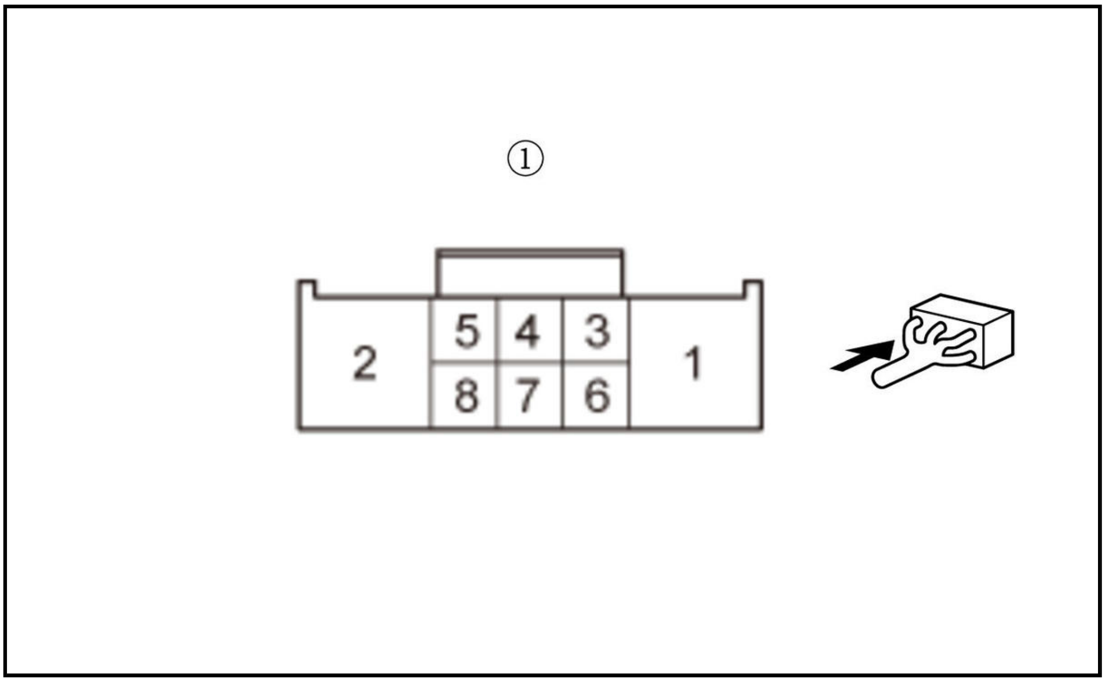
15. Open wire check (FI MAIN RLY CL- line)

-1. Disconnect the following connector.

Relay circuit board connector A (8P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
B	Relay circuit board connector A (8P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 7: ①
Test point 2	**PCM connector A (51P) No. 3**



Is there continuity?

YES

The FI MAIN RLY CL- wire is OK. **Remove and test the relay circuit board** . If the relay circuit board is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the FI MAIN RLY CL- wire between the PCM (A3) and the relay circuit board.

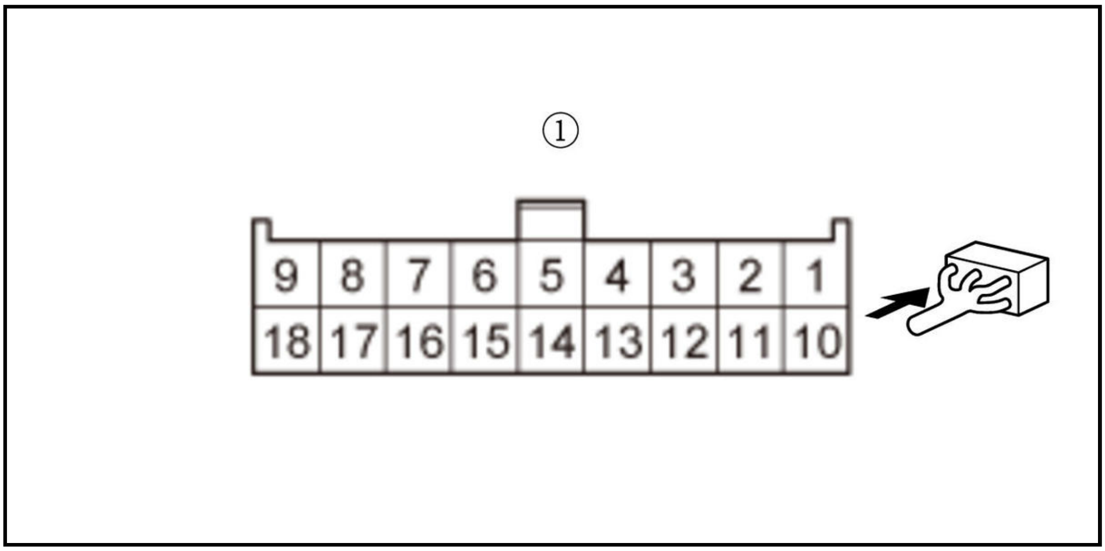
16. Open wire check (FI MAIN RLY OUT line)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	**PCM connector A (51P) No. 5**



Is there continuity?

YES

The FI MAIN RLY OUT wire is OK. Go to step 17.

NO

Repair an open in the FI MAIN RLY OUT wire between the PCM (A5) and the relay circuit board.

17. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

The relay circuit board is OK. Go to step 18.

NO

Replace the relay circuit board .

18. Open wire check (GND lines)

-1. Disconnect the following connector.

PCM connector B (51P)
PCM connector C (51P)

-2. Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
B	PCM connector E (80P): disconnected
B	Relay circuit board: removed

Connector	Terminal
PCM connector B (51P)	No. 11
	No. 12
PCM connector C (51P)	No. 1
	No. 8

Is there continuity?

YES

The PGM (GND), GND1, GND2, and GND3 wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the PGM, GND1, GND2, and/or GND3 wire between the PCM (B11, B12, C1, C8) and G101.

SERVICE INFORMATION

LIQUID GASKET APPLYING PROCEDURE (1.5 L ENGINE)

Procedure

1. Liquid Gasket - Apply

    1. Apply liquid gasket as shown.

    NOTE:

    - Remove all of the old liquid gasket of the mating surfaces of each part and clean.
    - Apply liquid gasket (08718-0003, 08718-0004, or 08718-0009). Install the component within 5 minutes of applying the liquid gasket.
    - If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.
    - Wait at least 30 minutes before filling the engine with oil.
    - Do not run the engine for at least 3 hours after installing the parts.

LIQUID GASKET APPLYING PROCEDURE (2.4 L ENGINE) (2017 2018 2019)

Procedure

1. Liquid Gasket - Apply

   1. Apply liquid gasket as shown.

   NOTE:

   - Remove all of the old liquid gasket of the mating surfaces of each part and clean.
   - Apply liquid gasket (P/N 08718-0003, 08718-0004, or 08718- 0009). Install the component within 5 minutes of applying the liquid gasket.
   - If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.
   - Wait at least 30 minutes before filling the engine with oil.
   - Do not run the engine for at least 3 hours after installing the parts.

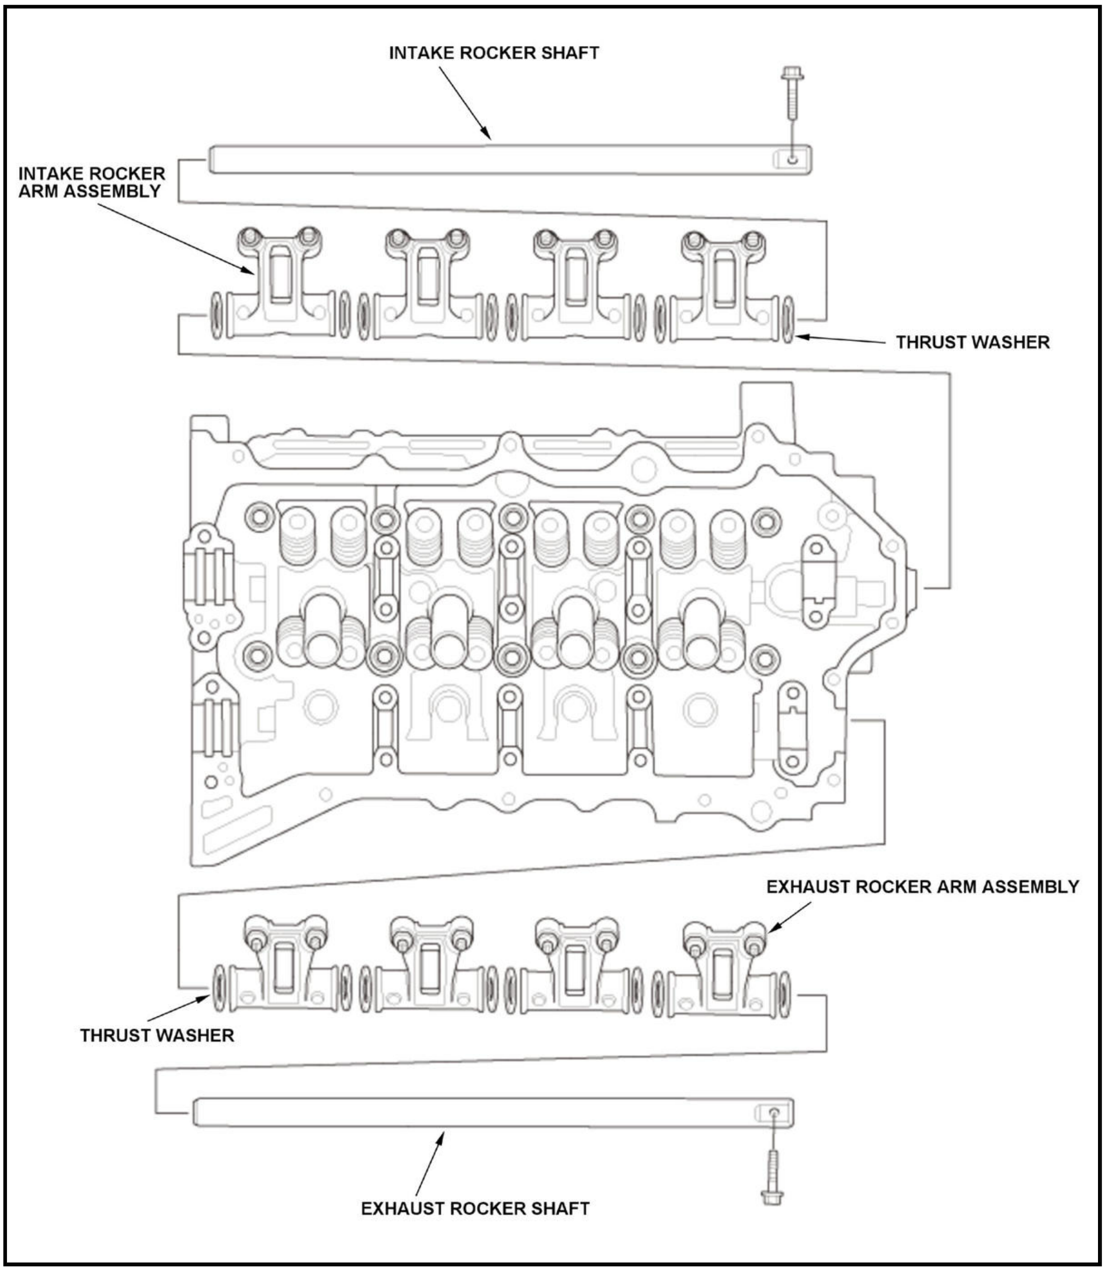
ROCKER ARM AND SHAFT DISASSEMBLY, REASSEMBLY, AND INSPECTION (1.5 L ENGINE)

Disassembly and Reassembly

1. Rocker Arm Assembly - Disassemble

NOTE:

- Identify each part as it is removed so that each item can be reinstalled in its original location.
- Inspect the rocker shafts and the rocker arms.
- If reused, the rocker arms must be installed in their original locations.
- When replacing the rocker arm assembly, remove the fastening hardware from a new rocker arm assembly.



INTAKE ROCKER SHAFT
INTAKE ROCKER ARM ASSEMBLY
THRUST WASHER
EXHAUST ROCKER ARM ASSEMBLY
THRUST WASHER
EXHAUST ROCKER SHAFT

2. All Disassembled Parts - Reassembly

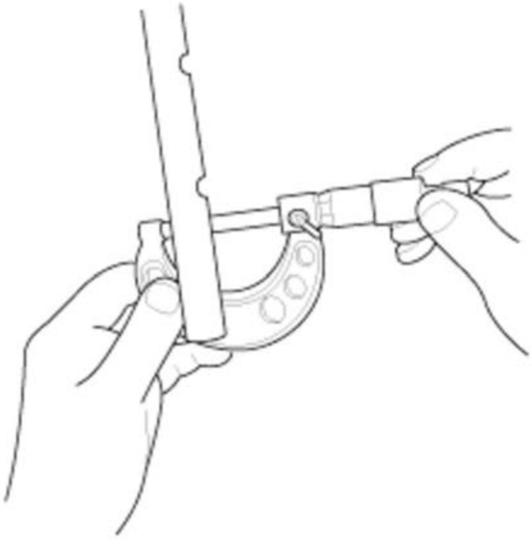
1. Reassemble the parts in the reverse order of disassembly.

NOTE:

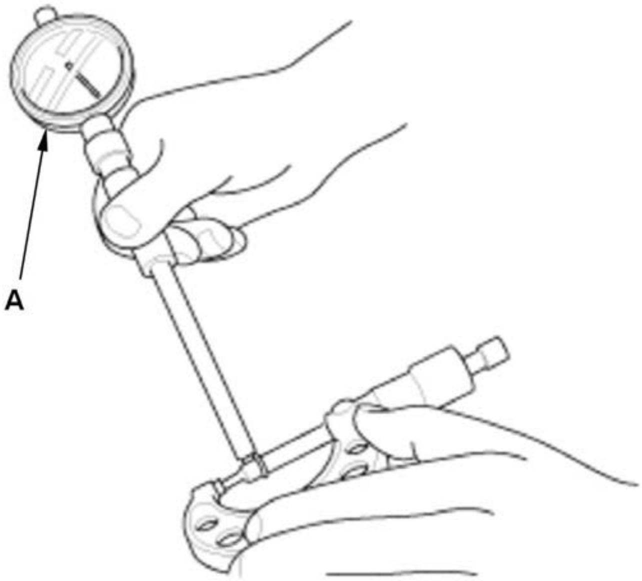
- If reused, the rocker arms must be installed in their original locations.
- Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to all contact points and the bearing surface.
- When replacing the rocker arm assembly, remove the fastening hardware from the new rocker arm assembly.

Inspection

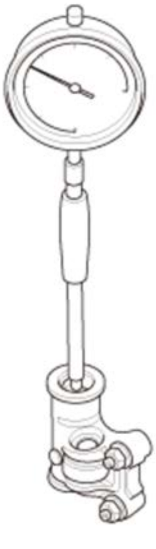
1. Rocker Arm and Shaft - Inspect



1. Measure the diameter of the rocker shaft at the first rocker location.



2. Zero the gauge (A) to the rocker shaft diameter.



3. Measure the inside diameter of the rocker arm, and check it for an out-of-round condition.

4. Repeat for all rocker arms and both shafts. If the clearance is beyond the service limit, replace the rocker shaft and all out of service limit rocker arms.

Rocker Arm-to-Shaft Clearance	
Standard (New):	**0.018-0.059 mm (0.00071-0.00232 in)**
Service Limit:	**0.080 mm (0.00315 in)**

ROCKER ARM AND SHAFT DISASSEMBLY, REASSEMBLY, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Disassembly and Reassembly

1. Rocker Arm Assembly - Disassemble

NOTE:

- Identify parts as they are removed so they can be reinstalled in its original locations.
- Inspect the rocker arm shaft and rocker arms.
- If reused, the rocker arms must be installed in their original location.
- When removing, or installing the rocker arm assembly, do not remove the camshaft holder bolts. The bolts will keep the holders and the rocker arms on the shaft.
- Bundle the intake rocker arms with rubber bands to keep them together as a set, and remove the bands after the intake rocker arms have been installed.
- Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to all contact points and the lost motion assembly.
- When replacing the intake rocker arm assembly, remove the fastening hardware from the new intake rocker arm assembly.
- When reassembling the rocker arm assembly, loosely tighten the rocker shaft bolts.

No. 3 ROCKER SHAFT HOLDER
No. 4 ROCKER SHAFT HOLDER
ROCKER SHAFT BOLT

2. All Disassembled Parts - Reassembly

1. Reassemble the parts in the reverse order of disassembly.

NOTE:

- When reassembling the rocker arm assembly, loosely tighten the rocker shaft bolts.
- If reused, the rocker arms must be installed in the their original locations.
- Bundle the intake rocker arms with rubber bands to keep them together as a set, and remove the bands after the intake rocker arms have been installed.
- Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to all contact points and the lost motion assembly.
- When replacing the intake rocker arm assembly, remove the fastening hardware from the new intake rocker arm assembly.

Inspection

1. Rocker Arm and Shaft - Inspect

	1. Measure the diameter of the shaft at the first rocker location.

	2. Zero the gauge (A) to the shaft diameter.

	3. Measure the inside diameter of the rocker arm, and check it for an out-of-round condition. 4. Repeat for all rocker arms and both shafts. If the clearance is beyond the service limit, replace the rocker shaft and all out of service limit rocker arms. If any VTEC rocker arm needs replacement, replace the rocker arms (primary, mid, and secondary), as a set.

Rocker Arm-to-Shaft Clearance	
Standard (New):	
Intake:	**0.018-0.059 mm (0.00071-0.00232 in)**
Exhaust:	**0.018-0.056 mm (0.00071-0.00220 in)**
Service Limit:	**0.080 mm (0.00315 in)**

2. VTEC Rocker Arm - Inspect

	1. Inspect the rocker arm pistons (A). Push on each piston manually. If it does not move smoothly, replace the rocker arm set.**NOTE:** Apply new engine oil to the rocker arm pistons when reassembling.

THROTTLE BODY CARBON ACCUMULATION CHECK AND CLEANING

Test

1. HDS - Connect
2. Throttle Body - Test

1. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle. 2. Check the REL TP SENSOR in the DATA LIST with the HDS. The reading should be below 2.46 deg. If it is not, clean the throttle body.

Cleaning

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

1. Air Cleaner Element - Check

1. Make sure the vehicle to the OFF (LOCK) mode. 2. Remove the air cleaner element 3. Check for damage to the air cleaner element. If the air cleaner element is damaged, replace it.

2. Throttle Body - Remove
3. Throttle Body - Clean

 This illustration shows an example.	1. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked in throttle plate cleaner. • Remove the throttle body to clean it. • Be careful not to pinch your fingers. • To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A). • Do not spray throttle plate cleaner directly on the throttle body. • Use a commercially available throttle plate cleaner.

4. **Throttle Body - Install**
5. **HDS - Connect**
6. **PCM - Reset**
7. TP POSITION CHECK - Select

1. Select the ETCS TEST in the INSPECTION MENU with the HDS.

2. Select TP POSITION CHECK and clear the throttle position (TP) learned value.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Turn the vehicle to the ON mode, and wait 2 seconds without pressing the accelerator pedal.

8. **PCM - Idle Learn**

ADJUSTMENT

VALVE CLEARANCE ADJUSTMENT (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Adjuster 07MAA-PR70110

Image	Description/Tool Number
	Locknut Wrench 07MAA-PR70120

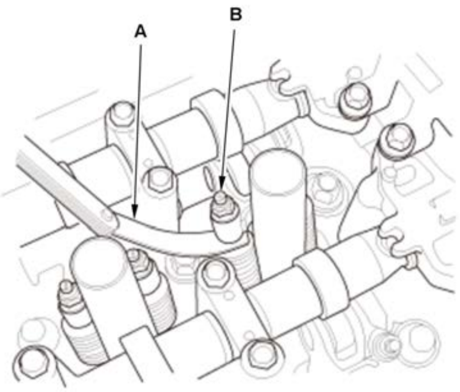
Adjustment

NOTE: Connect the HDS to the DLC and monitor ECT SENSOR 1 with the HDS. Adjust the valve clearance only when the engine coolant temperature is less than 100 deg. F (38 deg. C).

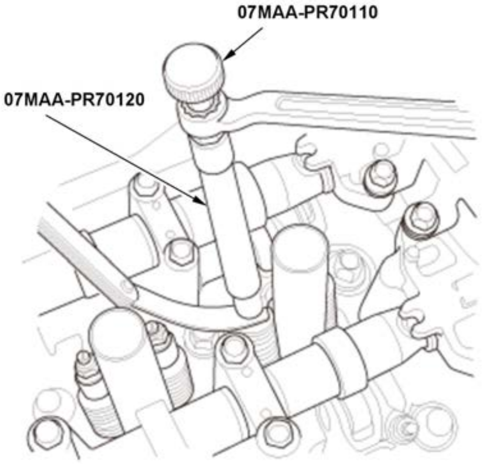
1. Cylinder Head Cover - Remove
2. Camshaft Timing - Inspect
3. Valve Clearance - Adjust

 INTAKE No. 1 No. 2 No. 3 No. 4 No. 1 No. 2 No. 3 No. 4 EXHAUST	1. Select the correct feeler gauge for the valve clearance you are going to check.

Valve Clearance	
Intake:	**0.21-0.25 mm (0.009 in)**
Exhaust:	**0.25-0.29 mm (0.010-0.011 in)**



2. Insert the feeler gauge (A) between the adjusting screw (B) and the end of the valve stem on the No. 1 cylinder, and slide it back and forth; you should feel a slight amount of drag.

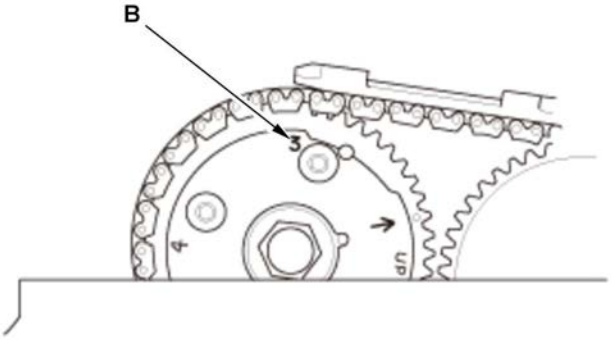


3. If you feel too much or too little drag, loosen the locknut with the locknut wrench, and turn the adjusting screw with the adjuster until the drag on the feeler gauge is correct.

4. Tighten the locknut to the specified torque, and recheck the clearance. Repeat the adjustment if necessary.

Apply new engine oil to the nut threads.

Specified Torque
14 N.m (1.4 kgf.m, 10 lbf.ft)



5. Rotate the crankshaft clockwise. The "3" mark (B) on VTC actuator A should be at the top.

6. Check and, if necessary, adjust the valve clearance on the No. 3 cylinder.

	7. Rotate the crankshaft clockwise. The "4" mark (B) on VTC actuator A should be at the top. 8. Check and, if necessary, adjust the valve clearance on the No. 4 cylinder.

	9. Rotate the crankshaft clockwise. The "2" mark (B) on VTC actuator A should be at the top. 10. Check and, if necessary, adjust the valve clearance on the No. 2 cylinder.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the spark plugs, reset the Maintenance Minder with the gauge (see "Resetting the Maintenance Minder").

VALVE CLEARANCE ADJUSTMENT (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

Image	Description/Tool Number
	Adjuster 07MAA-PR70110
	Locknut Wrench 07MAA-PR70120

Adjustment

NOTE: Connect the HDS to the DLC, and monitor ECT SENSOR 1. Adjust the valve clearance only when the engine coolant temperature is less than 100 deg. F (38 deg. C).

1. Cylinder Head Cover - Remove
2. Camshaft Timing - Inspect
3. Valve Clearance - Adjust

 INTAKE No. 1 No. 2 No. 3 No. 4 No. 1 No. 2 No. 3 No. 4 EXHAUST	1. Select the correct feeler gauge for the valve clearance you are going to check.

Valve Clearance	
Intake:	**0.21-0.25 mm (0.009 in)**
Exhaust:	**0.25-0.29 mm (0.010-0.011 in)**

	2. Insert the feeler gauge (A) between the adjusting screw (B) and the end of the valve stem on the No. 1 cylinder, and slide it back and forth; you should feel a slight amount of drag.
	3. If you feel too much or too little drag, loosen the locknut with the locknut wrench and the adjuster, and turn the adjusting screw until the drag on the feeler gauge is correct. 4. Tighten the locknut to the specified torque, and recheck the clearance. Repeat the adjustment if necessary.

Specified Torque
14 N.m (1.4 kgf.m, 10 lbf.ft)
Apply new engine oil to the nut threads.

	5. Rotate the crankshaft 180 deg. clockwise (camshaft pulley turns 90 deg.). 6. Check and, if necessary, adjust the valve clearance on the No. 3 cylinder.

	7. Rotate the crankshaft 180 deg. clockwise (camshaft pulley turns 90 deg.). 8. Check and, if necessary, adjust the valve clearance on the No. 4 cylinder.
	9. Rotate the crankshaft 180 deg. clockwise (camshaft pulley turns 90 deg.). 10. Check and, if necessary, adjust the valve clearance on the No. 2 cylinder.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the drive belt, reset the Maintenance Minder with the gauge (see "Resetting the Maintenance Minder").

TEST

VTEC ROCKER ARM TEST (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

Image	Description/Tool Number
	Air Pressure Regulator 07AAJ-PNAA101
	VCM Air Adapter 070AJ-001A101

Test

1. **Ignition Coil and Spark Plug - Remove**
2. **Cylinder Head Cover - Remove**
3. VTEC Rocker Arm - Test

 	1. Rotate the crankshaft pulley clockwise. Make sure that the intake secondary rocker arm (A), intake primary rocker arm (B), and the intake mid rocker arm (C) are separated and that the intake secondary rocker arm and the intake mid rocker arm should move independently: • If the mid and secondary rocker arms move together, remove the mid, primary, and secondary rocker arms as an assembly, and check that the pistons in the rocker arms move smoothly. If any rocker arm needs replacing, replace the mid, primary, and secondary rocker arms as an assembly, then retest. • If the secondary rocker arm moves independently, go to step 2. 2. Check that the air pressure on the shop air compressor gauge indicates over 400 kPa (4.08 kgf/cm^2, 58.0 psi). 3. **Inspect the valve clearance** .

	4. Install the VCM air adapter to the inspection hole. 5. Connect the air pressure regulator. 6. Loosen the valve on the air pressure regulator, and apply the specified air pressure.

Specified Air Pressure:
290 kPa (2.96 kgf/cm 2, 42.1 psi)

	7. With the specified air pressure applied, rotate the crankshaft pulley clockwise. The secondary rocker arm (A) should move together with the mid rocker arm (B) and the primary rocker arm (C): • If the mid, primary, and secondary rocker arms move independently, remove the mid, primary, and the secondary rocker arms as an assembly, and check that the pistons in the rocker arms move smoothly. If any rocker arm needs replacing, replace the mid, primary, and secondary rocker arms as an assembly, then retest. • If the mid, primary, and secondary rocker arms move together, go to step 8. 8. Remove the air pressure regulator and the VCM air adapter.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

INSPECTION

APP SENSOR SIGNAL INSPECTION

Inspection

NOTE:

- This procedure checks the APP sensor in its fully closed position. In any other position, the PCM stores the APP sensor DTCs which are covered in other troubleshooting procedures.
- Check for Pending or Confirmed DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.
- Press the accelerator pedal several times to check its operation. If it does not operate smoothly, check the pedal. If you find a problem, replace the accelerator pedal module .

1. HDS - Connect
2. APP Sensor Signal - Inspect

1. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0 %, the APP sensor is OK.
   - If it is not 0 %, **update the PCM if it does not have the latest software**, or **substitute a known-good PCM** , then go to step 2.
2. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0 %, the APP sensor is OK.
   - If it is not 0 %, **replace the accelerator pedal module** , then go to step 1.

AUTO IDLE STOP SYSTEM INSPECTION (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

NOTE:

- Before you do this inspection, check for the following conditions. If any of the following condition is found, reset the 12 volt battery sensor.
-
  - -

    12 volt battery charge procedure; Check if the 12 volt battery charge is properly done. When the 12 volt battery charge procedure is not correctly followed such as charging the 12 volt battery using a 12 volt battery charger without disconnecting the 12 volt battery terminals, it may cause inaccurate measurement of the 12 volt battery sensor current and cause idle stop malfunction.
  - -

    12 volt battery negative terminal; When an electric device or additional ground cables are directly connected to the negative terminal, they need to be removed.
- 12 volt battery sensor reset procedure; Turn the vehicle to the OFF (LOCK) mode, and disconnect the 12 volt battery sensor 2P connector, then reconnect it.

Check under these conditions:

- **Brake system indicators are not indicated** .
- Vehicle is not at high altitudes.
- No indicators are on in the gauge.
- CVT: Shift position indicator does not blink.
- **Starter system indication is not indicated** .
- **The 12 volt battery is fully charged** .

  NOTE: If the 12 volt battery is replaced, **do the 12 volt battery internal resistance reset procedure** .
- Hood is closed.
- All electrical items (headlights, blower fan, radiator fan, rear window defogger, A/C, etc.) are off.
- **PCM idle learn procedure is completed**.
- Drive the vehicle on a flat road or downhill.
- Idle stop off switch is not on.

  NOTE: If there is a problem on the idle stop off switch operation, do the following procedure:
-
  - -

    Test the idle stop off switch .
  - -

    Do the gauge control module self-diagnostic function .
- Driver fasten the seat belt (check the seat belt indicator and caution).

- **VSA sensor neutral position memorization learn is completed** .

Drive the vehicle to warm up the vehicle, and check the following items that meet the temperature requirement:

- ECT SENSOR 1
- ESTIMATED BATTERY TEMPERATURE (BATTERY SENSOR)

  NOTE: The 12 volt battery temperature is easy to rise when the engine is idling with the hood closed. If the outside air temperature is low, the 12 volt battery temperature will not rise enough.

- CVT: CVTF TEMPERATURE

Start the engine, and test-drive under these conditions:

- Drive the vehicle at 25 mph (40 km/h), then stop the vehicle within 5-15 seconds.
- Press and hold the brake pedal until the vehicle stops (do not pump the brake pedal or do not brake suddenly).
- Keep the brake pedal pressed after the vehicle stops.

NOTE:

Do not turn the steering wheel within the final moment before the vehicle stops.

4. Repeat steps 1 through 3 several times, then check the auto idle stop system. If the auto idle stop system works, the system is OK. If the auto idle stop system does not work, do the **symptom troubleshooting**

.

BLOCK AND PISTON INSPECTION (1.5 L ENGINE)

Inspection

1. **Crankshaft - Remove**
2. **Piston - Remove**
3. Engine Block - Inspect

 PRECISION STRAIGHT EDGE 	1. Check the top of the engine block for warpage. Measure along the edges and across the center as shown.

Engine Block Warpage	
Standard (New):	**0.07 mm (0.002 in) max.**

 10 mm (0.39 in) 50 mm (1.97 in) 110 mm (4.33 in) First Measurement Second Measurement Third Measurement  	2. Measure the wear and taper in direction Y and X at three levels inside each cylinder as shown. If measurements in any cylinder are beyond the oversize bore service limit, replace the engine block. If the engine block is being rebored, check the piston-to-cylinder bore clearance. 3. Hone any cored or scratched cylinder bores if needed.

Bore Taper	
Limit:	**(Difference between first and third measurement) 0.050 mm (0.00197 in)**

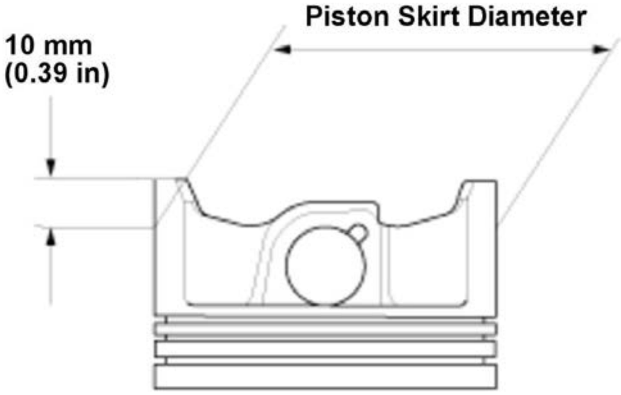
Reboring Limit:	**0.25 mm (0.0098 in) max.**

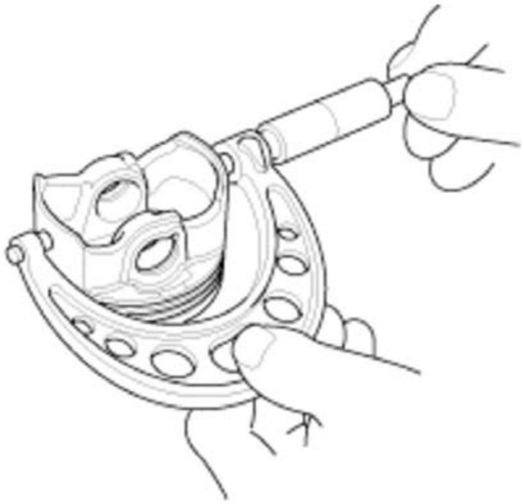
Oversize Bore

0.25:	**73.250-73.265 mm (2.88385-2.88444 in)**

Cylinder Bore Size	
Standard (New):	
Direction X:	**73.000-73.020 mm (2.87401-2.87480 in)**
Direction Y:	**73.000-73.015 mm (2.87401-2.87460 in)**
Service Limit:	**73.065 mm (2.87657 in)**

4. Piston - Inspect

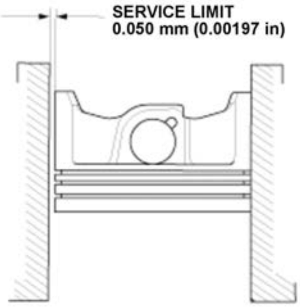




1. Check the pistons for distortion or cracks.

2. Measure the piston skirt diameter at a point 10 mm (0.39 in) from the bottom of the skirt.

Piston Skirt Diameter	
Standard (New):	**72.972-72.979 mm (2.87291 -2.87318 in)**
Service Limit:	**72.962 mm (2.87251 in)**



3. Calculate the difference between the cylinder bore diameter and the piston diameter. If the clearance is near, or exceeds the service limit, inspect the piston and the cylinder bore for excessive wear.

Piston-to-Cylinder Bore Clearance	
Standard (New):	**0.021-0.043 mm (0.00083- 0.00169 in)**
Service Limit:	**0.050 mm (0.00197 in)**

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

BLOCK AND PISTON INSPECTION (2.4 L ENGINE) (2017 2018 2019)

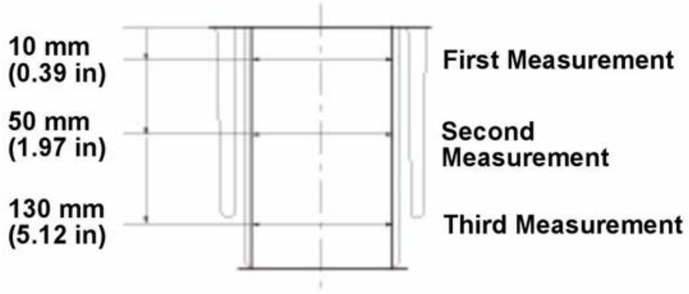
Inspection

1. Crankshaft - Remove
2. Piston - Remove
3. Block and Piston - Inspect

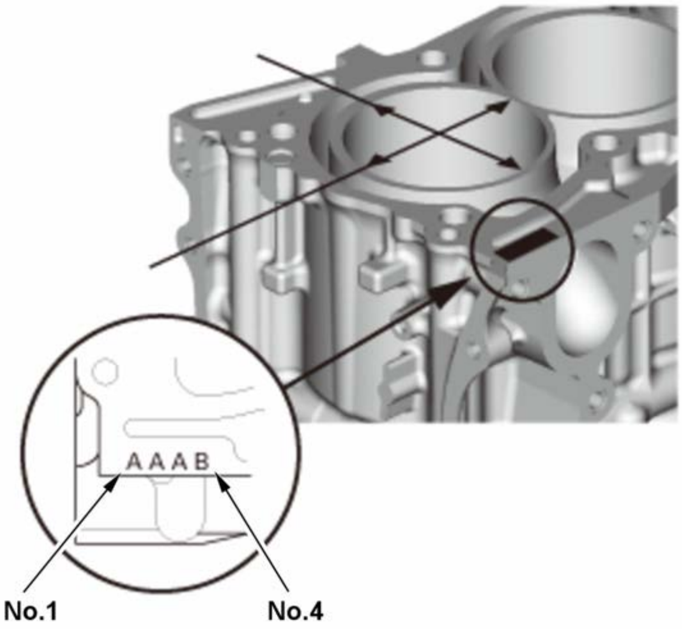
	1. Check the piston for distortion or cracks. 2. Measure the piston diameter at a point 10 mm (0.39 in) from the bottom of the skirt. There are two standard-size pistons (No Letter (A), and B). The letter is stamped on the top of the piston. Letters are also stamped on the engine block as the cylinder bore sizes.

Service Limit:	
No Letter (A):	**86.930 mm (3.42243 in)**
B:	**86.920 mm (3.42204 in)**

Piston Skirt Diameter	
Standard (New):	
No Letter (A):	**86.980-86.990 mm (3.42440-3.42480 in)**
B:	**86.970-86.980 mm (3.42401-3.42440 in)**



10 mm
(0.39 in)
First Measurement
50 mm
(1.97 in)
Second
Measurement
130 mm
(5.12 in)
Third Measurement



AAAB
No.1
No.4

3. Measure the wear and taper in direction X and Y at three levels in each cylinder as shown.

If the measurements in any cylinder are beyond the Oversize Bore Service Limit, replace the engine block.

If the engine block is being rebored, check the piston-to-cylinder bore clearance.

4. Hone any cored or scratched cylinder bores if needed.

Bore Taper	
Limit:	**(Difference between first and third measurement) 0.05 mm (0.0020 in)**

Oversize	
0.25:	**87.250-87.260 mm (3.43503-3.43543 in)**
B	
Reboring Limit:	**0.25 mm (0.0098 in) max.**

Cylinder Bore Size	
Standard (New):	
A or I:	**87.010-87.020 mm (3.42558-3.42598 in)**
B or II:	**87.000-87.010 mm (3.42519-3.42558 in)**
B	B
Service Limit:	**87.070 mm (3.42795 in)**

 	5. Check the top of the engine block for warpage. Measure along the edges and across the center as shown.

Engine Block Warpage	
Standard (New):	**0.07 mm (0.002 in) max.**

	6. Calculate the difference between the cylinder bore diameter and the piston diameter. If the clearance is near or exceeds the service limit, inspect the piston and cylinder bore for excessive wear.

Piston-to-Cylinder Bore Clearance	
Standard (New):	**0.020-0.040 mm (0.00079-0.00157 in)**
Service Limit:	**0.05 mm (0.0020 in)**

4. All Removed Parts - Install

1. Install the removed parts in the reverse order of removal.

CAMSHAFT TIMING INSPECTION (1.5 L ENGINE)

Inspection

1. Cylinder Head Cover - Remove
2. Right Front Wheel - Remove
3. Engine Undercover - Remove

4. Camshaft Timing - Inspect

	1. Turn the crankshaft to align the No. 1 position at top dead center (TDC); the white mark (A) on the crankshaft pulley lines up with the pointer (B) on the cam chain case.

	2. With the No. 1 piston at top dead center (TDC), check the "UP" mark (C) on VTC actuator A is facing up. 3. Check the TDC marks (D) on VTC actuator A and VTC actuator B, the marks should align. If the marks are not aligned, **remove the cam chain and reinstall the cam chain properly.**

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CAMSHAFT TIMING INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Inspection

1. **Cylinder Head Cover - Remove**
2. Camshaft Timing - Inspect

	1. Turn the crankshaft to align No. 1 position at top dead center (TDC); the white mark on the crankshaft pulley (A) lines up with the pointer (B).

	2. With the No. 1 piston at top dead center (TDC), check the punch mark (A) on the VTC actuator and the punch mark (B) on the exhaust camshaft sprocket, the punch marks should be at the top. 3. Check the TDC marks (C) on the VTC actuator and the exhaust camshaft sprocket, the marks should align. If the marks are not aligned, **remove the cam chain and reinstall the cam chain properly** .

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

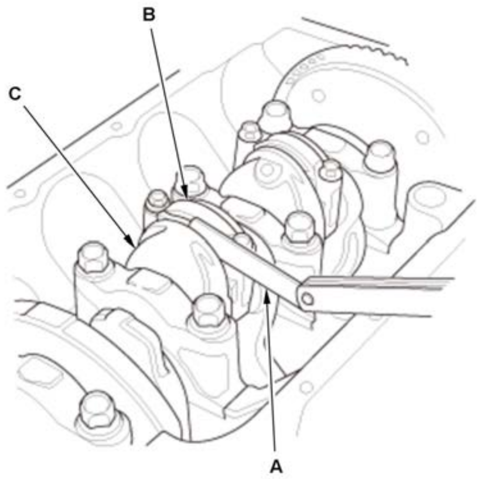
CONNECTING ROD AND CRANKSHAFT END PLAY INSPECTION (1.5 L ENGINE)

Inspection

1. **Engine - Remove**
2. **Transmission - Remove**
3. **Drive Plate - Remove**
4. **Cylinder Head - Remove**
5. Cam Chain Drive Sprocket - Remove

	1. Remove the key (A) and the cam chain drive sprocket (B).**NOTE:** Check the direction of the key. When the key is installed, install the key as same direction of the original one.

6. **Oil Pan - Remove**
7. **Oil Pump - Remove**
8. **Oil Seal Case - Remove**
9. Connecting Rod End Play - Inspect

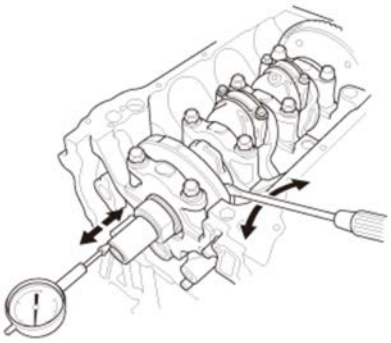


1. Measure the connecting rod end play with a feeler gauge (A) between the connecting rod (B) and the crankshaft (C).

2. If the connecting rod end play is beyond the service limit, install a new connecting rod, and recheck. If it is still beyond the service limit; **replace the crankshaft**.

Connecting Rod End Play	
Standard (New):	**0.15-0.35 mm (0.006-0.013 in)**
Service Limit:	**0.45 mm (0.017 in)**

10. Crankshaft End Play - Inspect



1. Push the crankshaft firmly away from the dial indicator by prying, and zero the dial against the end of the crankshaft. Then pull the crankshaft firmly back toward the indicator by prying; the dial reading should not exceed the service limit.

2. If the crankshaft end play is beyond the service limit, replace the thrust washers and recheck. If it is still beyond the service limit, **replace the crankshaft**.

Crankshaft End Play	
Standard (New):	**0.10-0.35 mm (0.0039-0.0138 in)**
Service Limit:	**0.45 mm (0.0177 in)**

11. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CONNECTING ROD AND CRANKSHAFT END PLAY INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Inspection

1. **Engine - Remove**
2. **Transmission - Remove**
3. **Drive Plate - Remove**
4. **Cylinder Head - Remove**
5. **Oil Pump - Remove**
6. **Baffle Plate - Remove**
7. Connecting Rod and Crankshaft End Play - Inspect

	1. Measure the connecting rod end play with a feeler gauge (A) between the connecting rod (B) and the crankshaft (C). **Connecting Rod End Play** 2. If the connecting rod end play is beyond the service limit, install a new connecting rod, and recheck. If it is still beyond the service limit, replace the crankshaft.

Standard (New):	**0.15-0.35 mm (0.006-0.013 in)**
Service Limit:	**0.40 mm (0.015 in)**

	3. Push the crankshaft firmly away from the dial indicator by prying, and zero the dial against the end of the crankshaft. Then pull the crankshaft firmly back toward the indicator by prying; the dial reading should not exceed the service limit. 4. If the crankshaft end play is beyond the service limit, replace the thrust washers and recheck, if it is still beyond the service limit, replace the crankshaft.

Crankshaft End Play	
Standard (New):	**0.10-0.35 mm (0.0039-0.0138 in)**
Service Limit:	**0.45 mm (0.0177 in)**

8. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

ENGINE COMPRESSION INSPECTION (1.5 L ENGINE)

Inspection

NOTE: After this inspection, you must reset the PCM. Otherwise, the PCM will continue to stop the injectors from operating.

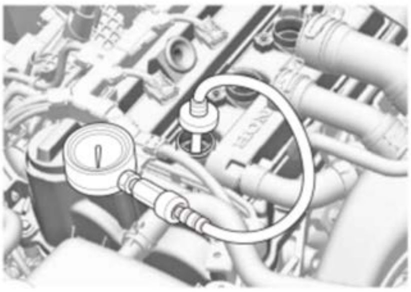
1. Engine - Warm Up

1. Start the engine. Hold the engine speed at 3, 000 rpm with no load (in P or N) until the cooling fan comes on, then let it idle.

2. HDS - Connect
3. All INJECTORS STOP - Select

1. Select ALL INJECTORS STOP in the PGM-FI INSPECTION menu with the HDS.

4. Ignition Coil and Spark Plug - Remove
5. Engine Compression - Inspect



1. Attach a compression gauge to the spark plug hole.

2. Step on the accelerator pedal to open the throttle fully, then crank the engine with the starter motor, and measure the compression.

3. Measure the compression on the remaining cylinders.

4. If the compression is not within specifications, perform a cylinder leak down test to determine the problem area. Then check the following items, and remeasure the compression:

- Incorrect valve clearance
- Confirmation of camshaft timing
- Damaged or worn cam lobes
- Damaged or worn valves and seats
- Damaged cylinder head gasket
- Damaged or worn piston rings
- Damaged or worn piston and cylinder bore

5. Remove the compression gauge from the spark plug hole.

Maximum Variation:
Within 200 kPa (2.04 kgf/cm 2, 29.0 psi)

Compression Pressure:
Above 980 kPa (9.99 kgf/cm 2, 142.1 psi)

6. Ignition Coil and Spark Plug - Install
7. All INJECTORS STOP - Cancel

1. Select PCM reset in the PGM-FI Mode menu to cancel ALL INJECTORS STOP with the HDS.

8. PCM Idle - Learn

ENGINE COMPRESSION INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Inspection

NOTE: After this inspection, you must reset the PCM. Otherwise, the PCM will continue to stop the injectors from operating.

1. Engine - Warm Up

1. Start the engine. Hold the engine speed at 3, 000 rpm with no load (in P or N) until the radiator fan comes on, then let it idle.

2. HDS DLC - Connect

NOTE: For specific operations, refer to the user's manual that came with the HDS. Make sure the HDS is loaded with the latest software.

3. ALL INJECTORS STOP - Select

1. Select ALL INJECTORS STOP in the PGM-FI INSPECTION menu with the HDS.

2. Turn the vehicle to the OFF (LOCK) mode.

4. Ignition Coil and Spark Plug - Remove
5. Engine Compression - Inspect

	1. Attach a compression gauge to the spark plug hole. 2. Step on the accelerator pedal to open the throttle fully, then crank the engine with the starter motor, and measure the compression. 3. Measure the compression on the remaining cylinders. 4. If the compression is not within specifications, perform a cylinder leak down test to determine the problem area. Then check the following items, and remeasure the compression: • Incorrect valve clearance • Confirmation of camshaft timing • Damaged or worn cam lobes • Damaged or worn valves and seats • Damaged cylinder head gasket • Damaged or worn piston rings • Damaged or worn piston and cylinder bore 5. Remove the compression gauge from the spark plug hole.

Maximum Variation:
Within 200 kPa (2.04 kgf/cm 2, 29.0 psi)

Compression Pressure:
Above 930 kPa (9.48 kgf/cm 2, 134.8 psi)

6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

7. ALL INJECTORS STOP - Cancel

1. **Select PCM reset** in the PGM-FI mode menu to cancel ALL INJECTORS STOP with the HDS.

IDLE SPEED INSPECTION

Inspection

NOTE:

- Before checking the idle speed, check these items:
-
  - -

    The malfunction indicator lamp (MIL) has not been reported on, and there are no DTCs.
  - -

    Spark plugs
  - -

    Air cleaner
  - -

    PCV system
- If DTCs are not indicated, the idle speed is normal.
- Apply the parking brake.

1. HDS - Connect
2. Idle Speed - Inspect

1. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle. 2. Check the idle speed under no load conditions: headlights, blower fan, radiator fan, audio system, and air conditioner off.**Idle speed should be:** *1: Idle speed is controlled to improve driving performance at the high altitude point of view. 3. Let the engine idle for 1 minute with high electric load (A/C on, temperature set to max cool, blower fan on high, headlights on high beam).**Idle speed should be: 720 +/- 50 rpm (in P or N) NOTE:** If the idle speed is not within specification, do the PCM idle learn procedure. If the idle speed is still not within specification, go to the symptom troubleshooting .

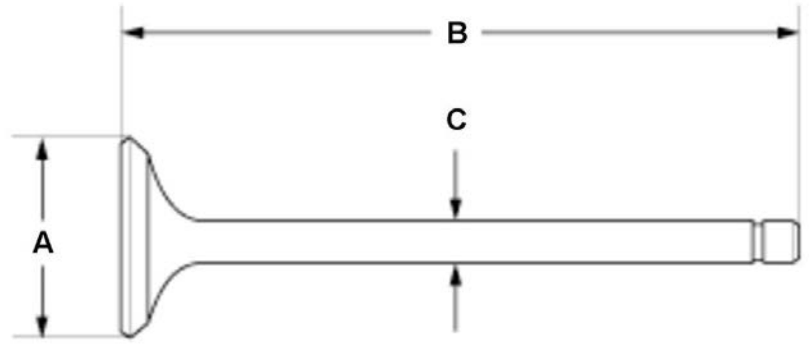
1.5 L engine	**720 +/- 50 rpm** (in P or N)
	975 +/- 50 min -1 (rpm) (in P or N) *1 (high altitude (BARO sensor in the DATA LIST with the HDS: less than 563 mmHg)
2.4 L engine	**720 +/- 50 rpm** (in P or N)

VALVE INSPECTION (1.5 L ENGINE)

Inspection

WARNING: Please carefully read "Precaution for Handling Sodium-Filled Valves" and follow the instructions as the exhaust valves contain metal sodium .

1. Valve - Remove
2. Valve - Inspect



1. Measure the valve in these areas.

Exhaust Valve Dimensions	
A Standard (New):	**22.90-23.10 mm (0.9016-0.9094 in)**
B Standard (New):	**98.80-99.20 mm (3.8898-3.9055 in)**
C Standard (New):	**5.45-5.46 mm (0.2146-0.2150 in)**
C Service Limit:	**5.42 mm (0.2134 in)**

Intake Valve Dimensions	
A Standard (New):	**27.90-28.10 mm (1.0984-1.1063 in)**
B Standard (New):	**99.15-99.65 mm (3.9035-3.9232 in)**
C Standard (New):	**5.48-5.49 mm (0.2157-0.2161 in)**
C Service Limit:	**5.45 mm (0.2146 in)**

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

VALVE INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Inspection

1. Valve - Remove
2. Valve - Inspect

	1. Measure the valve in these areas. **Intake Valve Dimensions** **Exhaust Valve Dimensions**

A Standard (New):	**29.85-30.15 mm (1.1752-1.1870 in)**
B Standard (New):	**115.40-116.00 mm (4.5433-4.5669 in)**
C Standard (New):	**5.445-5.460 mm (0.21437-0.21496 in)**
C Service Limit:	**5.435 mm (0.21398 in)**

A Standard (New):	**35.85-36.15 mm (1.4114-1.4232 in)**
B Standard (New):	**116.65-117.25 mm (4.5925-4.6161 in)**
C Standard (New):	**5.470-5.485 mm (0.21535-0.21594 in)**
C Service Limit:	**5.445 mm (0.21437 in)**

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

VALVE STEM-TO-GUIDE CLEARANCE INSPECTION (1.5 L ENGINE)

Inspection

WARNING: Please carefully read "Precaution for Handling Sodium-Filled Valves" and follow the instructions as the exhaust valves contain metal sodium .

1. Valve - Remove
2. Valve - Inspect
3. Valve Stem To Guide Clearance - Inspect

	1. Subtract the O. D. of the valve stem, measured with a micrometer, from the I. D. of the valve guide measured with an inside micrometer or a ball gauge. Take the measurements in three places along the valve stem and three places inside the valve guide. The difference between the largest guide measurement and the smallest stem measurement should not exceed the service limit.

Intake Valve Stem-to-Guide Clearance	
Standard (New):	**0.025-0.050 mm (0.00098-0.00197 in)**
Service Limit:	**0.08 mm (0.0031 in)**

Exhaust Valve Stem-to-Guide Clearance	
Standard (New):	**0.055-0.080 mm (0.00217-0.00315 in)**
Service Limit:	**0.11 mm (0.0043 in)**

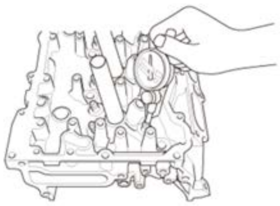
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

VALVE STEM-TO-GUIDE CLEARANCE INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Inspection

1. Valve - Remove
2. Valve - Inspect
3. Valve Stem-to-Guide Clearance - Inspect



1. Subtract the O. D. of the valve stem, measured with a micrometer, from the I. D. of the valve guide, measured with an inside micrometer or ball gauge. Take the measurements in three places along the valve stem and three places inside the valve guide. The difference between the largest valve guide measurement and the smallest valve stem measurement should not exceed the service limit.

Intake Valve Stem-to-Guide Clearance

Exhaust Valve Stem-to-Guide Clearance

Standard (New):	**0.055-0.085 mm (0.00217-0.00335 in)**
Service Limit:	**0.110 mm (0.00433 in)**

Standard (New):	**0.030-0.060 mm (0.00118-0.00236 in)**
Service Limit:	**0.080 mm (0.00315 in)**

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

REWRITE

PCM UPDATE

Procedure

NOTE: High temperature in the engine compartment might cause the PCM to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.

1. PCM - Update
2. PCM - Idle Learn
3. CKP Pattern - Clear/Learn

LEARNING RESET CLEAR

CKP PATTERN CLEAR/CKP PATTERN LEARN PROCEDURE

Procedure

NOTE:

- Clearing the DTCs with the HDS does not require you to do this procedure.
- The PCM memorizes the learning status in its memory after passed an hour from turning the vehicle to the OFF (LOCK) mode. If you need to disconnect the 12 volt battery terminals before memorizing the learning status in the PCM, jump the SCS line with the HDS, and wait 60 seconds, then disconnect the 12 volt battery terminals.

Clear/Learn Procedure (with the HDS)

1. **HDS - Connect**
2. CKP Pattern - Clear/Learn

1. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.

2. Select CRANK PATTERN CLEAR with the HDS, and clear the CKP pattern.

3. Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Jump the SCS line with the HDS.

6. Wait 60 seconds, and exit the SCS mode with the HDS.

Learn Procedure (without the HDS)

3. CKP Pattern - Learn

1. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

2. 1.5 L engine: Test-drive the vehicle on a level road: Decelerate (with the throttle fully closed) from an engine speed of 3, 200 rpm down to 1, 500 rpm with in L.

3. 2.4 L engine: Test-drive the vehicle on a level road: Decelerate (with the throttle fully closed) from an engine speed of 4, 000 rpm down to 1, 500 rpm with the in L.

4. Repeat step 2 several times.

5. Turn the vehicle to the OFF (LOCK) mode.

6. Turn the vehicle to the ON mode, and wait 30 seconds.

7. Turn the vehicle to the OFF (LOCK) mode, and wait an hour. The CKP pattern learn procedure is complete.

PCM IDLE LEARN PROCEDURE

Procedure

The idle learn procedure must be done so the PCM can learn the engine idle characteristics.

Do the idle learn procedure whenever you do any of these actions:

- Replace the PCM.
- Reset the PCM.
- Update the PCM.
- Replace or clean the throttle body.
- When the engine or transmission is disassembled.

NOTE:

- Clearing the DTCs with the HDS does not require you to do the idle learn procedure.
- The PCM memorizes the learning status in its memory after passed an hour from turning the vehicle to the OFF (LOCK) mode. If you need to disconnect the 12 volt battery terminals before memorizing the learning status in the PCM, jump the SCS line with the HDS, and wait 60 seconds, then disconnect the 12 volt battery terminals.

1. PCM Idle - Learn

Procedure

1. Make sure all electrical items (the A/C, the audio, the lights, etc.) are off.

2. **Reset the PCM with the HDS**

3. Turn the vehicle to the ON mode, and wait 2 seconds.

4. Start the engine. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, or until the engine coolant temperature reaches 194 deg. F (90 deg. C).

5. Let the engine idle for about 5 minutes with the throttle fully closed.

NOTE: If the radiator fan comes on, do not include its running time in the 5 minutes.

6. Turn the vehicle to the OFF (LOCK) mode.

7. Jump the SCS line with the HDS.

8. Wait 60 seconds, and exit the SCS mode with the HDS.

PCM RESET

Procedure

1. HDS - Connect
2. PCM - Reset

1. Select the PGM-FI system with the HDS.

2. Reset the PCM with the HDS while the engine is stopped.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Turn the vehicle to the ON mode, and wait 30 seconds.

5. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the DLC.

Fuel and Emissions Systems Learning Procedure

3. PCM - Idle Learn

Engine Rotation: Clockwise

HOW TO SET READINESS CODES

Malfunction Indicator Lamp (MIL) Indication (In relation to Readiness Codes)

The vehicle has certain readiness codes that are part of the on-board diagnostics for the emissions systems. If the vehicle's 12 volt battery has been disconnected or gone dead, if DTCs have been cleared, or if the PCM has been reset, these readiness codes are reset to incomplete. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the emission test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the vehicle to the ON mode, but do not start the engine. The MIL comes on for 15-20 seconds. If it then goes off, the readiness codes are set to complete. If it flashes five times, one or more readiness codes are not set to complete. To set readiness codes from incomplete to complete, do the procedure for the appropriate code.

To check the status of a specific DTC system, **check the OBD status in the DTC MENU with the HDS** . This screen displays the DTC, the current data list of the enable criteria, and the status of the readiness testing.

Catalytic Converter Monitor and Readiness Code

NOTE:

- During the procedure, do not turn the vehicle to the ACCESSORY mode or the OFF (LOCK) mode.
- All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.
- Low ambient temperatures or excessive stop-and-go traffic may increase the drive time needed to switch the readiness code from incomplete to complete.
- The readiness code will not switch to complete until all the enable criteria are met.
- If a fault in the secondary HO2S system caused the MIL to come on, the readiness code cannot be set to complete until you correct the fault.

Enable Criteria

- ECT SENSOR 1 at 158 deg. F (70 deg. C) or more.
- IAT SENSOR at 20 deg. F (-7 deg. C) or more.
- Vehicle speed above 25 mph (40 km/h).

Procedure

1. **Connect the HDS to the vehicle's data link connector (DLC)**

, and bring up the READINESS CODEs screen for Catalyst in the DTCs MENU.

2. Start the engine.

3. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. After about 5 miles (8 km), the readiness code should switch to complete.

4. If the readiness code is still not set to complete, check for a Pending DTC with the HDS. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

Evaporative Emission (EVAP) Control System Monitor and Readiness Code (1.5 L engine)

NOTE: All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Enable Criteria

Refer to the following DTC.

- **P0441**
- **P0456**
- **P145D**

Procedure

Refer to the following DTC.

NOTE: Do not FUNCTION TEST with the HDS.

- **P0441**

- **P0456**
- **P145D**

Evaporative Emission (EVAP) Control System Monitor and Readiness Code (2.4 L engine)

NOTE: All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Enable Criteria

- **P0441**
- **P0456**

Procedure

Refer to the following DTC.

NOTE: Do not FUNCTION TEST with the HDS.

- **P0441**
- **P0456**

Air Fuel Ratio (A/F) Sensor Monitor and Readiness Code

NOTE:

- During the procedure, do not turn the vehicle to the ACCESSORY mode or the OFF (LOCK) mode.
- All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Enable Criteria

ECT SENSOR 1 at 140 deg. F (60 deg. C) or more.

Procedure

1. Start the engine.

2. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. During the drive, decelerate (with the throttle fully closed) for 5 seconds. After about 3.5 miles (5.6 km), the readiness code should switch from incomplete to complete. Check the readiness codes screen for the AIR FUEL RATIO (A/F) SENSOR in the DTCs MENU with the HDS.

- If the HDS indicates complete, readiness is complete.
- If the HDS indicates not complete, go to the next step.

4. Check for a Pending DTC. If there is no DTC, the enable criteria was probably not met. Select the DATA LIST Menu. Check ECT SENSOR 1 in the ALL DATA LIST with the HDS. If ECT SENSOR 1 is less than 140 deg. F (60 deg. C), run the engine until it is more than 140 deg. F (60 deg. C), then repeat the procedure.

Air Fuel Ratio (A/F) Sensor Heater Monitor Readiness Code

NOTE: All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Procedure

1. Start the engine, and let it idle for 1 minute. The readiness code should switch from incomplete to complete.

2. If the readiness code is still not set to complete, check for a Pending DTC. If there is no DTC, repeat the procedure.

Misfire Monitor and Readiness Code

- This readiness code is always set to available because misfiring is continuously monitored.
- Monitoring pauses, and the misfire counter resets, if the vehicle is driven over a rough road.

- Monitoring also pauses, and the misfire counter holds at its current value, if the throttle position changes more than a predetermined value, or if driving conditions fall outside the range of any related enable criteria.

Fuel System Monitor and Readiness Code

- This readiness code is always set to available because the fuel system is continuously monitored during closed loop operation.
- Monitoring pauses when the catalytic converter, the EVAP control system, and the A/F sensor monitors are active.
- Monitoring also pauses when any related enable criteria are not being met. Monitoring resumes when the enable criteria is again being met.

Comprehensive Component Monitor and Readiness Code

This readiness code is always set to available because the comprehensive component monitor is continuously running whenever the engine is cranking or running.

EGR Monitor and Readiness Code

NOTE:

- During the procedure, do not turn the vehicle to the ACCESSORY mode or the OFF (LOCK) mode.
- All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Enable Criteria

ECT SENSOR 1 at 176 deg. F (80 deg. C) or more.

Procedure

1. Connect the HDS to the DLC

2. Start the engine.

3. Drive at a steady speed with the transmission in D at 50-62 mph (80-100 km/h) or above for more than 10 seconds.

4. With the transmission in D, decelerate from 62 mph (100 km/h) or above by completely releasing the throttle for at least 5 seconds. If the engine is stopped during this step, repeat steps 3 and 4. Check the OBD status screen for DTC P0401 in the DTC's MENU with the HDS.

- If it is passed, the readiness code is complete.
- If it is not passed, go to step 3 and retest.

SYMPTOM TROUBLESHOOTING

AUTO IDLE STOP SYSTEM SYMPTOM TROUBLESHOOTING - AUTO IDLE STOP SYSTEM DOES NOT OPERATE (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Auto idle stop system does not operate

NOTE:

- If the auto idle stop system indicator (amber) blinks, go to the auto idle stop system symptom troubleshooting (Auto idle stop system indicator blinks).
- When the 12 volt battery terminals are loose or corroded or an aftermarket electronic device is directly connected to the 12 volt battery negative terminal, the vehicle may wrongly detect the battery deterioration and this symptom may appear. Check for these conditions of the 12 volt battery terminals listed above before you troubleshoot and fix them as needed, then make sure that the indicator goes off when you start up the engine.

1. DTC check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the HDS to the data link connector, then select the PGM-FI system with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P154A Battery Sensor Internal Failure	B	B
P154B Battery Sensor Malfunction	B	B

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI - Battery Sensor LIN Communication Error	B	B

DTC (PGM-FI)

Is DTC P154A, P154B, and/or P16E3 indicated?

YES

Do the indicated DTC's troubleshooting.

NO

Go to step 2.

2. 12 volt battery check

-1. Start the engine.

-2. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IDLE STOP INHIBIT (BATTERY DETERIORATION)	INHIBITED	B	B	B

Do the current condition (s) match the threshold?

YES

Replace the 12 volt battery .

NO

Go to step 3.

3. DTC check 2

-1. Check for Pending or Confirmed DTCs with the HDS.

NOTE: **The low atmospheric pressure caused by the high altitudes can inhibit the auto idle stop**.

DTC Description	Confirmed DTC	Pending DTC
P2226 BARO Sensor Circuit Malfunction	B	B
P2228 BARO Sensor Circuit Low Voltage	B	B
P2229 BARO Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

Is DTC P2226, P2228, and/or P2229 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 4.

4. Problem verification:

Do the auto idle stop system inspection.

NOTE:

- Some prohibited condition of the auto idle stop system can be checked by the parameter of the HDS. Check the following parameters while a vehicle stops. If the parameter is indicated INHIBITED, the auto idle stop is prohibited by its item.
- If the IDLE STOP INHIBIT (BATTERY DETERIORATION) is INHIBITED, **do the 12 volt battery internal resistance reset procedure** , then recheck. If INHIBITED is still displayed after reset procedure, **replace the 12 volt battery** , then **do the 12 volt battery internal resistance reset procedure** , and recheck.
- There is a parameter that is not supported by the application. Parameters that are not supported will not be displayed.

Signal	Current conditions	
	Values	Unit
IDLE STOP INHIBIT (EPS UNIT)	B	B
IDLE STOP INHIBIT (ABS/VSA UNIT)	B	B
IDLE STOP INHIBIT (HVAC)	B	B
IDLE STOP INHIBIT (BATTERY MANAGEMENT SYSTEM)	B	B
IDLE STOP INHIBIT (BRAKE SYSTEM)	B	B
IDLE STOP INHIBIT (DC-DC CONVERTER)	B	B
IDLE STOP INHIBIT (IDLE STOP CANCEL SWITCH)	B	B
IDLE STOP INHIBIT (HOOD OPEN)	B	B
IDLE STOP INHIBIT (SEAT BELT UNFASTENED)	B	B
IDLE STOP INHIBIT (PCU)	B	B
IDLE STOP INHIBIT (BATTERY DETERIORATION)	B	B
IDLE STOP INHIBIT (AT/CVT: PRECONDITION)	B	B
IDLE STOP INHIBIT (AT/CVT: TRANSITION CONDITION)	B	B
IDLE STOP INHIBIT (LOW BATTERY VOLTAGE)	B	B
IDLE STOP INHIBIT (HOOD OPEN HISTORY)	B	B
IDLE STOP INHIBIT (DRIVING HISTORY)	B	B
IDLE STOP INHIBIT (PRECONDITION)	B	B
IDLE STOP INHIBIT (INCLINED STATE)	B	B
IDLE STOP INHIBIT (STARTING ASSIST BRAKE)	B	B
IDLE STOP INHIBIT (VEHICLE STOP JUDGMENT)	B	B

Signal	Current conditions	
	Values	Unit
IDLE STOP INHIBIT (OPERATING CONDITION)	B	B
IDLE STOP INHIBIT (BAROMETRIC AIR PRESSURE)	B	B

Is auto idle stop working?

YES

The system is OK at this time.

NO

Go to step 5.

5. Starter, Brake, Charging, CVT, EPS, VSA, EBB, SRS, PGM-FI system check

-1. Start the engine, and check the indicator on the gauge, and check for any DTC with the HDS.

Do charging system indicator, shift position indicator, EPS indicator, VSA indicator, brake system indicator, SRS indicator, and MIL indicator stay on or are any DTCs set?

1. **YES**

   Do the troubleshooting for the system that indicator stays on.

   - **PGM-FI system**
   - **Starter system**

- CVT: CVT system
- Electric brake booster system
- VSA system
- Electric parking brake system
- Charging system
- EPS system
- SRS system

NO

Go to step 6.

6. SRS system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Check for Pending or Confirmed DTCs in the SRS system with the HDS.

DTC Description	DTC
B	B

DTC (SRS)

Are any Pending or Confirmed DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 7.

7. CVT system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Check for Pending or Confirmed DTCs in the CVT system with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (CVT)

Are any Pending or Confirmed DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 8.

8. Shift position indicator check

-1. Shift the transmission to D position/mode while pressing the brake pedal firmly.

Does the shift position indicator display D position/mode?

YES

Go to step 9.

NO

Do the following procedures.

- **Do the gauge self-diagnostic function** .
- **Do the CVT system symptom troubleshooting** .

9. A/C system check

-1. Select the BODY ELECTRICAL system with the HDS.

-2. Select the HVAC/Climate Control, then check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC (AC)

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 10.

10. Starter system check

-1. Check the indicator on the gauge and stored DTC.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

DTC (PGM-FI)

Is the starter system indication indicated, or are any DTCs stored?

YES

Do the troubleshooting for the starter system .

NO

Go to step 11.

11. Brake pedal position switch signal check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
BRAKE SWITCH	B	B

Does the signal change ON and OFF when the brake pedal is pressed and released?

YES

Go to step 12.

NO

Test the brake pedal position switch .

12. Climate control system check

    -1. Select the BODY ELECTRICAL system with the HDS.

    -2. Select the HVAC/Climate Control, then check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC (AC)

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 13.

13. Climate control unit check

    -1. Turn the vehicle to the ON mode.

    -2. Check the outside air temperature reading on the gauge control module.

Is the outside air temperature reading accurate?

YES

The system is OK at this time.

NO

- If the outside air temperature is not indicated, substitute a known-good climate control unit , then recheck. If the auto idle stop system is OK, replace the original climate control unit .
- If the outside air temperature reading is not accurate, check the outside air temperature sensor .

AUTO IDLE STOP SYSTEM SYMPTOM TROUBLESHOOTING - AUTO IDLE STOP SYSTEM INDICATOR (AMBER) BLINKS (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Auto idle stop system indicator (amber) blinks

NOTE: When the 12 volt battery terminals are loose or corroded or an aftermarket electronic device is directly connected to the 12 volt battery negative terminal, the vehicle may wrongly detect the battery deterioration and this symptom may appear. Check for these conditions of the 12 volt battery terminals listed above before you troubleshoot and fix them as needed, then make sure that the indicator goes off when you start up the engine.

1. 12 volt battery check

    -1. Connect the HDS to the DLC, then select the PGM-FI system with the HDS.

    -2. Start the engine.

    -3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
IDLE STOP INHIBIT (BATTERY DETERIORATION)	INHIBITED	B	B	B

Do the current condition (s) match the threshold?

YES

Replace the 12 volt battery .

NO

Go to step 2.

2. Starter counter check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Do the IDLE STOP STARTER COUNTER CHECK in the PGM-FI Function Test menu with the HDS.

   NOTE: **If the number of starter motor operations exceeds the setting limit, auto idle stop is disabled**.

   IDLE STOP STARTER COUNTER CHECK

   Is the counter more than 275, 000 times?

   YES

   Replace **the starter** , **the relay circuit board which includes starter cut relay 1 and starter cut relay 2** , and **the oil pressure switch** . After replacing them, select the IDLE STOP STARTER COUNTER CLEAR in the Adjustment menu, and select the STARTER and STARTER CUT RELAY in the IDLE STOP STARTER COUNTER CLEAR, then follow the screen prompts.

   NO

   Go to step 3.

3. PGM-FI system check

   -1. Select the PGM-FI system with the HDS.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   DTC (PGM-FI)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 4.

4. A/C system check

   -1. Select the BODY ELECTRICAL system with the HDS.

   -2. Select the HVAC/Climate Control, then check for DTCs with the HDS.

DTC Description	DTC
B	B

   DTC (AC)

   Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

The auto idle stop system is OK. Do the gauge control module self-diagnostic function .

AUTO IDLE STOP SYSTEM SYMPTOM TROUBLESHOOTING - AUTO IDLE STOP SYSTEM INDICATOR (GREEN/AMBER) DOES NOT COME ON (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Auto idle stop system indicator (green/amber) does not come on

1. Auto idle stop system indicator check

-1. Turn the vehicle to the ON mode.

-2. Do the gauge control module self-diagnostic function .

Does the auto idle stop system indicator flash?

YES

Intermittent failure, the system is OK at this time.

NO

Replace the gauge control module .

SYMPTOM TROUBLESHOOTING INDEX

AUTO IDLE STOP SYSTEM SYMPTOM TROUBLESHOOTING INDEX (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

When the vehicle has one of these symptoms, do the diagnostic procedure for the symptom, until you find the cause.

Auto Idle Stop System Symptom Troubleshooting Index

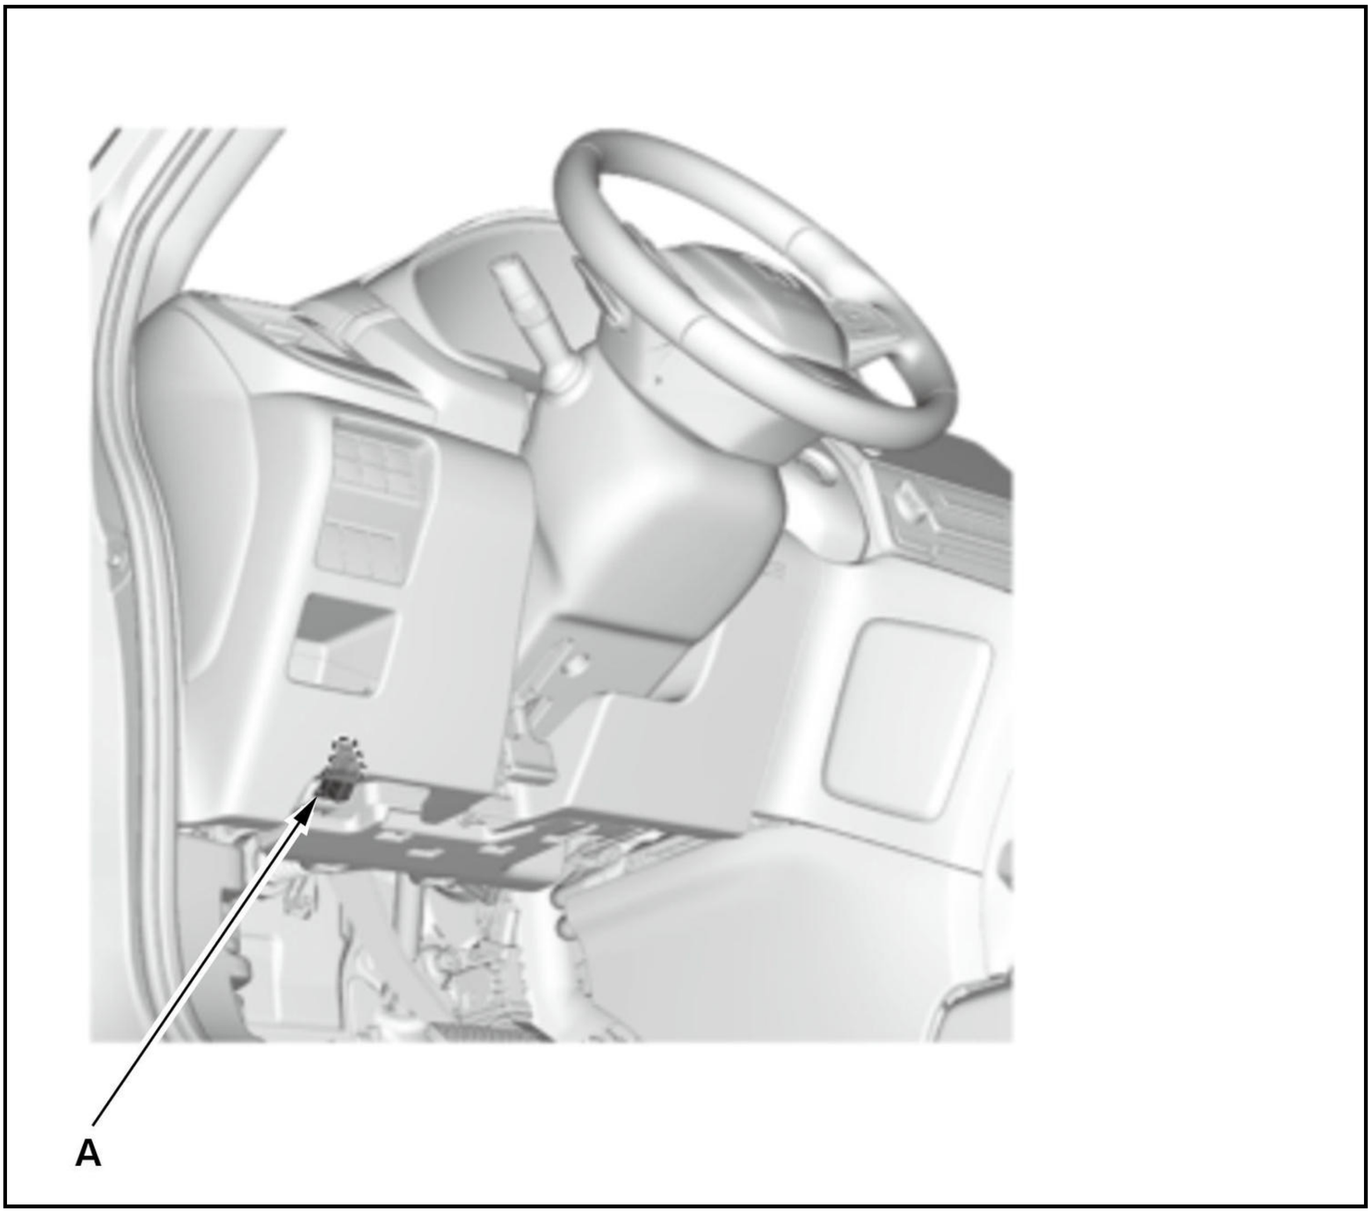
Symptom	Diagnostic procedure	Also check for
Auto idle stop system does not operate	• Inspect the auto idle stop system. • Troubleshoot the auto idle stop system (Auto idle stop system does not operate).	B
Auto idle stop system indicator (amber) blinks	Troubleshoot the auto idle stop system (Auto idle stop system indicator blinks).	B
Auto idle stop system indicator (green/amber) does not come on	Troubleshoot the auto idle stop system (Auto idle stop system indicator does not come on).	B
Idle stop time is short	Troubleshoot the auto idle stop system.	B

HOW TO INFORMATION

HOW TO CONNECT THE HDS

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.



3. Turn the vehicle to the ON mode, but do not start the engine.

4. Activate the HDS, then make sure the HDS communicates with the PCM and other vehicle systems. If it doesn't, **go to the DLC circuit troubleshooting**

.

REMOVAL & INSTALLATION INSPECTION

AIR CLEANER ELEMENT/AIR CLEANER/INTAKE AIR RESONATOR REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Removal and Installation

NOTE: Make sure the length of the bands as shown.

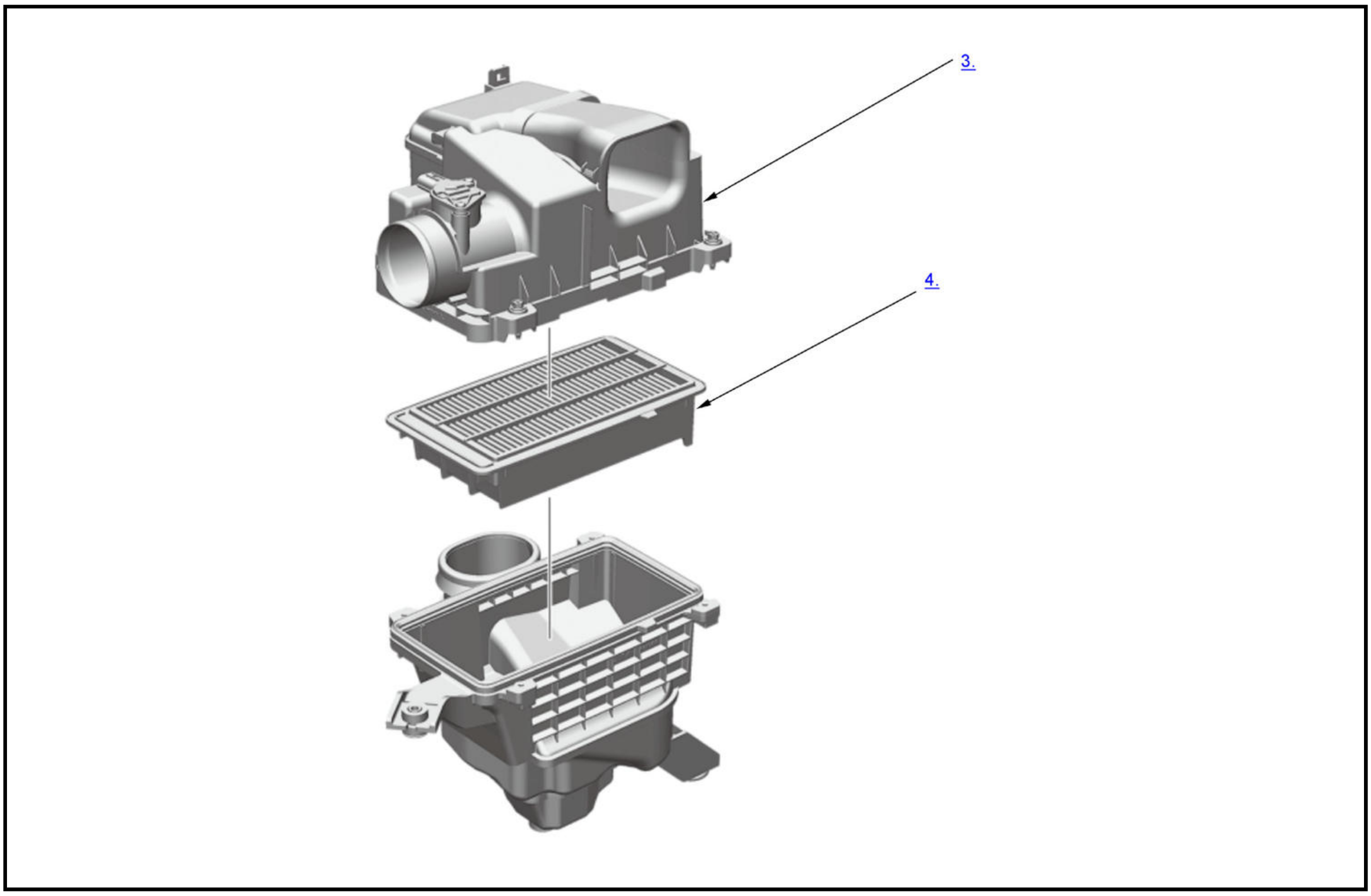
Air Cleaner Element/Air Cleaner/Intake Air Resonator Removal



1. Air Cleaner - Remove
2. Intake Air Resonator - Remove
3. Air Cleaner Housing Cover - Remove
4. Air Cleaner Element - Remove
5. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.**NOTE:** **If the idle speed fluctuates, do the idle speed inspection**.

6. Maintenance Minder - Reset (With Maintenance Minder System)

> 1. If the Maintenance Minder required to replace the air cleaner element, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").

Inspection

1. Air Cleaner Element - Inspect

> 1. Check the air cleaner element for damage or clogging. If it is damaged or clogged, replace it.
> **NOTE:**
>
> Do not use compressed air to clean the air cleaner element.
>
> 2. Clean and remove any debris from inside the air cleaner.

18. Front Subframe - Remove
19. Left Front Inner Fender - Remove

NOTE: Remove the appropriate portion of the left front inner fender.

20. Intake Air Resonator - Remove
21. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

22. Wheel Alignment - Check

Inspection

1. Air Cleaner Element - Inspect

1. Check the air cleaner element for damage or clogging. If it is damaged or clogged, replace it.
NOTE:

Do not use compressed air to clean the air cleaner element.

2. Clean and remove any debris from inside the air cleaner.

CAM CHAIN REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Camshaft Lock Pin Set 07AAB-RWCA120

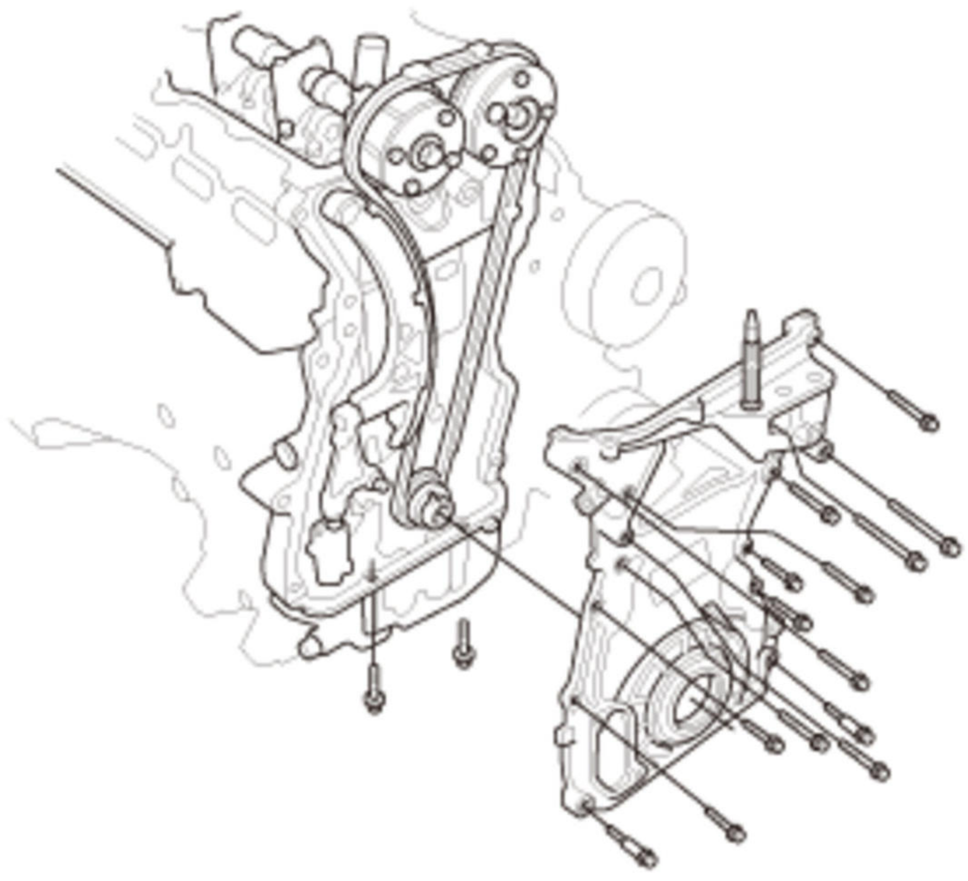
Removal

NOTE: Keep the cam chain away from magnetic fields.

1. Right Front Wheel - Remove
2. Engine Undercover - Remove
3. Drive Belt - Remove
4. Camshaft Timing - Inspect
5. Crankshaft Pulley - Remove
6. Drive Belt Auto-Tensioner - Remove
7. Dipstick - Remove
8. Side Engine Mount - Remove
9. Connector (VTC Oil Control Solenoid Valve A) - Disconnect

	1. Disconnect the connector (A). 2. Remove the harness clip (B).

10. **VTC Oil Control Solenoid Valve A - Remove**
11. Cam Chain Case - Remove



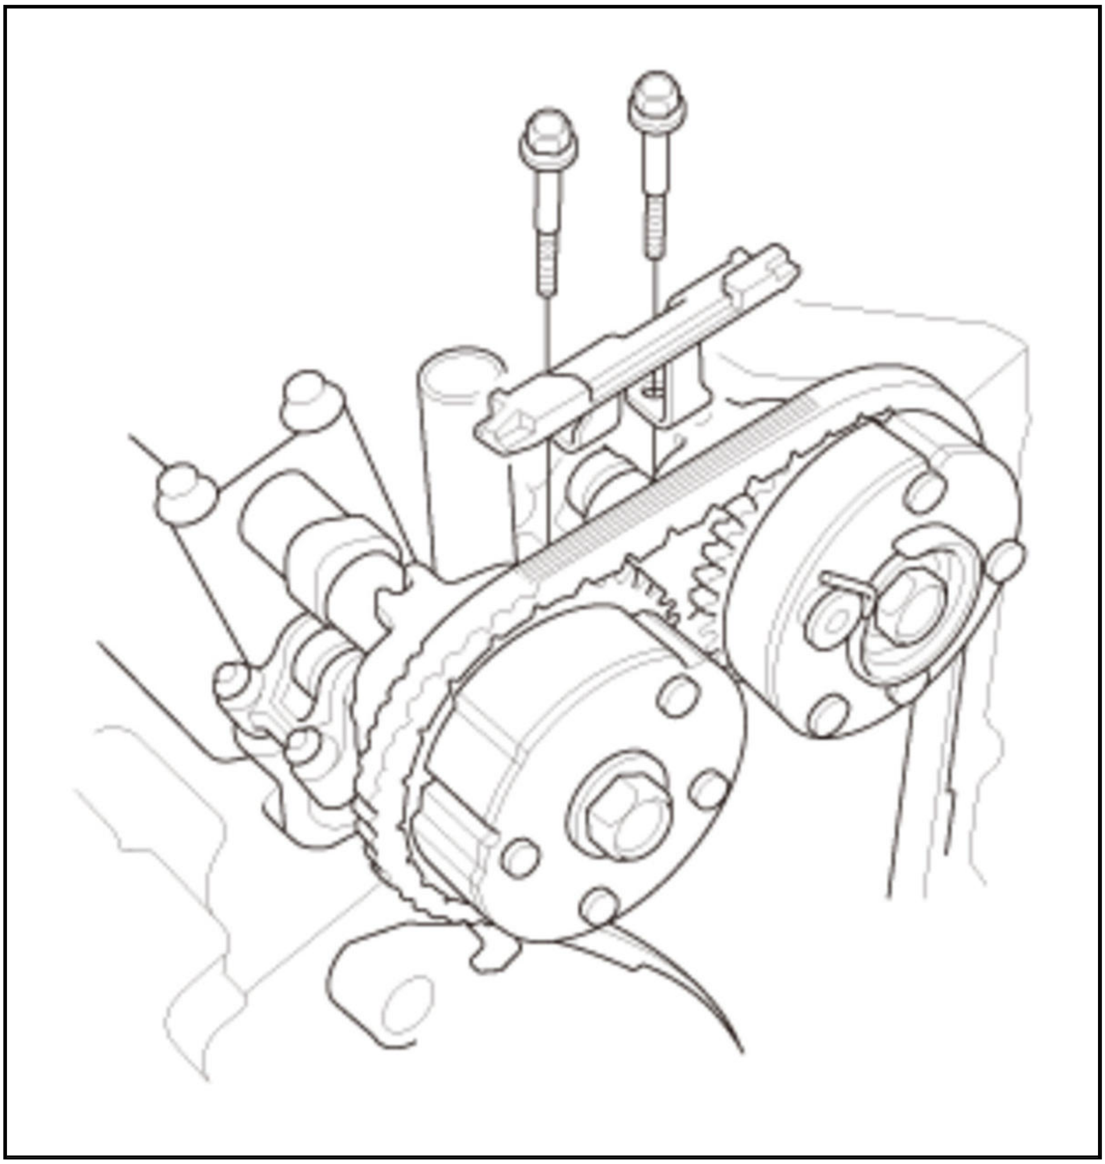
12. Cam Chain Auto-Tensioner - Remove

	1. Loosely install the crankshaft pulley. 2. Turn the crankshaft counterclockwise to compress the cam chain auto-tensioner.

	3. Rotate the crankshaft counterclockwise to align the holes on the lock (A) and the cam chain auto-tensioner (B). 4. Insert a 1.2 mm (3/64 in) diameter pin (C) into the holes. 5. Turn the crankshaft clockwise to secure the pin. **NOTE:** If the holes in the lock and the cam chain auto-tensioner do not align, continue to rotating the crankshaft counterclockwise until the holes align, then install the pin.

	6. Remove the cam chain auto-tensioner (A) and the cam chain auto-tensioner filter (B). **NOTE:** Check the cam chain auto-tensioner filter for damage. If filter is damaged, replace it. 7. Remove the crankshaft pulley.

13. Cam Chain Guide B - Remove



14. Cam Chain - Remove

	1. Remove the cam chain guide (A), the cam chain tensioner arm (B), and the cam chain tensioner sub arm (C). 2. Remove the cam chain.

Installation

NOTE:

- **How to read the torque specifications** .
- Keep the cam chain away from magnetic fields.

1. No. 1 Piston at Top Dead Center - Set (Crank Side)

	1. Set the crankshaft to top dead center (TDC). Align the TDC mark (punch mark) (A) on the cam chain drive sprocket with the pointer (B) on the oil pump.

2. No. 1 Piston at Top Dead Center - Set (Cam Side)

	1. Set the No. 1 piston at top dead center (TDC). The "UP" mark (C) on VTC actuator A should be at the top and align the TDC marks (D) on VTC actuator A and VTC actuator B.

3. Pin - Insert

	1. Insert the camshaft lock pin set to camshaft maintenance holes.

4. Cam Chain - Install

	1. Install the cam chain on the cam chain drive sprocket with the punch mark (A) aligned with the center of the colored link plates (B).
 **Intake** **Exhaust** 	2. Install the cam chain on VTC actuator A and VTC actuator B with the punch marks (C) aligned with the center of the colored link plates (D).

5. Cam Chain Tensioner Arm, Cam Chain Tensioner Sub Arm, and Cam Chain Guide - Install

6. Cam Chain Guide B - Install

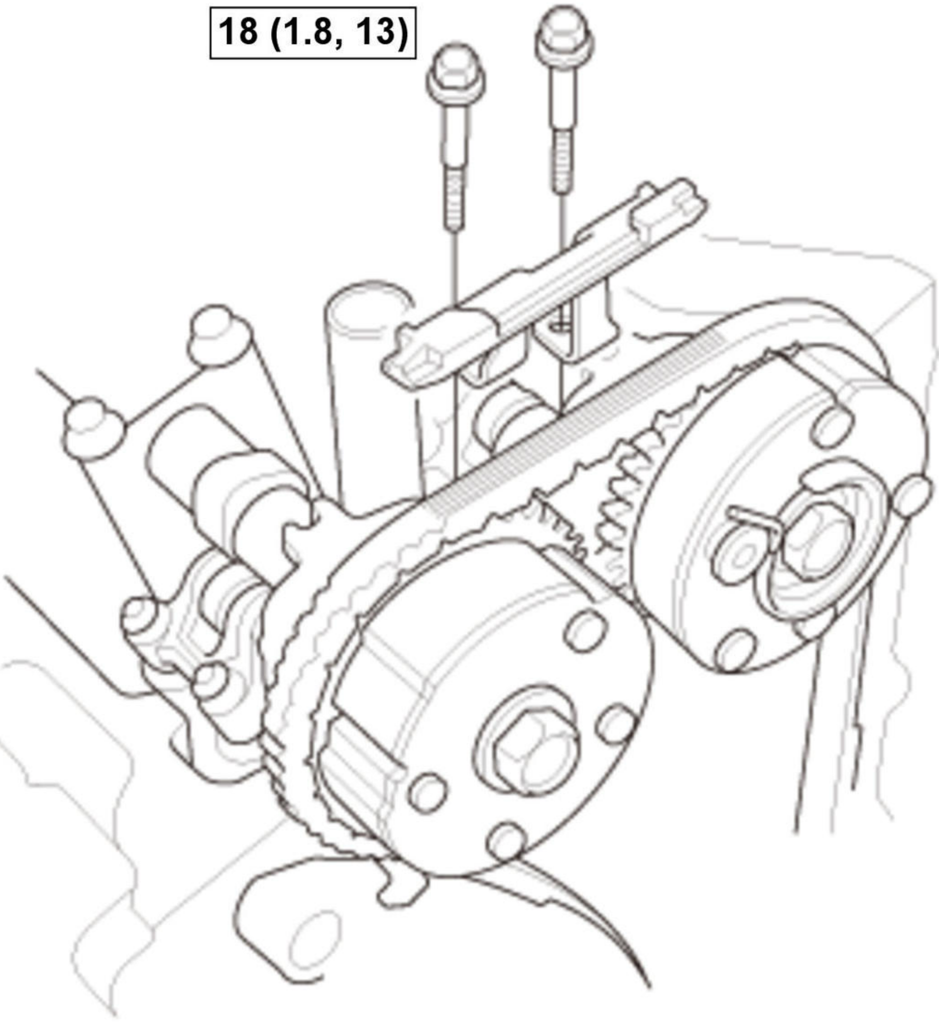

Fig. 6: Cam Chain Guide With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

7. Pin - Remove

 07AAB-RWCA120	1. Remove the camshaft lock pin set from the camshaft maintenance holes.

8. Cam Chain Auto-Tensioner - Install

	1. Compress the cam chain auto-tensioner when replacing the cam chain. Remove the pin (A) from the cam chain auto-tensioner that was installed during removal. Turn the plate (B) counterclockwise, to release the lock, then press the rod (C), and set the first cam (D) to the first edge of the rack (E). Insert the 1.2 mm (3/64 in) diameter pin back into the holes (F).**NOTE:** If the cam chain auto-tensioner is not set up as described, the cam chain auto-tensioner will be damaged.

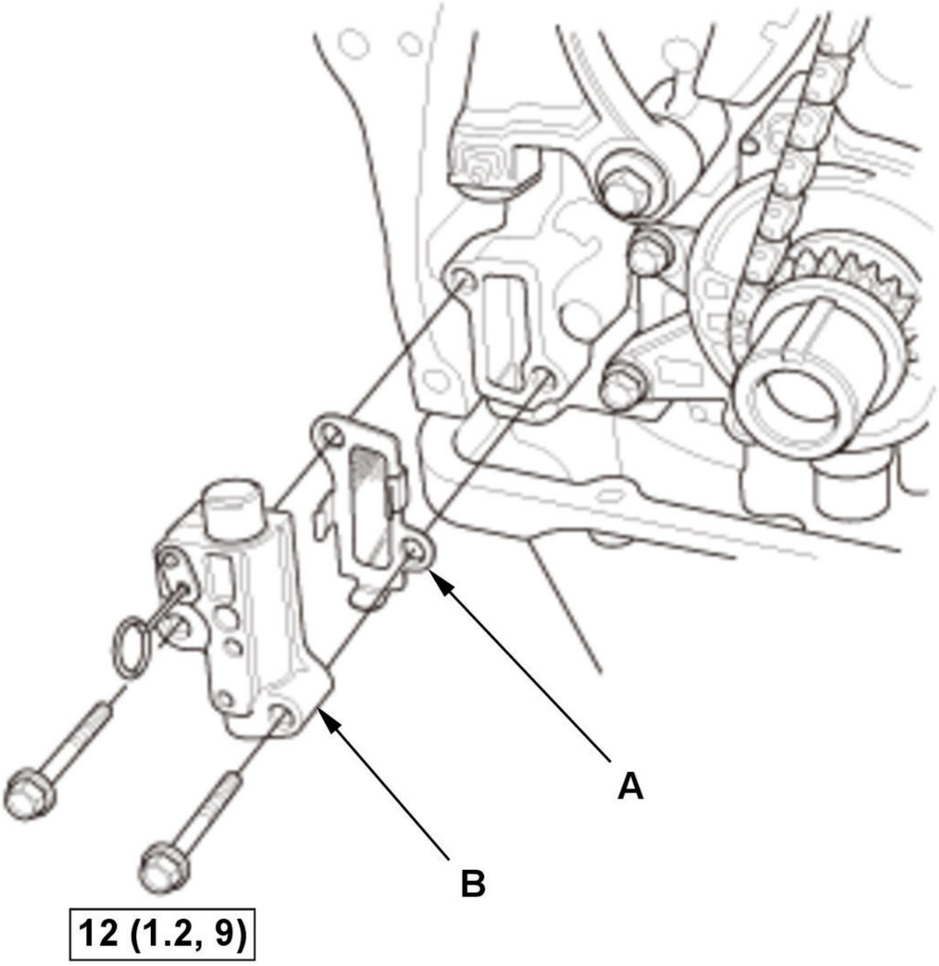

Fig. 7: Cam Chain Auto-Tensioner With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	2. Install the cam chain auto-tensioner filter (A) and the cam chain auto-tensioner (B).

	3. Remove the pin (A) from the cam chain auto-tensioner.

9. Cam Chain Case - Install

12 (1.2, 9)

Fig. 8: Cam Chain Case With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

	1. Check the pulley end crankshaft oil seal for damage. If the oil seal is damaged, replace the pulley end crankshaft oil seal. 2. Apply liquid gasket to the engine block, the cylinder head, and the oil pan mating surface of the cam chain case and to the inside edge of the threaded bolt holes. 3. Set the edge of the cam chain case (A) to the edge of the oil pan (B), then install the cam chain case on the engine block (C). Wipe off the excess liquid gasket on the oil pan and the cam chain case mating area. **NOTE:** When installing the cam chain case, do not slide the bottom surface onto the oil pan mounting surface.

10. VTC Oil Control Solenoid Valve A - Install
11. Connector (VTC Oil Control Solenoid Valve A) - Connect

	1. Install the harness clip (A). 2. Connect the connector (B).

12. Side Engine Mount - Install
13. Cylinder Head Cover - Install
14. Dipstick - Install
15. Drive Belt Auto-Tensioner - Install
16. Crankshaft Pulley - Install
17. Drive Belt - Install
18. Engine Undercover - Install
19. Right Front Wheel - Install
20. Ignition Timing - Inspect

Inspection

1. Right Front Wheel - Remove
2. Engine Undercover - Remove
3. Chain Case Cover - Remove
4. Cam Chain - Inspect

	1. Measure the length of the cam chain auto-tensioner rod. 2. If the length is over the service limit, replace the cam chain. When replacing, check the teeth on the cam chain drive sprocket, VTC actuator A, and VTC actuator B for wear and damage. If any of them are worn or damaged, replace if necessary. 3. Check the oil passage on the cam chain auto-tensioner for clogs. If the cam chain auto-tensioner is clogged, replace it.

Cam Chain Auto-Tensioner Rod Length	
Standard (New):	**20.0 mm (0.787 in)**
Service Limit:	**23.9 mm (0.941 in)**

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CAM CHAIN REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Removal

NOTE: Keep the cam chain away from magnetic fields.

1. Right Front Wheel - Remove
2. Engine Undercover - Remove
3. Cylinder Head Cover - Remove
4. Camshaft Timing - Inspect
5. VTC Oil Control Solenoid Valve - Remove
6. Rocker Arm Oil Control Valve - Remove
7. Crankshaft Pulley - Remove
8. Side Engine Mount - Remove
9. Cam Chain Case - Remove

	1. Remove the cam chain case (A) and the spacer (B).

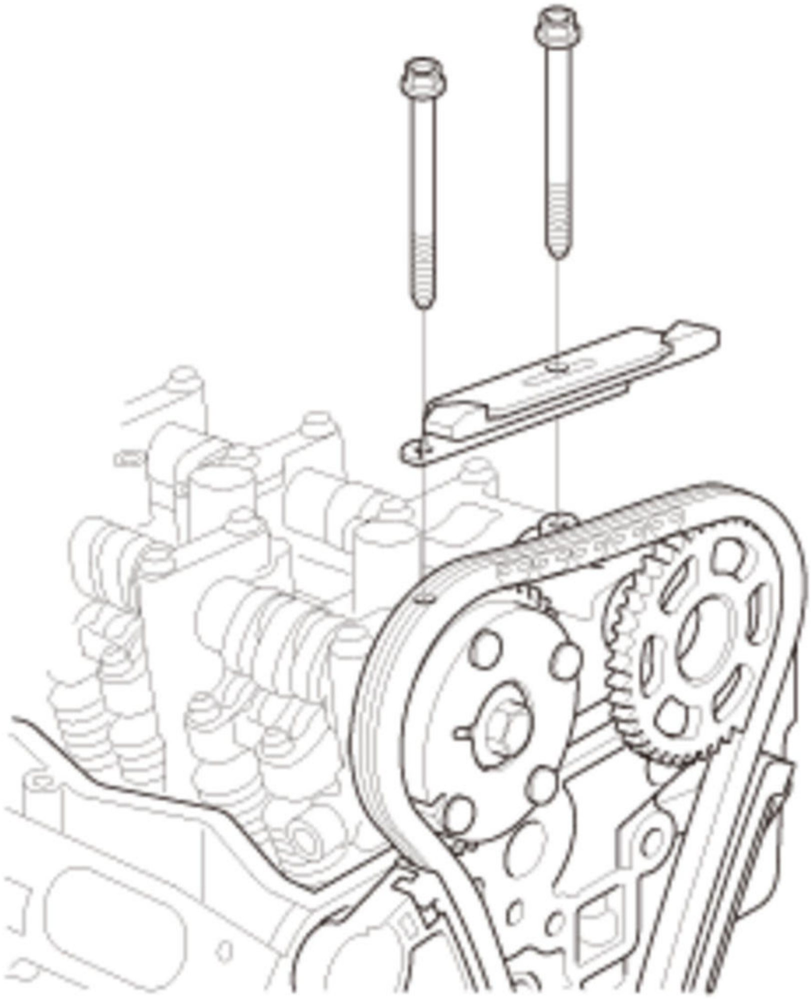
10. Cam Chain Auto-Tensioner - Remove

	1. Loosely install the crankshaft pulley. 2. Turn the crankshaft counterclockwise to compress the cam chain auto-tensioner.

	3. Rotate the crankshaft counterclockwise to align the holes on the lock (A) and the cam chain auto-tensioner (B), then insert a 1.2 mm (3/64 in) diameter pin (C) into the holes. Turn the crankshaft clockwise to secure the pin.**NOTE:** If the holes in the lock and the cam chain auto-tensioner do not align, continue to rotating the crankshaft counterclockwise until the holes align, then install the pin.

	4. Remove the cam chain auto-tensioner (A) and the cam chain auto-tensioner filter (B).**NOTE:** Check the cam chain auto-tensioner filter for damage. If filter is damaged, replace it.

11. Cam Chain Guide B - Remove



12. Cam Chain - Remove

	1. Remove cam chain guide A, the cam chain tensioner arm (B), and the cam chain tensioner sub arm (C). 2. Remove the cam chain (D).

Installation

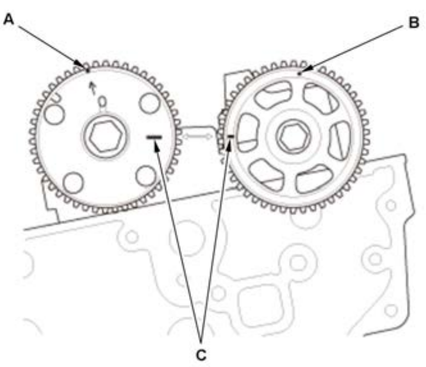
NOTE:

- **How to read the torque specifications** .
- Keep the cam chain away from magnetic fields.
- Before doing this procedure, check that the VTC actuator is locked by turning the VTC actuator counterclockwise. If not locked, turn the VTC actuator clockwise until it stops, then recheck it. If it is still not locked, replace the VTC actuator.

1. No. 1 Piston at Top Dead Center (Crank Side) - Set

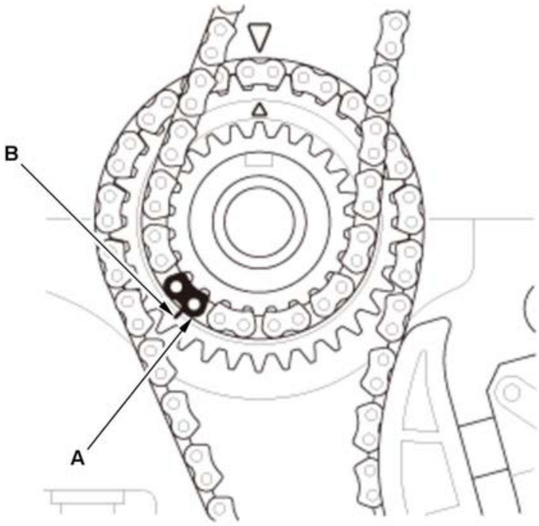
	1. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the engine block.

2. No. 1 Piston at Top Dead Center (Cam Side) - Set

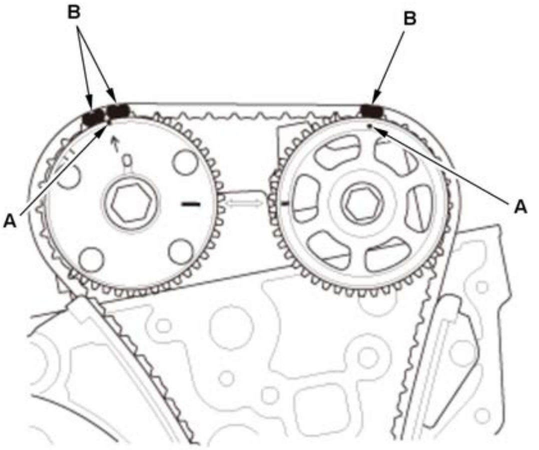


1. Set the camshafts to TDC. The punch mark (A) on the VTC actuator and the punch mark (B) on the exhaust camshaft sprocket should be at the top. Align the TDC marks (C) on the VTC actuator and the exhaust camshaft sprocket.

3. Cam Chain - Install



1. Install the cam chain on the crankshaft sprocket with the colored link plate (A) aligned with the mark (B) on the crankshaft sprocket.



2. Install the cam chain on the VTC actuator and the exhaust camshaft sprocket with the punch marks (A) aligned with the center of the colored link plates (B).

4. Cam Chain Guide B - Install

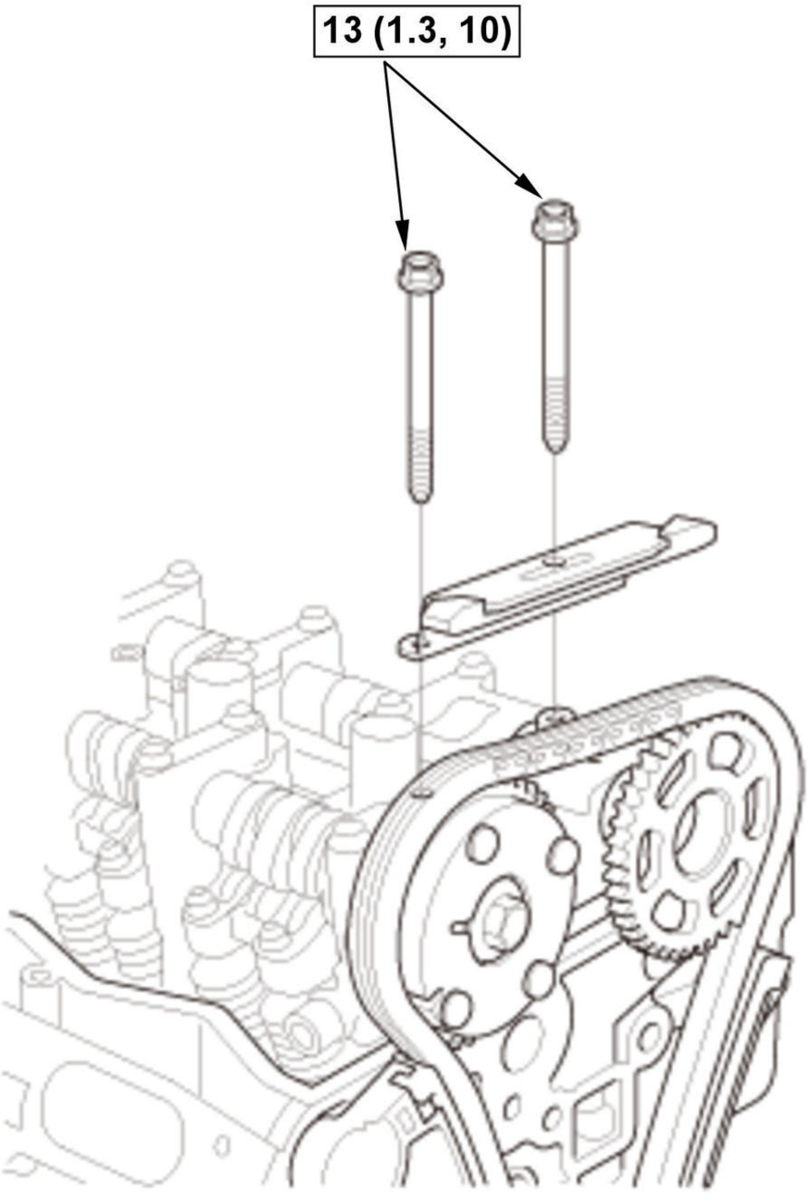


Fig. 9: Cam Chain Guide B With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B

NOTE: Apply new engine oil to the threads of the camshaft holder bolts.

5. Cam Chain Guide A, Tensioner Sub Arm, and Tensioner Arm - Install

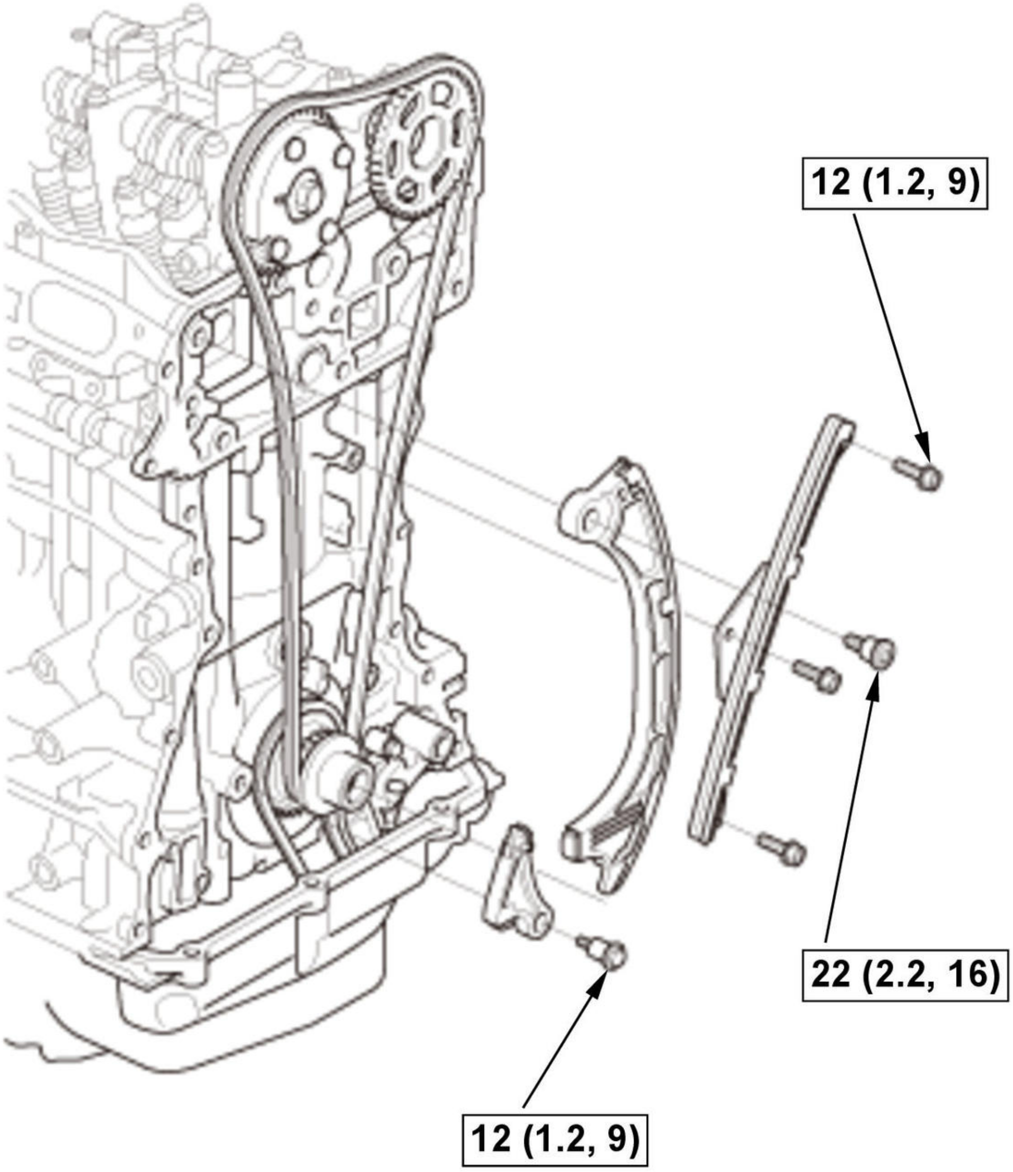

Fig. 10: Cam Chain Guide A / Tensioner Arm With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B

6. Cam Chain Auto-Tensioner - Install

	1. Compress the cam chain auto-tensioner when replacing the cam chain. Remove the pin (A) from the cam chain auto-tensioner that was installed during removal. Turn the plate (B) counterclockwise, to release the lock, then press the rod (C), and set the first cam (D) to the first edge of the rack (E). Insert the 1.2 mm (3/64 in) diameter pin back into the holes (F).**NOTE:** If the cam chain auto-tensioner is not set up as described, the cam chain auto-tensioner will be damaged.

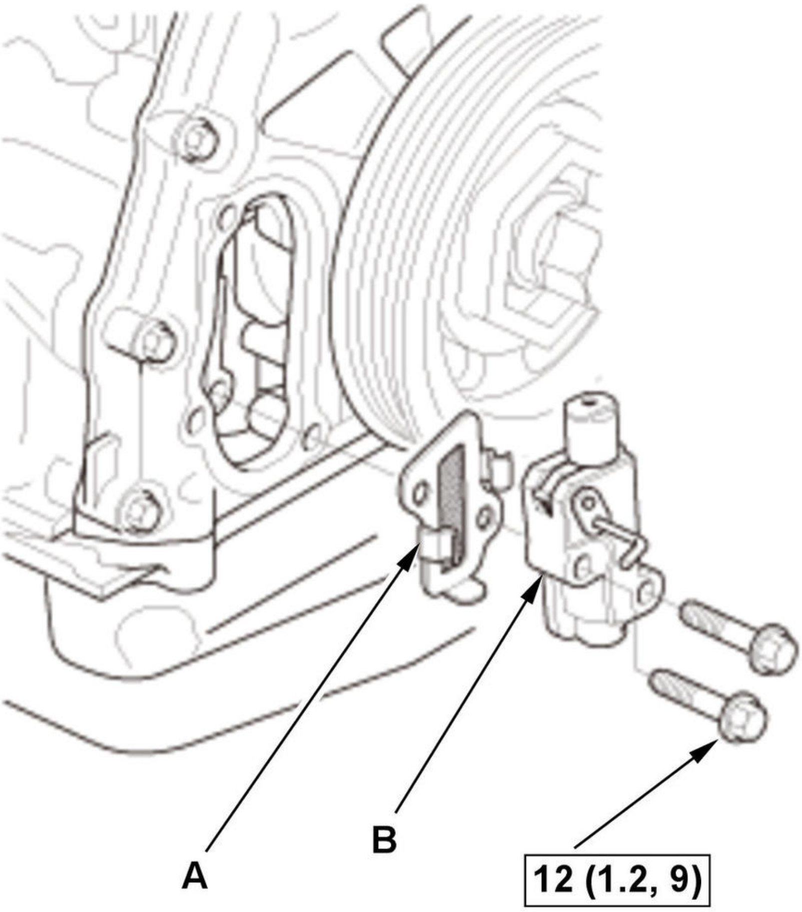

Fig. 11: Cam Chain Auto-Tensioner With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	2. Install the cam chain auto-tensioner filter (A) and the cam chain auto-tensioner (B).

	3. Remove the pin from the cam chain auto-tensioner.

7. Cam Chain Case - Install

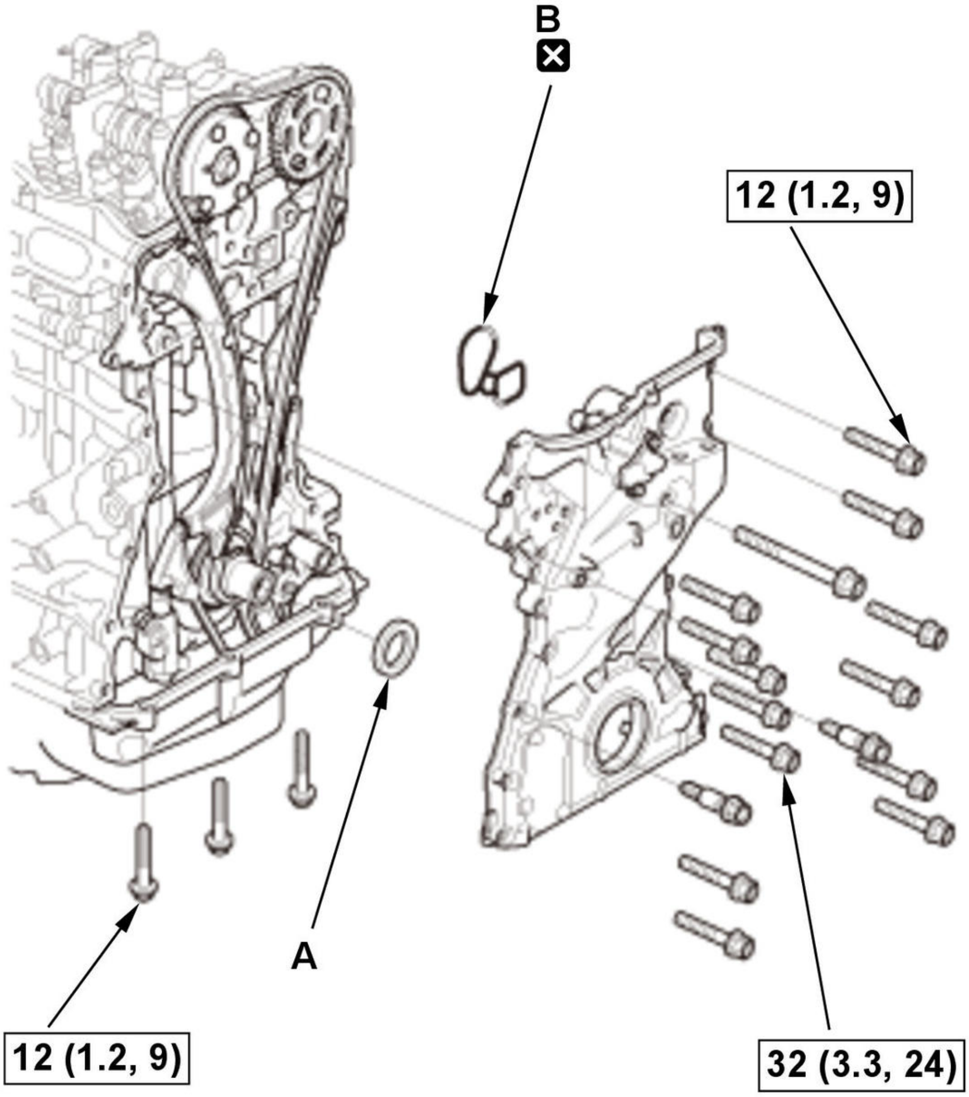

Fig. 12: Cam Chain Case With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

	1. Check the pulley end crankshaft oil seal for damage. If the oil seal is damaged, replace the pulley end crankshaft oil seal . 2. Apply liquid gasket to the engine block and the oil pan mating surface of the chain case and to the inside edge of the threaded bolt holes. 3. Install the spacer (A), then install a new O-ring (B) on the chain case. Set the edge of the chain case (C) to the edge of the oil pan (D), then install the chain case on the engine block (E). Wipe off the excess liquid gasket on the oil pan and the chain case mating area. **NOTE:** When installing the chain case, do not slide the bottom surface onto the oil pan mounting surface.

8. Side Engine Mount - Install
9. Crankshaft Pulley - Install
10. Rocker Arm Oil Control Valve - Install
11. VTC Oil Control Solenoid Valve - Install
12. Cylinder Head Cover - Install

13. Engine Undercover - Install
14. Right Front Wheel - Install

Inspection

NOTE: How to read the torque specifications .

1. Right Front Wheel - Remove
2. Engine Undercover - Remove
3. Chain Case Cover - Remove
4. Cam Chain - Inspect

	1. Measure the length of the cam chain auto-tensioner rod. 2. If the length is over the service limit, replace the cam chain. When replacing, check the teeth on the crankshaft sprocket, the VTC actuator, and the exhaust camshaft sprocket for wear and damage. If any of them are worn or damaged, replace if necessary. 3. Check the oil passage on the cam chain auto-tensioner for clogs. If the cam chain auto-tensioner is clogged, replace it.

Cam Chain Auto-Tensioner Rod Length	
Service Limit:	**26.6 mm (1.047 in)**

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CAMSHAFT AND VTC ACTUATOR REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Removal

1. Fuel Pressure - Relieve
2. Air Cleaner - Remove
3. High Pressure Fuel Pump - Remove
4. EVAP Canister Purge Valve - Remove
5. CMP Sensor A/B - Remove
6. High Pressure Fuel Pump Base - Remove
7. Cam Chain - Remove

   NOTE: After cam chain removal, reinstall the cam chain guide B mounting bolts to the specified torque, if remove VTC actuator A/B.

8. Adjusting Screw - Loosen

	1. Loosen the locknuts and the adjusting screws (A).

9. VTC Actuator A/B Mounting Bolt - Loosen

	**NOTE:** If remove VTC actuator A/B, do this procedure. 1. Hold the intake camshaft with an open-end wrench, then loosen the VTC actuator A mounting bolt.

	2. Hold the exhaust camshaft with an open-end wrench, then loosen the VTC actuator B mounting bolt.

10. Camshaft - Remove

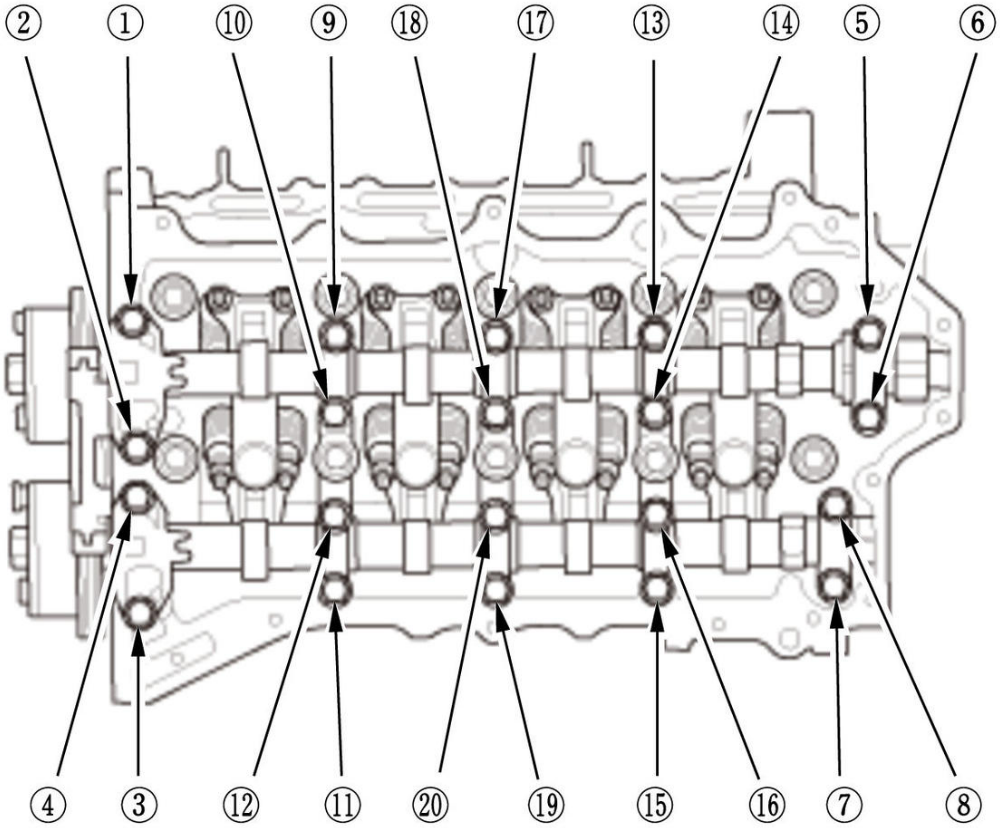

Fig. 13: Camshaft Loosening Sequence
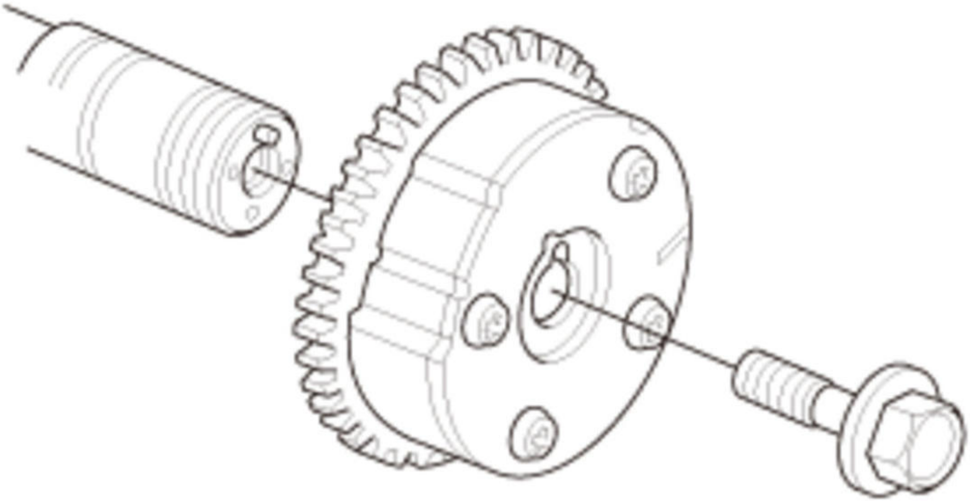
Courtesy of HONDA, U.S.A., INC.

B	1. Remove the camshaft holder bolts. To prevent damaging the camshafts, loosen the bolts, in sequence, two turns at a time.

	2. Remove the camshaft holders (A), cam chain guide B, the intake camshaft (C), and the exhaust camshaft (D).

11. VTC Actuator A/B - Remove



This illustration shows VTC actuator A.

NOTE: If remove VTC actuator A/B, do this procedure.

Installation

1. VTC Actuator A/B - Install

 This illustration shows VTC actuator A.	**NOTE:** If VTC actuator A/B is removed, do this procedure. 1. Install VTC actuator A/B. 2. Apply new engine oil to the threads of the VTC actuator A/B mounting bolt (C), then loosely install it.

2. Camshaft - Install

	1. Install the intake camshaft (A), the exhaust camshaft (C), the camshaft holders (D), and cam chain guide B.

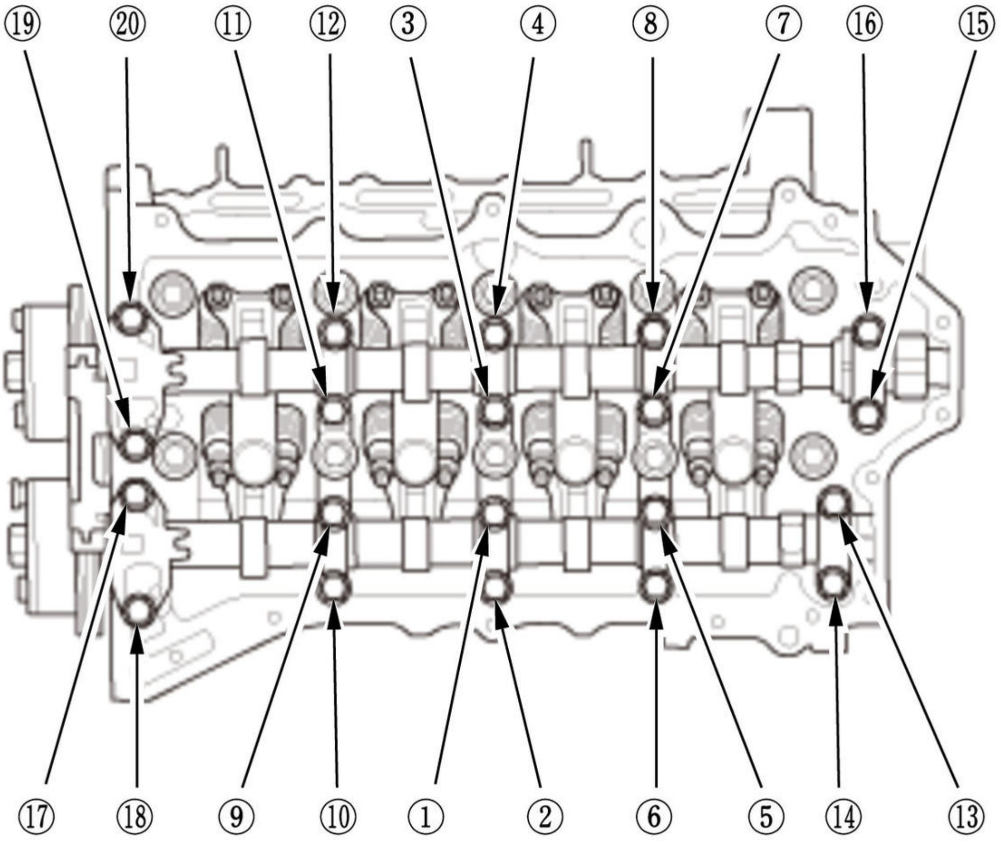


Fig. 14: Camshaft Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

B	2. Install the camshaft holder bolts, in sequence, to 5.0 N.m (0.51 kgf.m, 3.7 lbf.ft). 3. Tighten the camshaft holder bolts, in sequence, to the specified torque.

Specified Torque:
18 N.m (1.8 kgf.m, 13 lbf.ft)

3. VTC Actuator A/B Mounting Bolt - Tighten

	**NOTE:** If VTC actuator A/B is removed, do this procedure. 1. Hold the intake camshaft with an open-end wrench, then tighten the VTC actuator A mounting bolt to the specified torque.

115 N.m (11.7 kgf.m, 85 lbf.ft)

Specified Torque:

	2. Hold the exhaust camshaft with an open-end wrench, then tighten the VTC actuator B mounting bolt to the specified torque.

Specified Torque:
115 N.m (11.7 kgf.m, 85 lbf.ft)

4. Cam Chain - Install
5. Valve Clearance - Adjust
6. High Pressure Fuel Pump Base - Install
7. CMP Sensor A/B - Install
8. EVAP Canister Purge Valve - Install
9. Cylinder Head Cover - Install
10. High Pressure Fuel Pump - Install
11. Air Cleaner - Install
12. Fuel Leak (Low Pressure Side) - Check

1. Turn the vehicle to the ON mode, but do not start the engine. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three time, then check for fuel leakage.

13. Fuel Leak (High Pressure Side) - Check
14. Ignition Timing - Inspect

Inspection

VTC Actuator A and VTC Actuator B

1. VTC Actuator A/B - Inspect

 This illustration shows VTC actuator A.  This illustration shows VTC actuator A.	1. Check that VTC actuator A/B is locked by turning it. If it is not locked, replace VTC actuator A/B. 2. Seal the retard/advance holes (C) of the intake/exhaust camshaft with tape and a wire tie.

 This illustration shows VTC actuator A.	3. Seal one of the advance/retard holes (A) of the intake/exhaust camshaft with tape.

 This illustration shows VTC actuator A.	4. Apply air to the unsealed advance/retard hole (A) to release the lock.

 This illustration shows VTC actuator A.	5. Check that VTC actuator A/B moves smoothly. If VTC actuator A/B does not move smoothly, replace VTC actuator A/B. **NOTE:** Turn VTC actuator B by hand while applying air. 6. Remove the wire tie, the tape, and the adhesive residue from the camshaft journal. 7. VTC actuator A: Turn VTC actuator A clockwise until you hear it click. Make sure to lock VTC actuator A by turning it. VTC actuator B: Check that VTC actuator B is locked by turning it.

Camshaft

2. Rocker Arm Assembly - Remove
3. Camshaft - Inspect

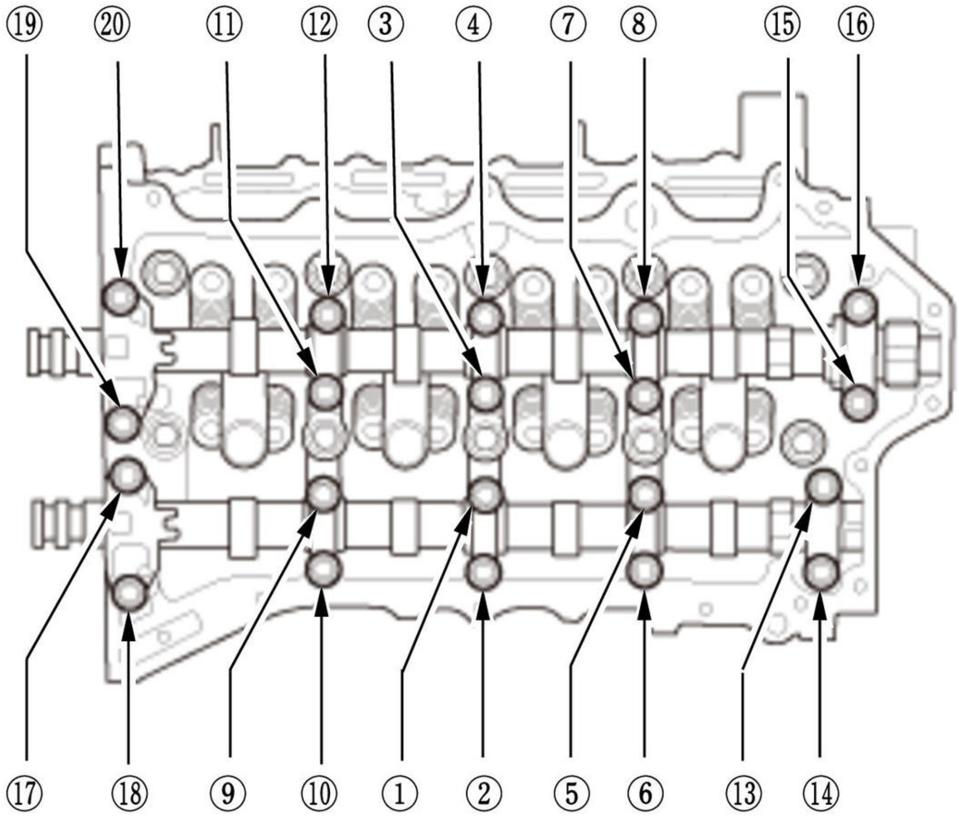

Fig. 15: Camshaft Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

B	1. Put the camshaft holders and the camshafts on the cylinder head, then install the camshaft holder bolts, in sequence, to 5.0 N.m (0.5 kgf.m, 3.7 lbf.ft). 2. Tighten the camshaft holder bolts, in sequence, to the specified torque.

Specified Torque:
18 N.m (1.8 kgf.m, 13 lbf.ft)

	3. Zero the dial indicator against the end of the camshaft, then push the camshaft back and forth, and read the end play. If the end play is beyond the service limit, replace the cylinder head and recheck. If it is still beyond the service limit, replace the camshaft.**NOTE:** Do not rotate the camshaft during inspection. 4. Loosen the camshaft holder bolts two turns at a time, in a crisscross pattern. Then remove the camshaft holders from the cylinder head. 5. Lift the camshafts out of the cylinder head, and wipe them clean, then inspect the lift ramps. Replace the camshaft if any lobes are pitted, scored, or excessively worn. 6. Clean the camshaft journal surfaces in the cylinder head, then set the camshafts back in place. Place a plastigage strip across each journal. 7. Install the camshaft holders, then tighten the camshaft holder bolts to the specified torque as shown in step 1 and step 2.

Camshaft End Play	
Standard (New):	**0.065-0.215 mm (0.00256-0.00846 in)**
Service Limit:	**0.415 mm (0.01634 in)**

8. Remove the camshaft holders. Measure the widest portion of plastigage on each journal:

- If the camshaft-to-holder clearance is within limits, go to step 10.
- If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has been replaced, replace the cylinder head.
- If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has not been replaced, go to step 9.

Camshaft-to-Holder Oil Clearance	
Standard (New):	
Intake: No. 1 Journal:	**0.030-0.069 mm (0.00118-0.00272 in)**
Exhaust: No. 1 and No. 2 Journals:	**0.030-0.069 mm (0.00118-0.00272 in)**
Intake: No. 2, No. 3, No. 4, and No. 5 Journals:	**0.060-0.099 mm (0.00236-0.00390 in)**
Exhaust: No. 3, No. 4, and No. 5 Journals:	**0.060-0.099 mm (0.00236-0.00390 in)**
Service Limit:	
Intake: No. 1 Journal:	**0.120 mm (0.00472 in)**
Exhaust: No. 1 and No. 2 Journals:	**0.120 mm (0.00472 in)**
Intake: No. 2, No. 3, No. 4, and No. 5 Journals:	**0.150 mm (0.00591 in)**
Exhaust: No. 3, No. 4, and No. 5 Journals:	**0.150 mm (0.00591 in)**

	9. Check the total runout with the camshaft supported on V-blocks. • If the total runout of the camshaft is within the standard, replace the cylinder head. • If the total runout is beyond the standard, replace the camshaft, and recheck the camshaft-to-holder oil clearance. If the oil clearance is still beyond the service limit, replace the cylinder head.

Camshaft Total Runout	
Standard (New):	**0.03 mm (0.0012 in) max.**

	10. Measure the cam lobe (A) height.

Cam Lobe Height Standard (New):	
Intake:	**33.099 mm (1.30311 in)**
Exhaust:	**33.273 mm (1.30996 in)**

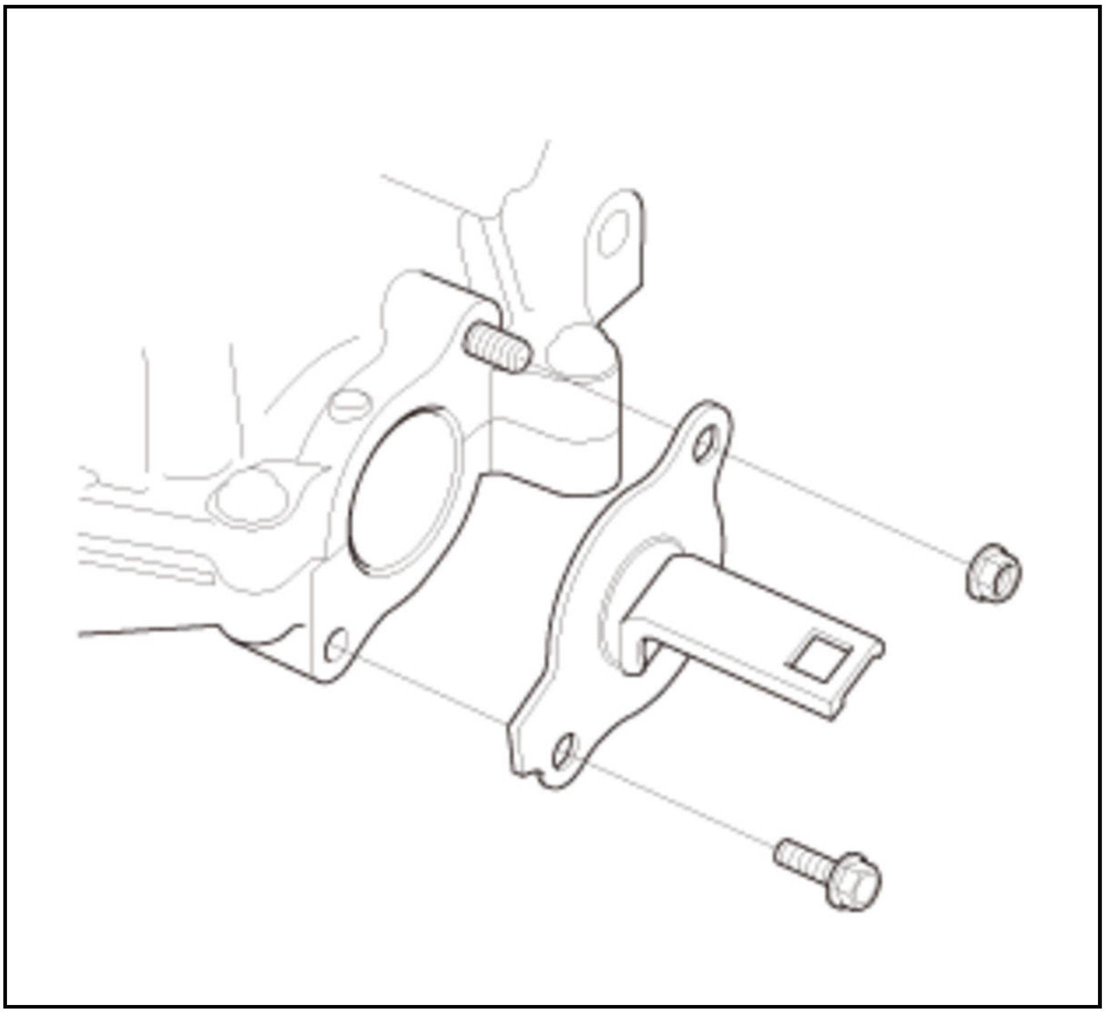
4. Rocker Arm Assembly - Install

CAMSHAFT/VTC ACTUATOR/EXHAUST CAMSHAFT SPROCKET REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

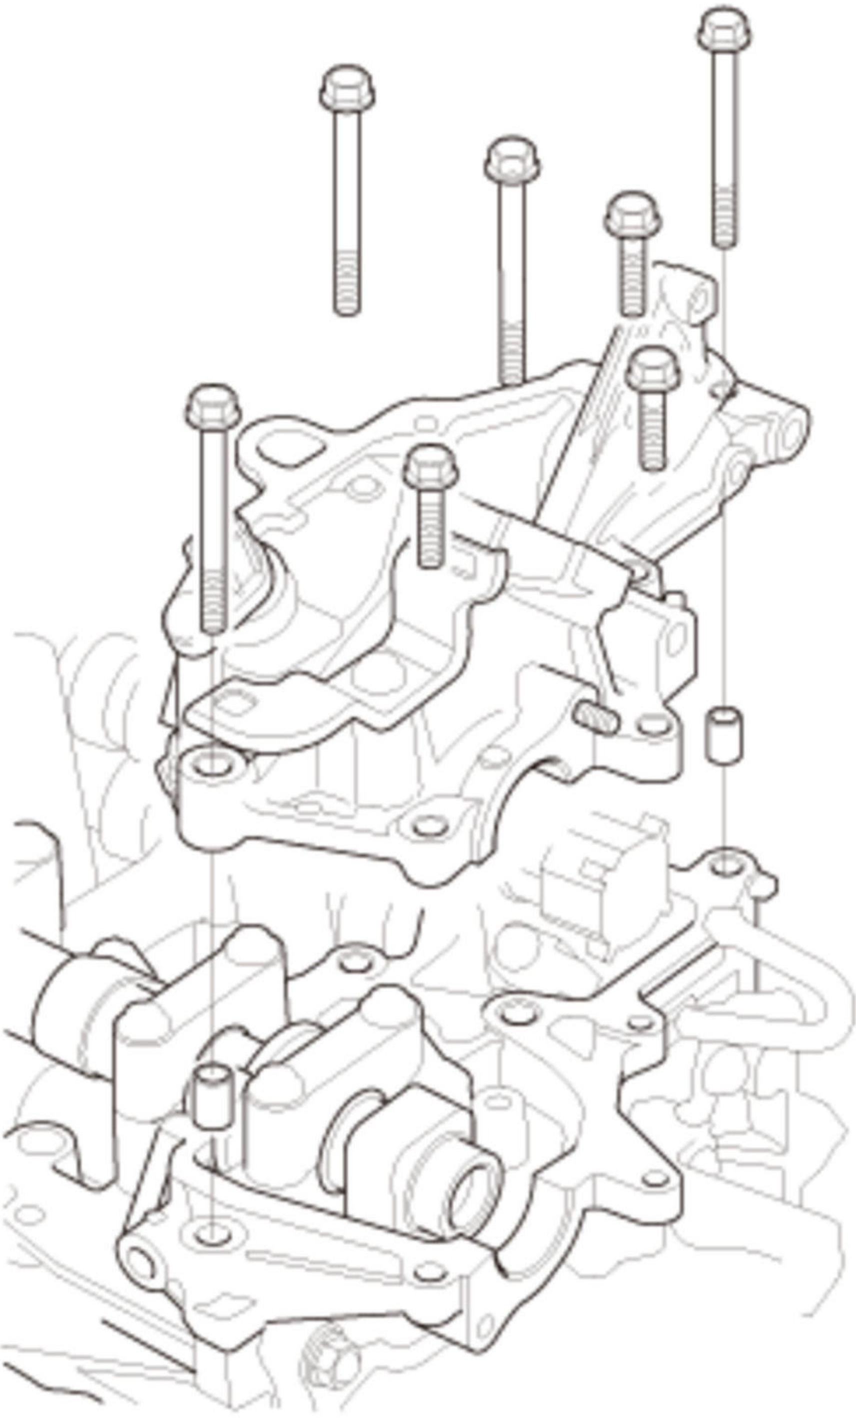
Removal

Camshaft

1. Fuel Pressure - Relieve
2. High Pressure Fuel Pump - Remove
3. Cylinder Head Cover - Remove
4. Camshaft Timing - Inspect
5. CMP Sensor A - Remove
6. Connector (CMP Sensor B) - Disconnect
7. Camshaft Holder Cover - Remove



8. High Pressure Fuel Pump Base - Remove



9. **Chain Case Cover - Remove**
10. Cam Chain Auto-Tensioner - Lock

	1. Rotate the crankshaft counterclockwise to align the holes on the lock (A) and the cam chain auto-tensioner (B), then insert a 1.2 mm (0.047 in) diameter pin (C) into the holes. **NOTE:** If the holes in the lock and the cam chain auto-tensioner do not align, continue to rotating the crankshaft counterclockwise until the holes align, then install the pin. 2. Turn the crankshaft clockwise to secure the pin and the TDC on the No. 1 cylinder.

11. Camshaft Holder - Remove

	1. Loosen the rocker arm and the adjusting screws (A).

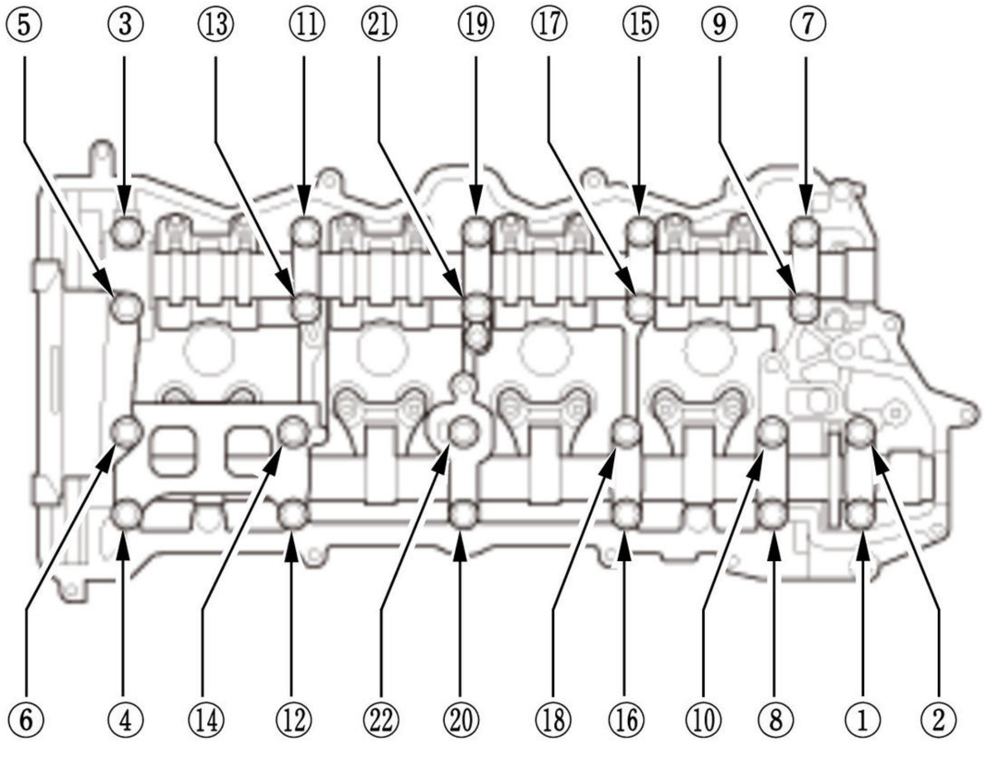


Fig. 16: Camshaft Holder Bolts Loosening Sequence
Courtesy of HONDA, U.S.A., INC.

B	2. Remove the camshaft holder bolts. To prevent damaging the camshafts, loosen the bolts, in sequence, two turns at a time.

 	3. Remove cam chain guide B and the camshaft holders (A).

12. Camshaft - Remove

 	1. Carefully tip up the intake camshaft on the transmission side of the engine until there is enough slack in the chain to lift the chain off of the VTC actuator's teeth. 2. Remove the intake camshaft (A), then remove the exhaust camshaft (B) while keeping some tension on the cam chain. 3. Secure the cam chain (C) to the A/C compressor suction hose with a wire tie to prevent the chain from falling down into the chain case.

VTC Actuator

13. VTC Actuator Lock Pin - Release

 	1. Check that the VTC actuator is locked by turning the VTC actuator counterclockwise. If it is not locked, turn the VTC actuator clockwise until it stops, then recheck it. If it is still not locked, replace the VTC actuator. 2. Seal the retard holes (A) in the No. 1 camshaft journal with tape and a wire tie.

	3. Seal one of the advance holes (A) with tape.

	4. Apply air to the unsealed advance hole to release the lock.

14. VTC Actuator - Remove

	1. Secure the intake camshaft in a vise with wood blocks, then loosen the VTC actuator mounting bolt.**NOTE:** After this procedure, remove wood chips that may be stuck to the intake camshaft.

	2. Remove the VTC actuator.

Exhaust Camshaft Sprocket

15. Exhaust Camshaft Sprocket - Remove

	1. Secure the exhaust camshaft in a vise with wood blocks, then loosen the exhaust camshaft sprocket mounting bolt.**NOTE:** After this procedure, remove wood chips that may be stuck to the exhaust camshaft.

	2. Remove the exhaust camshaft sprocket.

Installation

NOTE: How to read the torque specifications .

Exhaust Camshaft Sprocket

1. Exhaust Camshaft Sprocket - Install

	1. Install the exhaust camshaft sprocket. 2. Apply new engine oil to the threads of the exhaust camshaft sprocket mounting bolts, then loosely install them.

	3. Secure the exhaust camshaft in a vise with wood blocks, then tighten the exhaust camshaft sprocket mounting bolt.**NOTE:** After this procedure, remove wood chips that may be stuck to the exhaust camshaft.

Specified Torque:
73 N.m (7.4 kgf.m, 54 lbf.ft)

VTC Actuator

2. VTC Actuator - Install

	1. Install the VTC actuator. **NOTE:** Install the VTC actuator while in the unlocked position. 2. Apply new engine oil to the threads of the VTC actuator mounting bolts, then loosely install them.

	3. Secure the intake camshaft in a vise with wood blocks, then tighten the VTC actuator mounting bolt.**NOTE:** After this procedure, remove wood chips that may be stuck to the intake camshaft. 4. Turn the VTC actuator clockwise until you hear it click. Make sure to lock the VTC actuator by turning it.

Specified Torque:
115 N.m (11.7 kgf.m, 85 lbf.ft)

Camshaft

3. Camshaft - Install

	1. Remove the wire tie while keeping light tension on the cam chain. 2. Slide the exhaust camshaft (A) and the intake camshaft (B) in at an angle to allow the cam chain to slip over the teeth.

	3. Set the No. 1 piston at top dead center (TDC). The punch mark (A) on the VTC actuator and the punch mark (B) on the exhaust camshaft sprocket should be at the top. Align the TDC marks (C) on the VTC actuator and the exhaust camshaft sprocket. 4. Apply new engine oil to the camshaft journals and lobes on both cams.

4. Camshaft Holder - Install

	1. Apply new engine oil to the threads of the camshaft holder bolts. 2. Set the camshaft holders (A) and cam chain guide B in place.

B	3. Tighten the bolts to the specified torque.

Specified Torque:
13 N.m (1.3 kgf.m, 10 lbf.ft)

5. Rocker Shaft Bolt - Tighten

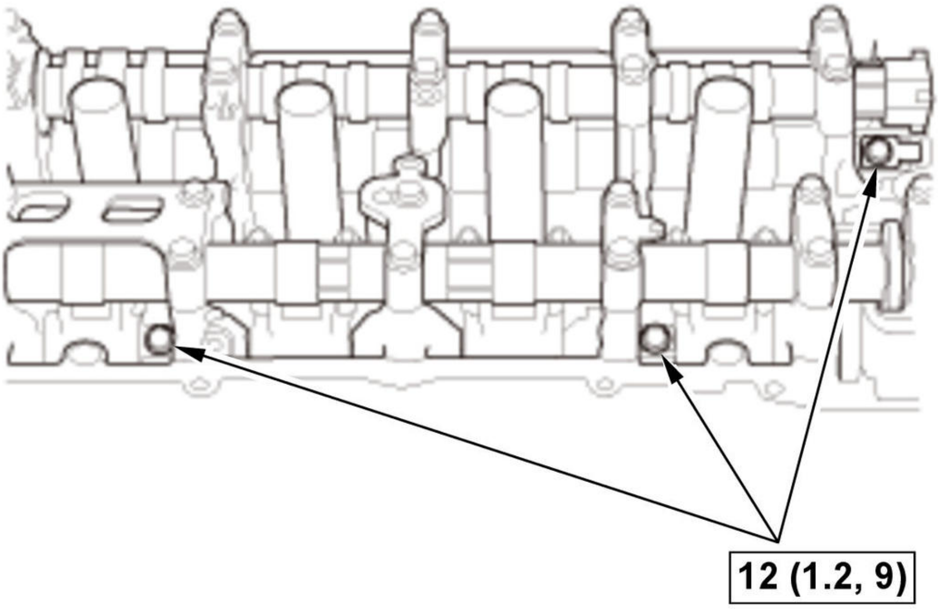

Fig. 18: Rocker Shaft With Torque Specifications
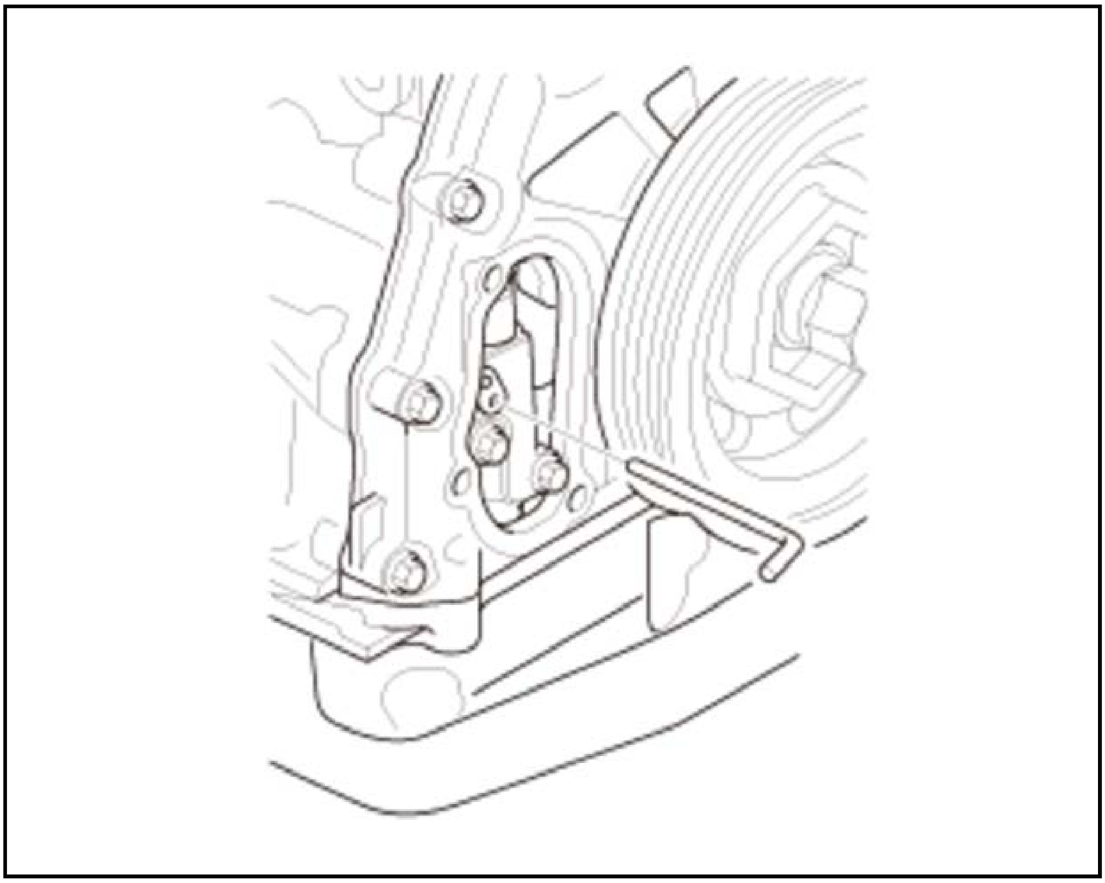
Courtesy of HONDA, U.S.A., INC.

NOTE: If the rocker arm assembly is disassembled, tighten the rocker shaft bolts.

6. Cam Chain Auto-Tensioner - Unlock



7. Chain Case Cover - Install

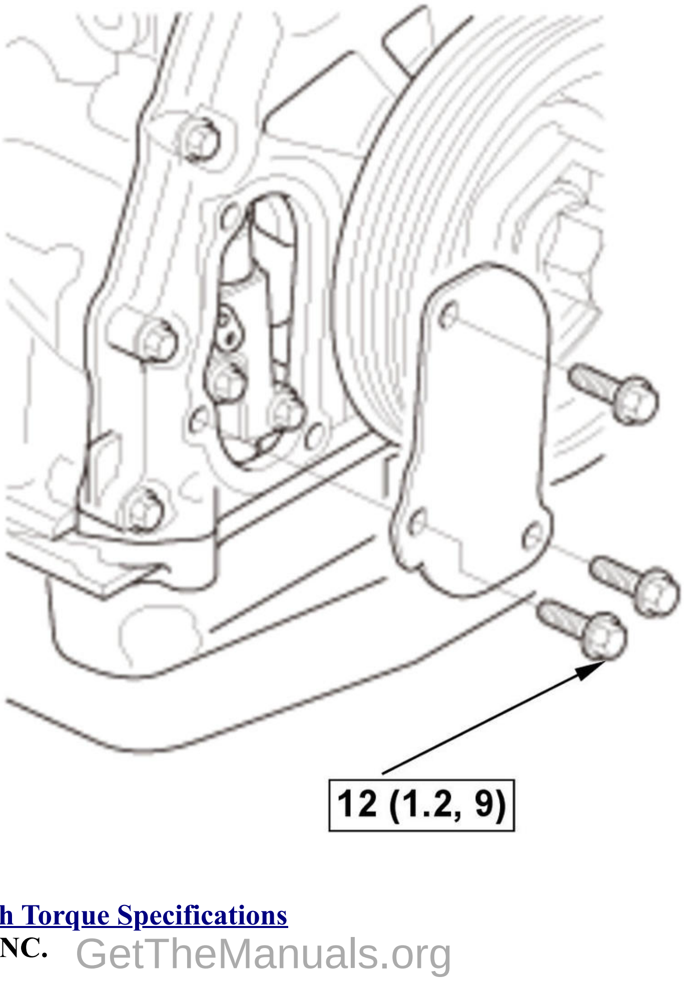


Fig. 19: Chain Case Cover With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	1. **Apply liquid gasket** to the chain case mating surface of the chain case cover and to the inside edge of the threaded bolt holes. 2. Install the chain case cover.

8. **Valve Clearance - Adjust**
9. High Pressure Fuel Pump Base - Install

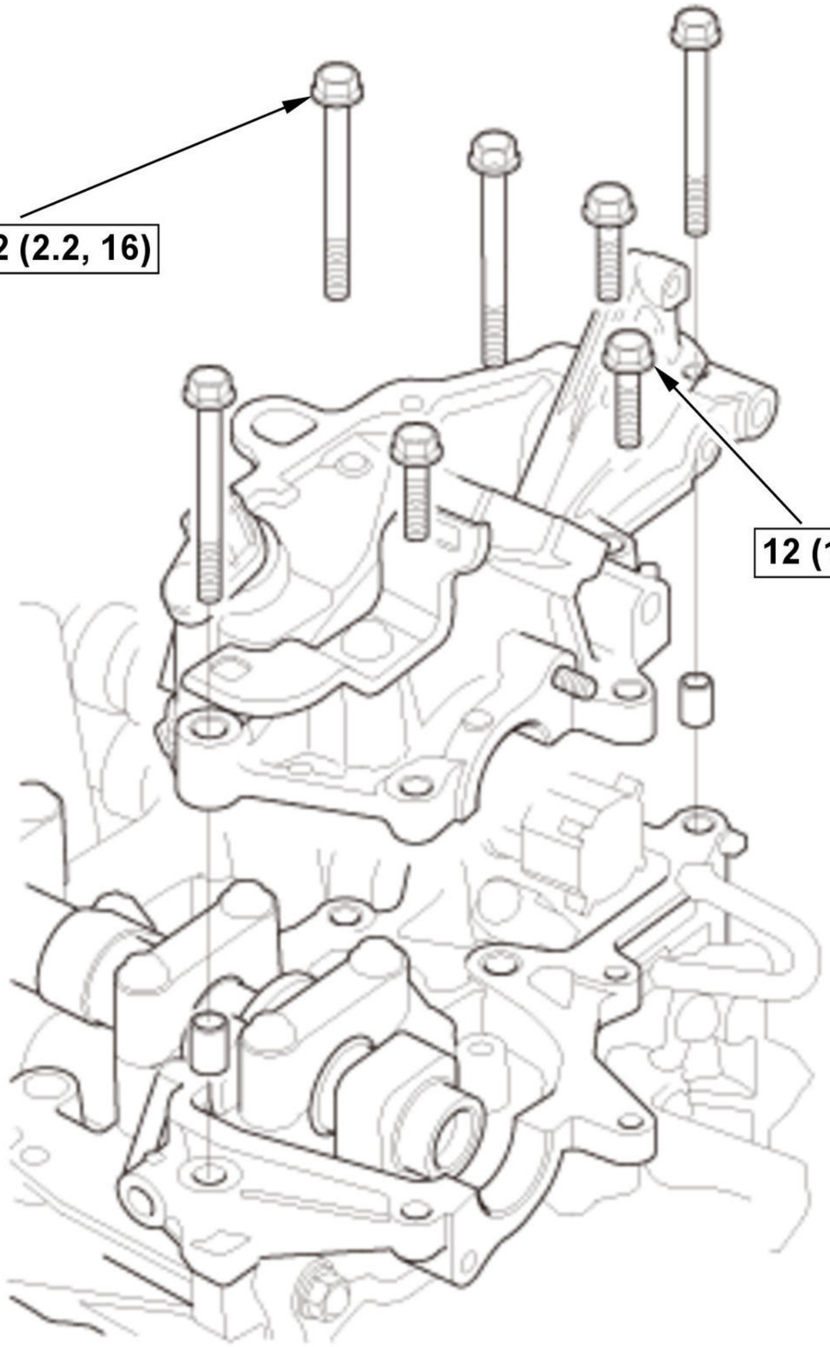

Fig. 20: High Pressure Fuel Pump Base With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	1. **Apply liquid gasket** to the cylinder head mating surface of the high pressure fuel pump base and to the inside edge of the threaded bolt holes. 2. Install the high pressure fuel pump base.

10. Camshaft Holder Cover - Install

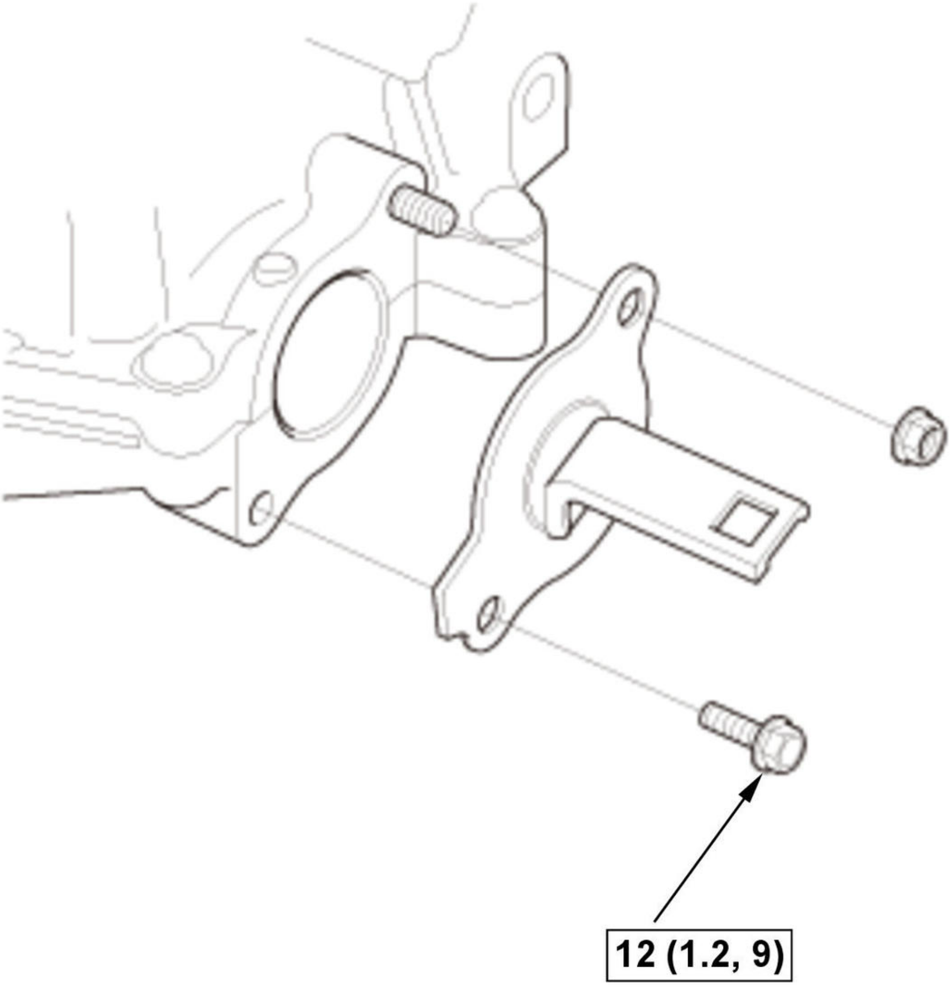

Fig. 21: Camshaft Holder Cover With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	1. Apply liquid gasket to the cylinder head mating surface of the camshaft holder cover and to the inside edge of the threaded bolt holes. 2. Install the camshaft holder cover.

11. Connector (CMP Sensor B) - Connect
12. CMP Sensor A - Install
13. High Pressure Fuel Pump - Install
14. Cylinder Head Cover - Install
15. Fuel Leak (Low Pressure) - Check

1. Turn the vehicle to the ON mode, but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail will be pressurized. Repeat this two or three times, then check for fuel leakage.

16. Fuel Leak (High Pressure) - Check

Inspection

VTC Actuator

1. Intake Camshaft - Remove
2. VTC Actuator - Inspection

 	1. Check that the VTC actuator is locked by turning the VTC actuator counterclockwise. If it is not locked, turn the VTC actuator clockwise until it stops, then recheck it. If it is still not locked, replace the VTC actuator. 2. Seal the retard holes (A) in the No. 1 camshaft journal with tape and a wire tie.

	3. Seal one of the advance holes (A) with tape.

	4. Apply air to the unsealed advance hole to release the lock.

	5. Check that the VTC actuator moves smoothly. If the VTC actuator does not move smoothly, replace the VTC actuator. 6. Remove the wire tie, the tape, and the adhesive residue from the camshaft journal.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Camshaft

4. Camshaft - Remove
5. VTC Actuator - Remove
6. Exhaust Camshaft Sprocket - Remove
7. **Rocker Arm Assembly - Remove**
8. **Rocker Arm - Disassemble**
9. Camshaft - Inspect

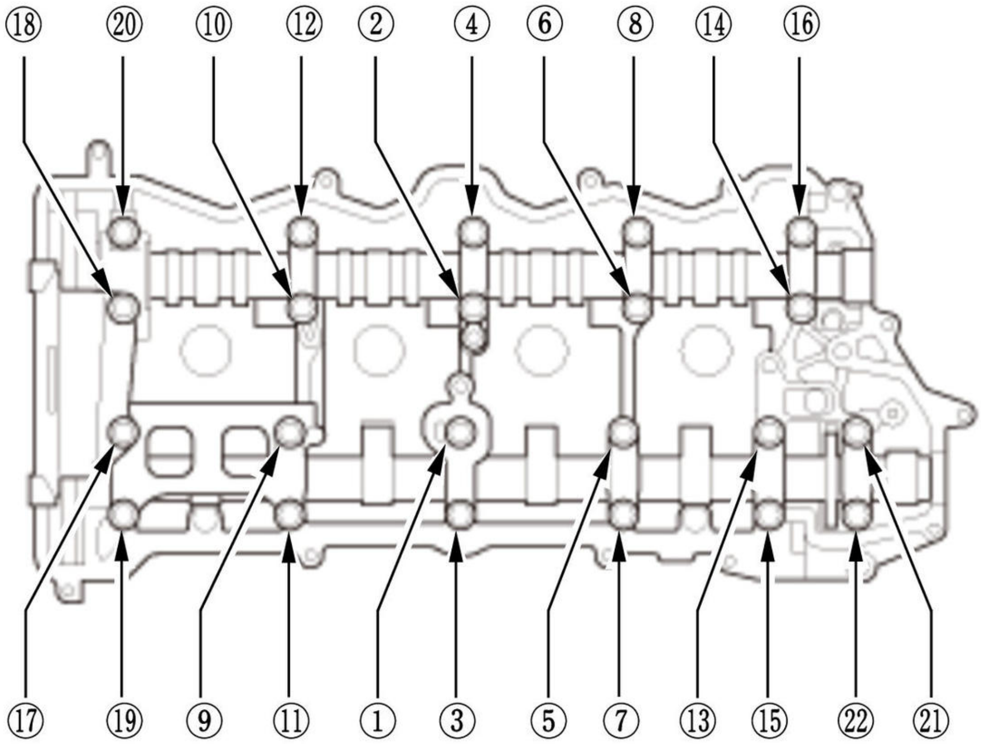

Fig. 22: Camshaft Bolts Tightening Sequence
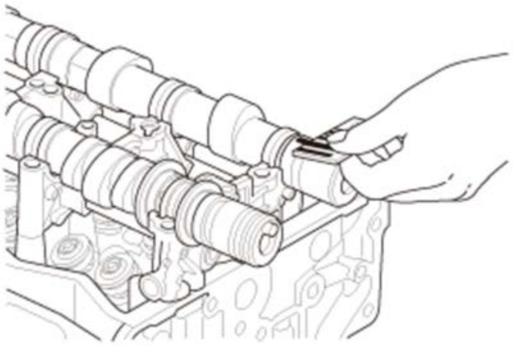
Courtesy of HONDA, U.S.A., INC.

B	1. Put the rocker shaft holders, the camshaft, and the camshaft holders on the cylinder head, then tighten the bolts, in sequence, to the specified torque. 2. Seat the camshaft by pushing it away from the camshaft pulley end of the cylinder head.

Specified Torque:
13 N.m (1.3 kgf.m, 10 lbf.ft)

	3. Zero the dial indicator against the end of the camshaft, then push the camshaft back and forth, and read the end play. If the end play is beyond the service limit, replace the cylinder head and recheck. If it is still beyond the service limit, replace the camshaft. 4. Loosen the camshaft holder bolts two turns at a time, in a crisscross pattern. Then remove the camshaft holders from the cylinder head. 5. Lift the camshafts out of the cylinder head, and wipe them clean, then inspect the lift ramps. Replace the camshaft if any lobes are pitted, scored, or excessively worn. 6. Clean the camshaft journal surfaces in the cylinder head, then set the camshafts back in place. Place a plastigage strip across each journal. 7. Install the camshaft holders, then tighten the bolts to the specified torque as shown in step 1.

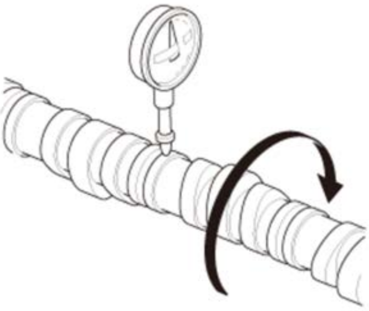
Camshaft End Play	
Intake:	
Standard (New):	**0.05-0.20 mm (0.0020-0.0079 in)**
Service Limit:	**0.40 mm (0.0157 in)**
Exhaust:	
Standard (New):	**0.05-0.15 mm (0.0020-0.0059 in)**
Service Limit:	**0.40 mm (0.0157 in)**



8. Remove the camshaft holders. Measure the widest portion of plastigage on each journal:

- If the camshaft-to-holder clearance is within the service limits, go to step 10.
- If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has been replaced, replace the cylinder head.
- If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has not been replaced, go to step 9.

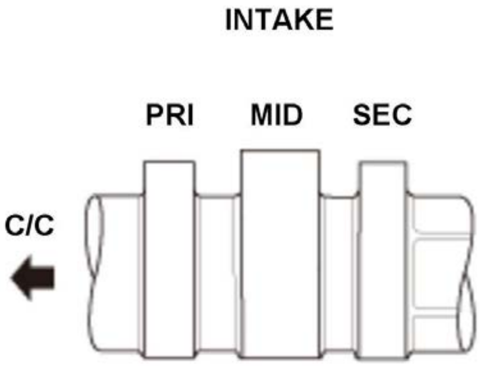
Camshaft-to-Holder Oil Clearance	
Standard (New):	
No. 1 Journal:	**0.030-0.069 mm (0.00118-0.00272 in)**
Service Limit:	**0.150 mm (0.00591 in)**
No. 2, No. 3, No. 4, No. 5, and No. 6 Journals:	**0.060-0.099 mm (0.00236-0.00390 in)**
Service Limit:	**0.150 mm (0.00591 in)**



9. Check the total runout with the camshaft supported on V-blocks:

- If the total runout of the camshaft is within the standard, replace the cylinder head.
- If the total runout is beyond the standard, replace the camshaft and recheck the camshaft-to-holder oil clearance. If the oil clearance is still beyond the standard, replace the cylinder head.

Camshaft Total Runout	
Standard (New):	**0.03 mm (0.0012 in) max.**



10. Measure cam lobe height.

Cam Lobe Height Standard (New):

PRI: Primary	MID: Mid	SEC: Secondary
C/C: Cam Chain		B

B	INTAKE	EXHAUST
PRI	33.858 mm (1.33299 in)	34.340 mm (1.35197 in)
MID	35.252 mm (1.38787 in)	
SEC	33.858 mm (1.33299 in)	

10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CATALYTIC CONVERTER REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Removal and Installation

NOTE:

- 📖 Where icon is shown, further information shown below.
- Due to the high temperatures of the exhaust system, the exhaust nut, studs and bolts may seize preventing easy removal. If you encounter a seized condition, do the following.
-
    - Apply rust penetrant to the nut/stud or bolt.
    - Allow the penetrant to sit. The amount of time may vary.
    - Lightly tap the nut/stud or bolt with a hammer.
    - Slowly loosen the nut or bolt.
    - If the nut or bolt still will not loosen, repeat steps ① to ④ .

Catalytic Converter Removal

B

📖	Detailed information, notes and precautions
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Secondary HO2S (Sensor 2) - Remove
2. Front Engine Undercover Lid - Remove
3. Exhaust Pipe A - Remove

   NOTE: Remove the exhaust mounting rubber.

4. Bracket - Remove
5. Exhaust Chamber Cover - Remove
6. TWC Bracket - Remove

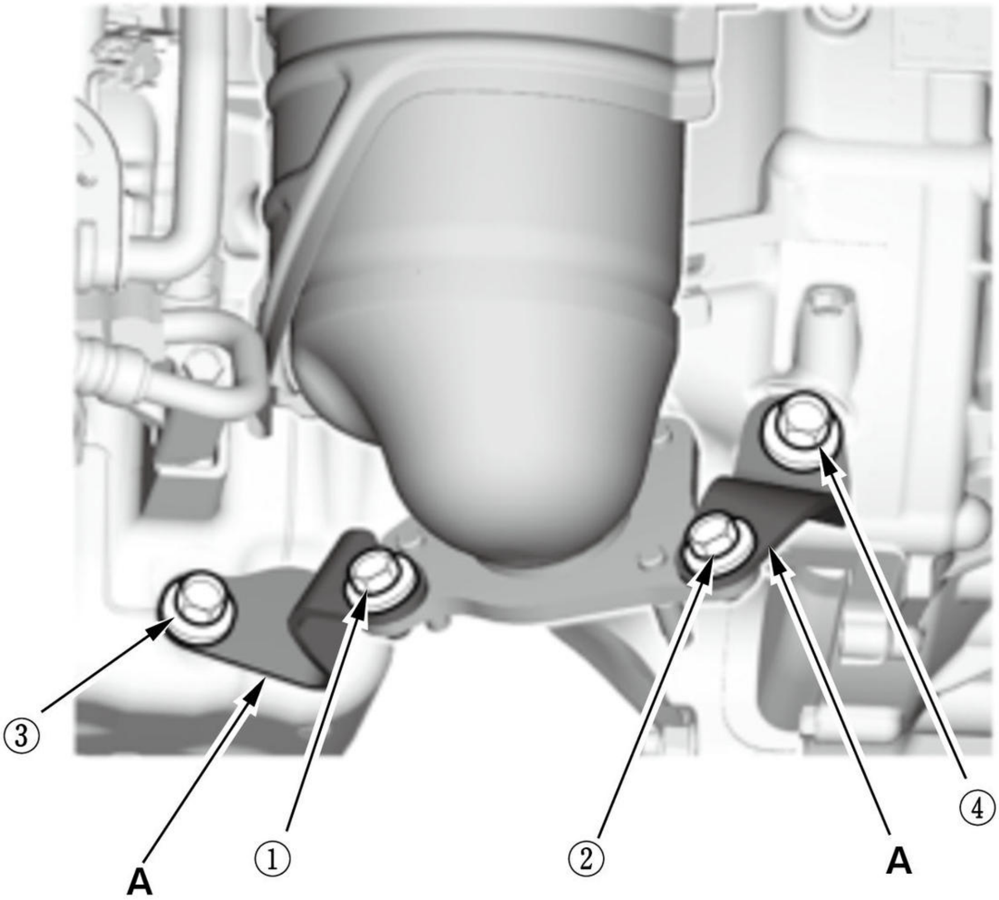

Fig. 24: TWC Bracket Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

B

Note for installation

- Before installing the TWC brackets (A), confirm the bolts and nuts fixing the TWC to the turbocharger are tightened to the specified torque.
- When installing the TWC, loosely install all bolts by hand. Then tighten the TWC bracket mounting bolts in the numbered sequence shown.

7. TWC Assembly - Remove

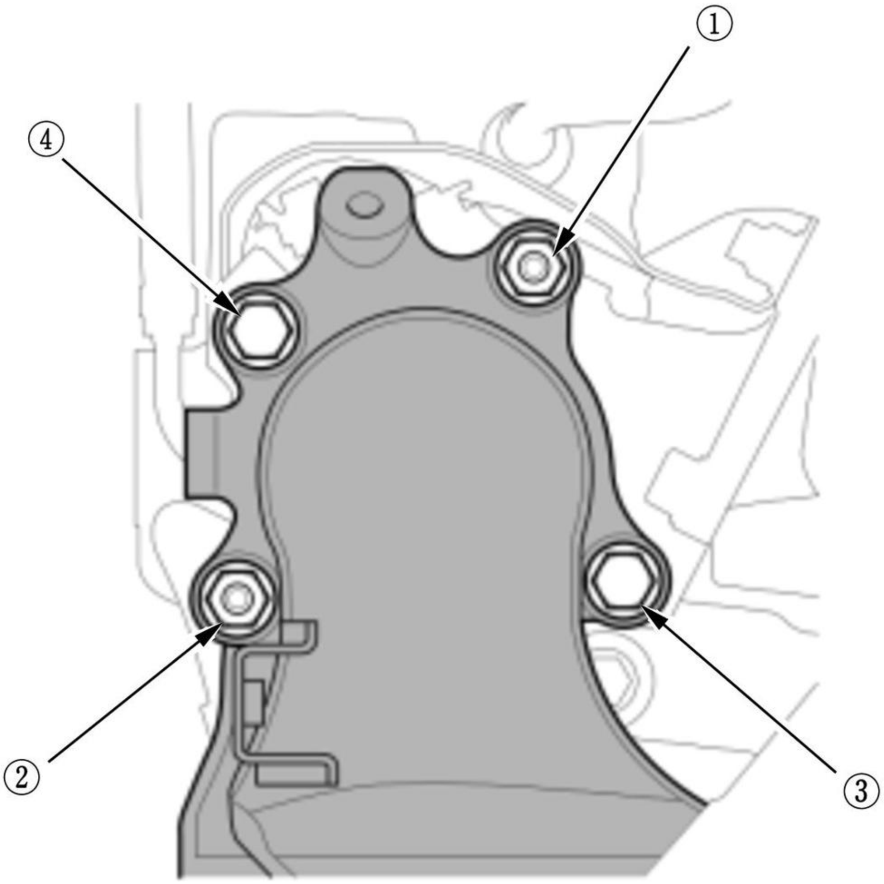

Fig. 25: TWC Assembly Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

B

Note for installation

- When installing the TWC, loosely install all bolts and nuts by hand. Then tighten the TWC mounting bolts and nuts in the numbered sequence shown.

8. TWC Cover - Remove (if necessary)
9. All Removed Parts - Install

1. Install the parts in the reverse order of removal with new gaskets and new self-locking nuts.

Inspection

1. TWC - Remove
2. TWC - Inspect

1. Plug up the hole (s) other than main exhaust gas route. 2. Using a flashlight visually check for plugging, melting, or cracking of the catalyst. Replace the TWC if any of the visible area is damaged or plugged.

CATALYTIC CONVERTER REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

NOTE:

- 🕮 Where icon is shown, further information shown below.

- Although a numbered sequence is shown, these "*1" indicated parts are separate components. If removal or replacement of one of the components is needed, it is not necessary to remove the other.
- Due to the high temperatures of the exhaust system, the exhaust nut, studs and bolts may seize preventing easy removal. If you encounter a seized condition, do the following.
-
    - Apply rust penetrant to the nut/stud or bolt.
    - Allow the penetrant to sit. The amount of time may vary.
    - Lightly tap the nut/stud or bolt with a hammer.
    - Slowly loosen the nut or bolt.
    - If the nut or bolt still will not loosen, repeat steps ① to ④.

☒	Replace

WU-TWC

1. A/F Sensor (Sensor 1) - Remove
2. Front Engine Undercover Lid - Remove
3. Exhaust Chamber Cover - Remove
4. TWC Bracket - Remove

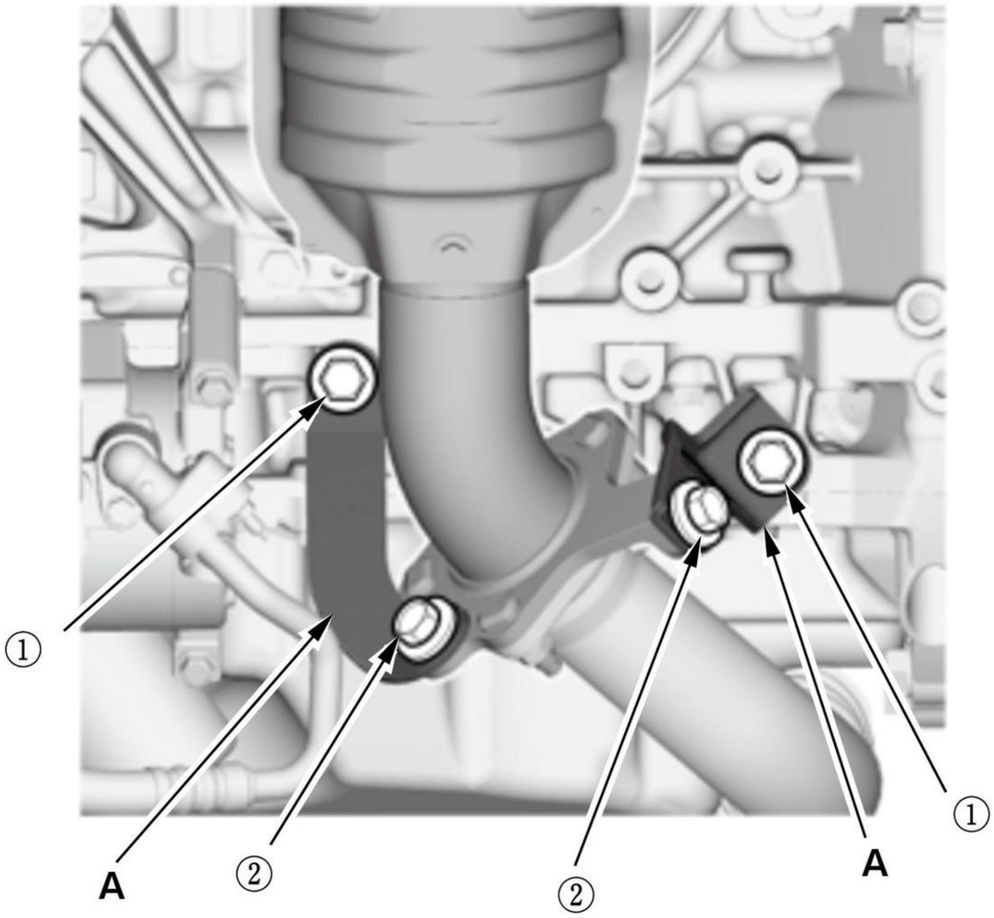

Fig. 28: TWC Bracket Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

Note for installation

- Before installing the TWC brackets (A), confirm the bolts and nuts fixing the TWC to the cylinder head are tightened to the specified torque.
- Tighten the TWC bracket mounting bolts in the numbered sequence shown.

5. TWC Assembly - Remove
6. Under-Floor TWC - Move (Only for installation)

	1. Move the under-floor TWC leftward and tie it up with string so as not to allow it to touch the WU-TWC (A). **NOTE:** • When the under-floor TWC is high temperature, be careful for thermal effect on the material and work. • If there is not enough clearance between the WU-TWC and the under-floor TWC, remove rubbers mounts as necessary.

7. TWC Cover - Remove (if necessary)
8. All Removed Parts - Install

1. Install the parts in the reverse order of removal with new gaskets and new self-locking nuts.

Under-Floor TWC

9. Engine Undercover - Remove
10. Secondary HO2S (Sensor 2) - Remove
11. Under-Floor TWC - Remove
12. All Removed Parts - Install

1. Install the parts in the reverse order of removal with new gaskets and new self-locking nuts.

Inspection

1. TWC - Remove
2. TWC - Inspect

1. Plug up the hole (s) other than main exhaust gas route.

2. Using a flashlight visually check for plugging, melting, or cracking of the catalyst. Replace the TWC if any of the visible area is damaged or plugged.

CRANKSHAFT AND CKP PULSE PLATE REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Special Tools Required

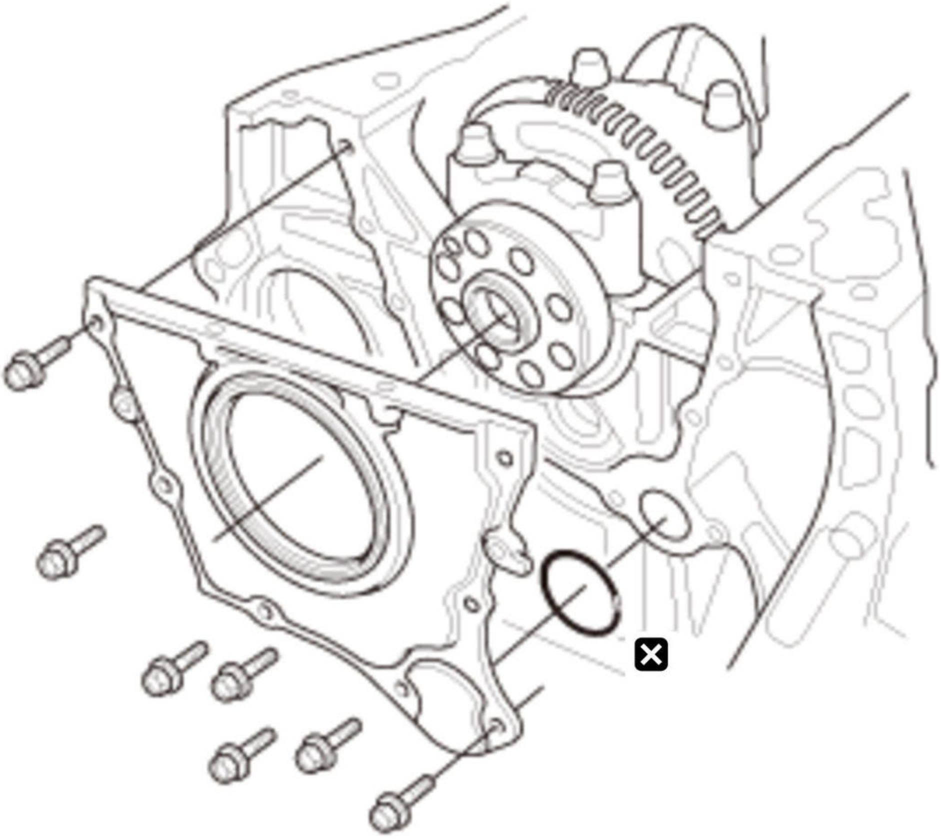
Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000
	Oil Seal Driver Attachment, 92 mm 070AD-5R00100

Removal

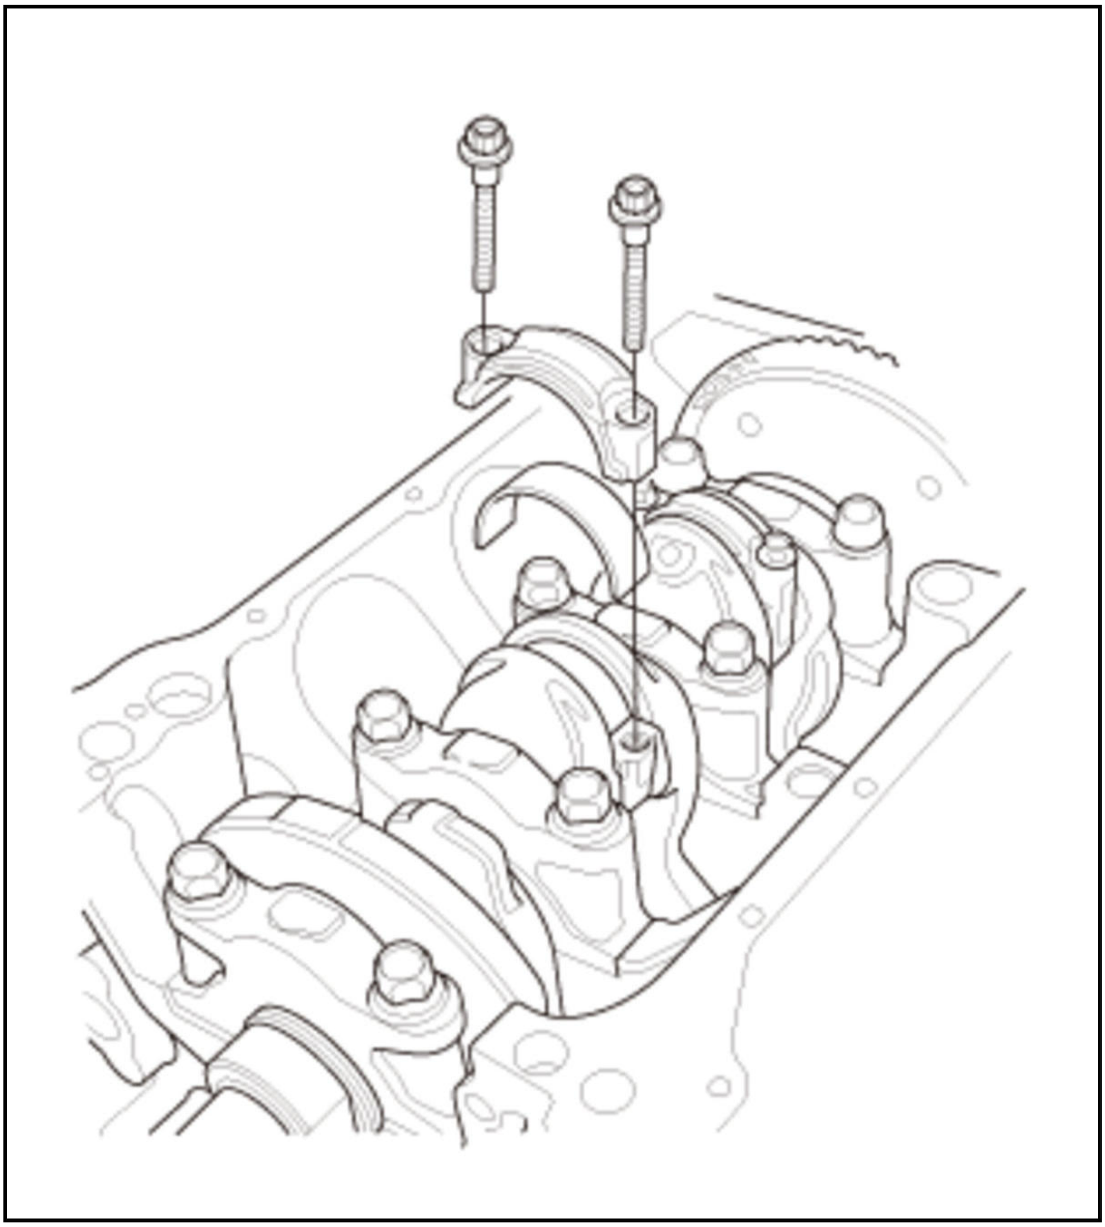
1. Engine - Remove
2. Transmission - Remove
3. Drive Plate - Remove
4. Cylinder Head - Remove
5. Cam Chain Drive Sprocket - Remove

	1. Remove the key (A) and the cam chain drive sprocket (B).**NOTE:** Check the direction of the key. When the key is installed, install the key as same direction of the original one.

6. **Oil Pan - Remove**
7. **Oil Pump - Remove**
8. Oil Seal Case - Remove



9. Connecting Rod Cap and Bearing Half - Remove



NOTE: Keep all connecting rod caps and connecting rod bearings in order.

10. Main Bearing Cap and Bearing Half - Remove

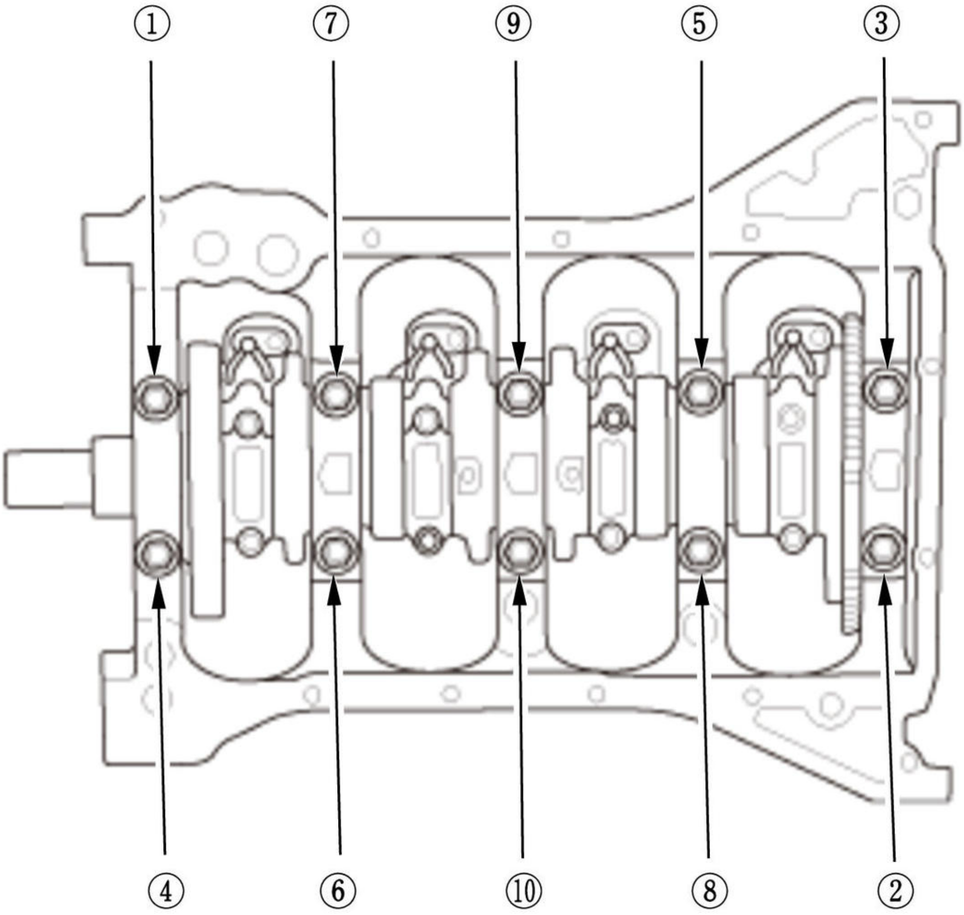


Fig. 29: Main Bearing Cap And Bearing Half Bolts Loosening Sequence
Courtesy of HONDA, U.S.A., INC.

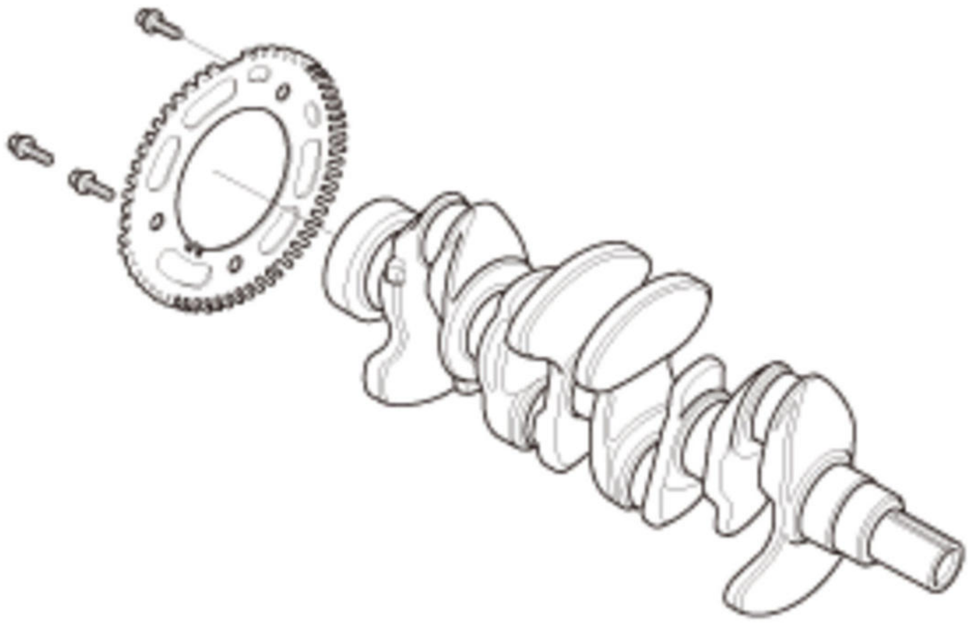
B	1. Remove the bearing cap bolts. To prevent warpage, loosen the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.

	2. Remove the main bearing caps (A) and the main bearings (B). **NOTE:** • Check the installed position and direction of the main bearing caps. • When the main bearing caps are installed, install the main bearing caps as same location and direction of the original them.

11. Crankshaft - Remove

	1. Lift the crankshaft (A) out of the engine block, being careful not to damage the CKP pulse plate (B). 2. Remove the thrust washers (C).

12. CKP Pulse Plate - Remove



Installation

NOTE: How to read the torque specifications .

1. Crankshaft Main Bearing Clearance - Check
2. CKP Pulse Plate - Install

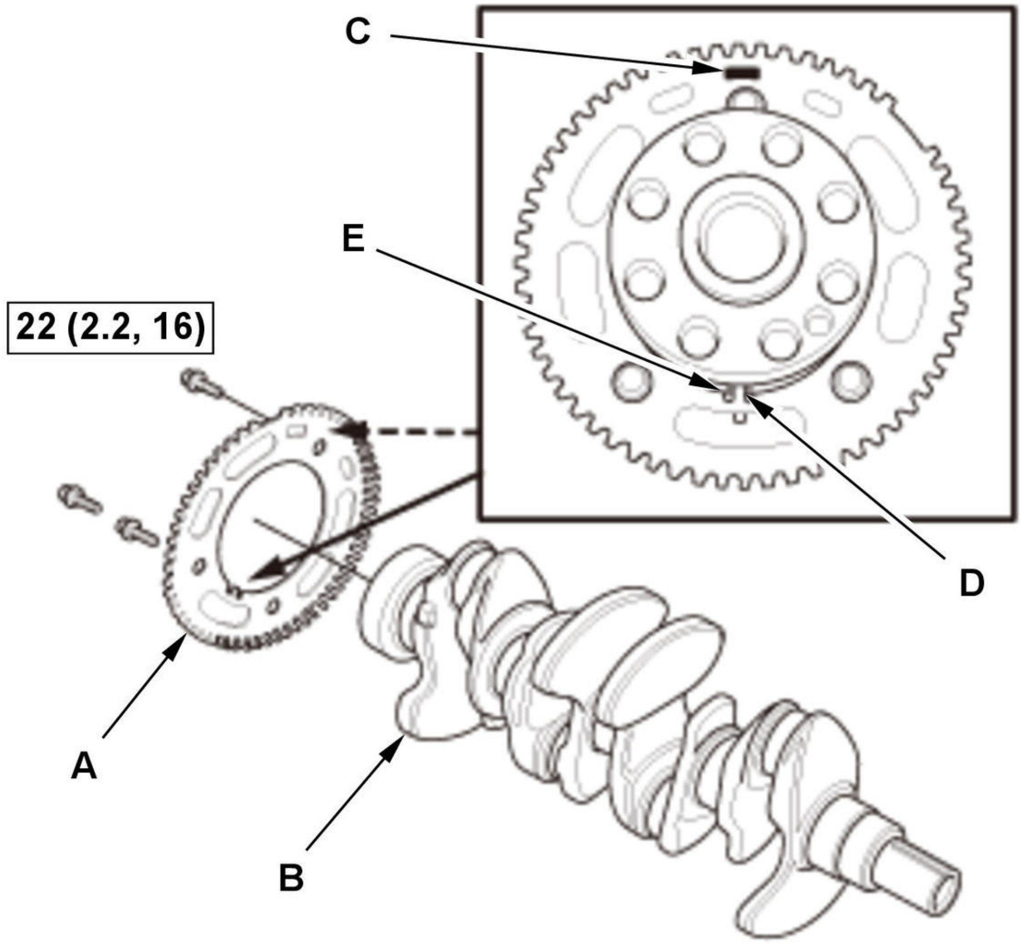


Fig. 30: CKP Pulse Plate With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	1. Apply new engine oil to the threads and flanges of CKP pulse plate mounting bolts. 2. Install the CKP pulse plate (A) on the crankshaft (B). **NOTE:** • Be careful not to damage the CKP pulse plate. • Position the mark (C) facing it out side and align the portion (D) on the CKP pulse plate and groove (E) on the crankshaft.

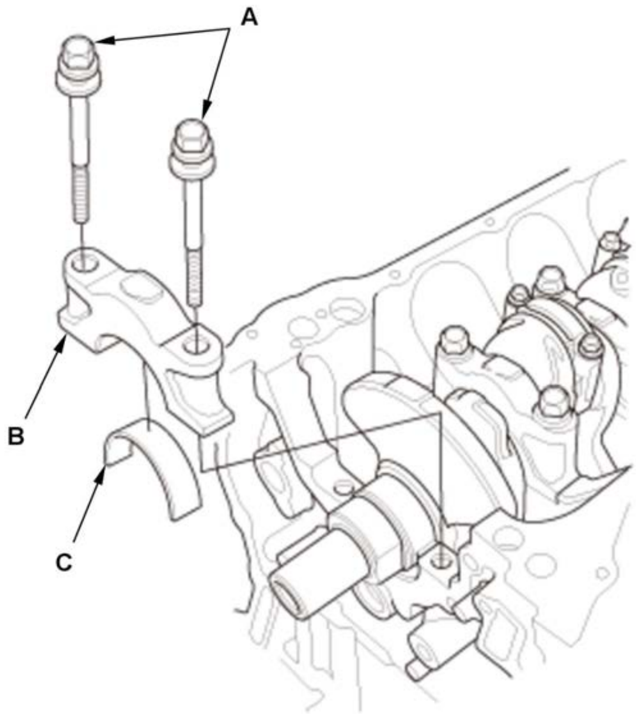
3. Crankshaft - Install

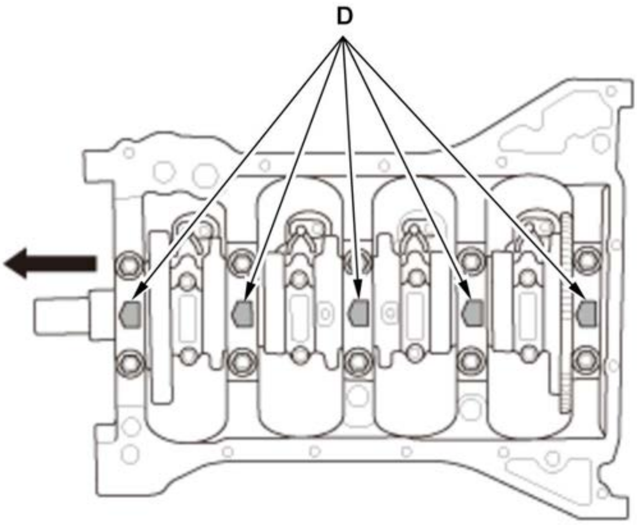
	1. Install the bearing halves in the engine block and the connecting rods. 2. Apply a coat of new engine oil to the main bearings and the connecting rod bearings. 3. Hold the crankshaft (A) so rod journal No. 2 and rod journal No. 3 are straight up, then lower the crankshaft into the engine block. **NOTE:** Be careful not to damage the journals and the CKP pulse plate (B).

4. Thrust Washer - Install

	1. Apply new engine oil to the thrust washer surfaces. Install the thrust washers (A) in the No. 4 journal of the engine block.

5. Main Bearing Cap and Bearing Half - Install





1. Apply new engine oil to the bearing cap bolts (A) threads and flanges.

2. Install the bearing cap bolts to the main bearing cap (B).

3. Set the bearing halves (C), the main bearing caps, and the bearing cap bolts in place. Then loosely tighten the bearing cap bolts.

NOTE:

- Install the main bearing caps aligning the arrows (D) with the direction to the cam chain case.
- When loosely tightening the bearing cap bolts, do not sit the bolts on the main bearing caps.

4. Lightly tap the main bearing caps with a plastic mallet until the main bearing caps sit on the engine block.

6. Bearing Cap Bolt - Tighten

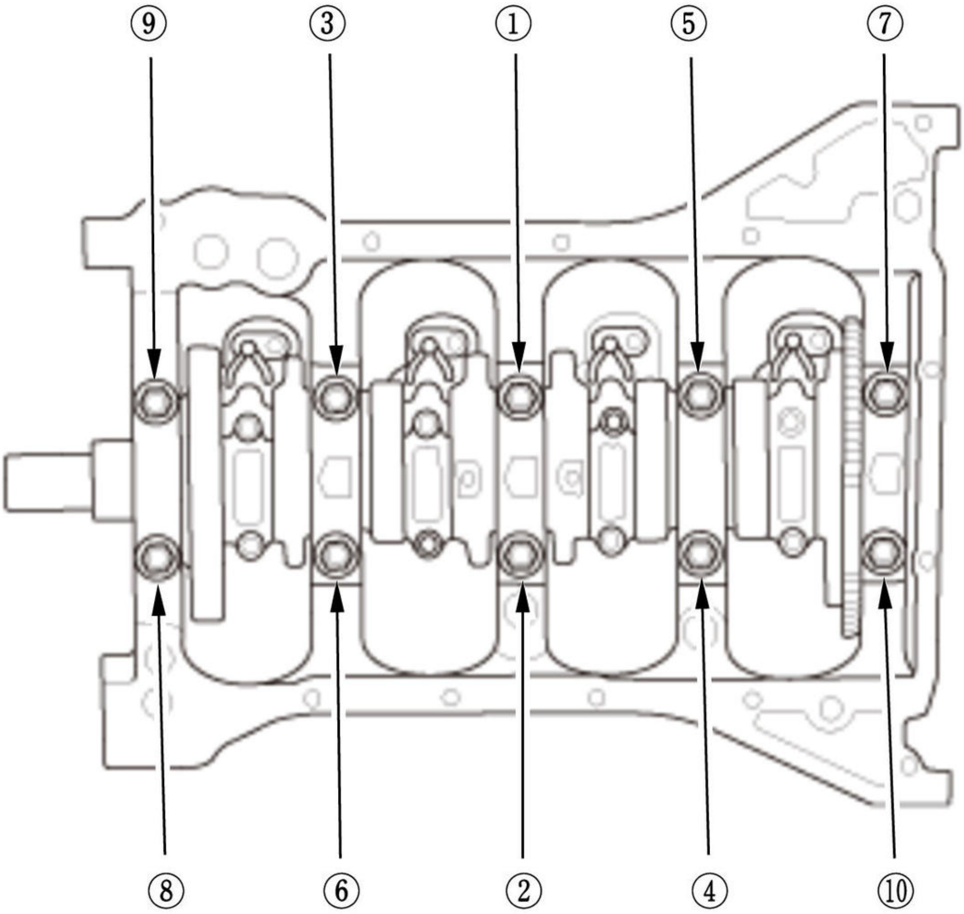


Fig. 31: Bearing Cap Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

	1. Tighten the bearing cap bolts, in the numbered sequence shown, to the specified torque. **NOTE:** Do not rotate the crankshaft during inspection. 2. Tighten the bearing cap bolts an additional 40 deg..

Specified Torque:
30 N.m (3.1 kgf.m, 22 lbf.ft)

7. Connecting Rod Bearing Clearance - Check
8. Connecting Rod Bolt - Inspect

	1. Measure the diameter of each connecting rod bolt at point A and point B. 2. Calculate the difference in diameter between point A and point B. 3. If the difference in diameter is out of specification, replace the connecting rod bolt.

Point A-Point B = Difference in Diameter	
Difference in Diameter	
Specification:	**0-0.05 mm (0-0.0020 in)**

9. Connecting Rod Cap and Bearing Half - Install

	1. Apply new engine oil to the threads of the connecting rod bolts. 2. Seat the rod journals into connecting rod No. 1 and connecting rod No. 4. Line up the mark (A) on the connecting rod and the connecting rod cap. 3. Install the connecting rod caps and the bolts finger-tight. 4. Rotate the crankshaft clockwise, and seat the journals into connecting rod No. 2 and connecting rod No. 3. Line up the mark on the connecting rod and the connecting rod cap. 5. Install the connecting rod caps and the bolts finger-tight.

	6. Torque the connecting rod bolts to the specified torque. 7. Tighten the connecting rod bolts an additional 90 deg..**NOTE:** Remove the connecting rod bolt if you tightened it beyond the specified angle, inspect the connecting rod bolts. Do not loosen it back to the specified angle.

Specified Torque:
13 N.m (1.3 kgf.m, 10 lbf.ft)

10. Transmission End Crankshaft Oil Seal - Install

	1. Remove the transmission end crankshaft oil seal. 2. Clean and dry the transmission end crankshaft oil seal housing. 3. Apply a light coat of new engine oil to the lip of the new transmission end crankshaft oil seal. 4. Use the driver handle, 15 x 135L and the oil seal driver attachment, 92 mm to drive a new transmission end crankshaft oil seal (A) squarely into the oil seal case.

11. Oil Seal Case - Install

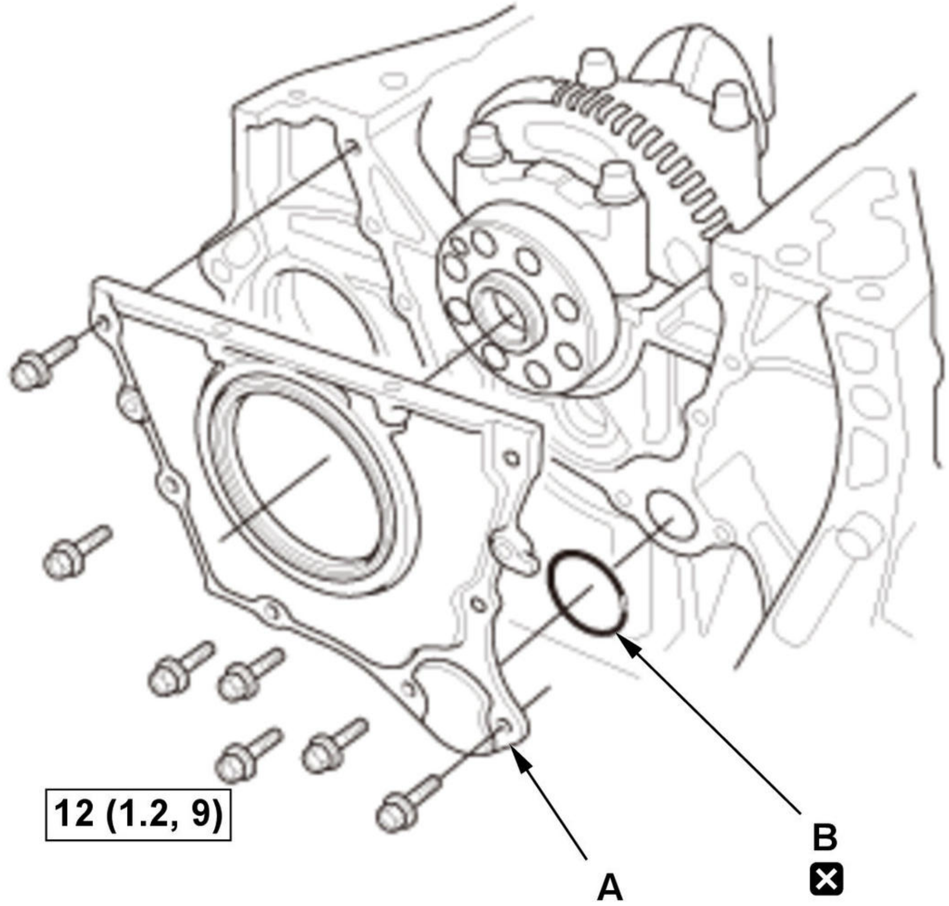

Fig. 32: Oil Seal Case With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	1. **Apply liquid gasket** to the engine block mating surface of the oil seal case, and to the inside edge of the threaded bolt holes. 2. Install the oil seal case (A) with a new O-ring (B).

12. **Oil Pump - Install**
13. **Oil Pan - Install**
14. Cam Chain Drive Sprocket - Install

	1. Install the cam chain drive sprocket (A) and the key (B).

15. Cylinder Head - Install
16. Drive Plate - Install
17. Transmission - Install
18. Engine - Install

Inspection

1. Crankshaft - Inspect

	**Out-of-Round and Taper** 1. Clean the crankshaft oil passages with pipe cleaners or a suitable brush. 2. Check the keyway slot and the threaded holes. 3. Measure the out-of-round at the middle of each rod and main journal in two places. The difference between measurements on each journal must not be more than the service limit. 4. Measure the taper at the edges of each rod and the main journal. The difference between measurements on each journal must not be more than the service limit.

Journal Taper	
Standard (New):	**0.005 mm (0.00020 in) max.**
Service Limit:	**0.010 mm (0.00039 in)**

Journal Out-of-Round	
Standard (New):	**0.005 mm (0.00020 in) max.**
Service Limit:	**0.010 mm (0.00039 in)**

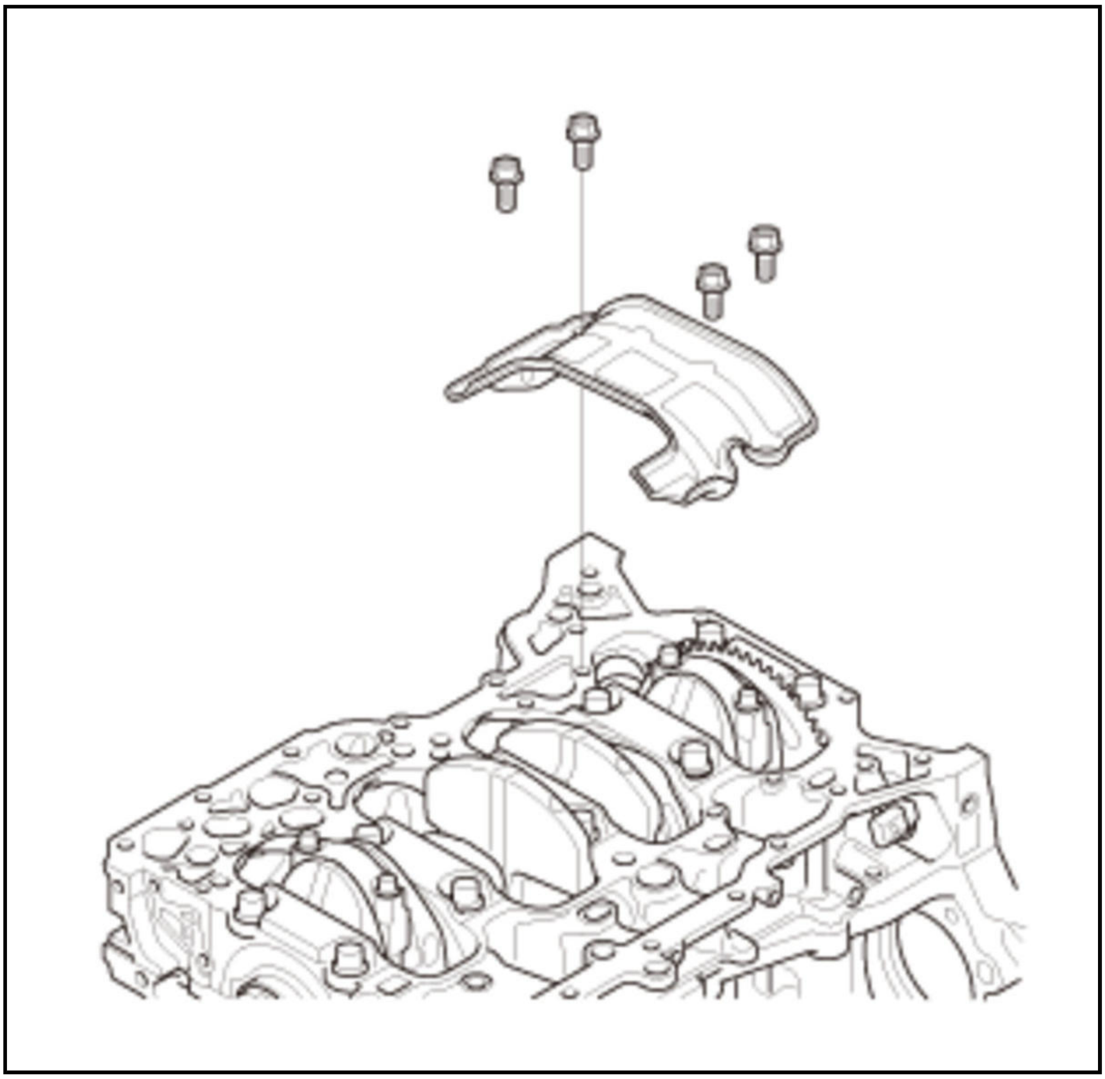
	**Straightness** 5. Place the V-blocks on a flat surface. 6. Check the total runout with the crankshaft supported on V-blocks. 7. Measure the runout on all of the main journals. Rotate the crankshaft two complete revolutions. The difference between measurements on each journal must not be more than the service limit.

Crankshaft Total Runout	
Standard (New):	**0.03 mm (0.0012 in) max.**
Service Limit:	**0.040 mm (0.00157 in)**

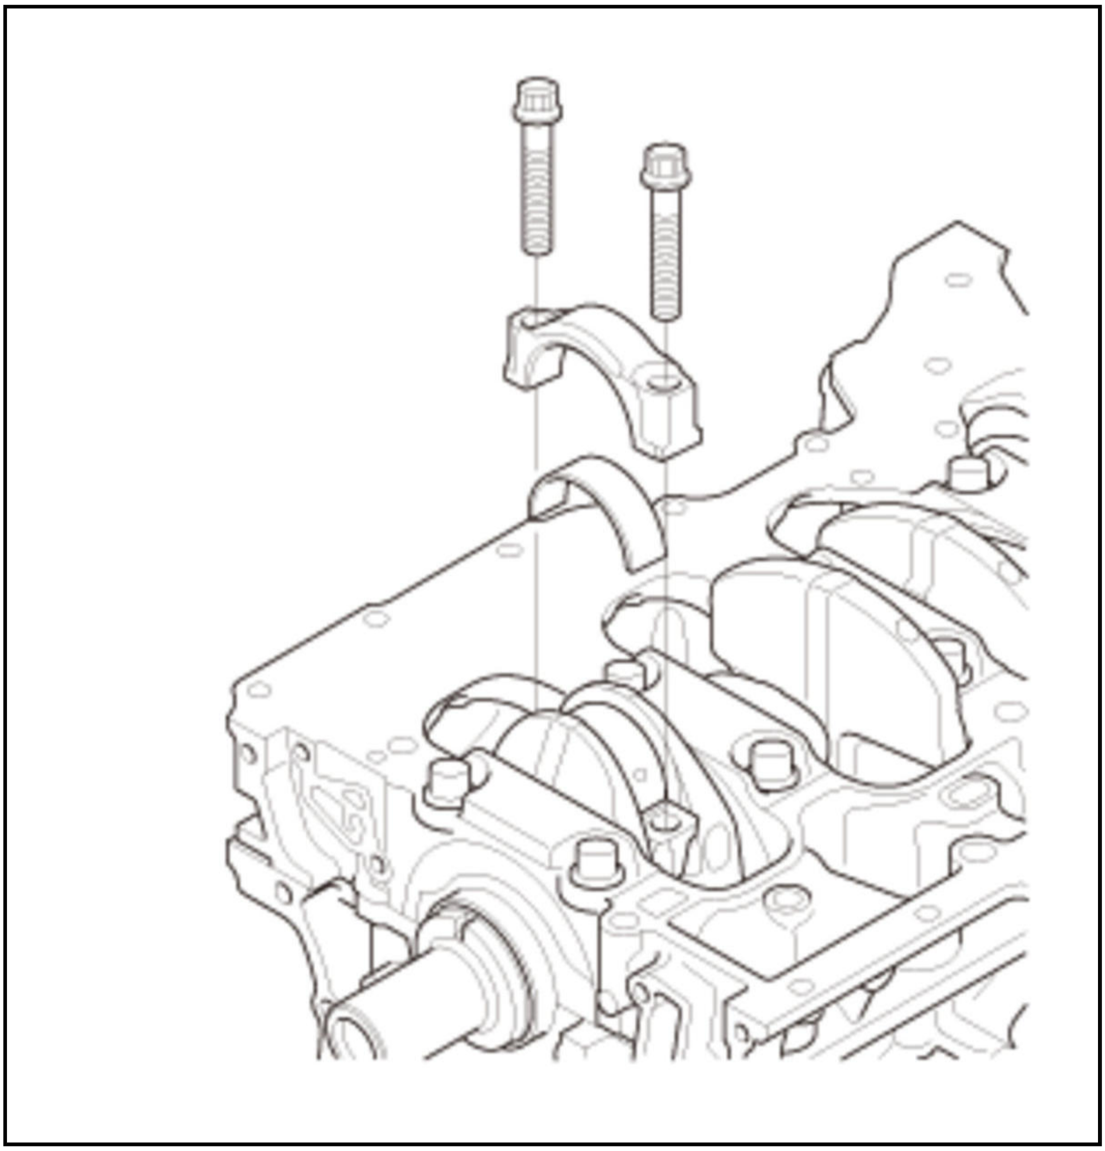
CRANKSHAFT AND CKP PULSE PLATE REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Removal

1. Engine - Remove
2. Transmission - Remove
3. Drive Plate - Remove
4. Cylinder Head - Remove
5. Transmission End Crankshaft Oil Seal - Remove
6. Intermediate Shaft Assembly - Remove
7. Oil Pan - Remove
8. Oil Pump - Remove
9. Baffle Plate - Remove

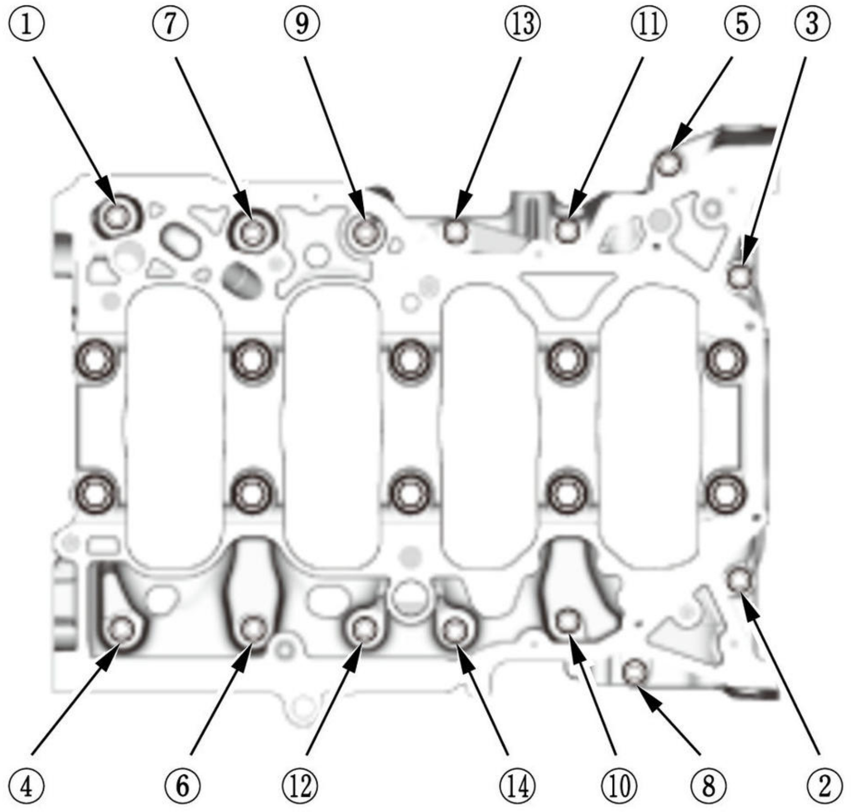


10. Connecting Rod Cap and Bearing Half - Remove



NOTE: Keep all connecting rod caps/bearing halves in order.

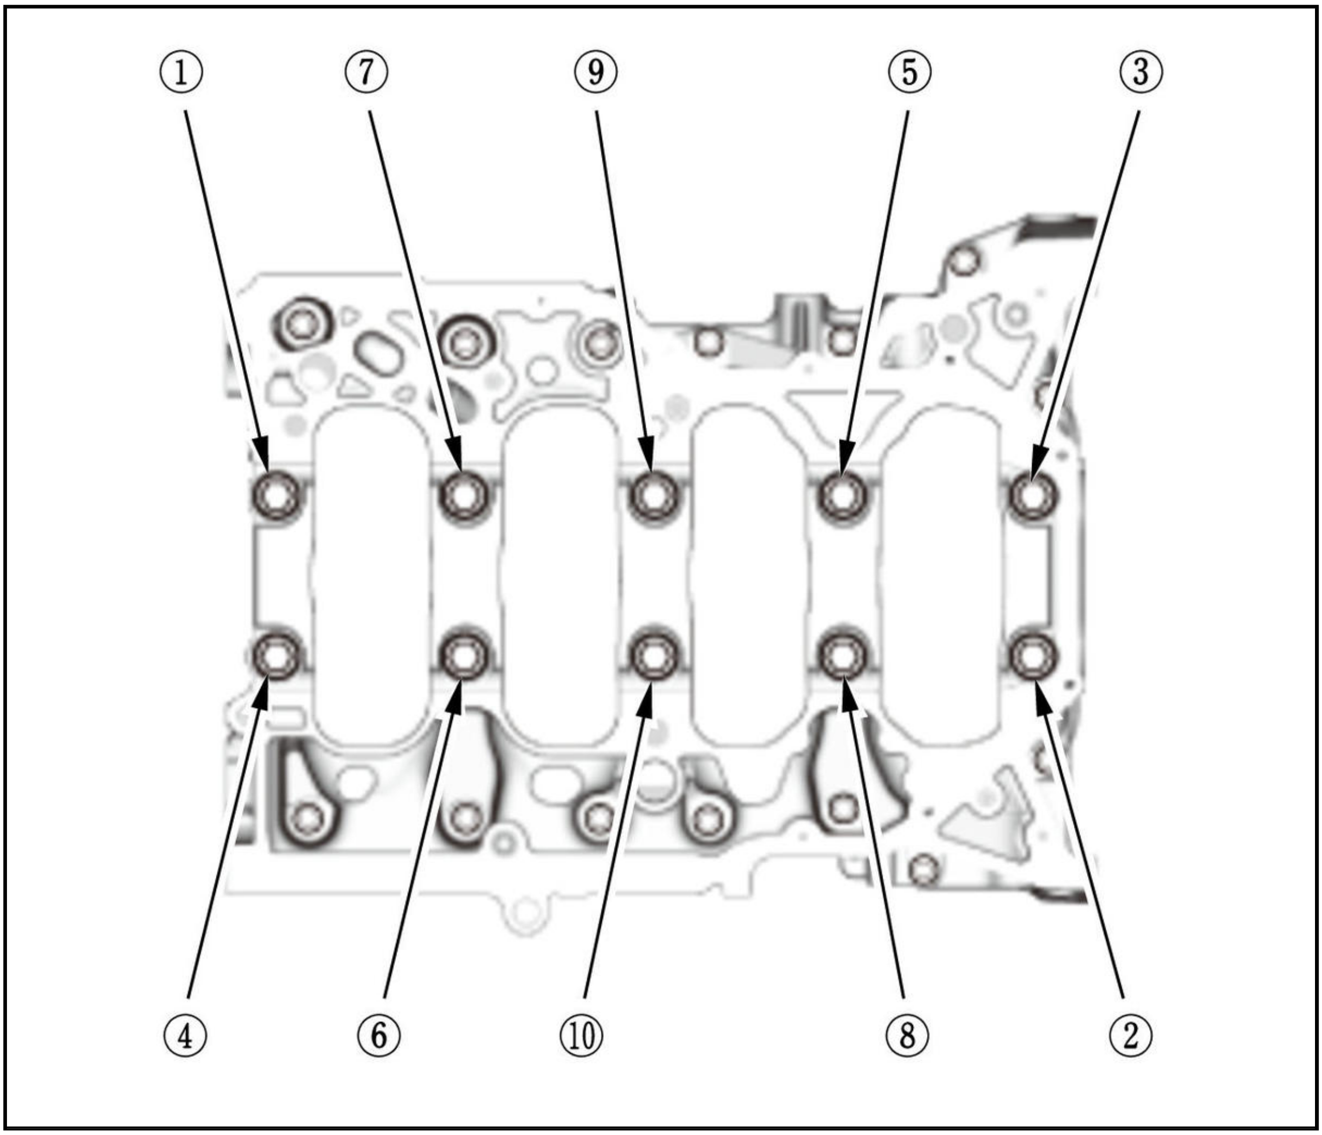
11. Lower Block - Remove



①
⑦
⑨
⑬
⑪
⑤
③
④
⑥
⑫
⑭
⑩
⑧
②

Fig. 33: Lower Block Bolts Loosening Sequence
Courtesy of HONDA, U.S.A., INC.

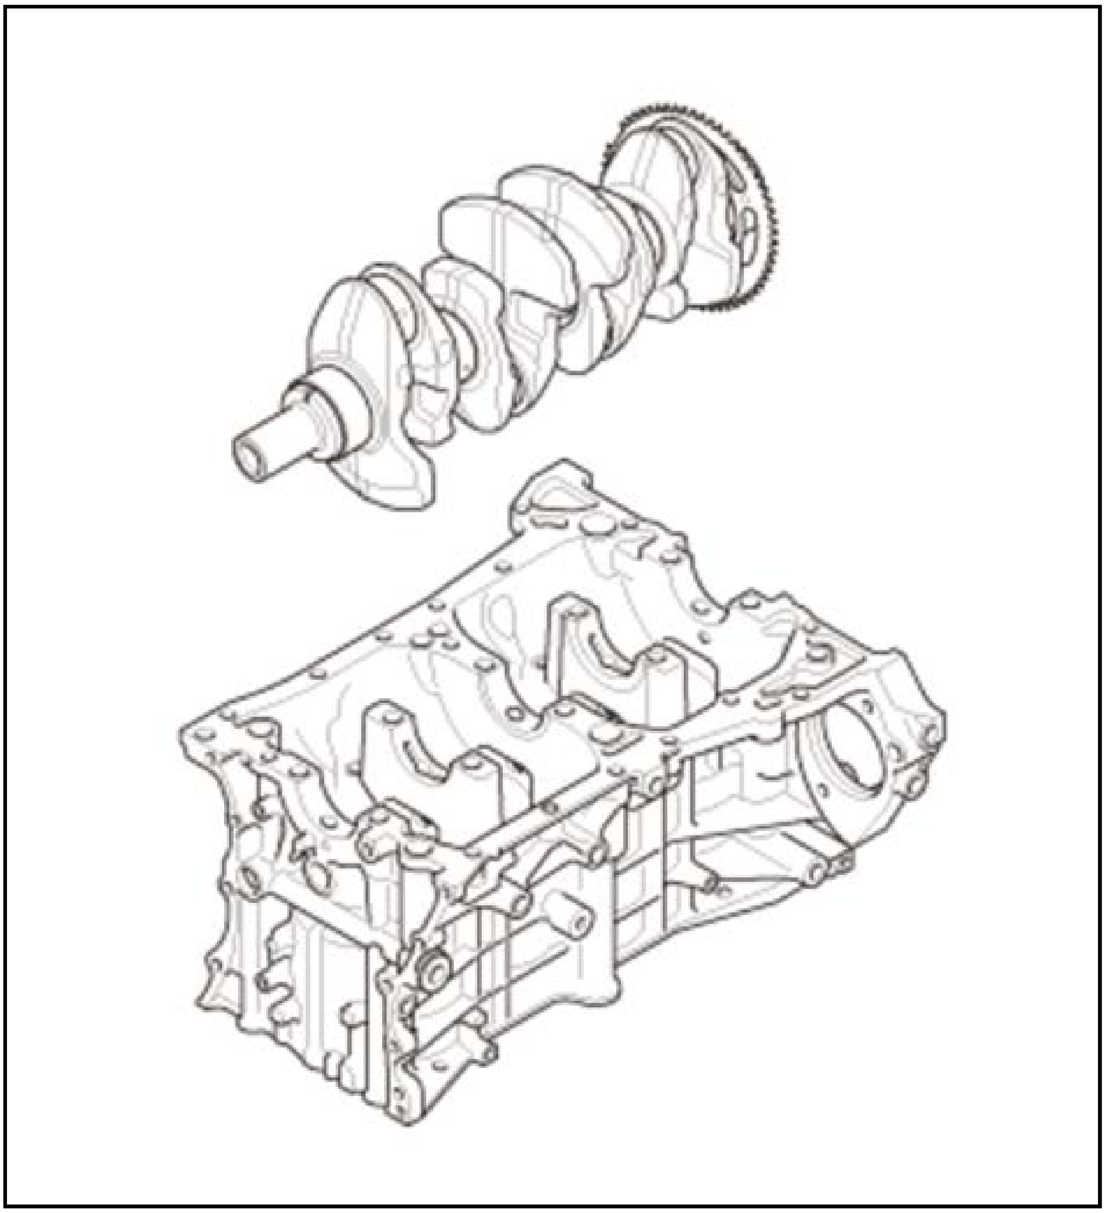
B	1. Remove the 8 mm bolts.



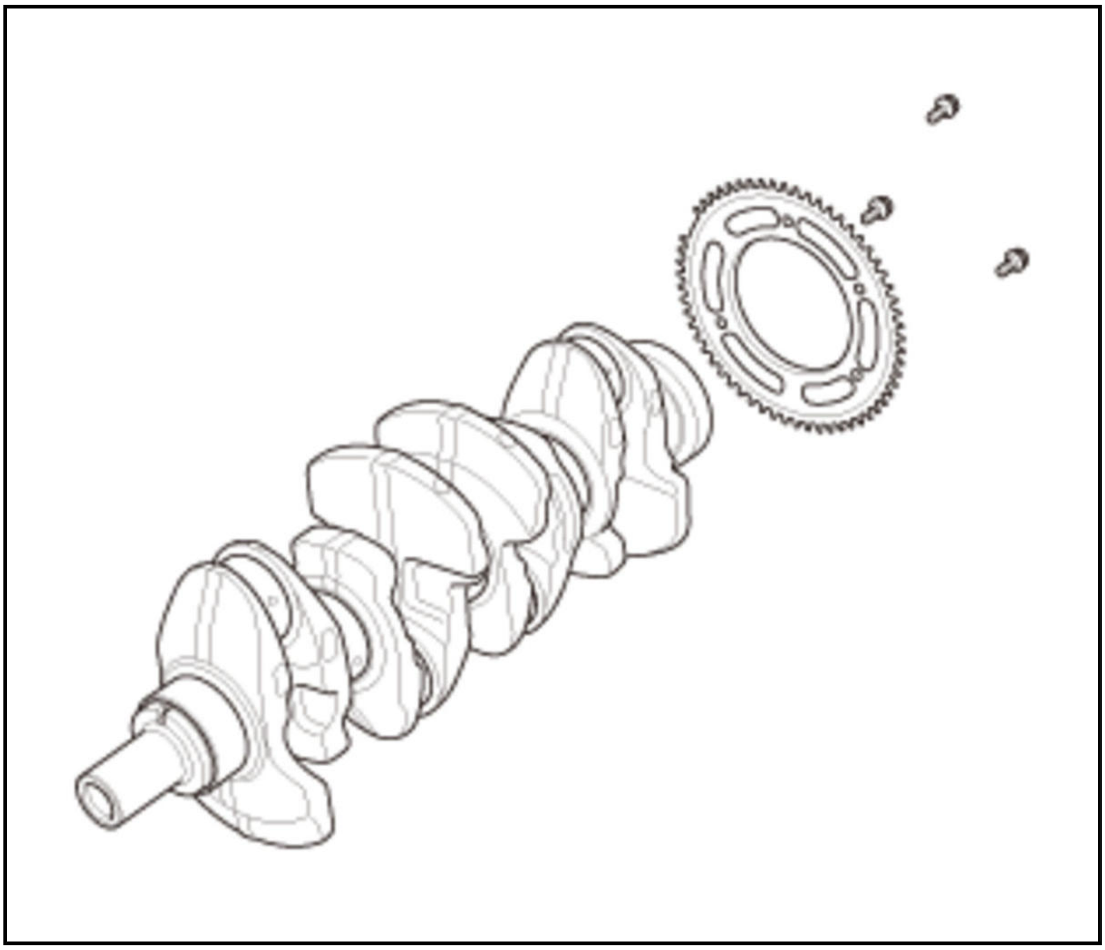
B	2. Remove the bearing cap bolts. To prevent warpage, loosen the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.

	3. Remove the lower block and the bearings. Keep all the bearings in order.

12. Crankshaft - Remove



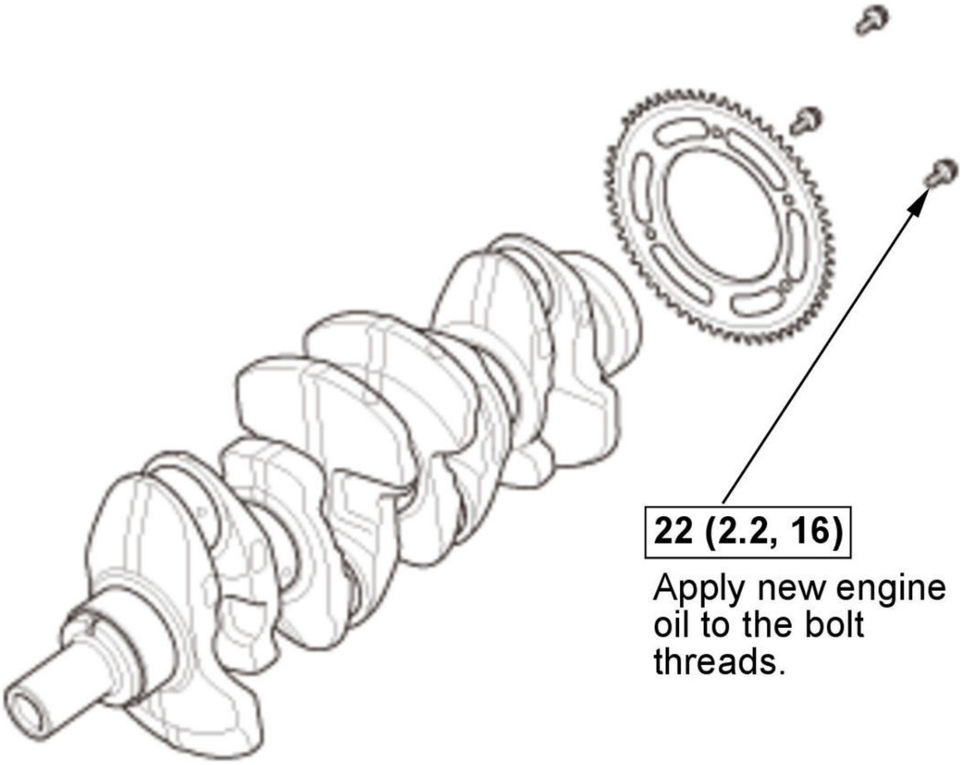
13. CKP Pulse Plate - Remove



Installation

NOTE: How to read the torque specifications .

1. Main Bearing Clearance - Inspect
2. CKP Pulse Plate - Install



22 (2.2, 16)
Apply new engine oil to the bolt threads.

[Fig. 34:](#)
Courtesy of HONDA, U.S.A., INC.

B

3. Crankshaft - Install

	1. Install the bearing halves in the engine block and the connecting rods. 2. Apply a coat of new engine oil to the main bearings and the connecting rod bearings. 3. Hold the crankshaft so rod journal No. 2 and rod journal No. 3 are straight up, then lower the crankshaft into the engine block. **NOTE:** Be careful not to damage the journals and the CKP pulse plate.

	4. Apply new engine oil to the thrust washer surfaces. Install the thrust washers in the No. 4 journal of the engine block.

4. Lower Block - Install

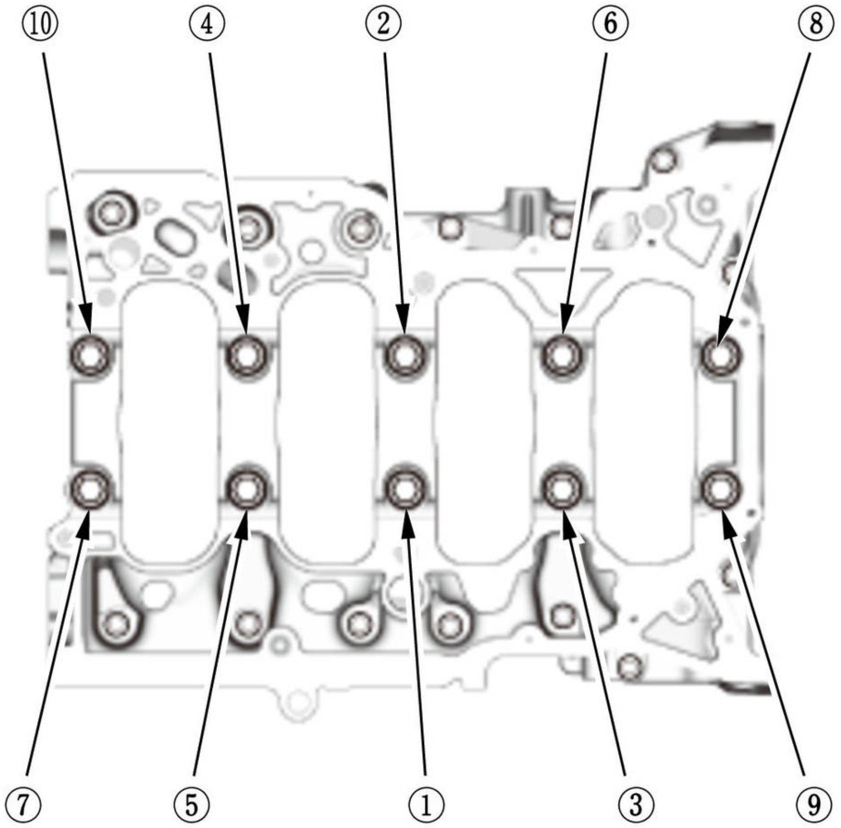


Fig. 35: Lower Block Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

B	1. **Apply liquid gasket** to the engine block mating surface of the lower block and to the inside edge of the threaded bolt holes. 2. Put the lower block on the engine block. 3. Apply new engine oil to the threads of the bearing cap bolts. Torque the bearing cap bolts in sequence, to 35 N.m (3.6 kgf.m, 26 lbf.ft).

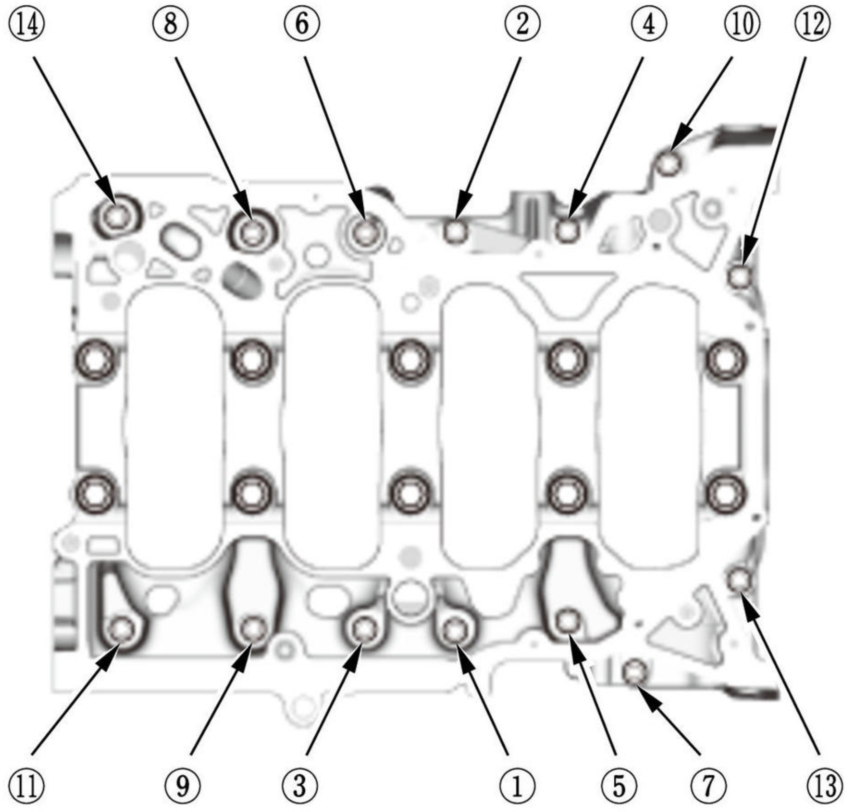

Fig. 36: Bearing Cap Bolts Bolts Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

	4. Tighten the bearing cap bolts an additional 41 deg..

B	5. Torque the 8 mm bolts in sequence to 24 N.m (2.2 kgf.m, 16 lbf.ft). **NOTE:** • Wait at least 30 minutes before filling the engine with oil. • Do not run the engine for at least 3 hours after installing the lower block.

5. Connecting Rod Bearing Clearance - Inspect
6. Connecting Rod Cap and Bearing Half - Install

	1. Apply new engine oil to the threads of the connecting rod bolts. 2. Seat the rod journals into connecting rod No. 1 and connecting rod No. 4. Line up the mark (A) on the connecting rod and the bearing cap. 3. Install the bearing caps and the bolts finger-tight. 4. Rotate the crankshaft clockwise, and seat the journals into connecting rod No. 2 and connecting rod No. 3. Line up the mark on the connecting rod and the bearing cap. 5. Install the bearing caps and the bolts finger-tight. 6. Tighten the connecting rod bolts to 5.0 N.m (0.51 kgf.m, 3.7 lbf.ft).

	7. Torque the connecting rod bolts to 41 N.m (4.2 kgf.m, 30 lbf.ft). 8. Tighten the connecting rod bolts an additional 120 deg.. **NOTE:** Remove the connecting rod bolt if you tightened it beyond the specified angle, inspect the connecting rod bolts. Do not loosen it back to the specified angle.

7. **Transmission End Crankshaft Oil Seal - Install**
8. Baffle Plate - Install

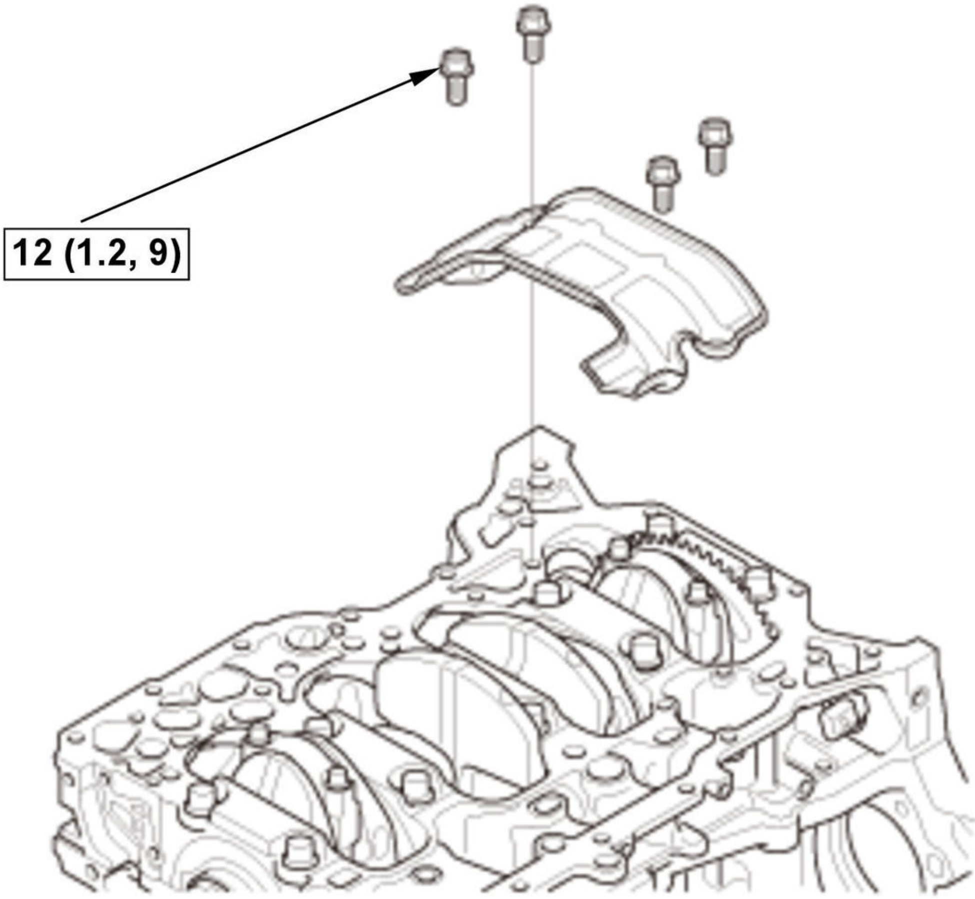

Fig. 37: Baffle Plate With Torque Specifications
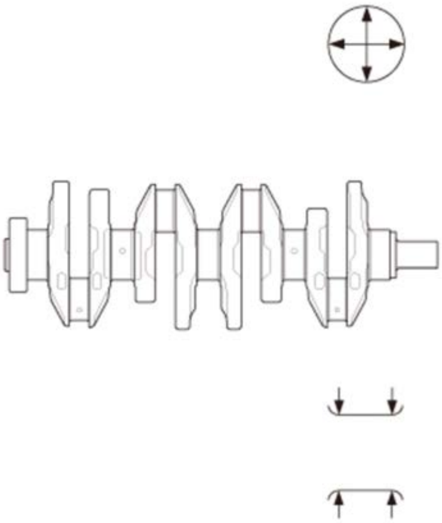
Courtesy of HONDA, U.S.A., INC.

9. Oil Pump - Install
10. Oil Pan - Install
11. Intermediate Shaft Assembly - Install
12. Cylinder Head - Install
13. Drive Plate - Install
14. Transmission - Install
15. Engine - Install

NOTE: The CKP pattern learn is required after this procedure.

Inspection

1. Crankshaft - Inspect



1. Clean the crankshaft oil passages with pipe cleaners or a suitable brush.

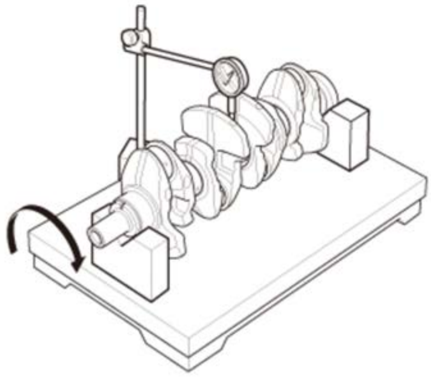
2. Check the keyway slot and the threaded holes for damage.

3. Measure the out-of-round at the middle of each rod and the main journal in two places. The difference between measurements on each journal must not be more than the service limit.

4. Measure the taper at the edges of each rod and the main journal. The difference between measurements on each journal must not be more than the service limit.

Journal Taper	
Standard (New):	**0.005 mm (0.00020 in) max.**
Service Limit:	**0.010 mm (0.00039 in)**

Journal Out-of-Round	
Standard (New):	**0.004 mm (0.00016 in) max.**
Service Limit:	**0.010 mm (0.00039 in)**



5. Place the V-blocks on a flat surface.

6. Check the total runout with the crankshaft supported on V-blocks.

7. Measure the runout on all of the main journals. Rotate the crankshaft two complete revolutions. The difference between measurements on each journal must not be more than the service limit.

Crankshaft Total Runout	
Standard (New):	**0.03 mm (0.0012 in) max.**

ENGINE OIL JET AND BOLT REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

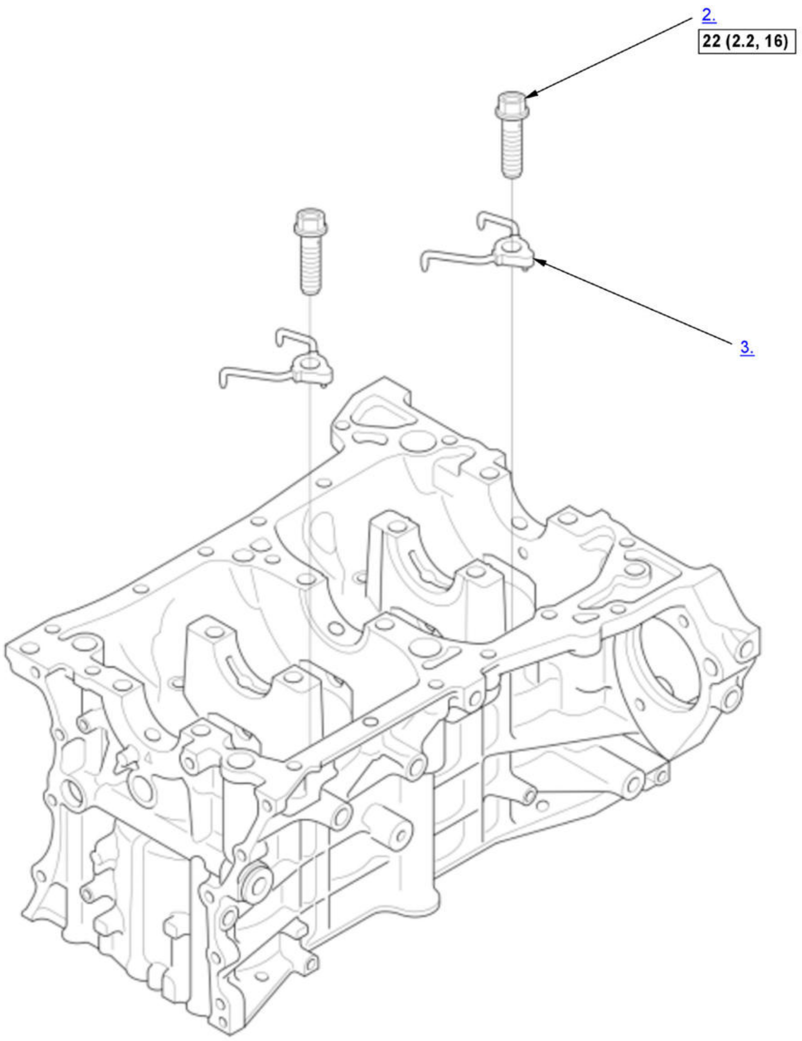


Fig. 38: Oil Jet Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B

▭	Torque: N.m (kgf.m, lbf.ft)

1. Crankshaft - Remove
2. Oil Jet Bolt - Remove
3. Oil Jet - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Inspection

1. Engine Oil Jet and Oil Jet Bolt - Inspect

	1. Inspect the oil jet and the bolt as follows.**NOTE:** Replace the oil jet assembly, if the nozzle is damaged or bent. • Make sure that a 1.0 mm (3/64 in) diameter drill bit will go through the nozzle hole (A) (1.2 mm (0.047 in) diameter). • Insert the other end of a 3.0 mm (1/8 in) drill into the oil intake (3.2 mm (0.126 in) diameter). Make sure the check ball (B) moves smoothly and has a stroke of about 2.0 mm (0.079 in). • Check the oil jet operation with an air nozzle. It should take at least 175 kPa (1.78 kgf/cm 2, 25.4 psi) to unseat the check ball.

PCV VALVE REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Removal and Installation

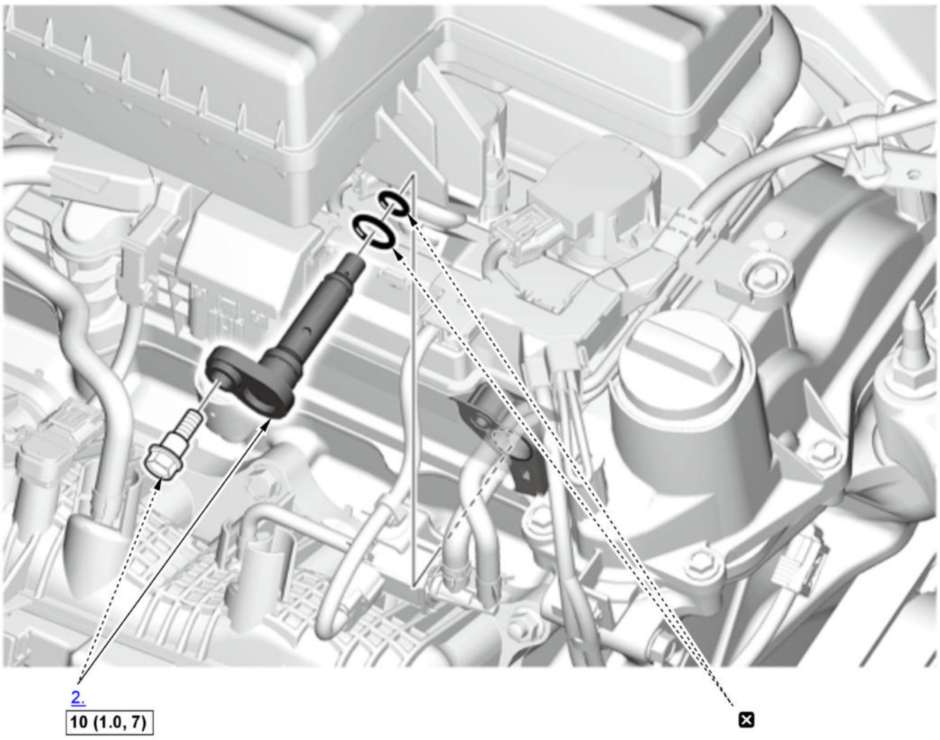

Fig. 39: PCV Valve Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Turbocharger Bypass Control Solenoid Valve - Remove
2. PCV Valve - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal with new O-rings.**NOTE:** Make sure the O-rings are in place.

Inspection

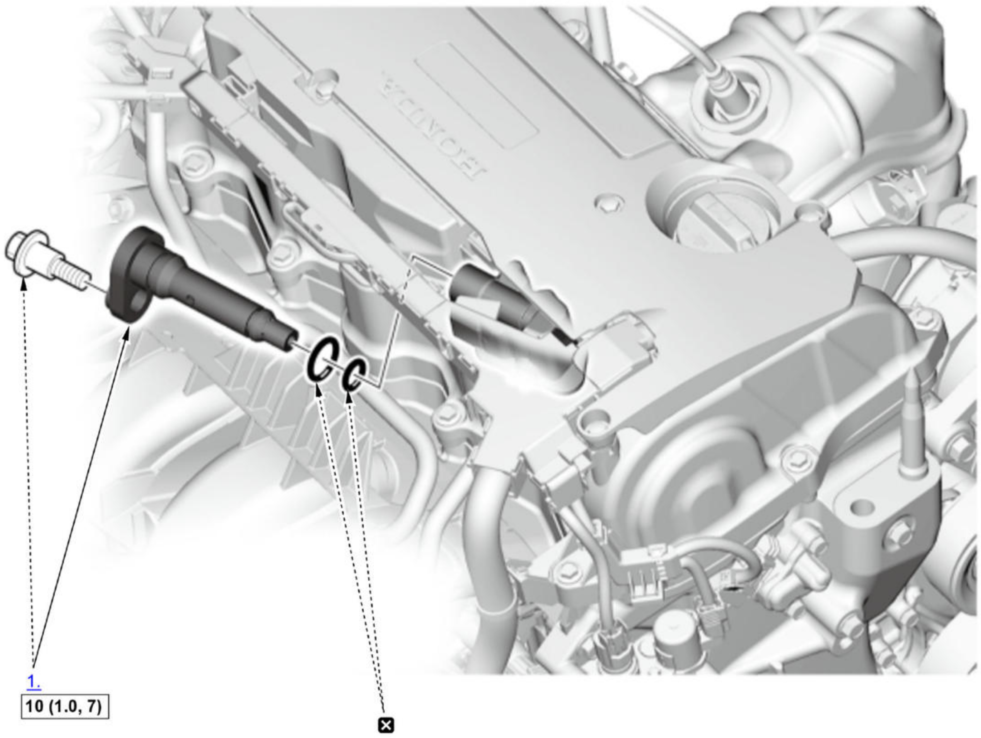
1. PCV Valve - Inspect

	1. Check the PCV valve (A), the hoses (B), and their connections for leaks or restrictions.

	2. Start the engine. 3. At idle, make sure there is a clicking sound from the PCV valve (A) when the hose (B) between the PCV valve and intake manifold is lightly pinched with your fingers or pliers. If there is no clicking sound, check the O-rings for cracks or damage. If they are OK, replace the PCV valve and recheck.

PCV VALVE REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation



☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. PCV Valve - Remove
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal with new O-rings.**NOTE:** Make sure the O-rings are in place.

Inspection

1. PCV Valve - Inspect

	1. Check the PCV valve (A), the hoses (B), and their connections for leaks or restrictions.

	2. Start the engine. 3. At idle, make sure there is a clicking sound from the PCV valve (A) when the hose (B) between the PCV valve and intake manifold is lightly pinched with your fingers or pliers. If there is no clicking sound, check the O-rings for cracks or damage. If they are OK, replace the PCV valve and recheck.

TURBOCHARGER BYPASS CONTROL SOLENOID VALVE REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Removal and Installation

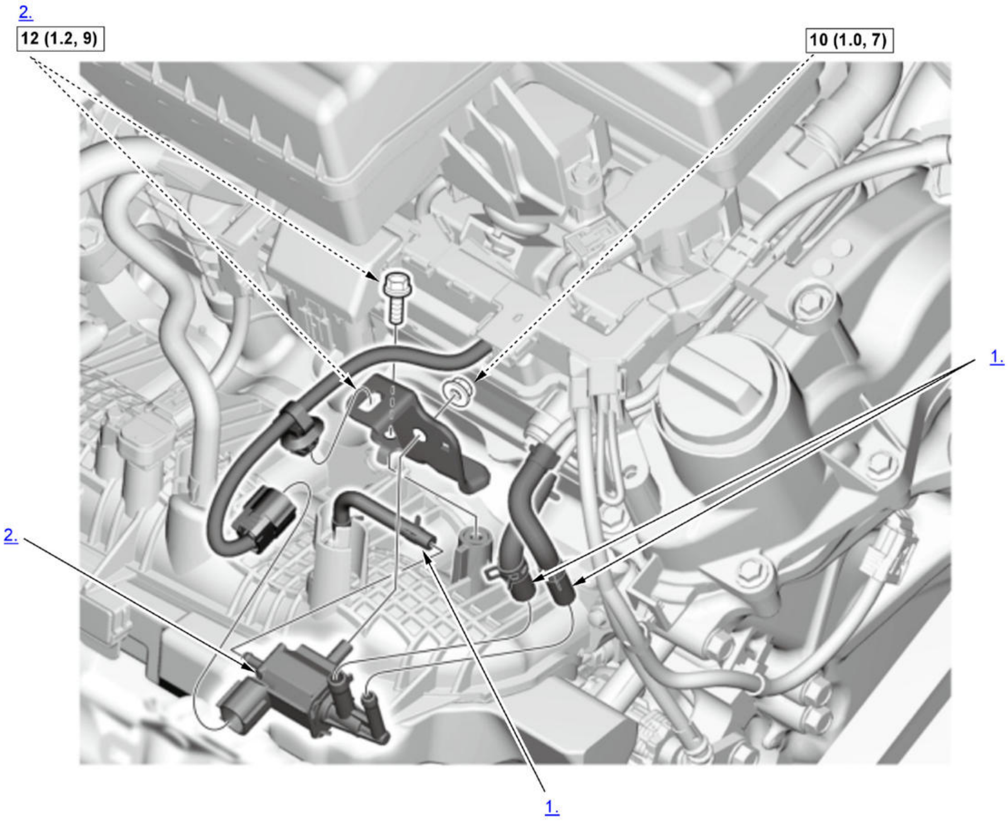


Fig. 40: Turbocharger Bypass Control Solenoid Valve Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

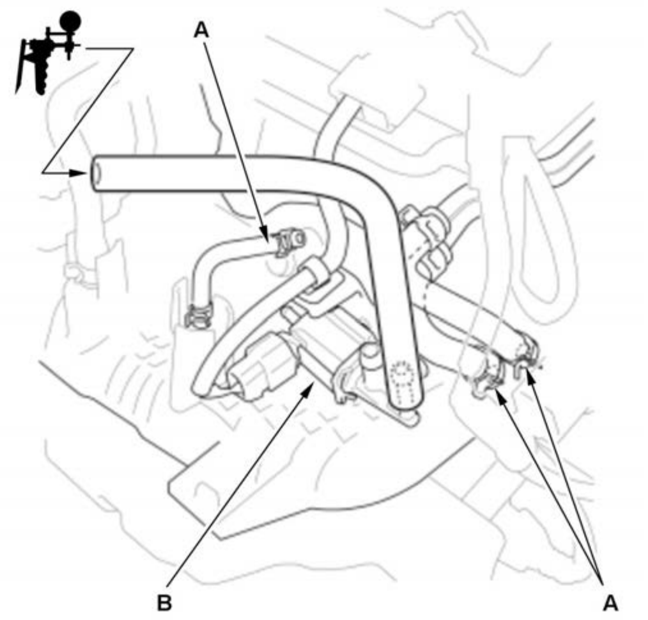
▭	Torque: N.m (kgf.m, lbf.ft)

1. Hoses - Disconnect
2. Turbocharger Bypass Control Solenoid Valve - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Inspection

1. Turbocharger Bypass Control Solenoid Valve - Bypass Air Line Open Stuck Check



1. Disconnect the hoses (A).

2. Connect the vacuum pump to the turbocharger bypass control solenoid valve (B) as shown.

3. Apply vacuum to the port.

- If it holds vacuum, release the vacuum, then go to step 2.
- If it does not hold vacuum, replace the turbocharger bypass control solenoid valve.

2. **HDS - Connect**
3. Turbocharger Bypass Control Solenoid Valve - Bypass Air Line Closed Stuck Check

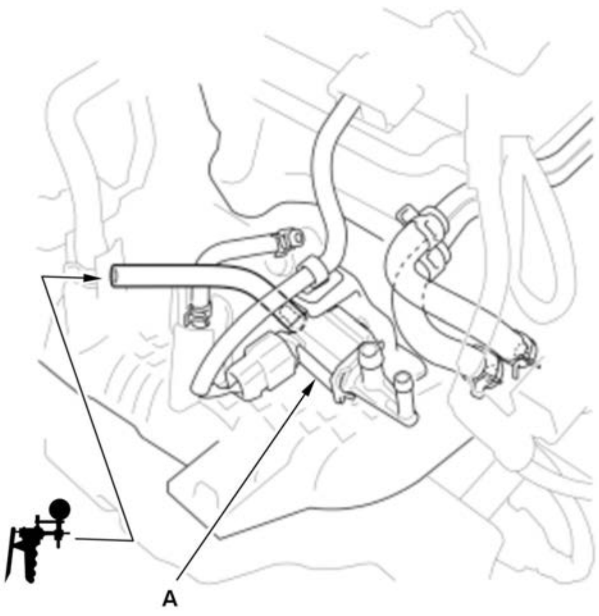
1. Turn the vehicle to the ON mode.

2. Select TURBOCHARGER BYPASS CONTROL SOLENOID VALVE ON in the INSPECTION MENU with the HDS.

3. Reapply vacuum to the port.

- If it holds vacuum, replace the turbocharger bypass control solenoid valve.
- If it does not hold vacuum, release the vacuum, and turn the vehicle to the OFF (LOCK) mode, then go to step 4.

4. Turbocharger Bypass Control Solenoid Valve - Vacuum Line Closed Stuck Check



1. Connect the vacuum pump to the turbocharger bypass control solenoid valve (A) as shown.

2. Apply vacuum to the port.

- If it does not hold vacuum, release the vacuum, then go to step 5.
- If it holds vacuum, replace the turbocharger bypass control solenoid valve.

5. Turbocharger Bypass Control Solenoid Valve - Vacuum Line Open Stuck Check

1. Turn the vehicle to the ON mode.

2. Select TURBOCHARGER BYPASS CONTROL SOLENOID VALVE ON in the INSPECTION MENU with the HDS.

3. Reapply vacuum to the port.

- If it does not hold vacuum, replace the turbocharger bypass control solenoid valve.
- If it holds vacuum, the turbocharger bypass control solenoid valve is OK. Check the vacuum hose between the turbocharger bypass control solenoid valve, the intake manifold, turbocharger bypass valve, and the turbocharger joint.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

AFTER WARMING UP, IDLE SPEED IS ABOVE SPECIFICATIONS WITHOUT LOAD (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- **Inspect the APP sensor**.

Also check for

Intake air leaks

AFTER WARMING UP, IDLE SPEED IS BELOW SPECIFICATIONS WITHOUT LOAD (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- **Do the carbon accumulation check**.

Also check for

Incorrect valve timing or clearance adjustment

AUTO IDLE STOP SYSTEM DOES NOT OPERATE (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Diagnostic procedure

- **Inspect the auto idle stop system**.
- **Troubleshoot the auto idle stop system (Auto idle stop system does not operate)**.

AUTO IDLE STOP SYSTEM INDICATOR (AMBER) BLINKS (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Diagnostic procedure

- **Troubleshoot the auto idle stop system (Auto idle stop system indicator blinks)**.

AUTO IDLE STOP SYSTEM INDICATOR (GREEN/AMBER) DOES NOT COME ON (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Diagnostic procedure

- **Troubleshoot the auto idle stop system (Auto idle stop system indicator does not come on)**.

COLD FAST IDLE TOO HIGH (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- **Do the PCM idle learn procedure**.
- **Check the idle speed**.

Also check for

Intake air leaks

COLD FAST IDLE TOO LOW (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- Do the PCM idle learn procedure.
- Check the idle speed.
- Do the carbon accumulation check.

DIFFICULT TO REFUEL (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- Check the fuel vent tube between the EVAP canister and the fuel tank unit.
- Check the fuel tank vapor recirculation tube between the fuel fill pipe and the fuel tank unit.
- Insert the emergency fuel funnel into the fuel filler neck, then check the operation of the shut-off valve flap.

  NOTE: The emergency fuel funnel is stored in the trunk tool box.

- Replace the fuel tank .

Also check for

Malfunctioning gas station filling nozzle

ENGINE IS HARD TO START (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- Troubleshoot the engine will not start, engine starts but stalls immediately, or engine is hard to start .
- Do the CVT system symptom troubleshooting .

ENGINE STALLS (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- Troubleshoot the engine stalls .

ENGINE STARTS BUT STALLS IMMEDIATELY (MIL WORKS OK, NO DTCS SET, SECURITY INDICATOR STAYS ON OR FLASHES) (KA/KC)

Diagnostic procedure

- Without keyless access system: Check the immobilizer system .
- With keyless access system: Check the keyless access system .

ENGINE WILL NOT START (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- Troubleshoot the engine will not start, engine starts but stalls immediately, or engine is hard to start .
- Do the CVT system symptom troubleshooting .

ENGINE WILL NOT START (MIL WORKS OK, NO DTCS SET, SECURITY INDICATOR STAYS ON OR FLASHES) (KA/KC)

Diagnostic procedure

- Without keyless access system: Check the immobilizer system .
- With keyless access system: Check the keyless access system .

ENGINE WILL NOT START AND HDS DOES NOT COMMUNICATE WITH THE PCM (MIL COMES ON AND STAYS ON, NO DTCS SET) (KA/KC)

Diagnostic procedure

- PCM power and ground circuit troubleshooting.

HDS DOES NOT COMMUNICATE WITH THE PCM OR THE VEHICLE (KA/KC)

Diagnostic procedure

- Troubleshoot the DLC circuit .

Also check for

Correct HDS software

IDLE SPEED FLUCTUATES (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- Do the PCM idle learn procedure.
- Check the idle speed.
- Check the fuel pressure .
- Do the carbon accumulation check.
- Troubleshoot the A/C signal circuit .
- Check the A/C refrigerant amount .

  NOTE: Turning the A/C to ON under the conditions that the A/C refrigerant amount is out of specification (excessive or too little) may cause the idle speed fluctuation.

Also check for

- Incorrect valve adjustment
- Intake air leaks

IDLE STOP TIME IS SHORT (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Diagnostic procedure

- Troubleshoot the auto idle stop system.

LOW POWER (MIL WORKS OK, NO DTCS SET) (KA/KC)

Diagnostic procedure

- Check the fuel pressure .
- Check the air cleaner element.

Also check for

- Low compression
- Incorrect camshaft timing
- Incorrect engine oil level
- Exhaust restriction
- Fuel contamination
- Intercooler insufficient cooling (for some models)

MIL COMES ON AND STAYS ON, OR NEVER COMES ON AT ALL, NO DTCS SET (KA/KC)

Diagnostic procedure

- Troubleshoot the MIL circuit.

OVERHAUL

BALANCER SHAFT/BALANCER SHAFT HOLDER ASSEMBLY OVERHAUL

Disassembly and Reassembly

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

LOWER BALANCER
SHAFT HOLDER

Fig. 1: Exploded View Of Balancer Shaft/Balancer Shaft Holder Assembly Overhaul Components With Torque Specifications

Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	These parts have inspection items.

1. Baffle Plate - Remove
2. Upper Balancer Shaft Holder - Remove

   Note for installation

   NOTE: Apply new engine oil to the 8 mm bolts threads and flanges.

3. Front Balancer Shaft and Rear Balancer Shaft - Remove

   Note for installation

   1. Apply new engine oil to the journals.

   2. Align the punch mark (A) on the rear balancer shaft (B) in the center of the two punch marks (C) on the front balancer shaft (D), then install the balancer shafts on the lower balancer shaft holder.

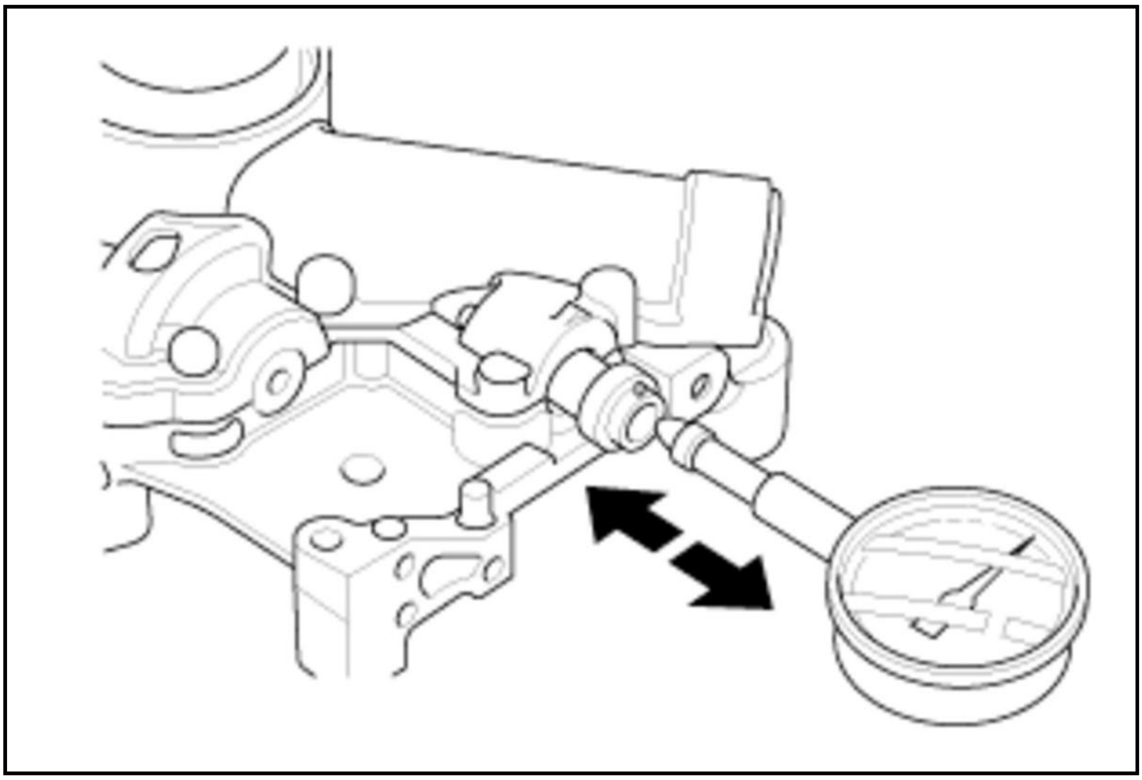
4. Balancer Shaft Bearing - Remove
5. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

Inspection

1. Balancer Shaft End Play - Inspect

   1. Seat the balancer shaft by pushing it away from the balancer shaft sprocket end of the balancer shaft holder.

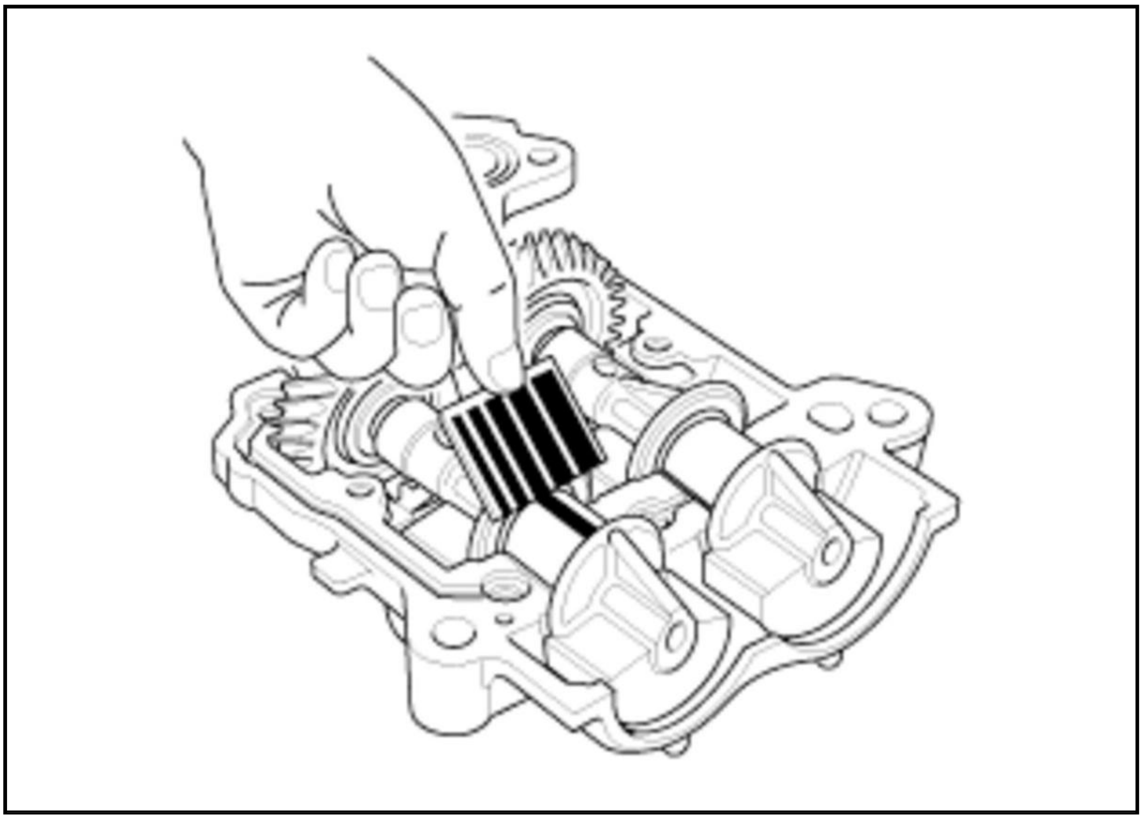


2. Zero the dial indicator against the end of the balancer shaft, then push the balancer shaft back and forth and read the end play.

Balancer Shaft End Play	
Standard (New):	**0.070-0.120 mm (0.00276-0.00472 in)**
Service Limit:	**0.135 mm (0.00531 in)**

2. Balancer Shaft Journal Oil Clearance - Inspect

1. Clean the both balancer shaft journals, the balancer shaft holders, and the bearing halves with a clean shop towel.



2. Place one strip of plastigage across each journal.

3. Reinstall the bearings and the upper balancer shaft holder, then tighten the bolts to the specified torque.

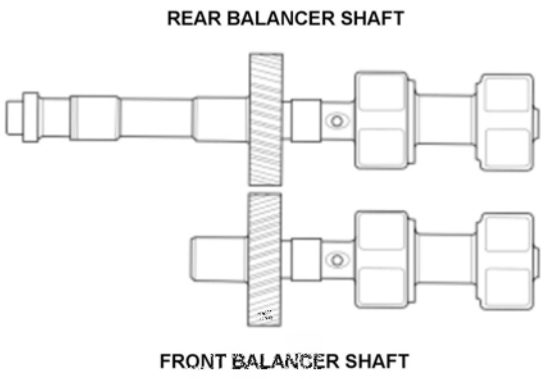
NOTE: Do not rotate the balancer shafts during inspection.

4. Remove the upper balancer shaft holder and the bearings again, and measure the widest part with the plastigage.

- If the front balancer shaft No. 1 journal and the rear balancer shaft No. 1, 2 journals oil clearance is out-of-tolerance, replace the balancer shaft and recheck. If it is still out-of-tolerance, replace the balancer shaft holders.
- If the front balancer shaft No. 2 journal and the rear balancer shaft No. 3 journal oil clearance is out-of-tolerance, install new bearings, and recheck. If it is still out-of-tolerance, replace the balancer shafts.

Journal Oil Clearance	
Front No. 1 Journal:	
Standard (New):	**0.030-0.062 mm (0.00118-0.00244 in)**
Service Limit:	**0.080 mm (0.00315 in)**
Front No. 2 Journal:	
Standard (New):	**0.040-0.100 mm (0.00157-0.00394 in)**
Service Limit:	**0.130 mm (0.00512 in)**
Rear No. 1, 2 Journals:	
Standard (New):	**0.030-0.062 mm (0.00118-0.00244 in)**
Service Limit:	**0.080 mm (0.00315 in)**
Rear No. 3 Journal:	
Standard (New):	**0.040-0.100 mm (0.00157-0.00394 in)**
Service Limit:	**0.130 mm (0.00512 in)**

3. Balancer Shaft Journal Taper - Inspect



1. Remove the balancer shafts.

2. Measure the taper at the edges of each journal. The difference between measurements on each journal must not be more than the standard.

Balancer Shaft Journal Taper

Standard (New):	**0.005 mm (0.00020 in) max.**

ENGINE BLOCK OVERHAUL

Removal

NOTE:

- Be careful not to damage the journals and the CKP pulse plate.
- The No. 1 journal is on the crankshaft pulley side.

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

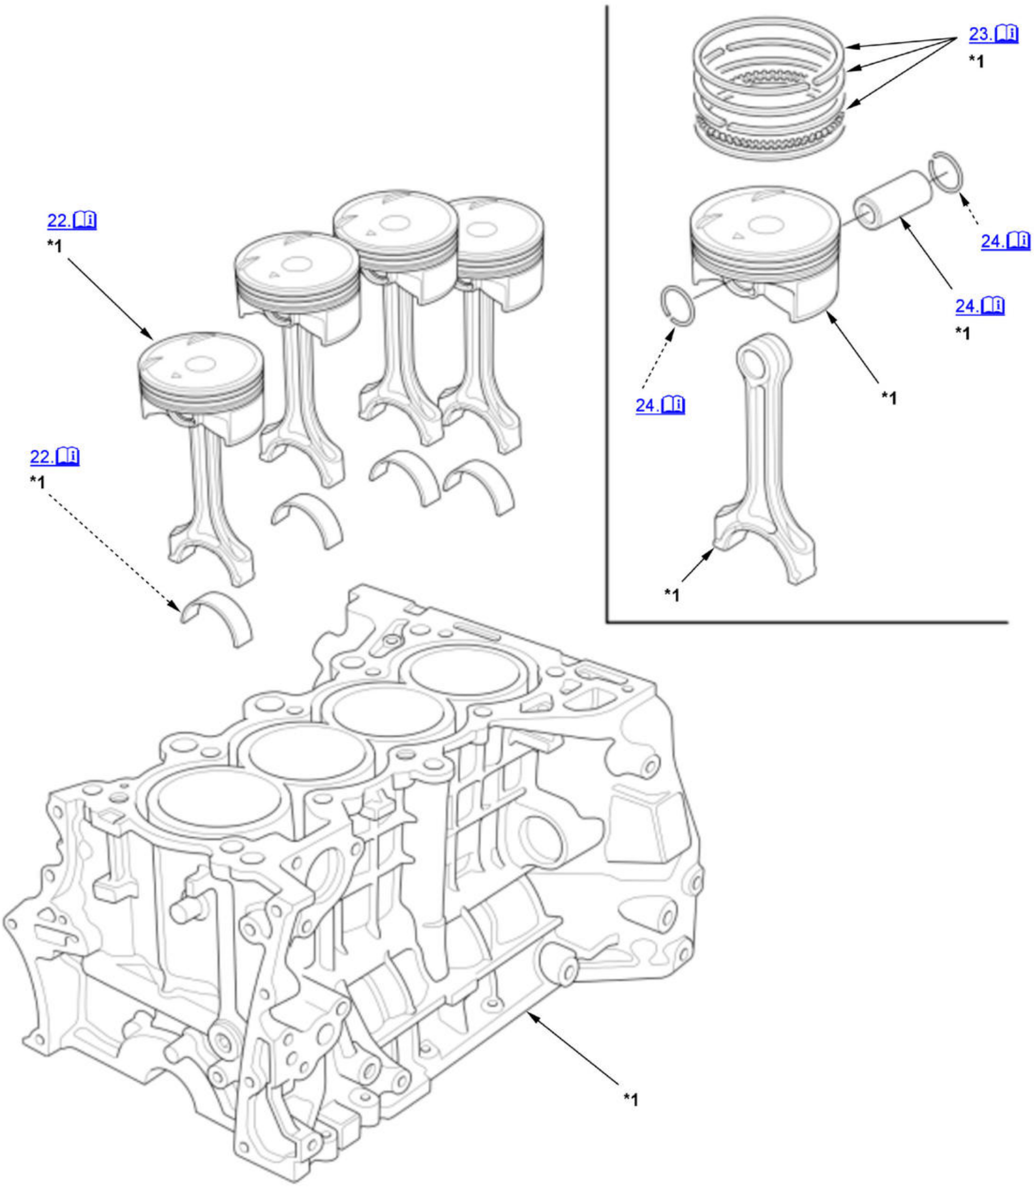

Fig. 3: Exploded View Of Engine Block Overhaul Components For Removal (2 Of 2)
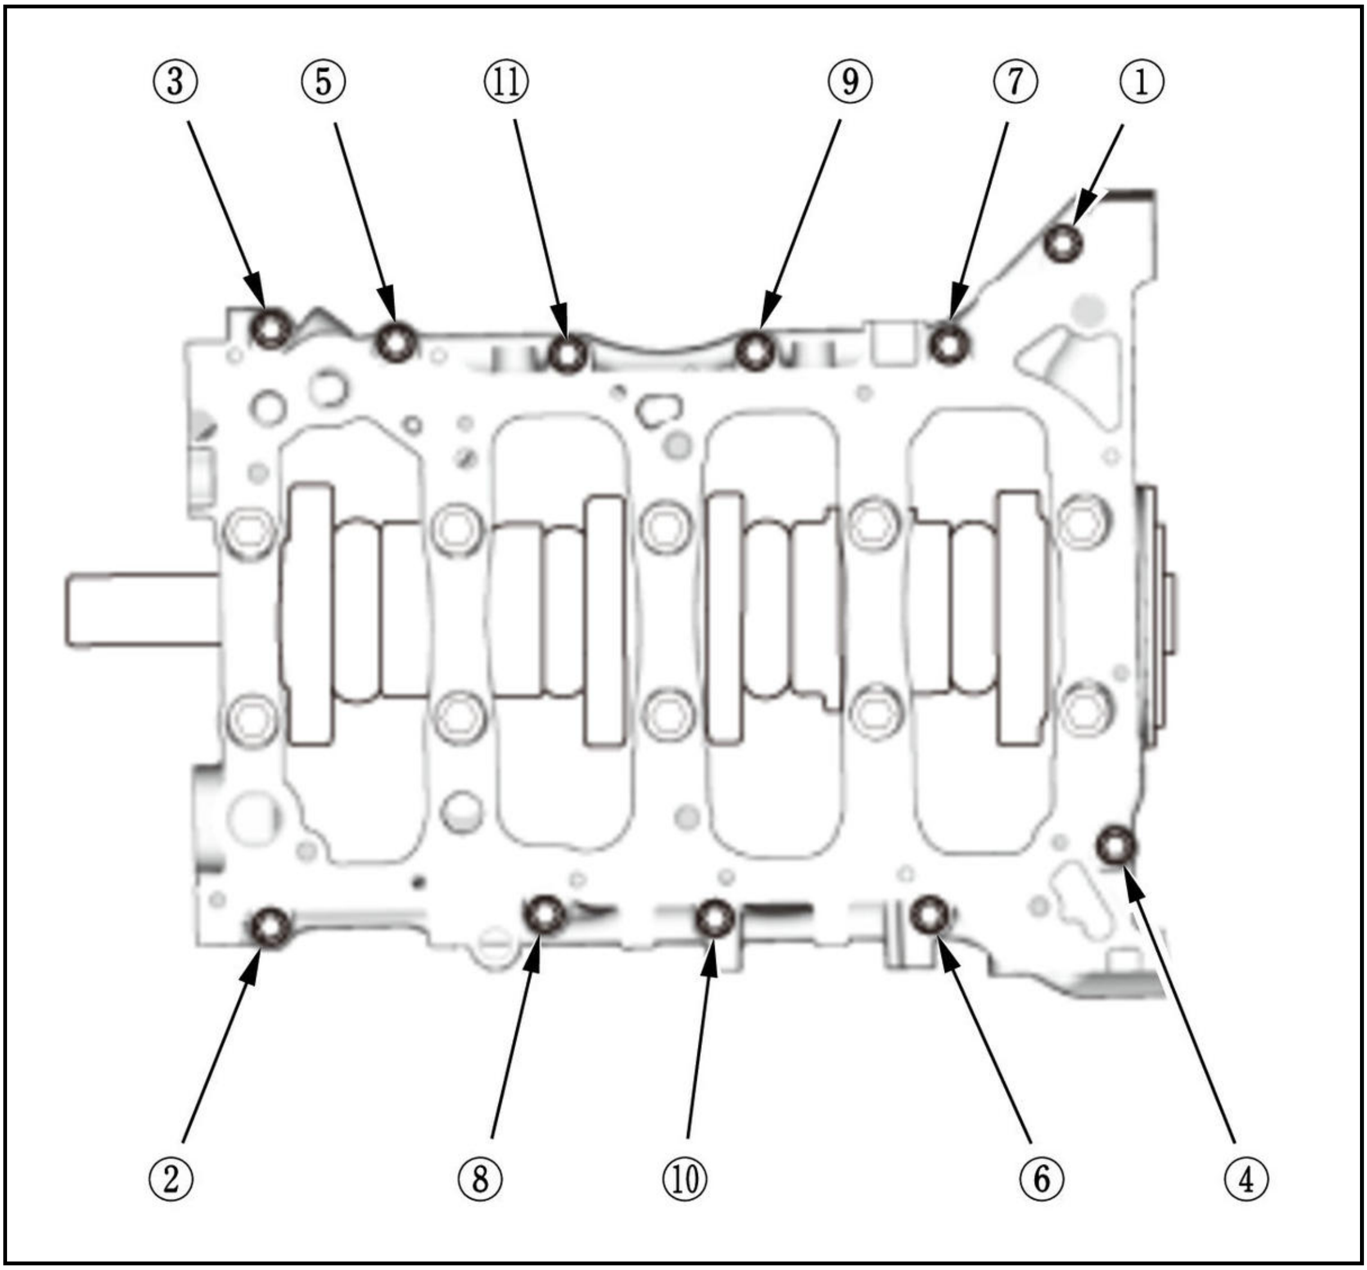
Courtesy of HONDA, U.S.A., INC.

*1	These parts have inspection items

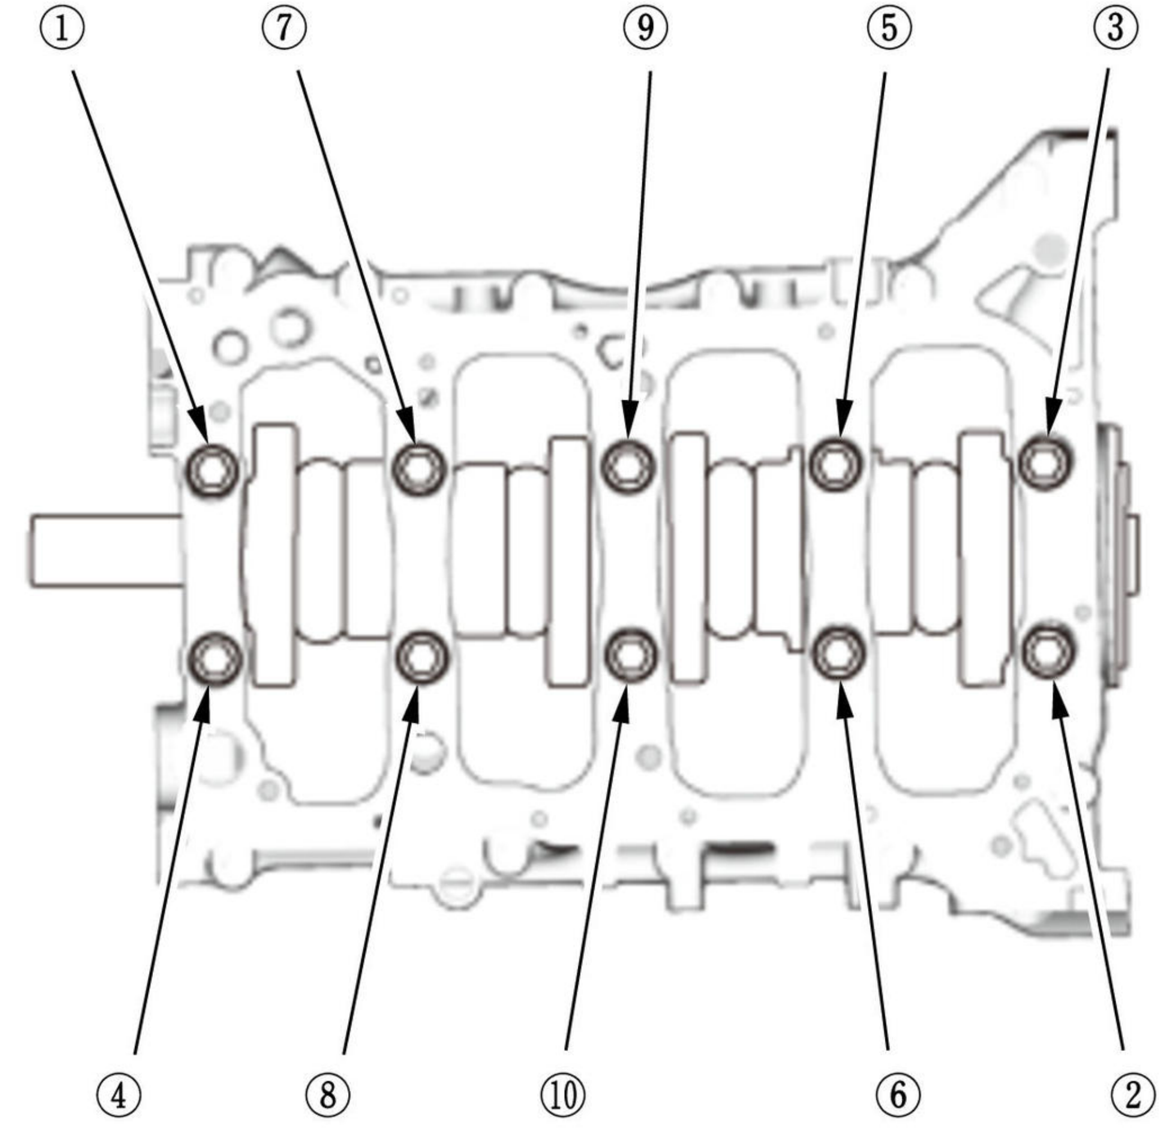
1. **Engine - Remove**
2. **Transmission (e-CVT) - Remove**
3. **Drive Plate - Remove**
4. **Cylinder Head - Remove**
5. **Oil Pan - Remove**
6. **Balancer Shaft/Balancer Shaft Holder Assembly - Remove**
7. **Transmission End Crankshaft Oil Seal - Remove**
8. Balancer Chain Guide - Remove
9. Balancer Chain - Remove
10. Crankshaft Sprocket - Remove
11. Oil Control Orifice - Remove (if necessary)
12. Engine Block Heat Insulator - Remove (if necessary)
13. Connecting Rod Bearing Cap and Bearing Half - Remove

NOTE: Keep all connecting rod bearing caps and connecting rod bearings in order.

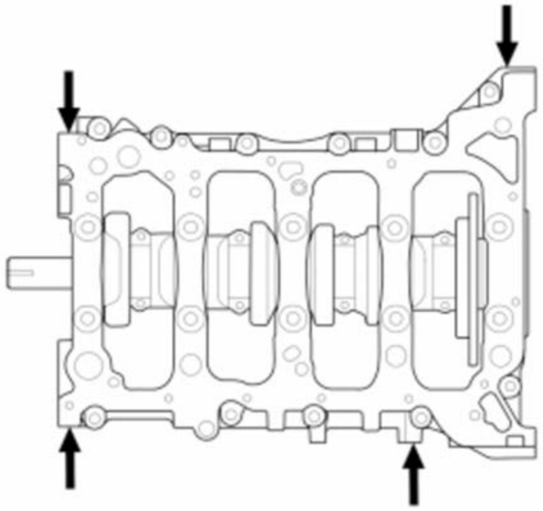
14. Lower Block and Bearing Half - Remove



1. Remove the 8 mm bolts in the sequence shown.



2. Remove the bearing cap bolts. To prevent warpage, loosen the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.



3. Using a flat blade screwdriver, separate the lower block from the engine block in the places shown.

4. Remove the lower block and the bearings. Keep all the bearings in order.

15. Crankshaft - Remove
16. Thrust Washer - Remove
17. CKP Pulse Plate - Remove
18. L Side Cover - Remove (if necessary)
19. Drain Bolt - Remove (if necessary)
20. Sealing Bolt - Remove (if necessary)
21. **Oil Jet and Oil Jet Bolt - Remove**
22. Piston/Connecting Rod Assembly - Remove

	1. If you can feel a ridge of metal or hard carbon around the top of each cylinder, remove it with a ridge reamer (A). Follow the reamer manufacturer's instructions. If the ridge is not removed, it may damage the piston as it is pushed out.

	2. Use the wooden handle of a hammer (A) to drive out the piston/connecting rod assembly (B). Take care not to damage the cylinder with the connecting rod. 3. Reinstall the connecting rod bearings and caps after removing each piston/connecting rod assembly. 4. Mark each piston/connecting rod assembly with its cylinder number to make sure they are reinstalled in the original order. **NOTE:** The existing number on the connecting rod does not indicate its position in the engine, it indicates the rod bore size.

23. Piston Ring - Remove

	1. Using a ring expander (A), remove the old piston rings (B). 2. Clean all ring grooves thoroughly with a squared-off broken ring or a ring groove cleaner with a blade to fit the piston grooves. The top and second grooves are 1.0 mm (0.039 in) wide. The oil ring groove is 2.0 mm (0.079 in) wide. File down a blade if necessary. Do not use a wire brush to clean the ring grooves, or cut the ring grooves deeper with the cleaning tools. **NOTE:** If the piston is to be separated from the connecting rod, do not install new rings yet.

24. Piston Pin - Remove

	1. Apply new engine oil to the piston pin snap rings (A), and turn them in the ring grooves until the end gaps are lined up with the cutouts in the piston pin bores (B). **NOTE:** Take care not to damage the ring grooves.

	2. Remove the snap rings (A) from both sides of each piston. Start at the cutout in the piston pin bore. Remove the snap rings carefully so they do not go flying or get lost. Wear eye protection.

	3. Heat the piston and connecting rod assembly to about 158B°F (70B°C). 4. Remove the piston pin.

Installation

NOTE:

- Be careful not to damage the journals and the CKP pulse plate.
- The No. 1 journal is on the crankshaft pulley side.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	These parts have inspection items

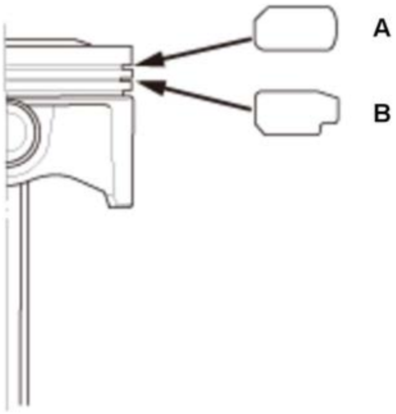
1. Piston Pin - Install

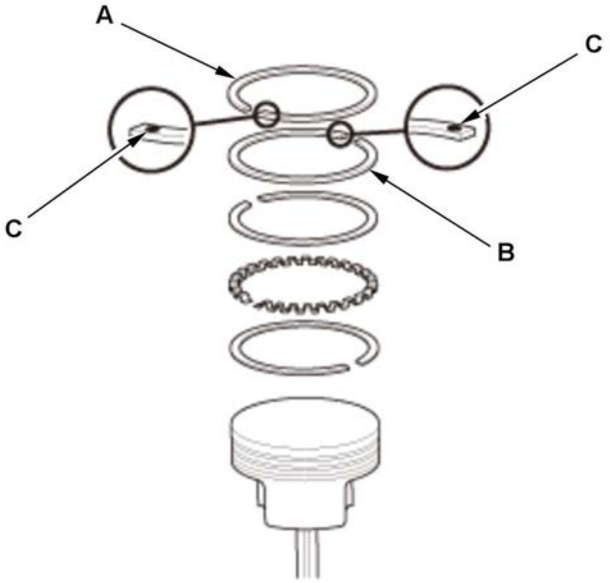
	1. Install a piston pin snap ring (A) only on one side. 2. Coat the piston pin bore in the piston, the bore in the connecting rod, and the piston pin with new engine oil.

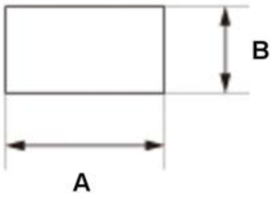
	3. Heat the piston to about 158B°F (70B°C).

 	4. Assemble the piston (A) and the connecting rod (B). **NOTE:** Align the mark (C) with the groove (D) direction on the connecting rod as shown. 5. Install the piston pin (E). 6. Install the remaining snap ring (F). 7. Turn the snap rings in the ring grooves until the end gaps are positioned at the bottom of the piston.

2. Piston Ring - Install



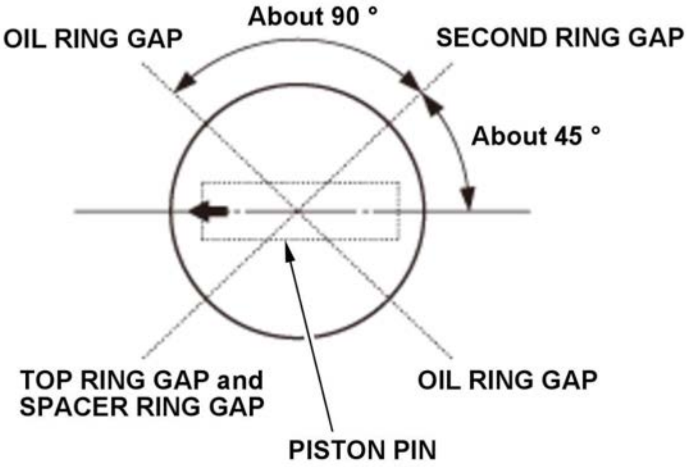




Top Ring (Standard):
A: 2.3 mm (0.091 in)
B: 1.0 mm (0.039 in)
Second Ring (Standard):
A: 2.3 mm (0.091 in)
B: 1.0 mm (0.039 in)

1. Apply new engine oil to the piston rings.

2. Install the top ring and the second ring as shown. The top ring (A) has a 1R mark, and the second ring (B) has a 2R mark. The manufacturing marks (C) must be facing upward.



About 90 °
OIL RING GAP
SECOND RING GAP
About 45 °
TOP RING GAP and SPACER RING GAP
OIL RING GAP
PISTON PIN

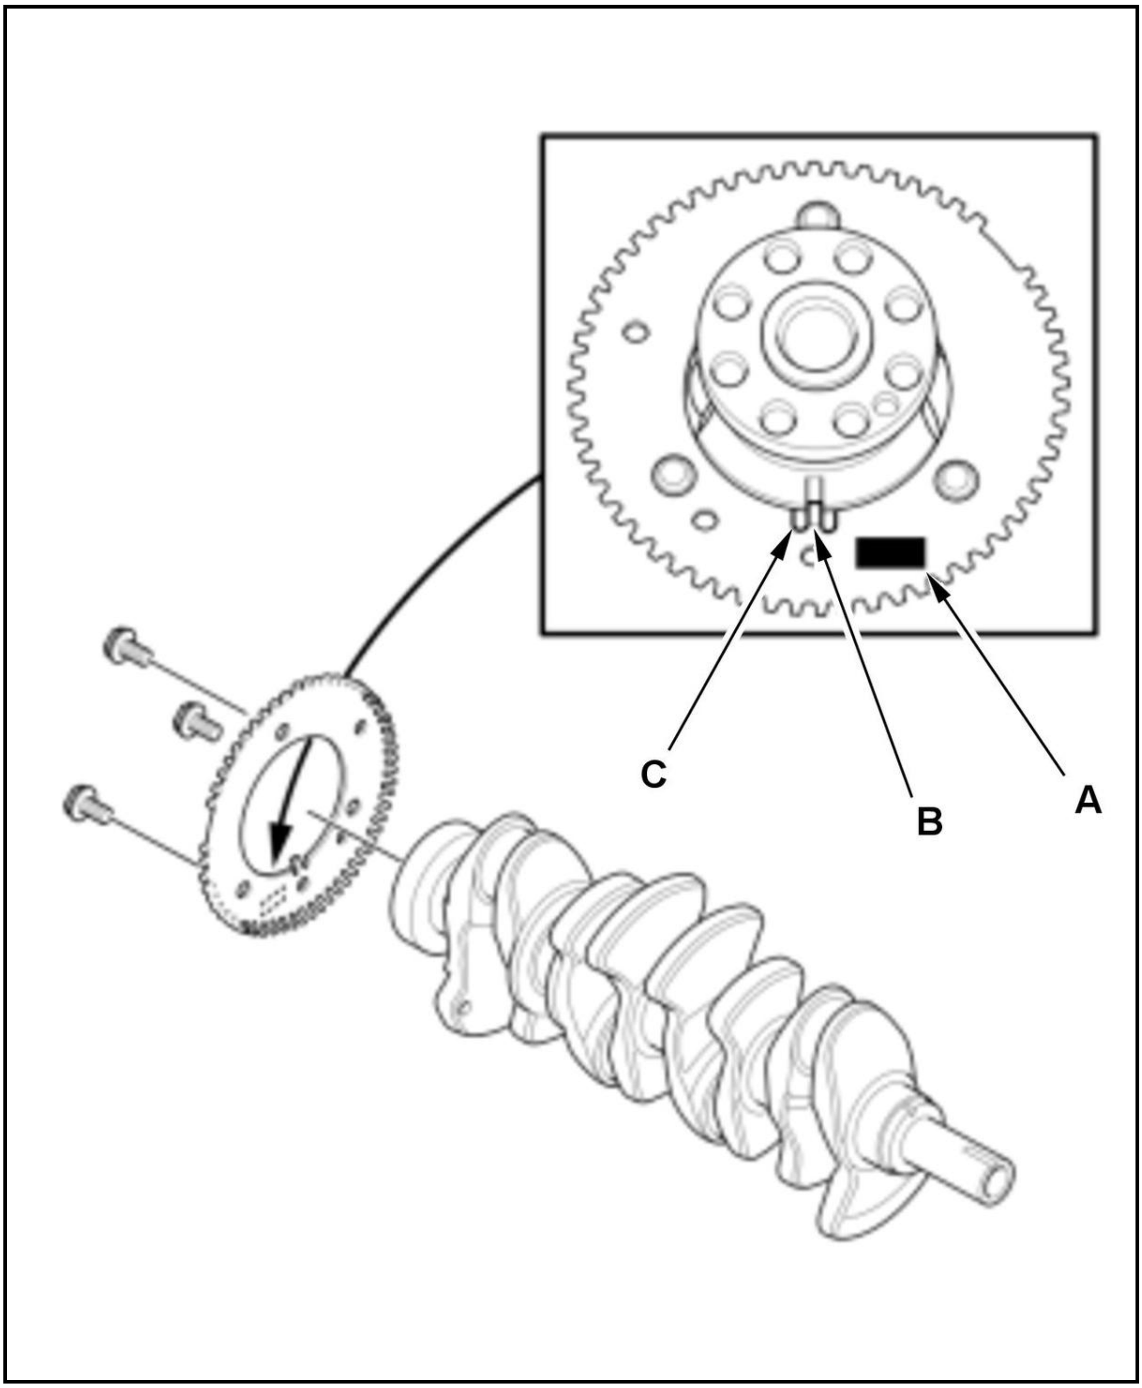
3. Rotate the rings in their grooves to make sure they do not bind.

4. Position the ring end gaps as shown.

3. Piston/Connecting Rod Assembly - Install

	1. Remove the connecting rod caps. Check that the bearing is securely in place. 2. Apply new engine oil to the piston, the inside of the ring compressor, and the cylinder bore, then attach the ring compressor to the piston/connecting rod assembly. 3. Position the mark (A) to face the cam chain side of the engine.
	4. Position the piston/connecting rod assembly in the cylinder, and tap it in using the wooden handle of a hammer (A). Push down on the ring compressor (B) to prevent the rings from expanding before entering the cylinder bore. 5. Stop after the ring compressor pops free, and check the connecting rod-to-rod journal alignment before pushing the piston into place.

4. **Oil Jet and Oil Jet Bolt - Install**
5. Main Bearing Clearance - Check
6. Sealing Bolt - Install (if necessary)
7. Drain Bolt - Install (if necessary)
8. L Side Cover - Install (if necessary)
9. CKP Pulse Plate - Install



NOTE:

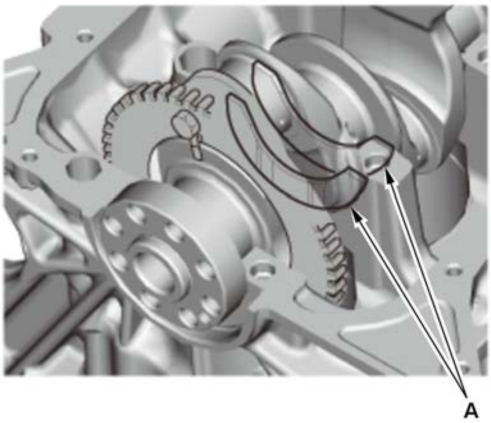
- Apply new engine oil to the threads and flange of the CKP pulse plate mounting bolts.
- Position the mark (A) facing it out side and align the portion (B) on the CKP pulse plate and groove (C) on the crankshaft.

10. Crankshaft - Install

NOTE:

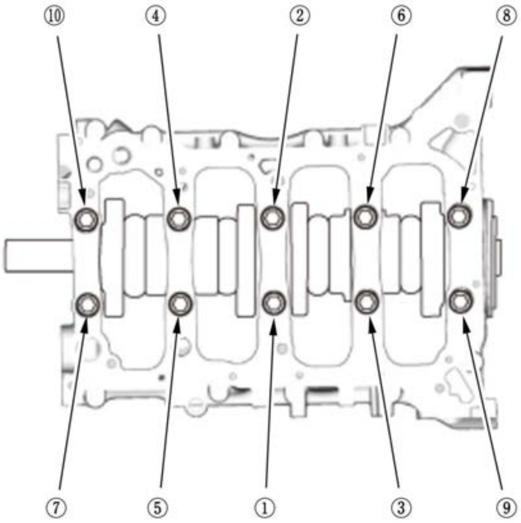
- Apply a coat of new engine oil to the main bearings and the connecting rod bearings.
- Hold the crankshaft so rod journal No. 2 and rod journal No. 3 are straight up, then lower the crankshaft into the engine block.

11. Thrust Washer - Install



1. Apply new engine oil to the thrust washer surfaces. Install the thrust washers (A) in the No. 4 journal of the engine block.

12. Lower Block and Bearing Half - Install

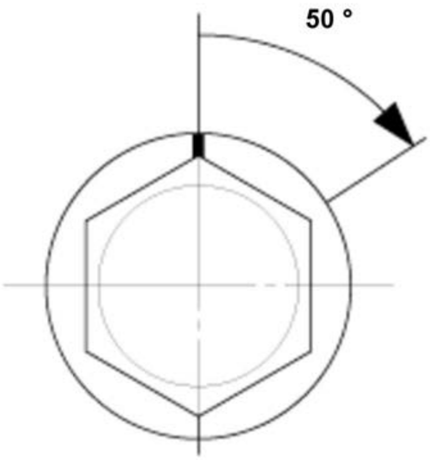


1. **Apply liquid gasket** to the engine block mating surface of the lower block, and to the inside edge of the threaded bolt holes.

2. Put the lower block on the engine block.

3. Apply new engine oil to the threads and flange of the bearing cap bolts.

4. Torque the bearing cap bolts, in sequence, to 30 N.m (3.1 kgf.m, 22 lbf.ft).



5. Tighten the bearing cap bolts an additional specified angle.

Specified Angle: 50B°

	6. Torque the 8 mm bolts, in sequence, to the specified torque.

13. Connecting Rod Bearing Clearance - Check
14. Connecting Rod Bearing Cap and Bearing Half - Install

	1. Measure the diameter of each connecting rod bolt at point A and point B. 2. Calculate the difference in diameter between point A and point B. **Point A-Point B = Difference in Diameter** 3. If the difference in diameter is out of tolerance, replace the connecting rod bolt.

Difference in Diameter

Specification:	**0-0.1 mm (0-0.004 in)**

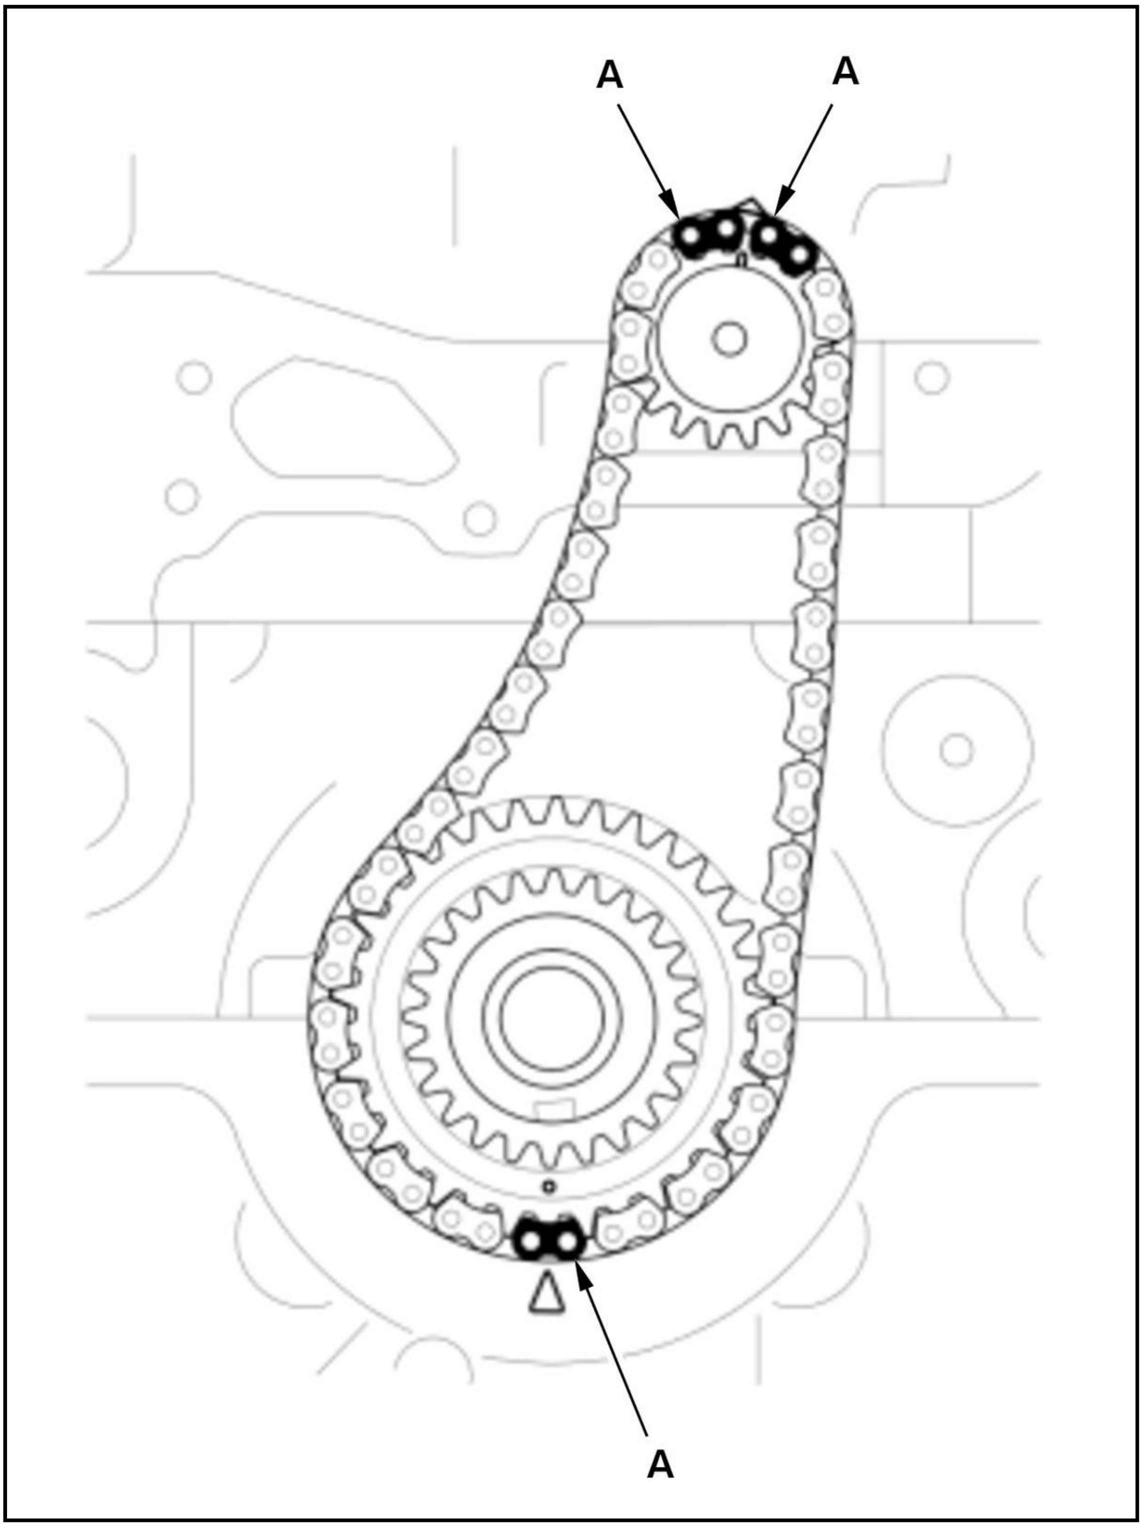
	4. Apply new engine oil to the threads and flanges of the connecting rod bolts and the bearing half. 5. Seat the rod journals into connecting rod No. 1 and connecting rod No. 4. Line up the mark (A) on the connecting rod and the bearing cap. 6. Install the bearing caps and the bolts finger-tight. 7. Rotate the crankshaft clockwise, and seat the journals into connecting rod No. 2 and connecting rod No. 3. Line up the mark on the connecting rod and the bearing cap. 8. Install the bearing caps and the bolts finger-tight. 9. Torque the connecting rod bolts to 20 N.m (2.0 kgf.m, 15 lbf.ft).

	10. Tighten the connecting rod bolts an additional 90B°. **NOTE:** Remove the connecting rod bolt if you tightened it beyond the specified angle, inspect the connecting rod bolts. Do not loosen it back to the specified angle.

15. Engine Block Heat Insulator - Install (if necessary)
16. Oil Control Orifice - Install (if necessary)
17. Crankshaft Sprocket - Install

	1. Install the crankshaft sprocket. 2. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the engine block.

18. Balancer Chain - Install



NOTE: These colored link plates (A) shall be used in product process only and not used for maintenance purpose. There is no need to line up the colored link plates as it has no effect on the engine operation.

19. Balancer Chain Guide - Install
20. Transmission End Crankshaft Oil Seal - Install
21. Balancer Shaft/Balancer Shaft Holder Assembly - Install
22. Oil Pan - Install
23. Cylinder Head - Install
24. Drive Plate - Install
25. Transmission (e-CVT) - Install
26. Engine - Install

Inspection

Connecting Rod and Crankshaft End Play Inspection

1. Connecting Rod - Inspect

	1. Measure the connecting rod end play with a feeler gauge (A) between the connecting rod (B) and the crankshaft (C). 2. If the connecting rod end play is beyond the service limit, install a new connecting rod, and recheck. If it is still beyond the service limit, replace the crankshaft.

Connecting Rod End Play	
Standard (New):	**0.15-0.35 mm (0.0059-0.0138 in)**
Service Limit:	**0.45 mm (0.0177 in)**

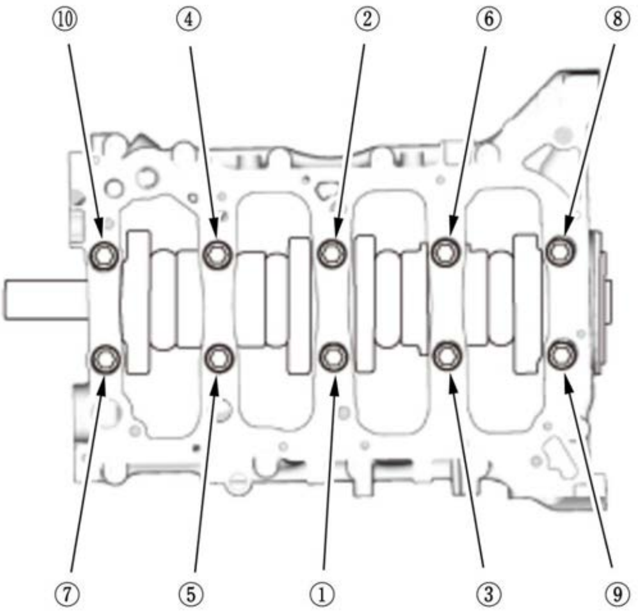
2. Crankshaft End Play - Inspect

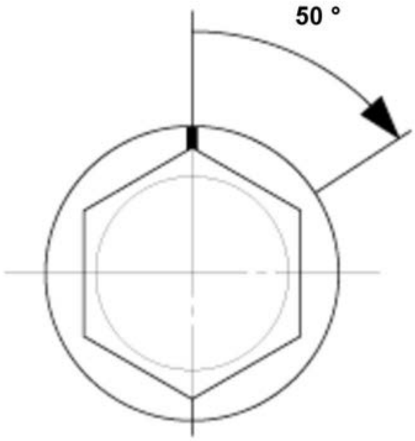
	1. Push the crankshaft firmly away from the dial indicator by prying, and zero the dial against the end of the crankshaft. Then pull the crankshaft firmly back toward the indicator by prying; the dial reading should not exceed the service limit. 2. If the crankshaft end play is beyond the service limit, replace the thrust washers and recheck, if it is still beyond the service limit, replace the crankshaft.

Crankshaft End Play	
Standard (New):	**0.10-0.35 mm (0.0039-0.0138 in)**
Service Limit:	**0.45 mm (0.0177 in)**

Main Bearing Clearance Inspection

1. Lower Block and Bearing Half - Remove
2. Main Bearing Clearance - Inspect





1. Clean each main journal and the bearing half with a clean shop towel.

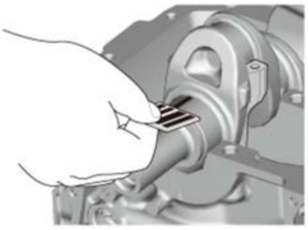
2. Place one strip of plastigage across each main journal.

3. Reinstall the main bearings and the lower block, then torque the bolts to 30 N.m (3.1 kgf.m, 22 lbf.ft).

NOTE:

- Apply new engine oil to the bolt threads and flanges.
- Do not rotate the crankshaft during inspection.

4. Tighten the bearing cap bolts an additional 50B°.



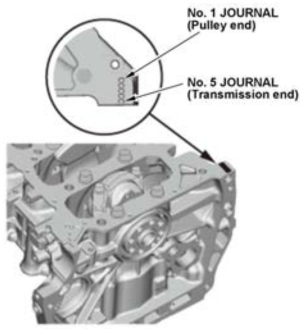
5. Remove the lower block and the bearings again, and measure the widest part of the plastigage.

6. If the plastigage measures too wide or too narrow, remove the crankshaft, and remove the upper half of the bearing. Install a new, complete bearing with the appropriate color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.

7. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

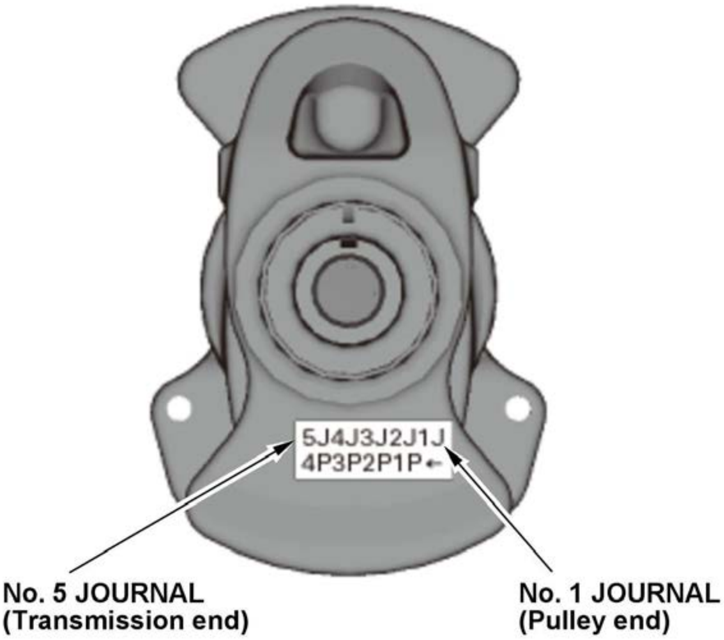
Main Bearing-to-Journal Oil Clearance	
Standard (New):	**0.017-0.035 mm (0.00067-0.00138 in)**
Service Limit:	**0.045 mm (0.00177 in)**

3. Crankshaft Main Bearing - Select



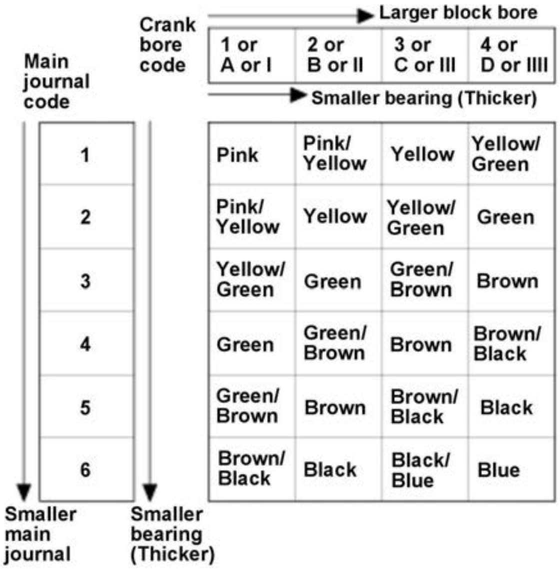
Crankshaft Bore Code Location

1. Numbers, letters, or bars have been stamped on either side of the lower block end as a code for the size of each of the five main journal bores. Write down the block bore codes. If you cannot read the codes because of accumulated dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.



Main Journal Code Location

2. The main journal codes are stamped on the crankshaft.



Crank bore code: → Larger block bore; → Smaller bearing (Thicker)

Main journal code: ↓ Smaller main journal; ↓ Smaller bearing (Thicker)

Main journal code	1 or A or I	2 or B or II	3 or C or III	4 or D or IIII
1	Pink	Pink/ Yellow	Yellow	Yellow/ Green
2	Pink/ Yellow	Yellow	Yellow/ Green	Green
3	Yellow/ Green	Green	Green/ Brown	Brown
4	Green	Green/ Brown	Brown	Brown/ Black
5	Green/ Brown	Brown	Brown/ Black	Black
6	Brown/ Black	Black	Black/ Blue	Blue

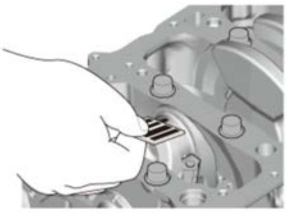
3. Use the block bore codes and the main journal codes to select the appropriate replacement bearings from the following table.

NOTE:

- Color code is on the edge of the bearing.
- When using bearing halves of different colors, it does not matter which color is used in the top or bottom.

Connecting Rod Bearing Clearance Inspection

1. Connecting Rod Bearing Cap and Bearing Half - Remove
2. Connecting Rod Bearing Clearance - Inspect



1. Clean the connecting rod journal and the bearing half with a clean shop towel.

2. Place plastigage across the rod journal.

3. Reinstall the bearing half and the cap, then torque the bolts to 20 N.m (2.0 kgf.m, 15 lbf.ft) +90B°.

NOTE:

- Apply new engine oil to the bolt threads and flanges.
- Do not rotate the crankshaft during inspection.

4. Remove the connecting rod bearing cap and the bearing half, and measure the widest part of the plastigage.

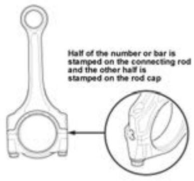
Connecting Rod Bearing-to-Journal Oil Clearance

5. If the plastigage measures too wide or too narrow, remove the cap, and the upper half of the bearing. Install a new, complete bearing with the appropriate color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.

6. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check the clearance again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

Standard (New):	**0.024-0.042 mm (0.00094-0.00165 in)**

3. Connecting Rod Bearing - Select



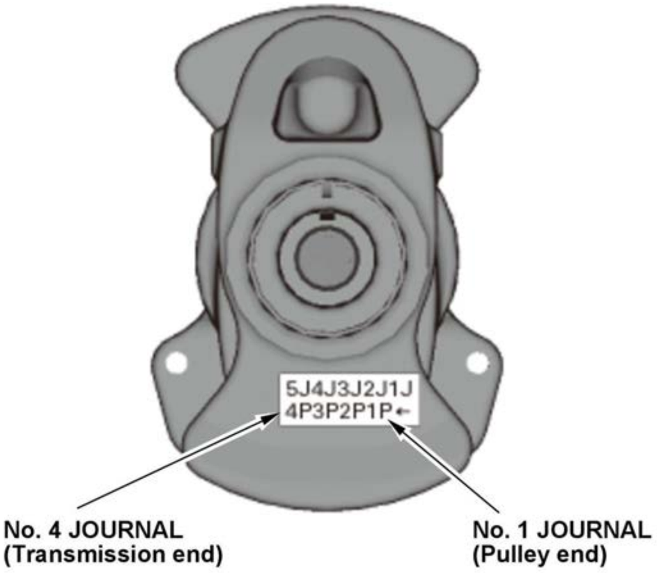
Half of the number or bar is stamped on the connecting rod and the other half is stamped on the rod cap
3

1. Inspect each connecting rod for cracks and heat damage.

Big End Bore Code Locations

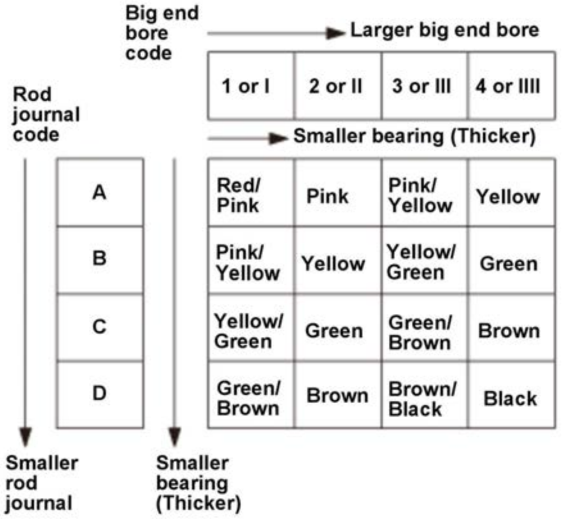
2. Each connecting rod has a tolerance range from 0 to 0.024 mm (0.00094 in), in 0.006 mm (0.00024 in) increments, depending on the size of its big end bore. It's then stamped with a number or bar (1, 2, 3, or 4/l, ll, lll, or llll) indicating the range. You may find any combination of numbers and bars in any engine. (Half the number or bar is stamped on the rod cap, the other half is on the connecting rod.) If you cannot read the code because of an accumulation of oil and varnish, do not scrub it with a wire brush or scraper. Clean it only with solvent or detergent.

Big End Bore Size:	**48.0 mm (1.890 in)**



Connecting Rod Journal Code Location

3. The connecting rod journal codes are stamped on the crankshaft in either location.



Big end bore code → Larger big end bore

→ Smaller bearing (Thicker)

Rod journal code	1 or I	2 or II	3 or III	4 or IIII
A	Red/ Pink	Pink	Pink/ Yellow	Yellow
B	Pink/ Yellow	Yellow	Yellow/ Green	Green
C	Yellow/ Green	Green	Green/ Brown	Brown
D	Green/ Brown	Brown	Brown/ Black	Black

↓ Smaller rod journal

↓ Smaller bearing (Thicker)

4. Use the big end bore codes and the rod journal codes to select appropriate replacement bearings from the following table.

NOTE:

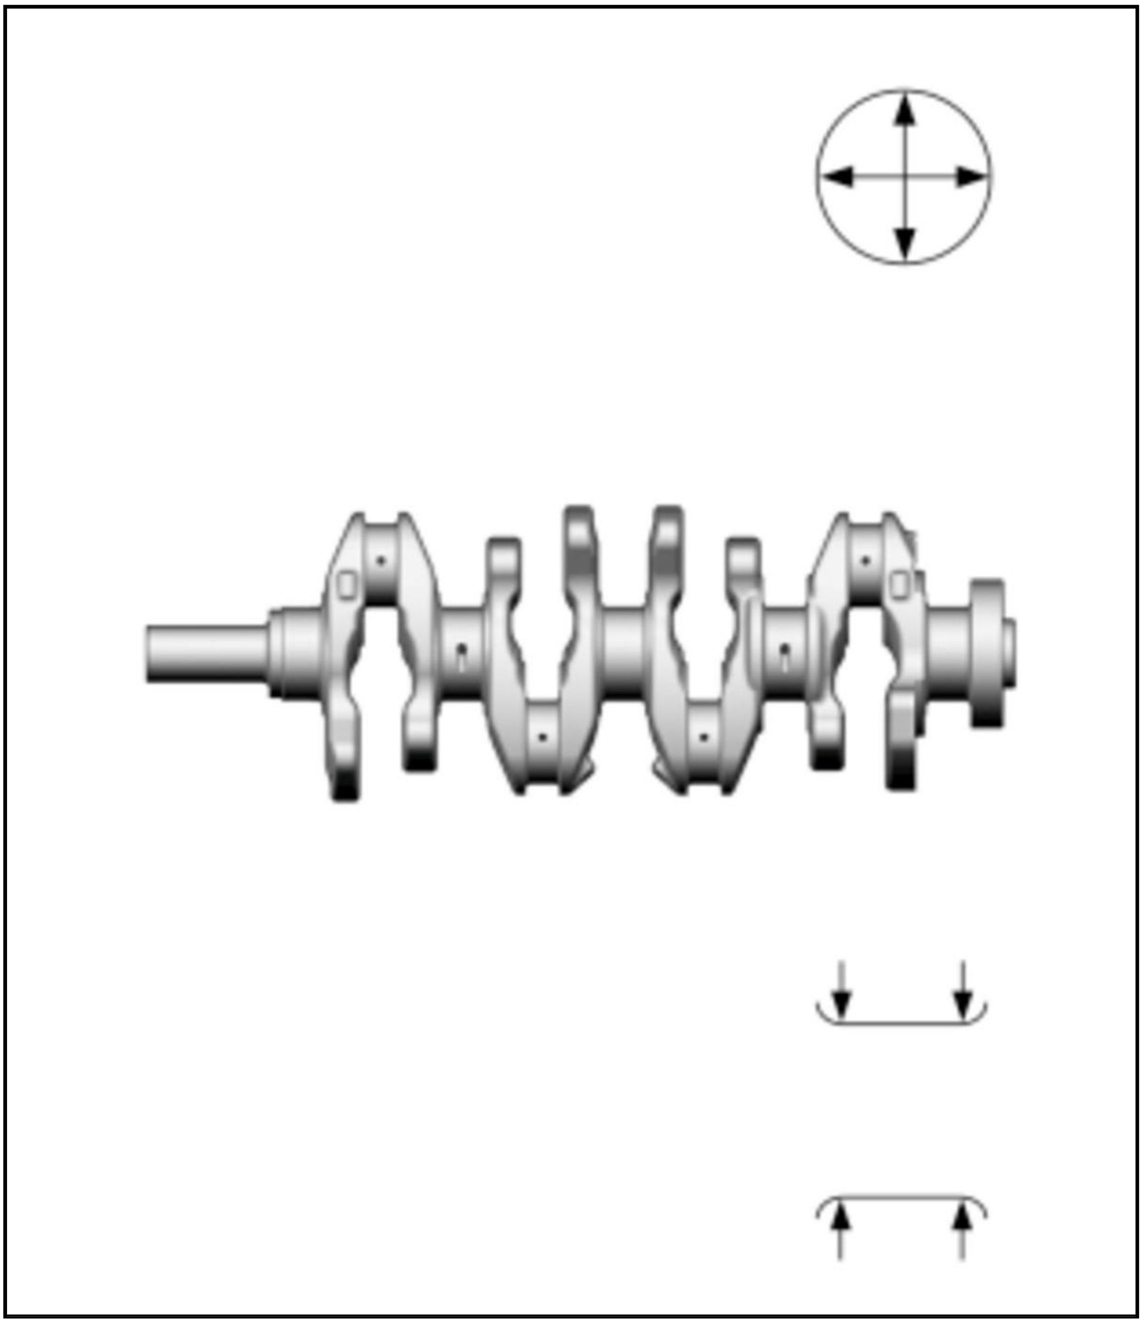
- Color code is on the edge of the bearing.
- When using bearing halves of different colors, it does not matter which color is used in the top or bottom.

Crankshaft Inspection

1. Crankshaft - Inspect

Out-of-Round and Taper

1. Clean the crankshaft oil passages with pipe cleaners or a suitable brush.



2. Check the keyway slot and the threaded holes.

3. Measure the out-of-round at the middle of each rod and main journal in two places. The difference between measurements on each journal must not be more than the service limit.

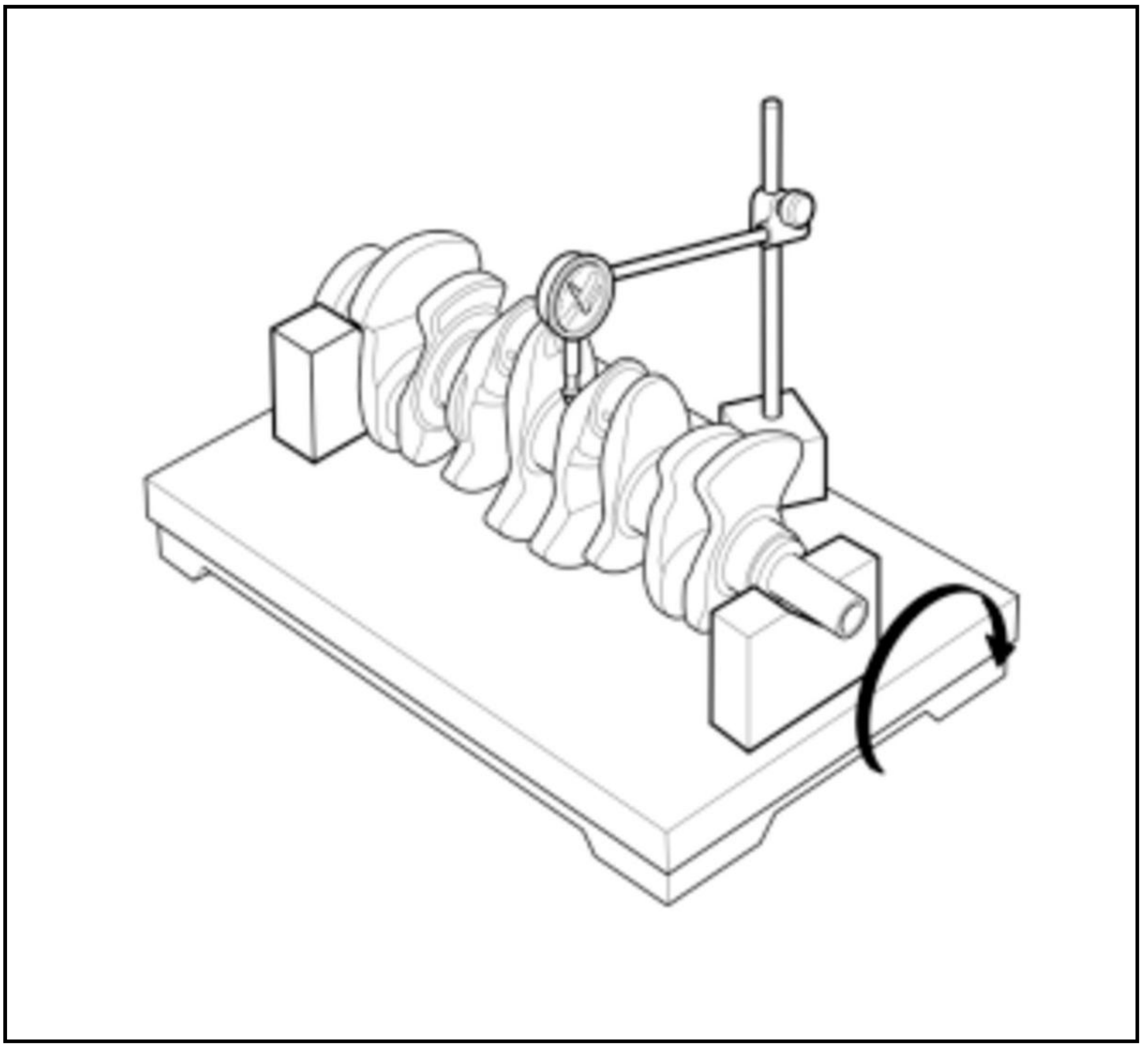
Journal Out-of-Round	
Standard (New):	**0.005 mm (0.00020 in) max.**
Service Limit:	**0.010 mm (0.00039 in)**

4. Measure the taper at the edges of each rod and the main journal. The difference between measurements on each journal must not be more than the service limit.

Journal Taper	
Standard (New):	**0.005 mm (0.00020 in) max.**
Service Limit:	**0.010 mm (0.00039 in)**

Straightness

5. Place the V-blocks on a flat surface.



6. Check the total runout with the crankshaft supported on V-blocks.

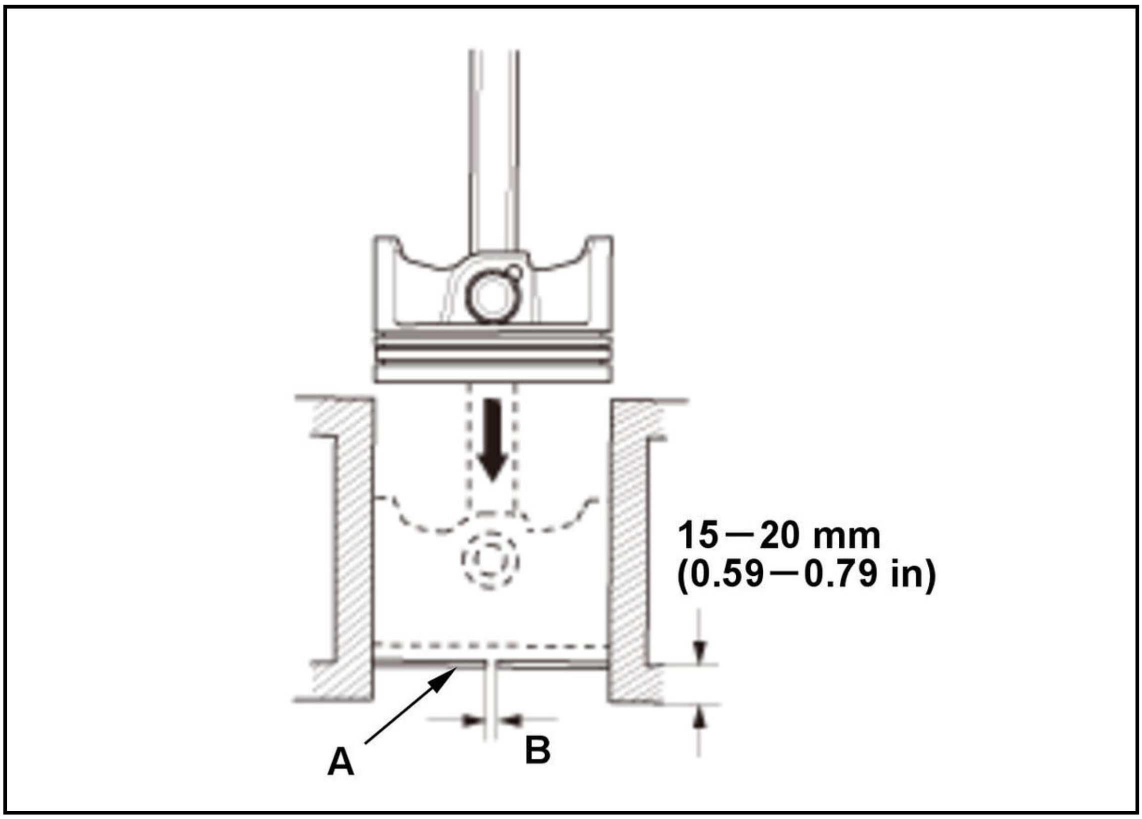
7. Measure the runout on all of the main journals. Rotate the crankshaft two complete revolutions. The difference between measurements on each journal must not be more than the service limit.

Crankshaft Total Runout	
Standard (New):	**0.03 mm (0.0012 in)**
Service Limit:	**0.04 mm (0.0016 in)**

Piston, Ring, Pin, and Connecting Rod Inspection

1. Piston Ring End Gap - Inspect

1. Using a piston that has its rings removed, push a new ring (A) into the cylinder bore 15-20 mm (0.59-0.79 in) from the bottom.



2. Measure the piston ring end-gap (B) with a feeler gauge:

- If the gap is too small, check to see if you have the proper rings for your engine.
- If the gap is too large, recheck the cylinder bore diameter against the wear limits. If the bore is beyond the service limit, the engine block must be rebored.

Piston Ring End-Gap	
Top Ring	
Standard (New):	**0.20-0.30 mm (0.0079-0.0118 in)**
Service Limit:	**0.60 mm (0.0236 in)**
Second Ring	
Standard (New):	**0.30-0.42 mm (0.0118-0.0165 in)**
Service Limit:	**0.70 mm (0.0276 in)**
Oil Ring	
Standard (New):	**0.20-0.50 mm (0.0079-0.0197 in)**
Service Limit:	**0.80 mm (0.0315 in)**

2. Piston Pin - Inspect

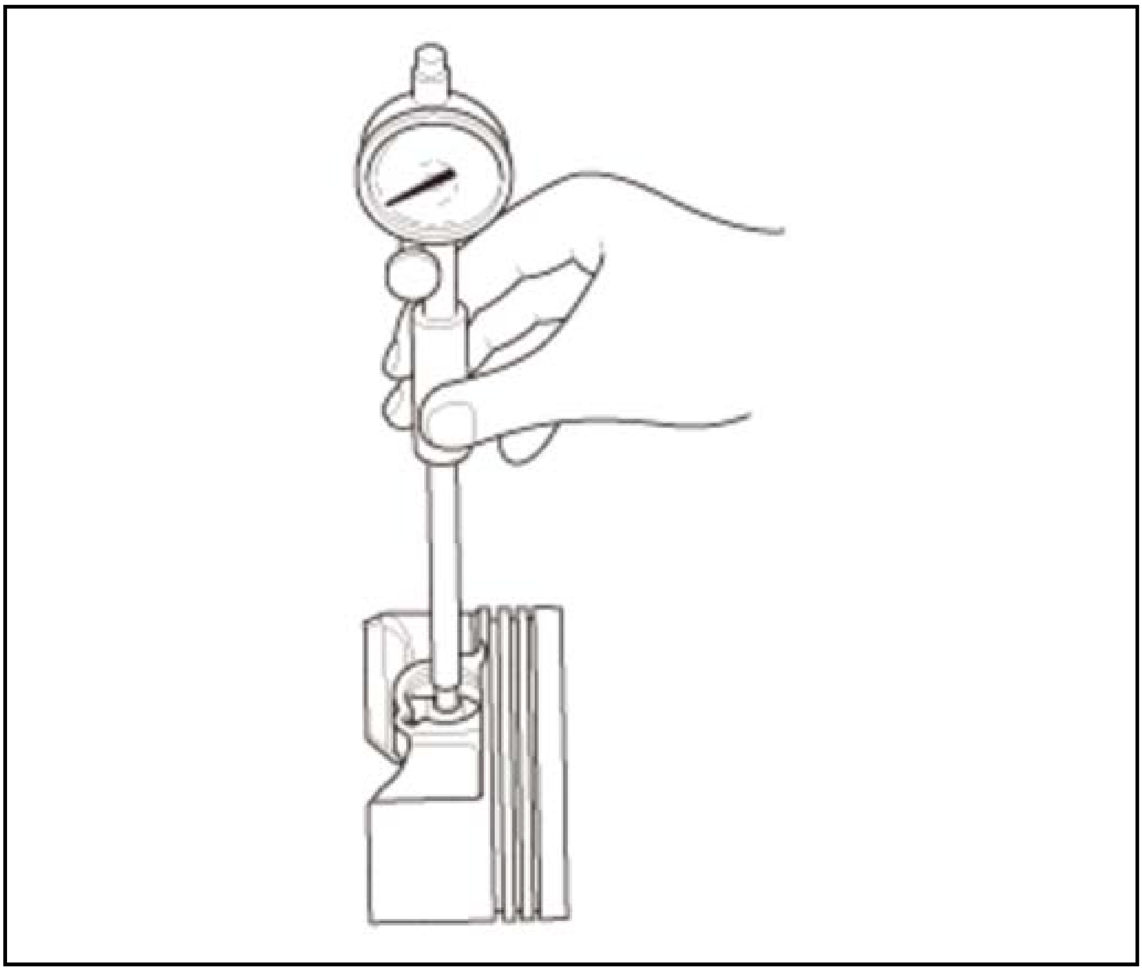
1. Measure the diameter of the piston pin.

Piston Pin Diameter	
Standard (New):	**17.960-17.964 mm (0.70709-0.70724 in)**
Service Limit:	**17.960 mm (0.70709 in)**

	2. Zero the dial indicator (A) to the piston pin diameter.

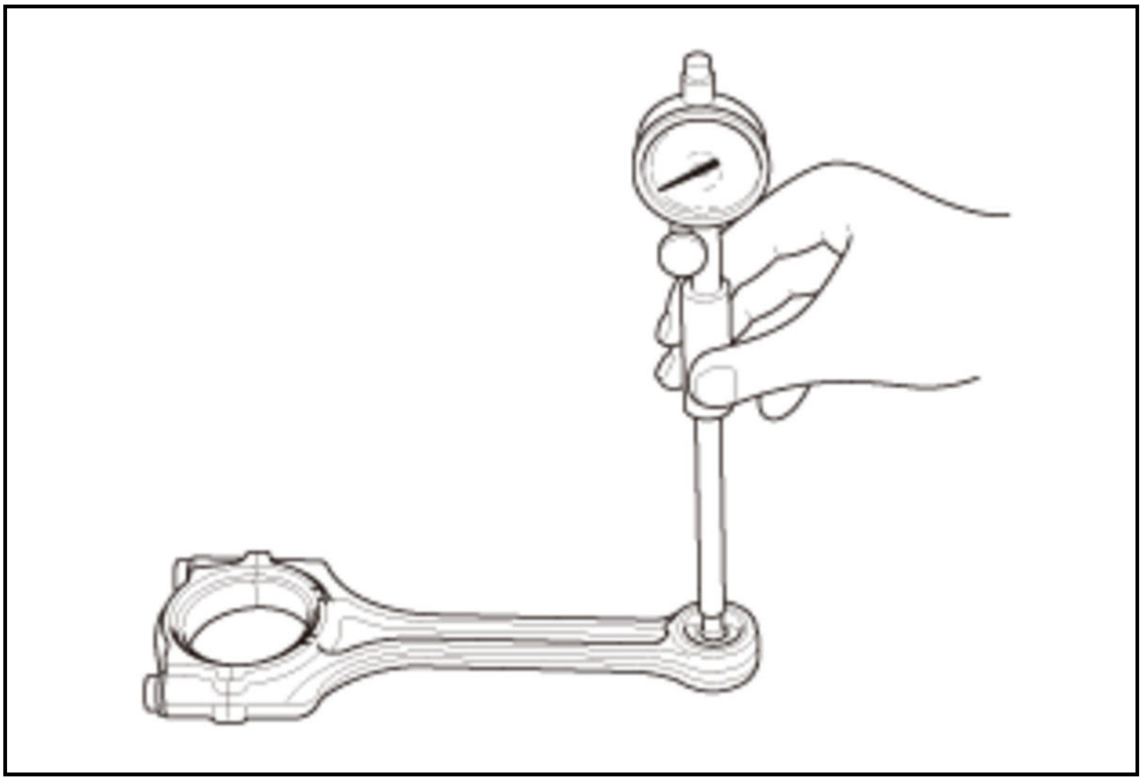
3. Check the difference between the piston pin diameter and the piston pin hole diameter in the piston.

Piston Pin-to-Piston Clearance	
Standard (New):	**-0.004-0.003 mm (-0.00016-0.00012 in)**
Service Limit:	**0.006 mm (0.00024 in)**



4. Measure the piston pin-to-connecting rod clearance.

Piston Pin-to-Connecting Rod Clearance	
Standard (New):	**0.004-0.016 mm (0.00016-0.00063 in)**
Service Limit:	**0.020 mm (0.00079 in)**

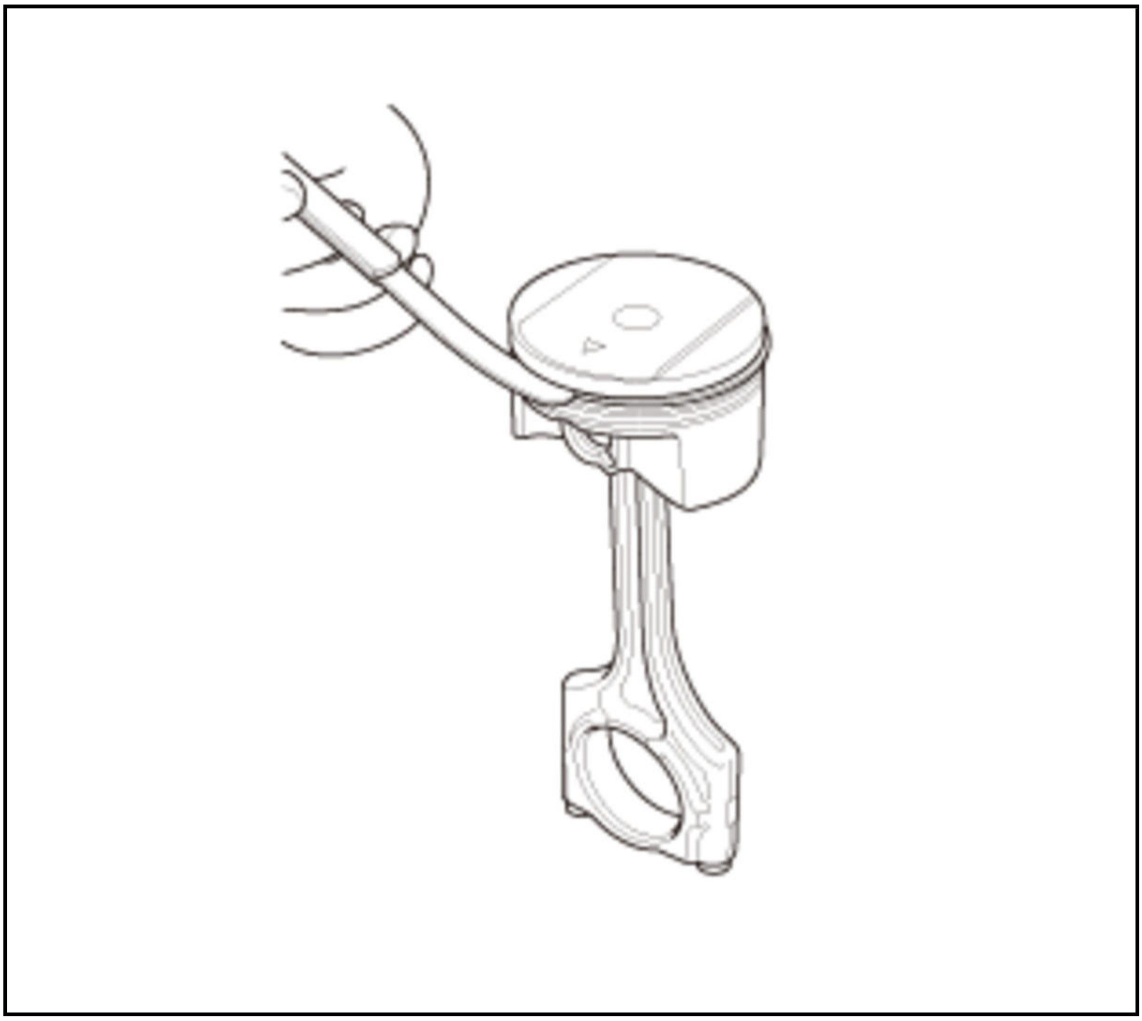


3. Piston Ring-to-Piston Ring Groove Clearance - Inspect

1. After installing a new set of rings, measure the ring-to-groove clearances:

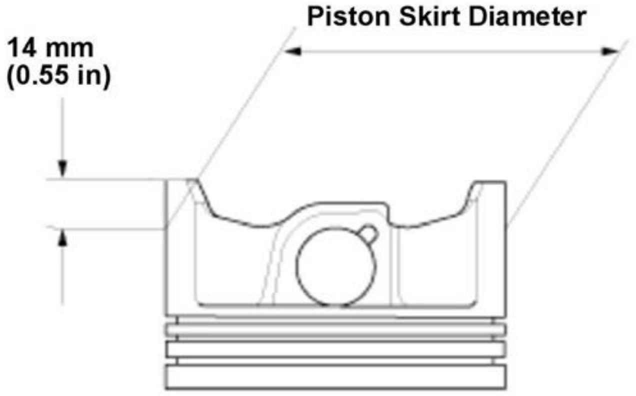
Top Ring Clearance	
Standard (New):	**0.045-0.085 mm (0.00177-0.00335 in)**
Service Limit:	**0.165 mm (0.00650 in)**

Second Ring Clearance	
Standard (New):	**0.030-0.055 mm (0.00118-0.00217 in)**
Service Limit:	**0.125 mm (0.00492 in)**

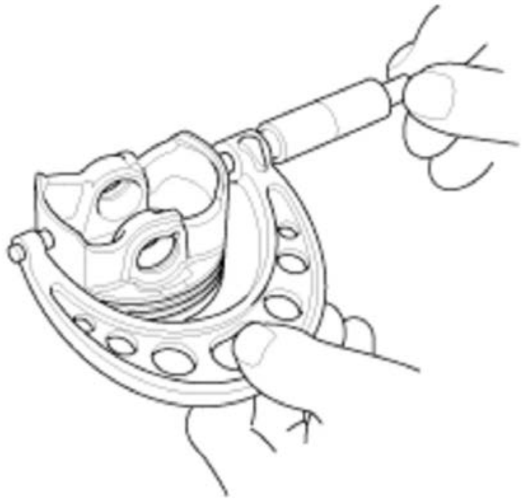


Block and Piston Inspection

1. Block and Piston - Inspect



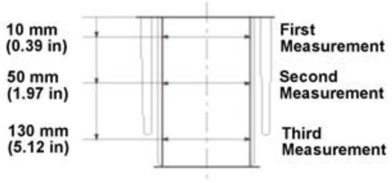
Piston Skirt Diameter
14 mm
(0.55 in)



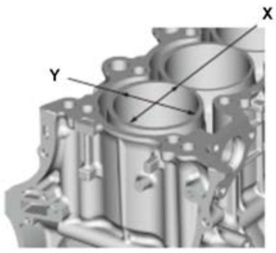
1. Check the pistons for distortion or cracks.

2. Measure the piston skirt diameter at a point 14 mm (0.55 in) from the bottom of the skirt.

Piston Skirt Diameter	
Service Limit:	**80.93 mm (3.1862 in)**
Oversize Piston 0.25 mm (0.0098 in) Skirt Diameter	
Service Limit:	**81.18 mm (3.1961 in)**



10 mm
(0.39 in)
First
Measurement
50 mm
(1.97 in)
Second
Measurement
130 mm
(5.12 in)
Third
Measurement



3. Measure the wear and taper in direction X and Y at three levels inside each cylinder as shown. If measurements in any cylinder are beyond the oversize bore service limit, replace the engine block.

4. Hone any cored or scratched cylinder bores if needed.

Bore Taper	B
Limit:	**(Difference between first and third measurement) 0.050 mm (0.00197 in)**

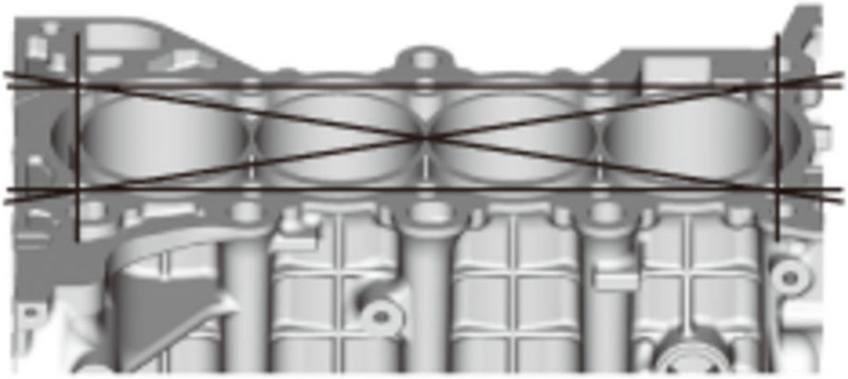
Reboring limit:	**0.25 mm (0.0098 in) max.**

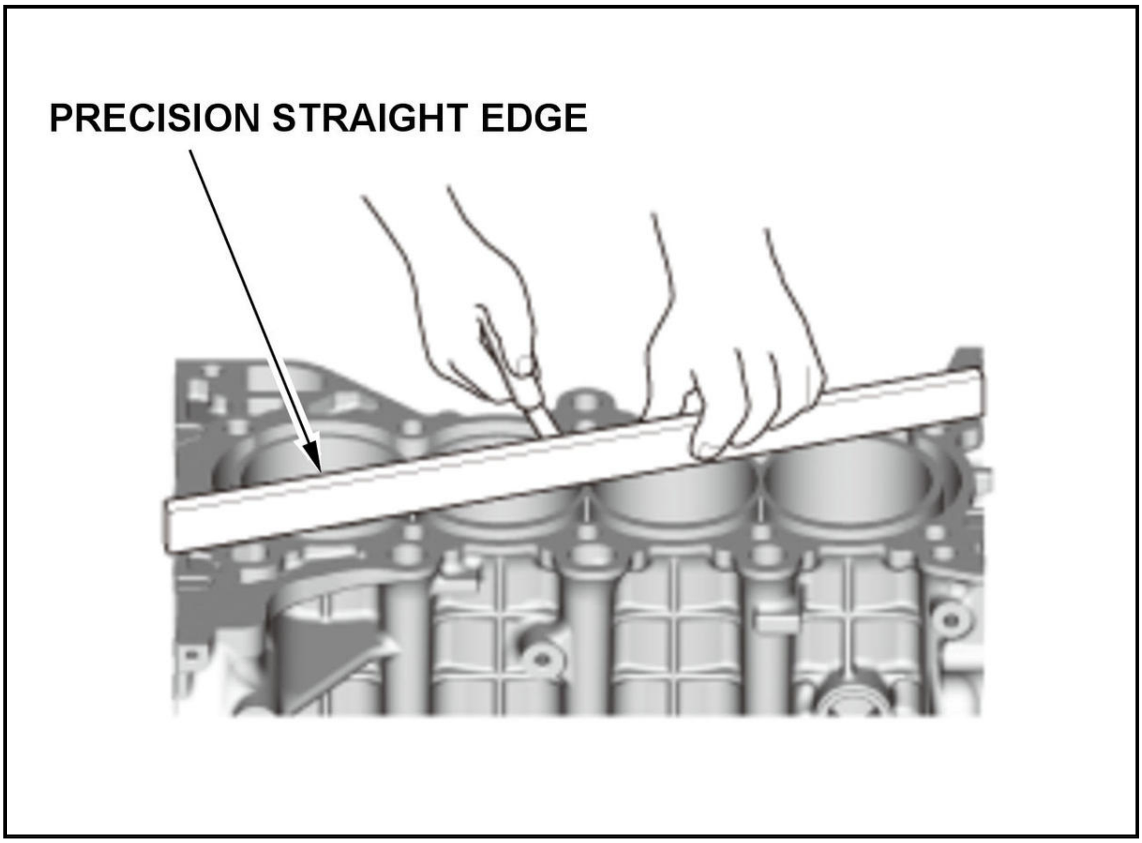
Oversize Bore	
Oversize Bore:	**+ 0.25 mm (0.0098 in)**

Cylinder Bore Size	
Standard (New):	
X:	**81.000-81.020 mm (3.18897-3.18976 in)**
Y:	**81.000-81.015 mm (3.18897-3.18956 in)**
Service Limit:	**81.070 mm (3.19173 in)**

5. Check the top of the engine block for warpage. Measure along the edges and across the center as shown.

Engine Block Warpage	
Standard (New):	**0.07 mm (0.0028 in) max.**

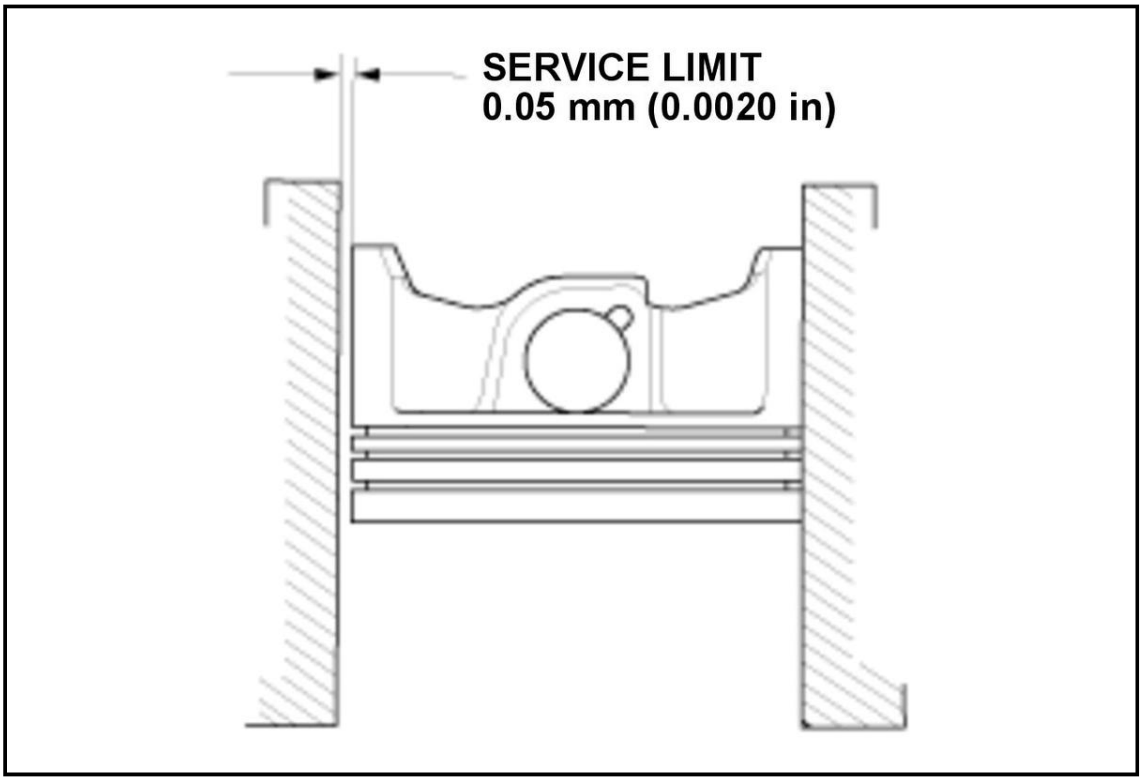




PRECISION STRAIGHT EDGE

6. Calculate the difference between the cylinder bore diameter and the piston diameter. If the clearance is near, or exceeds the service limit, inspect the piston and the cylinder bore for excessive wear.

Piston-to-Cylinder Bore Clearance	
Service Limit:	**0.050 mm (0.00197 in)**



SERVICE LIMIT
0.05 mm (0.0020 in)

Honing

1. Oil Jet - Remove
2. Cylinder Bore - Honing

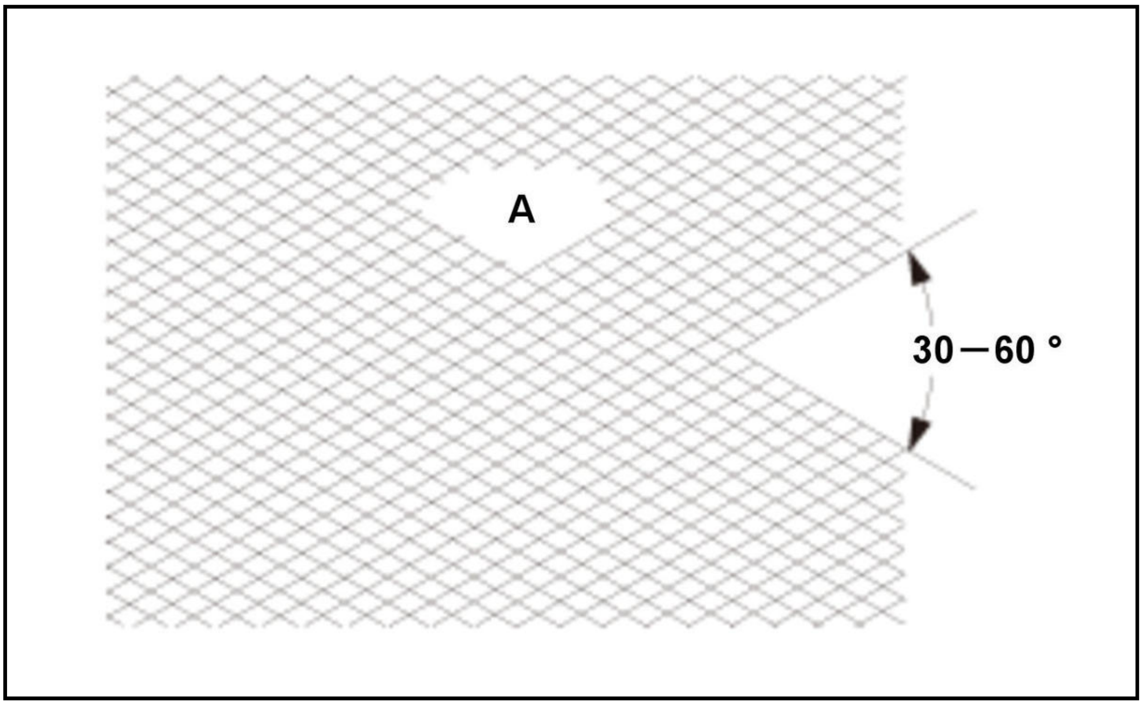
1. Measure the cylinder bores. If the engine block is to be reused, hone the cylinders and remeasure the bores. Only scored or scratched cylinder bore must be honed.

2. Hone the cylinder bores with honing oil and a fine (400 grit) stone.

NOTE:

- Use only a rigid hone with 400 grit or finer stone such as Sunnen, Ammco, or equivalent.
- Do not use stones that are worn or broken.

Honing Pattern:	**Within 30-60 degree cross-hatch pattern (A)**



3. When honing is complete, thoroughly clean the engine block of all metal particles. Wash the cylinder bores with hot soapy water, then dry and oil them immediately to prevent rusting.

NOTE: Never use solvent, it will only redistribute the grit on the cylinder walls.

4. If scoring or scratches are still present in the cylinder bores after honing to the service limit, rebore the engine block. Some light vertical scoring and scratching is acceptable if it is not deep enough to catch your fingernail and does not run the full length of the bore.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

REMOVAL AND INSTALLATION

A/F SENSOR REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	O2 Sensor Wrench Snap-on S6176 or equivalent, commercially available

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

*1	These parts have inspection items

Intake Air Resonator

1. Air Intake Tube C - Remove
2. Air Intake Tube A - Remove
3. Intake Air Resonator - Remove

   Air Cleaner

4. Air Intake Tube B - Remove
5. Intake Air Resonator Bracket - Remove
6. Harness Holder - Remove
7. Breather Pipe - Move

   NOTE: Do not disconnect the water bypass hoses.

8. Air Cleaner - Remove
9. Air Cleaner Housing Cover - Remove
10. Air Cleaner Element - Remove

Note for installation

NOTE: **If the idle speed fluctuates, do the idle speed inspection** .

11. Air Cleaner Tube - Remove
12. Umbrella Valve - Remove
13. Throttle Body Rubber Joint - Remove
14. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

15. Maintenance Minder - Reset

1. If the Maintenance Minder required to replace the air cleaner element, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").

Inspection

1. Air Cleaner Element - Inspect

1. Check the air cleaner element for damage or clogging. If it is damaged or clogged, replace it.

NOTE: Do not use compressed air to clean the air cleaner element.

2. Clean and remove any debris from inside the air cleaner.

BALANCER SHAFT/BALANCER SHAFT HOLDER ASSEMBLY REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Pin Driver, 6.0 mm 07744-0010500

Removal

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

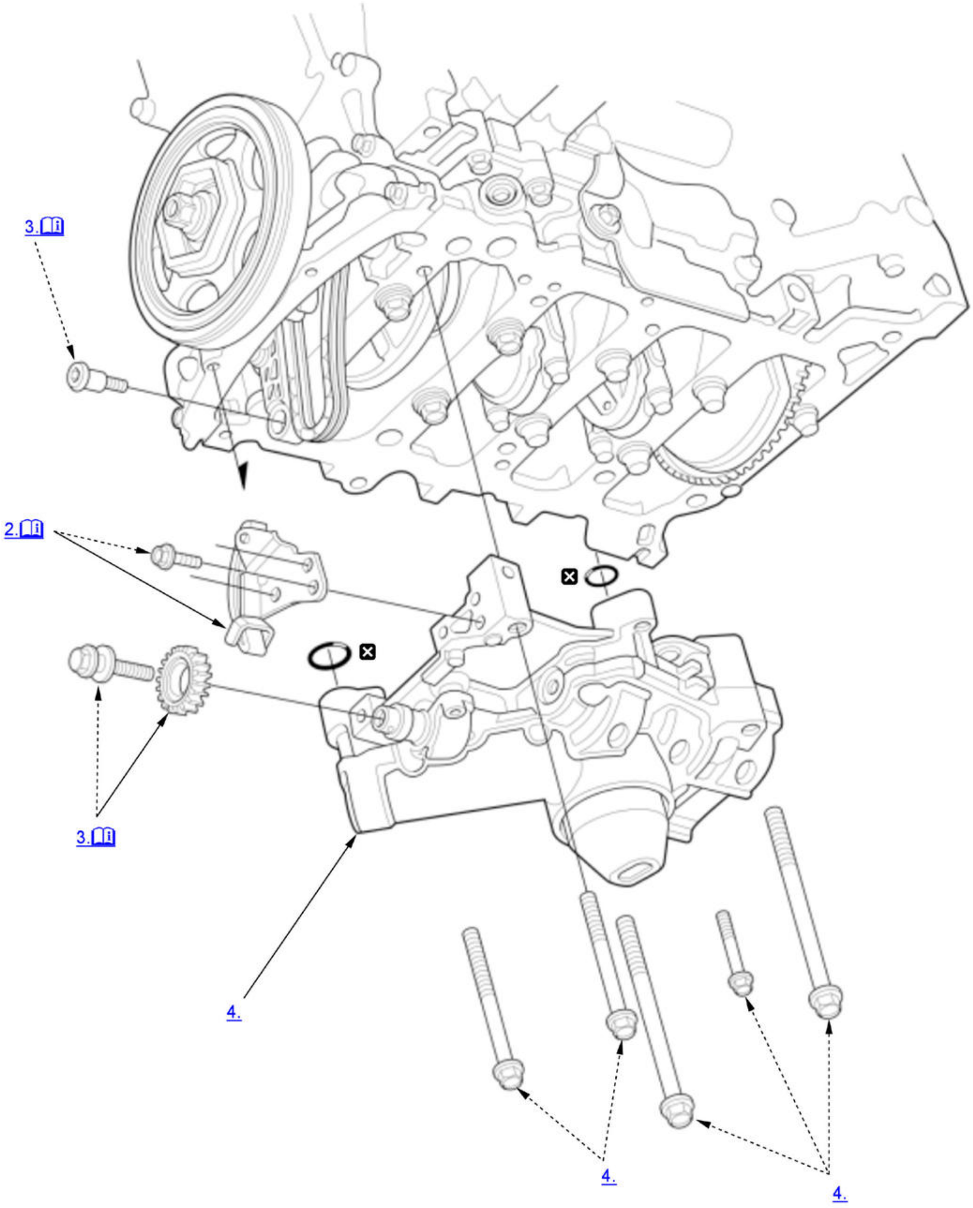

Fig. 11: Exploded View Of Balancer Shaft/Balancer Shaft Holder Assembly Removal Components
Courtesy of HONDA, U.S.A., INC.

☒	Replace

1. Oil Pan - Remove
2. Balancer Chain Tensioner - Remove

	1. Turn the crankshaft to align No. 1 position at top dead center (TDC); the white mark (A) on the crankshaft pulley lines up with the pointer (B). 2. Remove and discard the balancer chain tensioner.

3. Balancer Shaft Sprocket - Remove

	1. To hold the rear balancer shaft, insert a pin driver, 6.0 mm into the maintenance hole in the lower balancer shaft holder and through the rear balancer shaft. 2. Loosen the balancer shaft sprocket mounting bolt. 3. Remove the balancer chain guide mounting bolt (A), then remove the balancer shaft sprocket mounting bolt and the balancer shaft sprocket.

4. Balancer Shaft/Balancer Shaft Holder Assembly - Remove

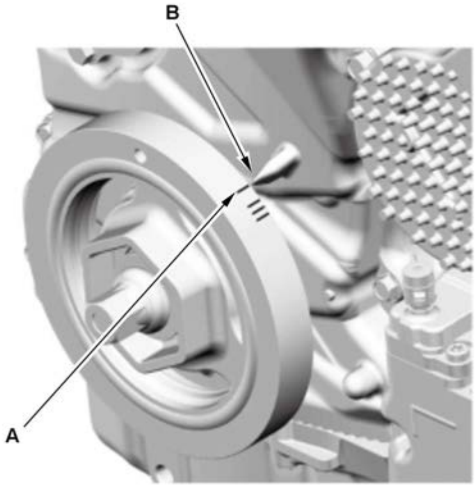
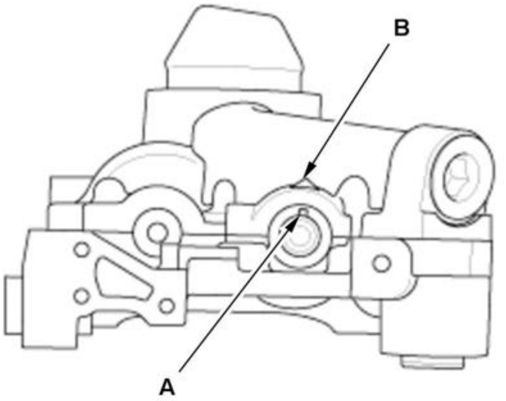
▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

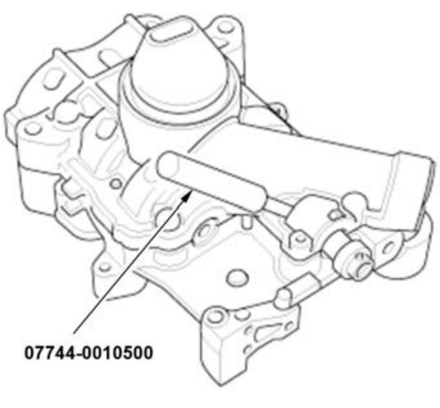
1. Balancer Shaft Sprocket and Balancer Shaft/Balancer Shaft Holder Assembly - Install



1. Turn the crankshaft to align No. 1 position at top dead center (TDC); the white mark (A) on the crankshaft pulley lines up with the pointer (B).



2. Align the dowel pin (A) on the rear balancer shaft with the mark (B) on the balancer shaft holder.



3. To hold the rear balancer shaft, insert a pin driver, 6.0 mm into the maintenance hole in the lower balancer shaft holder and through the rear balancer shaft.

 	4. Apply new engine oil to the threads of the balancer shaft sprocket mounting bolt (A). 5. Loosely install the balancer shaft/balancer shaft holder assembly (B) with the O-rings (C), then install the balancer shaft sprocket (D). **NOTE:** These colored link plates (E) shall be used in product process only and not used for maintenance purpose. There is no need to line up the colored link plates as it has no effect on the engine operation. 6. Remove the pin driver, 6.0 mm, then tighten the balancer shaft/balancer shaft holder assembly mounting bolts. 7. Tighten the balancer chain guide mounting bolt (F).

2. Balancer Chain Tensioner - Install

	1. Squeeze the new balancer chain tensioner (A), then install the set clip (B) on it as shown. **NOTE:** The set clip is supplied with the balancer chain tensioner.

	2. Install the new balancer chain tensioner. 3. Remove the set clip from the balancer chain tensioner.

3. Oil Pan - Install

CMP SENSOR/CKP SENSOR REMOVAL AND INSTALLATION

Removal and Installation

CMP Sensor A, CMP Sensor B

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	Coat the clean engine oil

1. **Engine Undercover Lid - Remove**
2. CKP Sensor Cover - Remove
3. CKP Sensor - Remove
4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

5. **CKP Pattern - Clear/Learn**

CRANKSHAFT PULLEY, CAM CHAIN, AND OIL PUMP REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Holder Attachment, 50 mm, Offset 07MAB-PY3010A or 07MAB-PY3010B
	Socket, 19 mm 07JAA-001020A or equivalent
	Holder Handle 07JAB-001020B
	Oil Seal Driver 07LAD-PT3010A

Removal

NOTE: Keep the cam chain away from magnetic fields.

Crankshaft Pulley

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

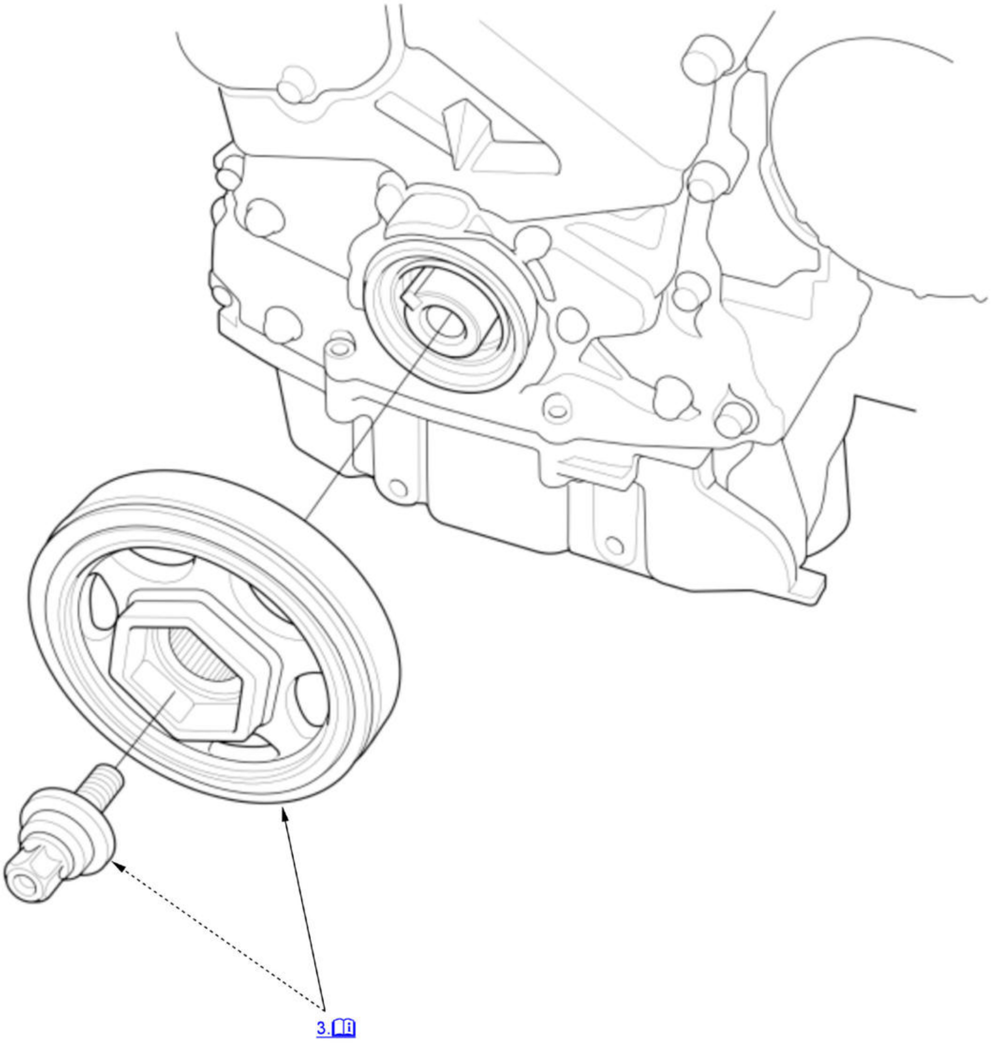

Fig. 15: Exploded View Of Crankshaft Pulley Components For Removal
Courtesy of HONDA, U.S.A., INC.

1. Right Front Wheel - Remove
2. Engine Undercover - Remove

   NOTE: Remove the necessary part(s).

3. Crankshaft Pulley - Remove

 07JAA-001020A (or commercially available) 07JAB-001020B 07MAB-PY3010A	1. Hold the crankshaft pulley with the holder handle and the holder attachment, 50 mm, offset. 2. Remove the pulley bolt with a socket, 19 mm and a breaker bar, then remove the crankshaft pulley.

Oil Pump, Pulley End Crankshaft Oil Seal, and Cam Chain

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

Courtesy of HONDA, U.S.A., INC.

☒	Replace
*1	These parts have inspection items

1. 12 Volt Battery Terminal - Disconnect
2. Right Front Wheel - Remove
3. Engine Undercover - Remove

   NOTE: Remove the necessary part(s).

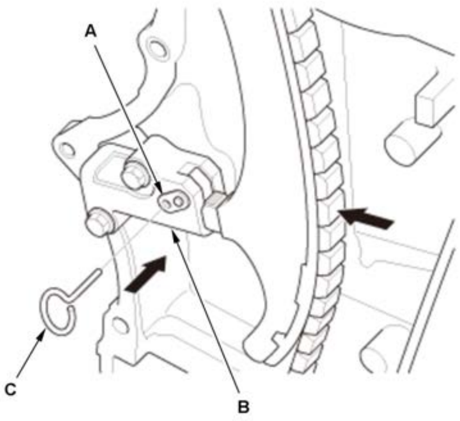
4. Crankshaft Pulley - Remove
5. Cylinder Head Cover - Remove
6. Electric VTC Motor - Remove
7. Side Engine Mount - Remove
8. Chain Case Cover - Remove (if necessary)
9. Oil Pump - Remove
10. Pulley End Crankshaft Oil Seal - Remove (if necessary)

    NOTE: Check the pulley end crankshaft oil seal for damage. If the pulley end crankshaft oil seal is damaged, remove the pulley end crankshaft oil seal.

11. Cam Chain Auto-Tensioner - Remove

	1. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the engine block.

	2. Align the mark (A) on the VTC actuator with the mark (C) on cam chain guide B.
	3. Align the mark (A) on the exhaust camshaft sprocket with the mark (C) on cam chain guide B.
	4. Loosely install the crankshaft pulley. 5. Turn the crankshaft counterclockwise to compress the cam chain auto-tensioner.

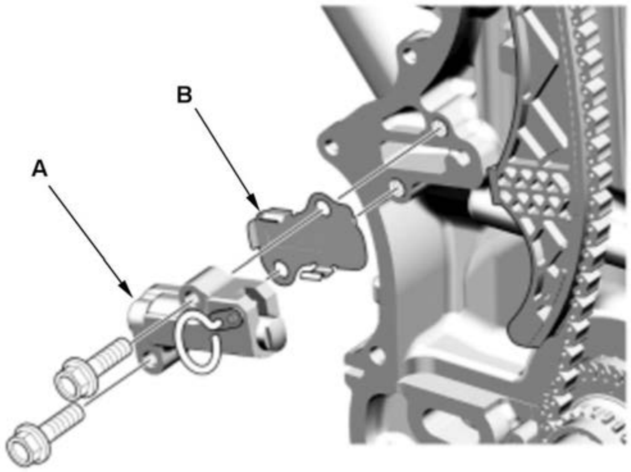


6. Rotate the crankshaft counterclockwise to align the holes on the lock (A) and the cam chain auto-tensioner (B).

7. Insert a 1.2 mm (0.047 in) diameter pin (C) into the holes.

8. Turn the crankshaft clockwise to secure the pin.

NOTE: If the holes in the lock and the cam chain auto-tensioner do not align, continue to rotating the crankshaft counterclockwise until the holes align, then install the pin.



9. Remove the cam chain auto-tensioner (A) and the cam chain auto-tensioner filter (B).

NOTE: Check the cam chain auto-tensioner filter for damage. If the filter is damaged, replace it.

10. Remove the crankshaft pulley.

12. Cam Chain Guide B - Remove
13. Cam Chain Guide - Remove
14. Cam Chain Tensioner Arm - Remove
15. Cam Chain - Remove
16. Key - Remove (if necessary)

Installation

NOTE: Keep the cam chain away from magnetic fields.

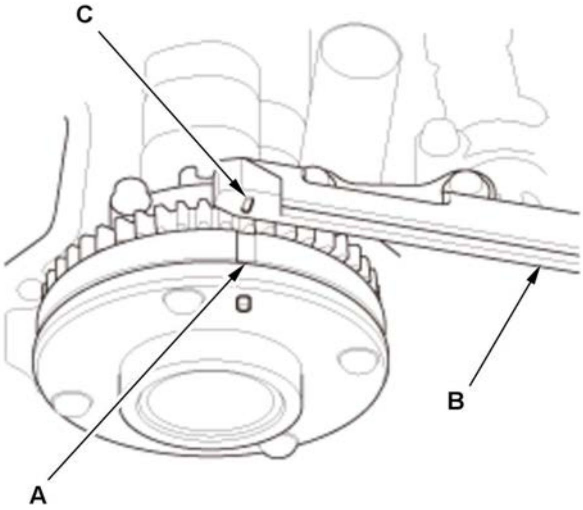
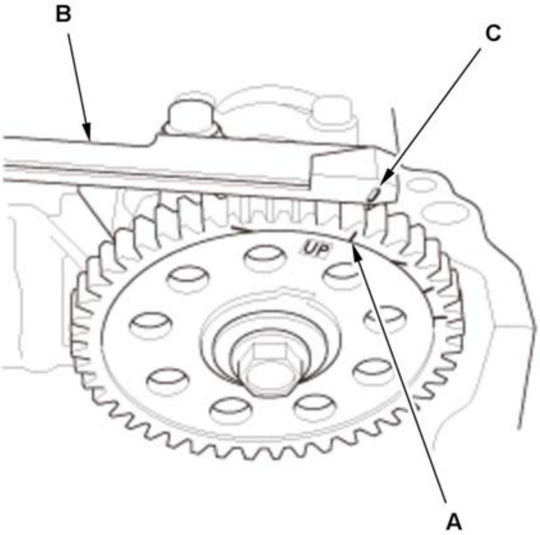
▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	These parts have inspection items

1. Key - Install (if necessary)
2. Cam Chain - Install



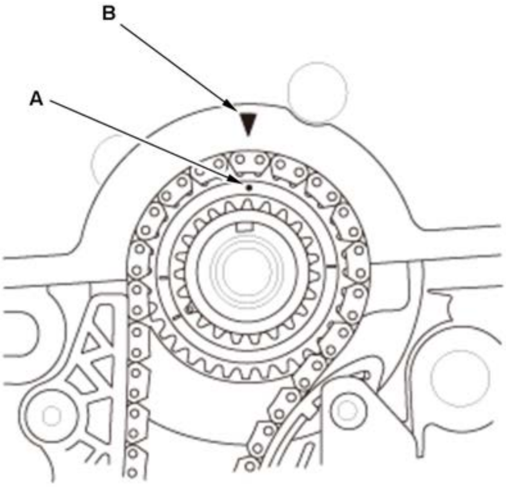
1. Install cam chain guide B.

2. Align the mark (A) on the VTC actuator with the mark (C) on cam chain guide B.

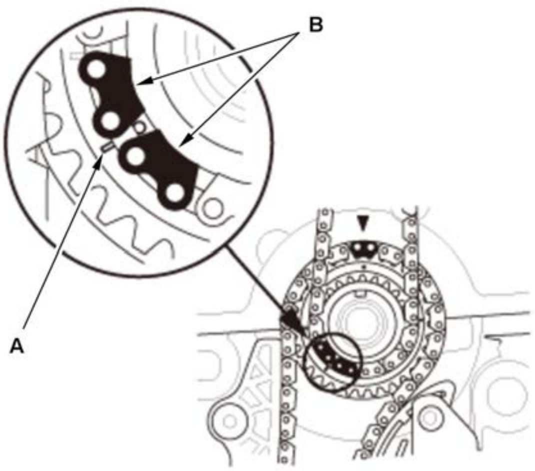


3. Align the mark (A) on the exhaust camshaft sprocket with the mark (C) on cam chain guide B.

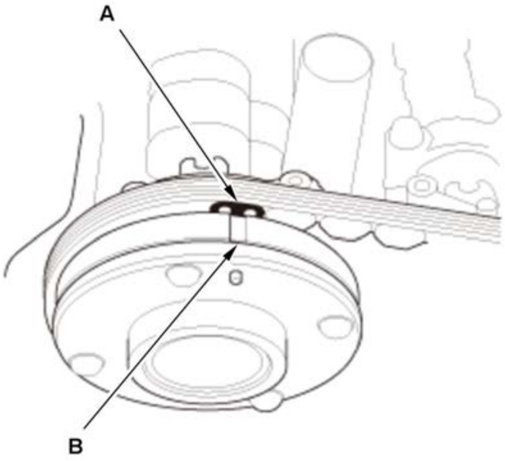
4. Remove cam chain guide B.



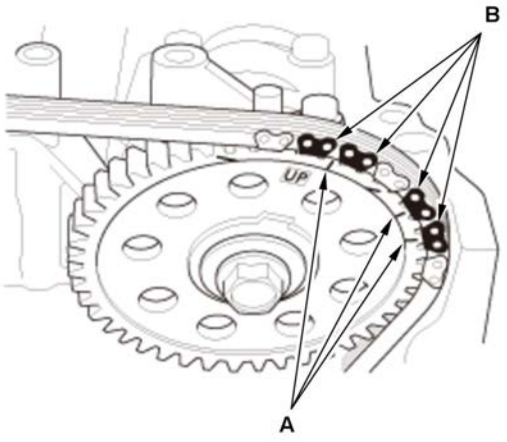
5. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the engine block.



6. Install the cam chain on the crankshaft sprocket with the mark (A) aligned with the center of the two colored link plates (B).



7. Install the cam chain on the VTC actuator with the colored link plate (A) aligned with the mark (B) on the VTC actuator.



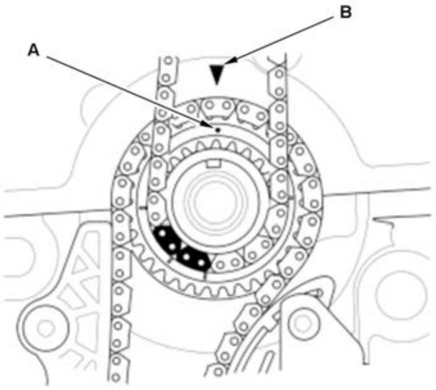
8. Install the cam chain on the exhaust camshaft sprocket with the marks (A) aligned with each colored link plates (B).

3. Cam Chain Guide - Install
4. Cam Chain Tensioner Arm - Install
5. Cam Chain Guide B - Install
6. Cam Chain Auto-Tensioner - Install

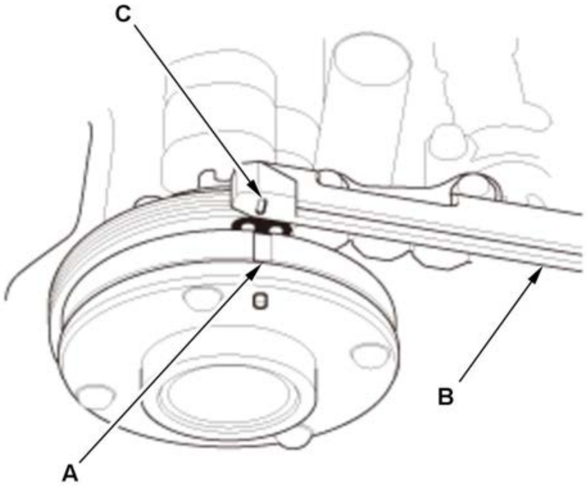
	1. Compress the cam chain auto-tensioner when replacing the cam chain. Remove the pin (A) from the cam chain auto-tensioner that was installed during removal. Turn the plate (B) counterclockwise, to release the lock, then press the rod (C), and set the first cam (D) to the first edge of the rack (E). Insert the 1.2 mm (0.047 in) diameter pin back into the holes (F). **NOTE:** If the cam chain auto-tensioner is not set up as described, the cam chain auto-tensioner will be damaged.

	2. Install the cam chain auto-tensioner filter (A) and the cam chain auto-tensioner (B). **NOTE:** Check the cam chain auto-tensioner filter for damage. If the filter is damaged, replace it.

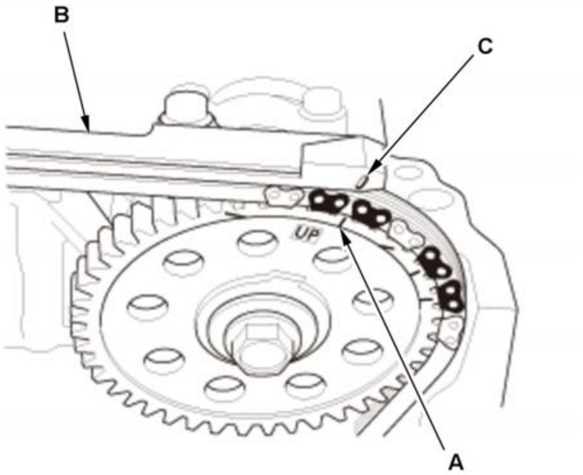
	3. Remove the pin (A) from the cam chain auto-tensioner.



4. Check the camshaft position. Turn the crankshaft to align No. 1 position at top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the engine block.



5. Make sure the mark (A) on the VTC actuator aligns with the mark (C) on cam chain guide B.



6. Make sure the mark (A) on the exhaust camshaft sprocket aligns with the mark (C) on cam chain guide B.

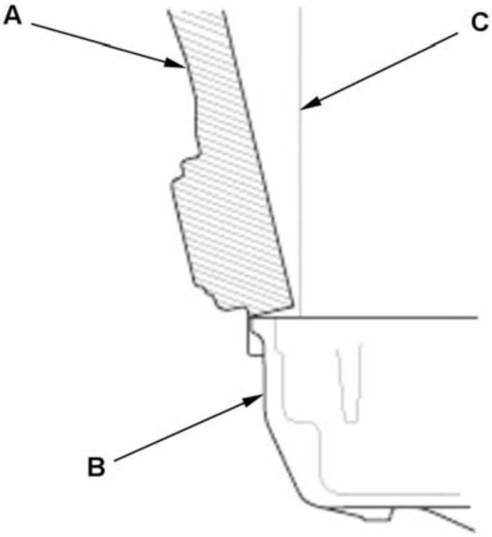
7. Pulley End Crankshaft Oil Seal - Install (if necessary)

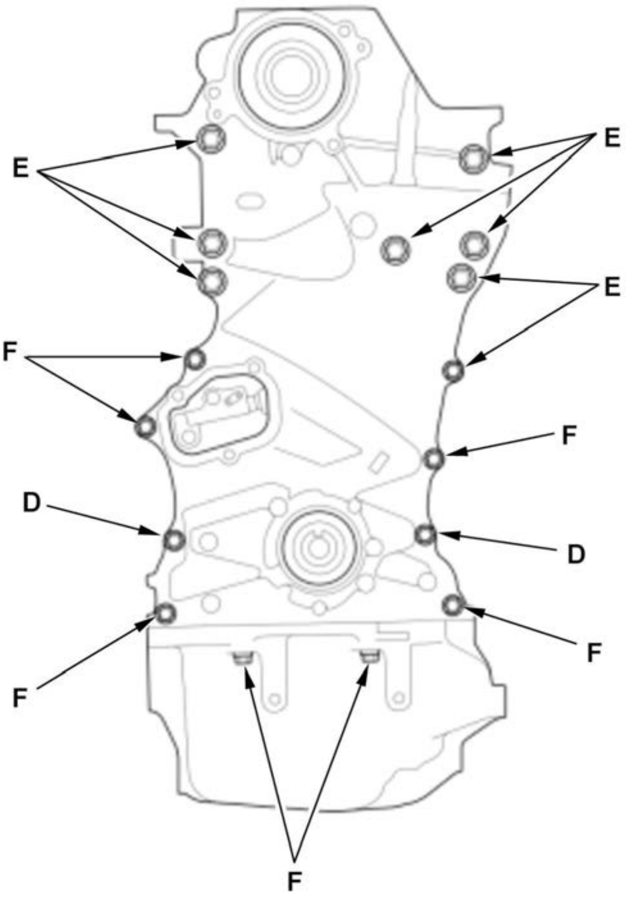
	1. Clean and dry the pulley end crankshaft oil seal housing. 2. Apply light coat of new engine oil to the lip of the pulley end crankshaft oil seal. 3. Use the oil seal driver to drive the pulley end crankshaft oil seal (A) squarely into the oil pump to the specified installed height.

	4. Measure the distance between the oil pump surface (A) and the pulley end crankshaft oil seal (B).

Pulley End Crankshaft Oil Seal Installed Height:
52.1-52.7 mm (2.051-2.075 in)

8. Oil Pump - Install





1. **Apply liquid gasket**

to the engine block and the oil pan mating surface of the oil pump and to the inside edge of the threaded bolt holes.

2. Set the edge of the oil pump (A) on the edge of the oil pan (B).

3. Install the oil pump on the engine block (C).

4. Loosely install the dowel bolts (D), then tighten the 8 mm bolts (E), the 6 mm bolts (F), and the dowel bolts.

5. Wipe off the excess liquid gasket on the oil pan and oil pump mating surface.

NOTE: Do not slide the bottom surface onto the oil pan mounting surface.

9. Chain Case Cover - Install (if necessary)

   NOTE: **Apply liquid gasket** to the oil pump mating surface of the chain case cover and to the inside edge of the threaded bolt holes.

10. **Side Engine Mount - Install**
11. **Electric VTC Motor - Install**
12. **Cylinder Head Cover - Install**
13. Crankshaft Pulley - Install
14. **Engine Undercover - Install**
15. **Right Front Wheel - Install**

16. 12 Volt Battery Terminal - Connect

Crankshaft Pulley

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

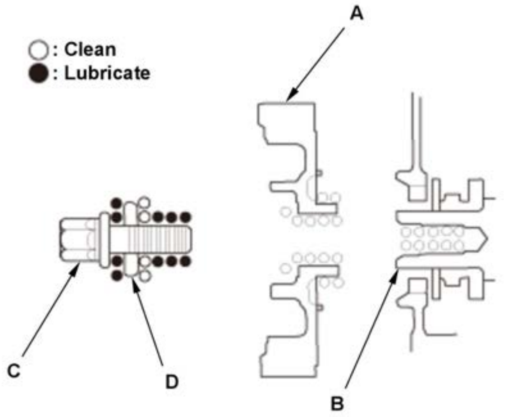
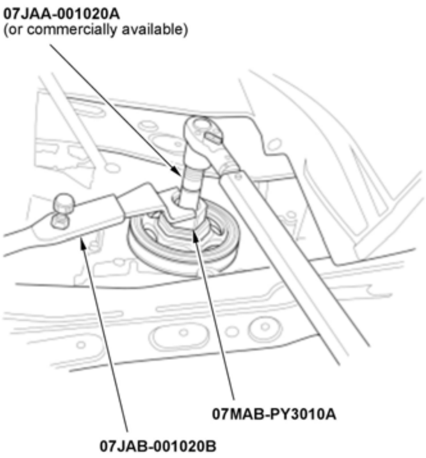
1. Crankshaft Pulley - Install



○: Clean
●: Lubricate
A
C
D
B

1. Remove any oil and clean the crankshaft pulley (A), the crankshaft (B), the bolt (C), and the washer (D). Lubricate with new engine oil as shown.



07JAA-001020A
(or commercially available)
07MAB-PY3010A
07JAB-001020B

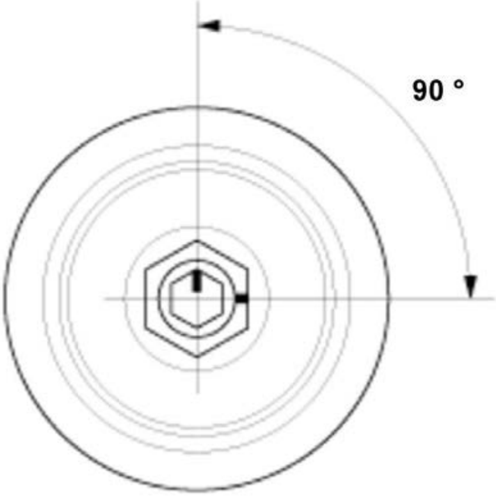
When a new crankshaft or a new pulley bolt is installed

2. Install the crankshaft pulley and the pulley bolt.

3. Hold the crankshaft pulley with the holder handle and the holder attachment, 50 mm, offset, torque the pulley bolt to 180 N.m (18.4 kgf.m, 133 lbf.ft) with a torque wrench and a socket, 19 mm, then remove the pulley bolt.

4. Torque the pulley bolt to 92 N.m (9.4 kgf.m, 68 lbf.ft) with a torque wrench and a socket, 19 mm.

NOTE: Do not use an impact wrench.



5. Tighten the bolt an additional 90B°.

 07JAA-001020A (or commercially available) 07MAB-PY30100 07JAB-001020B	**When the crankshaft or the pulley bolt is reused** 6. Install the crankshaft pulley and the pulley bolt. 7. Hold the crankshaft pulley with the holder handle and the holder attachment, 50 mm, offset, then torque the pulley bolt to 86 N.m (8.8 kgf.m, 63 lbf.ft) with a torque wrench and a socket, 19 mm. **NOTE:** Do not use an impact wrench.

	8. Tighten the bolt an additional 90B°.

2. Engine Undercover - Install
3. Right Front Wheel - Install

Inspection

1. Right Front Wheel - Remove
2. Engine Undercover - Remove

   NOTE: Remove the necessary part(s).

3. Chain Case Cover - Remove
4. Cam Chain - Inspect

	1. Measure the length of the cam chain auto-tensioner rod. 2. If the length is over the service limit, replace the cam chain. When replacing, check the teeth on the crankshaft sprocket, the VTC actuator, and the exhaust camshaft sprocket for wear and damage. If any of them are worn or damaged, replace if necessary. 3. Check the oil passage on the cam chain auto-tensioner for clogs. If the cam chain auto-tensioner is clogged, replace it.

Cam Chain Auto-Tensioner Rod Length	
Service Limit:	**13.55 mm (0.5335 in)**

5. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

DRIVE PLATE REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

9. **Exhaust Pipe A - Install**
10. **Electric A/C Compressor - Install**
11. **Engine Undercover - Install**
12. **Engine Oil - Refill**

ENGINE REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Subframe Adapter VSB02C000016*
	Universal Lifting Eyelet 07AAK-SNAA120

Removal

WARNING:

The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain **service precautions** before doing repairs or service.

NOTE:

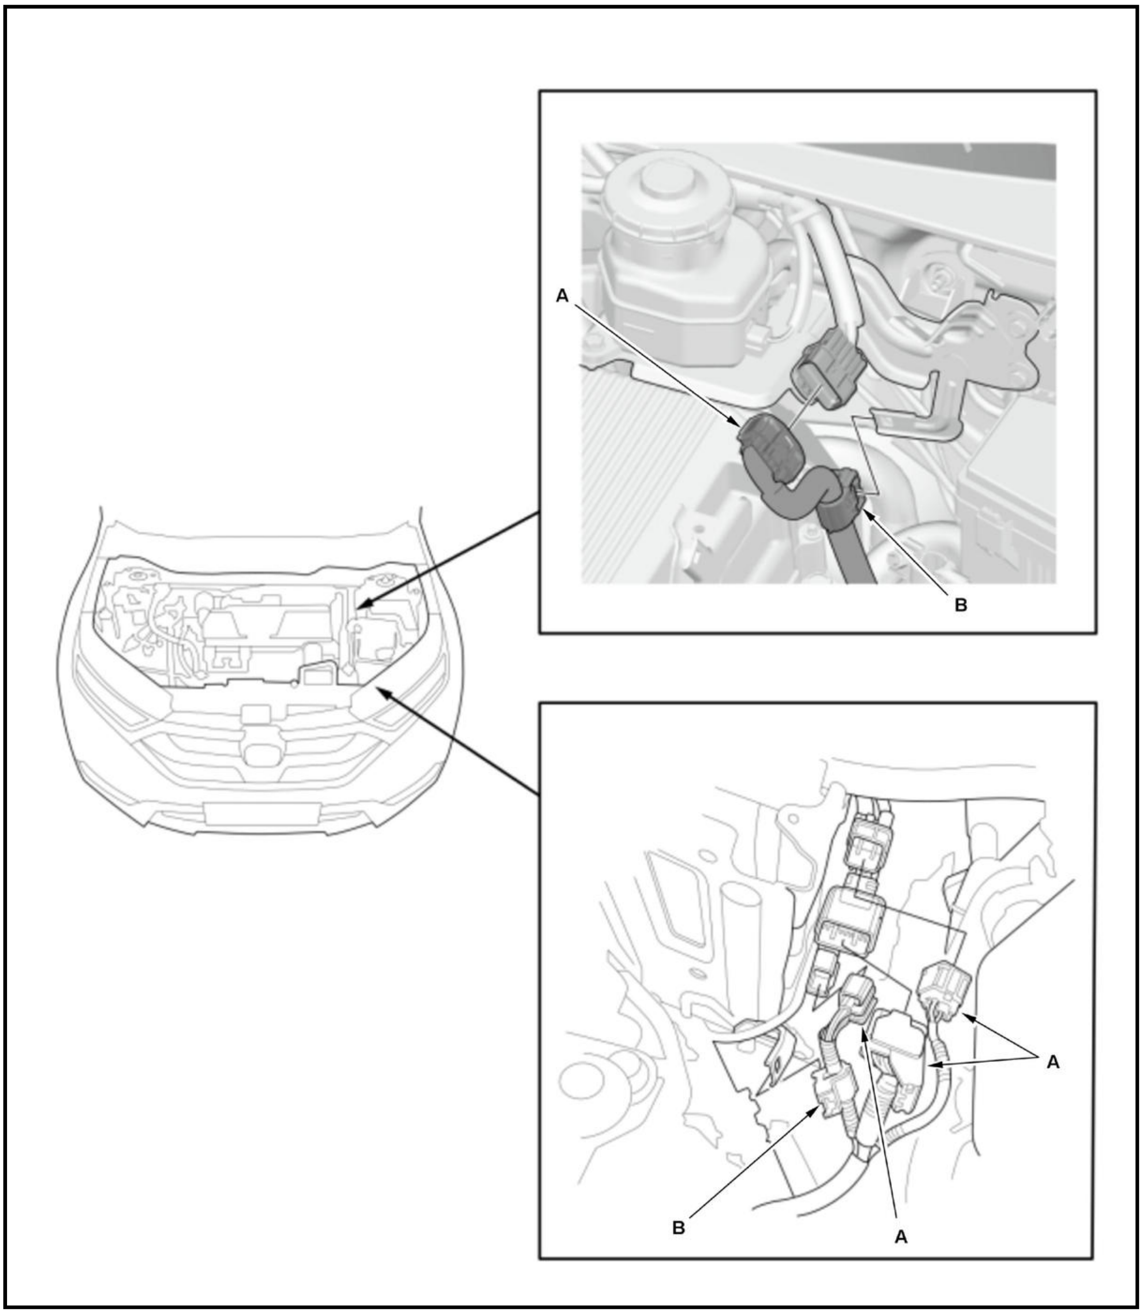
- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Hood - Wide Open

	1. Open the hood. 2. Remove and relocate the hood support rod (A) to the wide-open positions (B) and secure the hood.

2. **Fuel Pressure - Relieve**
3. **Service Plug - Turn Off**
4. **Front Bulkhead Cover - Remove**
5. **Intake Air Resonator - Remove**
6. **Air Intake Tube B - Remove**
7. **12 Volt Battery - Remove**
8. **PCM - Remove**
9. **12 Volt Battery Base - Remove**
10. Connector (Engine Wire Harness and Park Pawl Actuator Harness) - Disconnect

    1. Disconnect the connectors (A).



2. Remove the harness clamps (B).

11. **Engine Undercover - Remove**
12. **PCU Coolant - Drain**
13. **PCU - Remove**
14. **Cooling Hose - Disconnect**
15. EVAP Canister Purge Hose and Fuel Feed Hose - Disconnect

	1. **Remove the quick-connect fitting cover (A), then disconnect the fuel feed hose (B)** . 2. Disconnect the EVAP canister purge hose (C).

16. **Steering Joint - Disconnect**
17. Vehicle - Lift

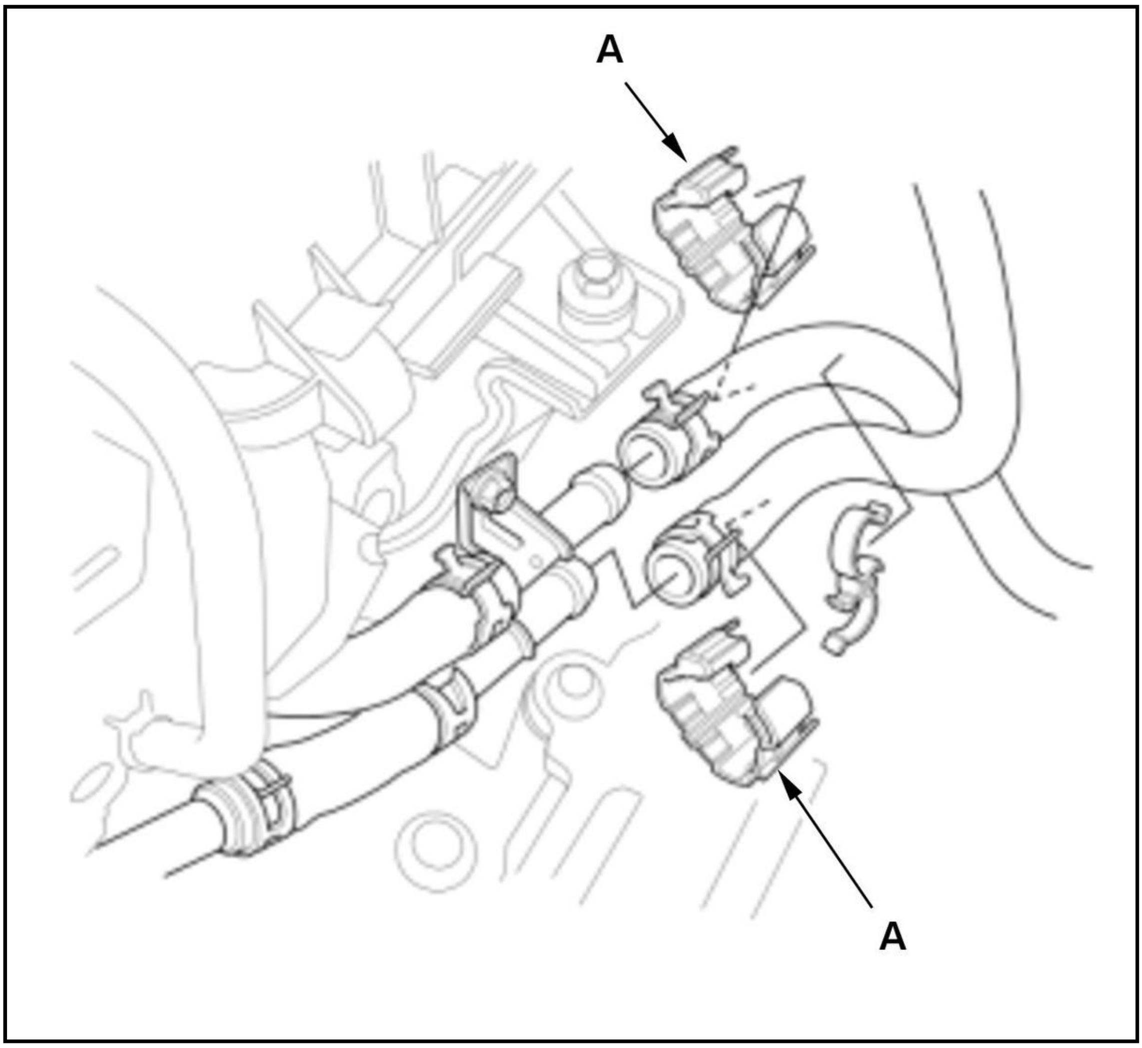
1. **Raise and support the vehicle** .

18. **Front Wheel - Remove**
19. **Engine Coolant - Drain**
20. **Engine Oil - Drain**
21. **ATF - Drain**
22. **Radiator - Remove**
23. **Electric A/C Compressor - Move**

NOTE:

- Do not disconnect the connector (electric A/C compressor).
- Do not disconnect the suction hose and the discharge pipe.
- Do not bend the suction hose and the discharge hose excessively.
- Hang the electric A/C compressor with a wire tie.

24. **Connector (EPS Motor/Control Unit) - Disconnect**
25. **Exhaust Pipe A - Remove**
26. **Tie-Rod End Ball Joint - Disconnect**
27. **Front Stabilizer Link Ball Joint - Disconnect**
28. **Lower Arm - Disconnect**
29. **Front Driveshaft - Remove**
30. **Propeller Shaft - Remove**
31. **ATF Hose - Disconnect**
32. **Ground Cable (Transmission (e-CVT) Side) - Disconnect**
33. Vehicle - Lower
34. Heater Hose - Disconnect

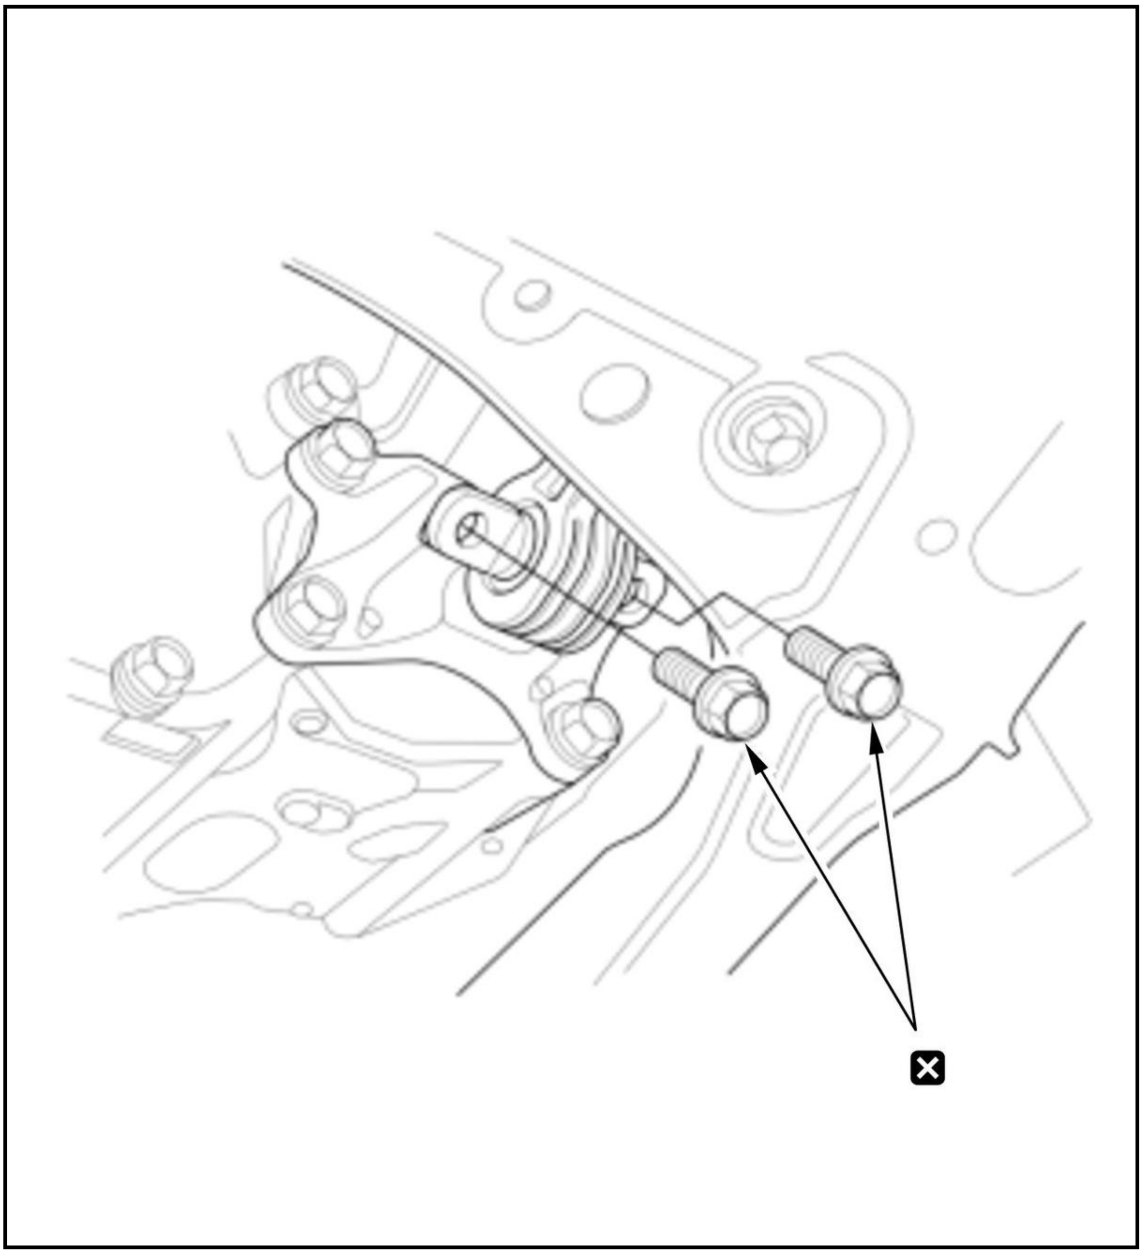


NOTE: The hose band clip (A) can be installed after the heater hoses are connected.

35. Vehicle - Lift

    1. Raise the vehicle.

36. Lower Torque Rod Mounting Bolt - Remove



37. Lower Arm Mounting Bolt - Remove

	1. Remove the lower arm mounting bolt on both sides.

38. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

39. **Front Subframe - Remove**
40. Vehicle - Lower
41. **Side Engine Mount - Remove**
42. Universal Lifting Eyelet - Install

	1. Install the universal lifting eyelet with a commercially available spacer (A) to the oil pump.

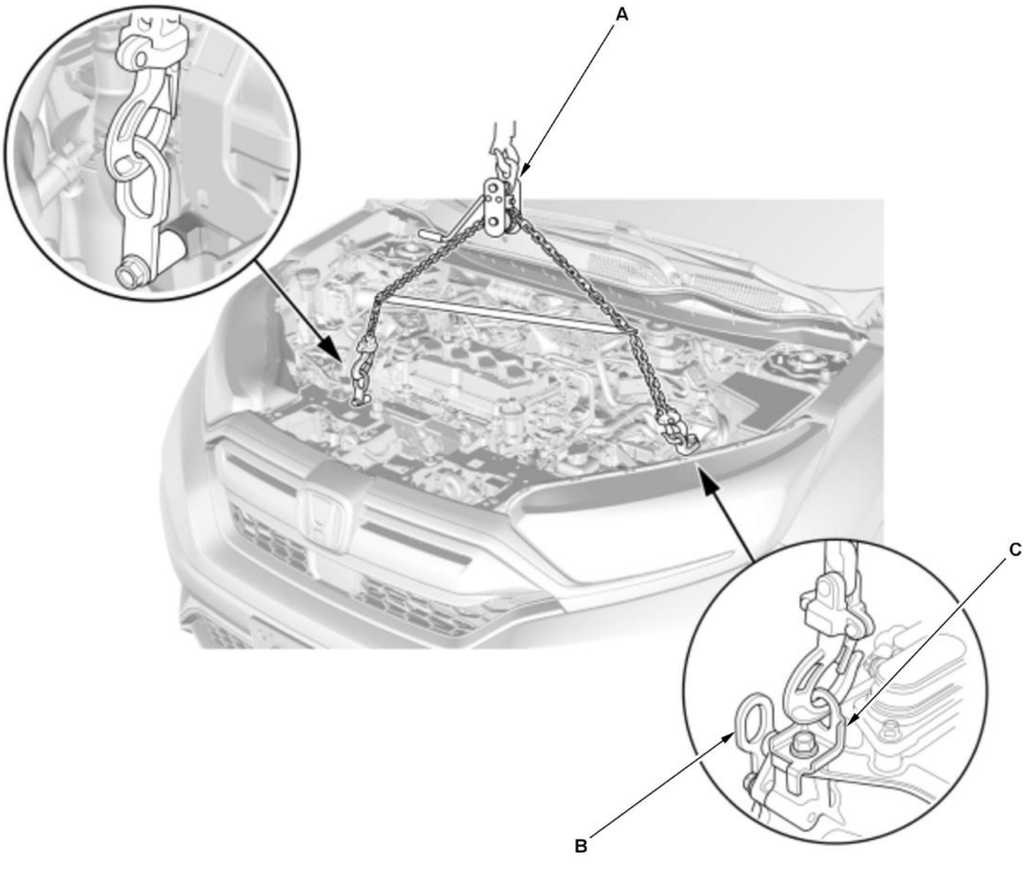
43. Transmission Hanger Bracket - Install

	1. Install the transmission hanger bracket (P/N 21232-RCT-A00) (A) to the transmission (e-CVT).

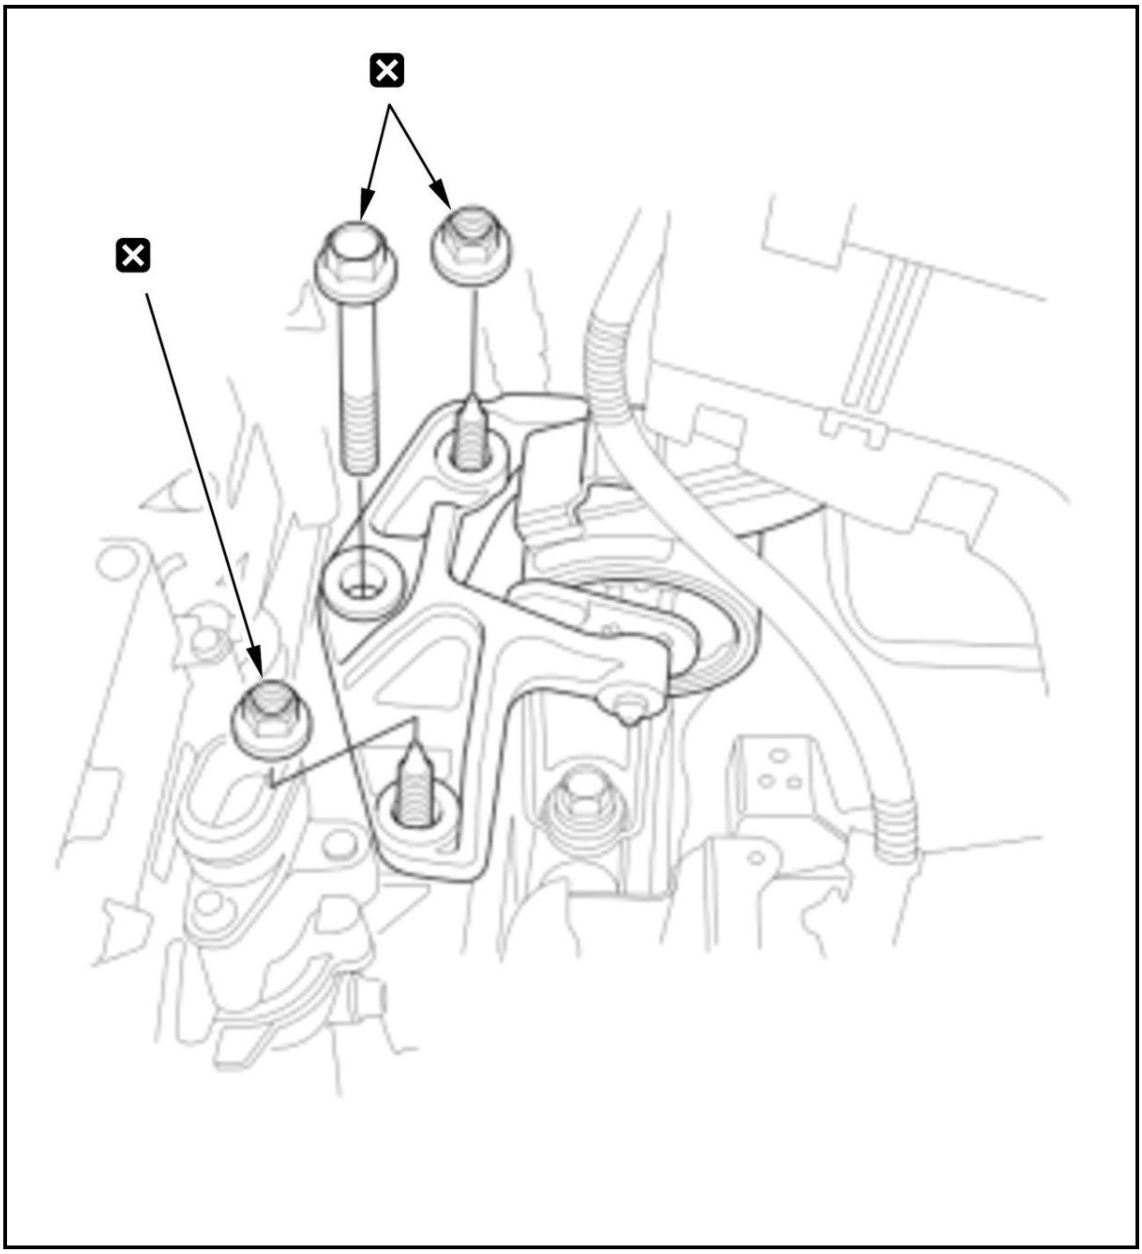
44. Chain Hoist - Install

1. Attach a chain hoist (A) to the universal lifting eyelet and the transmission hanger bracket (C), then lift the engine/transmission (e-CVT) until it is securely supported by the chain hoist.

NOTE: Do not use transmission hanger B.



45. Transmission Mount Bracket Mounting Bolt and Nut - Remove



46. Engine - Remove

1. Check that the engine/transmission (e-CVT) is completely free of the vacuum hoses, the fuel hoses, the coolant hoses, and the electrical wiring.

2. Slowly lower the engine/transmission (e-CVT) about 150 mm (5.91 in). Check once again that all the hoses and the electrical wiring are disconnected and free from the engine/transmission (e-CVT), then lower it all the way and support it.

3. Remove the chain hoist from the engine/transmission (e-CVT).

4. Raise the vehicle, and remove the engine/transmission (e-CVT) from under the vehicle.

Installation

WARNING:

The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain **service precautions** before doing repairs or service.

NOTE:

- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Lower Torque Rod Bracket - Install

   1. If the lower torque rod bracket is removed, install the lower torque rod bracket .

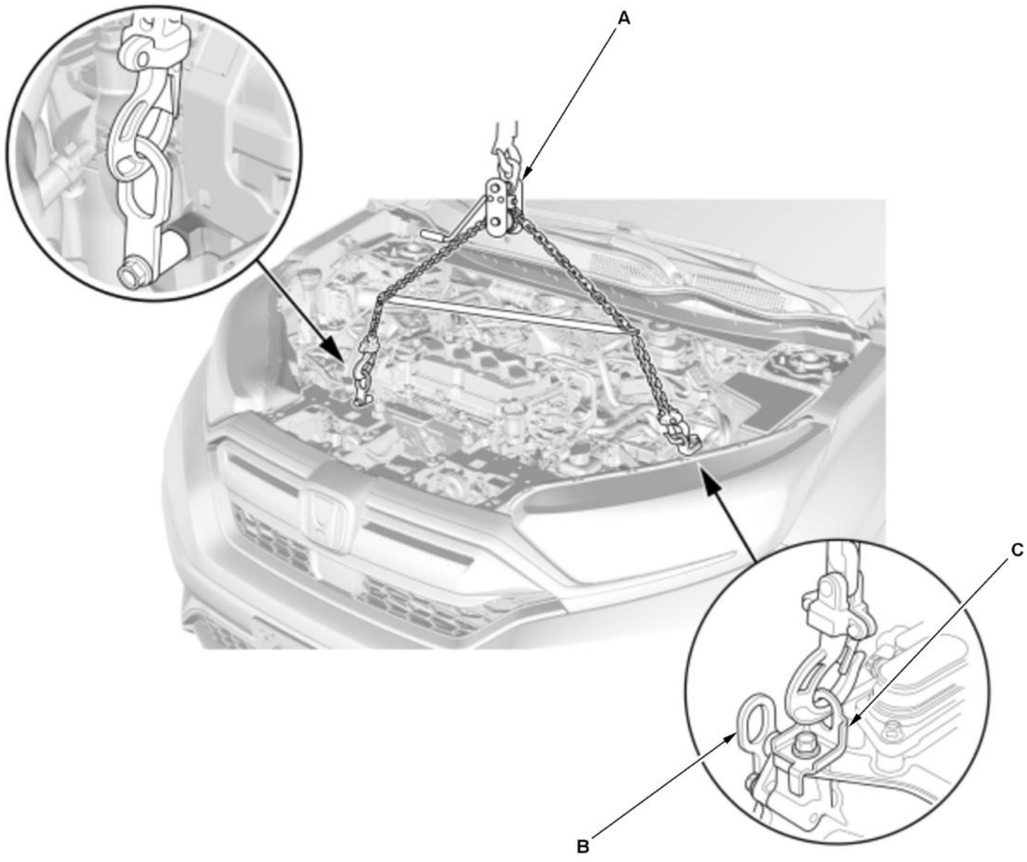
2. Engine/Transmission (e-CVT) - Position

   1. Position the engine/transmission (e-CVT) under the vehicle, and be sure that they are properly positioned. Carefully lower the vehicle, and stop with the installation position of the engine/transmission (e-CVT).

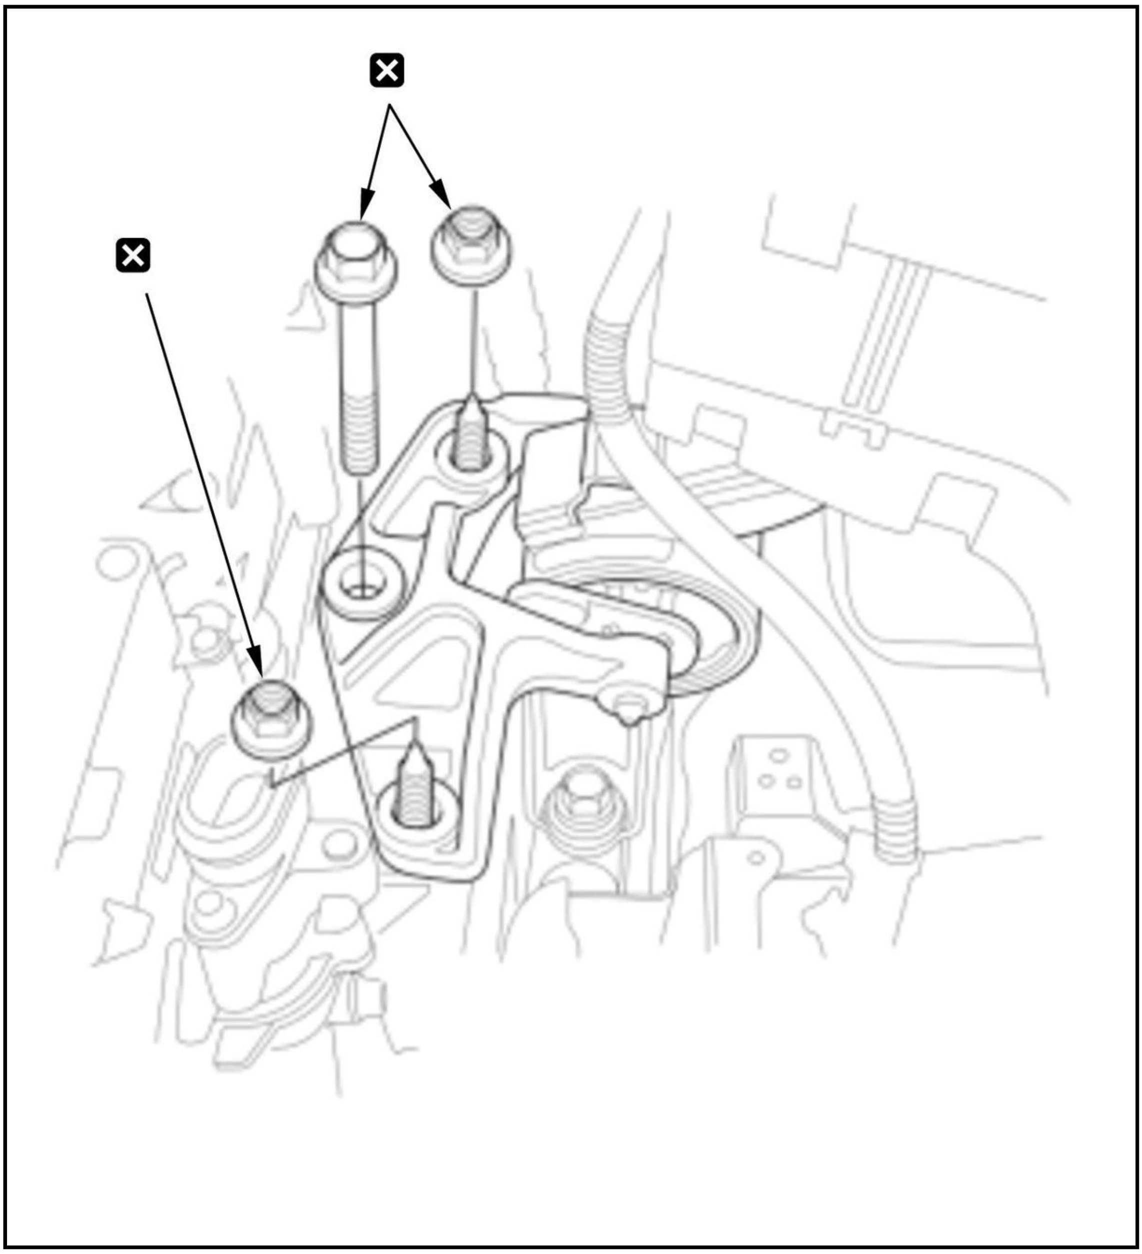
3. Chain Hoist - Install

   1. Attach a chain hoist (A) to the universal lifting eyelet and the transmission hanger bracket (C), then lift the engine/transmission (e-CVT) until it is securely supported by the chain hoist.

   NOTE: Do not use transmission hanger B.



4. Transmission Mount Bracket Mounting Bolt and Nut - Loosely Install



5. Engine - Support

   1. Lift and support the engine with a jack and a wood block under the oil pan.

6. Chain Hoist and Universal Lifting Eyelet - Remove
7. **Side Engine Mount - Loosely Install**
8. Transmission Hanger Bracket - Remove

	1. Remove the transmission hanger bracket (P/N 21232-RCT-A00) (A) from the transmission (e-CVT).

9. Vehicle - Lift

1. Raise the vehicle.

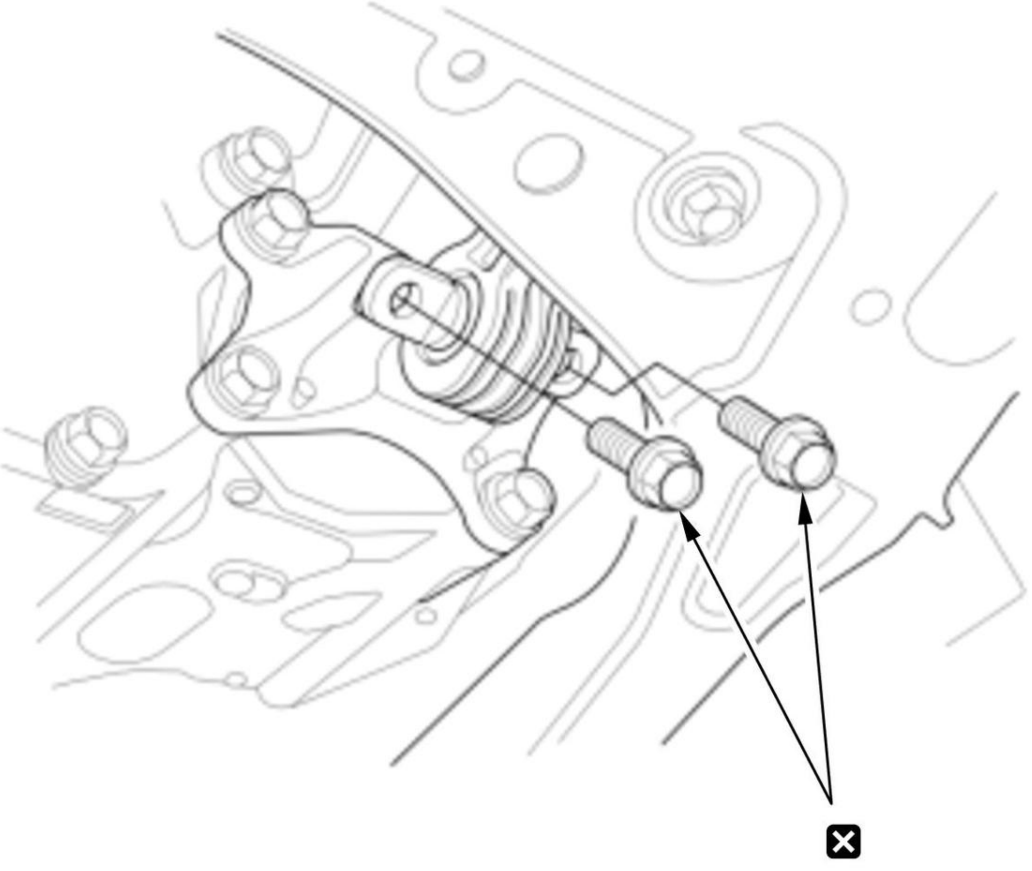
10. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

11. **Front Subframe - Install**
12. Lower Arm Mounting Bolt - Install

	1. **Install the lower arm mounting bolt on both sides**.

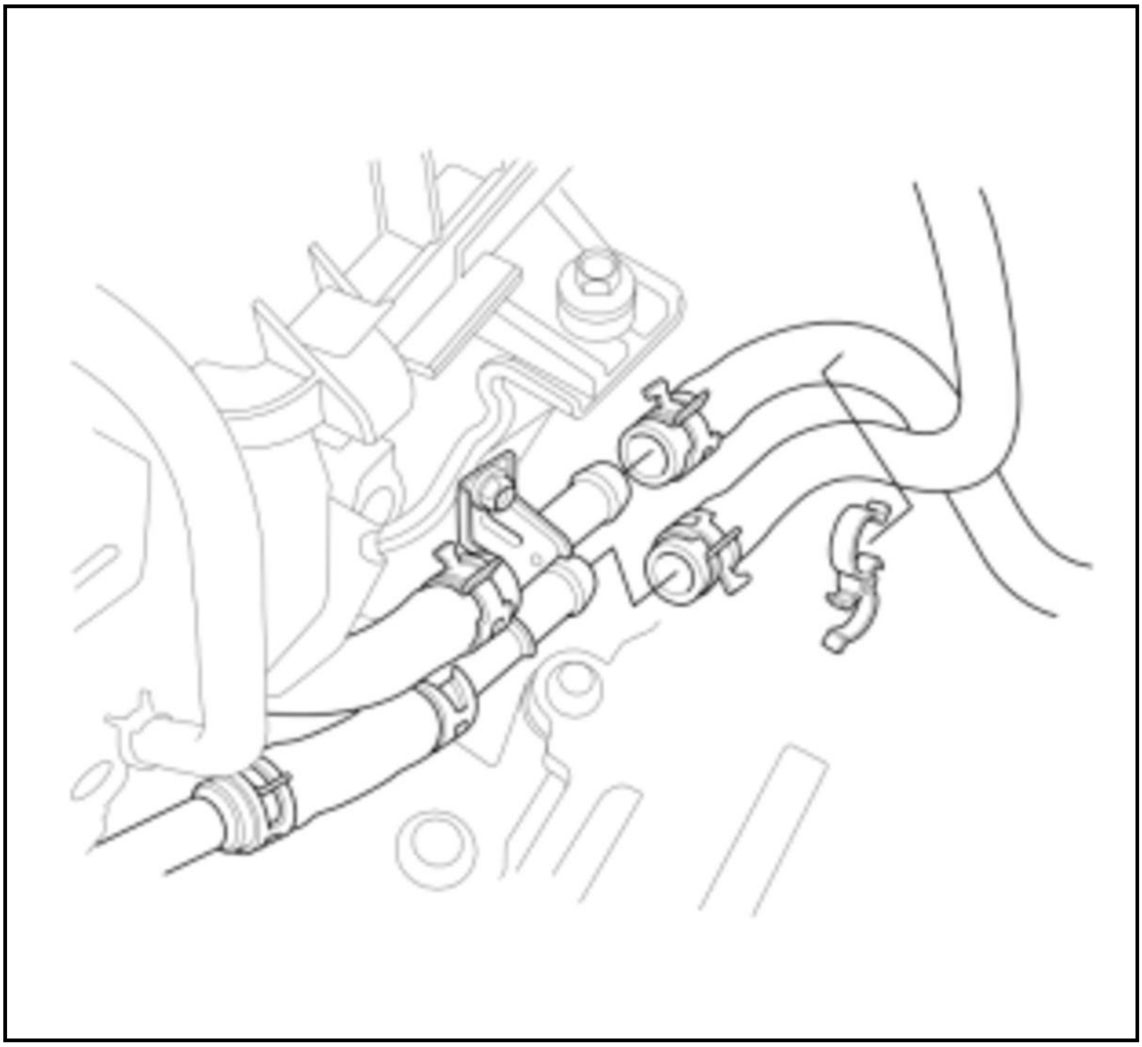
13. Lower Torque Rod Mounting Bolt - Loosely Install



14. Vehicle - Lower
15. All Engine Mount Mounting Bolt and Nut - Tighten
16. Vehicle - Lift

1. Raise the vehicle.

17. Propeller Shaft - Install
18. Front Driveshaft - Install
19. Lower Arm - Connect
20. Front Stabilizer Link Ball Joint - Connect
21. Tie-Rod End Ball Joint - Connect
22. Exhaust Pipe A - Install
23. Connector (EPS Motor/Control Unit) - Connect
24. Electric A/C Compressor - Install
25. Radiator - Install
26. ATF Hose - Connect
27. Ground Cable (Transmission (e-CVT) Side) - Connect
28. Vehicle - Lower
29. Steering Joint - Connect
30. Heater Hose - Connect

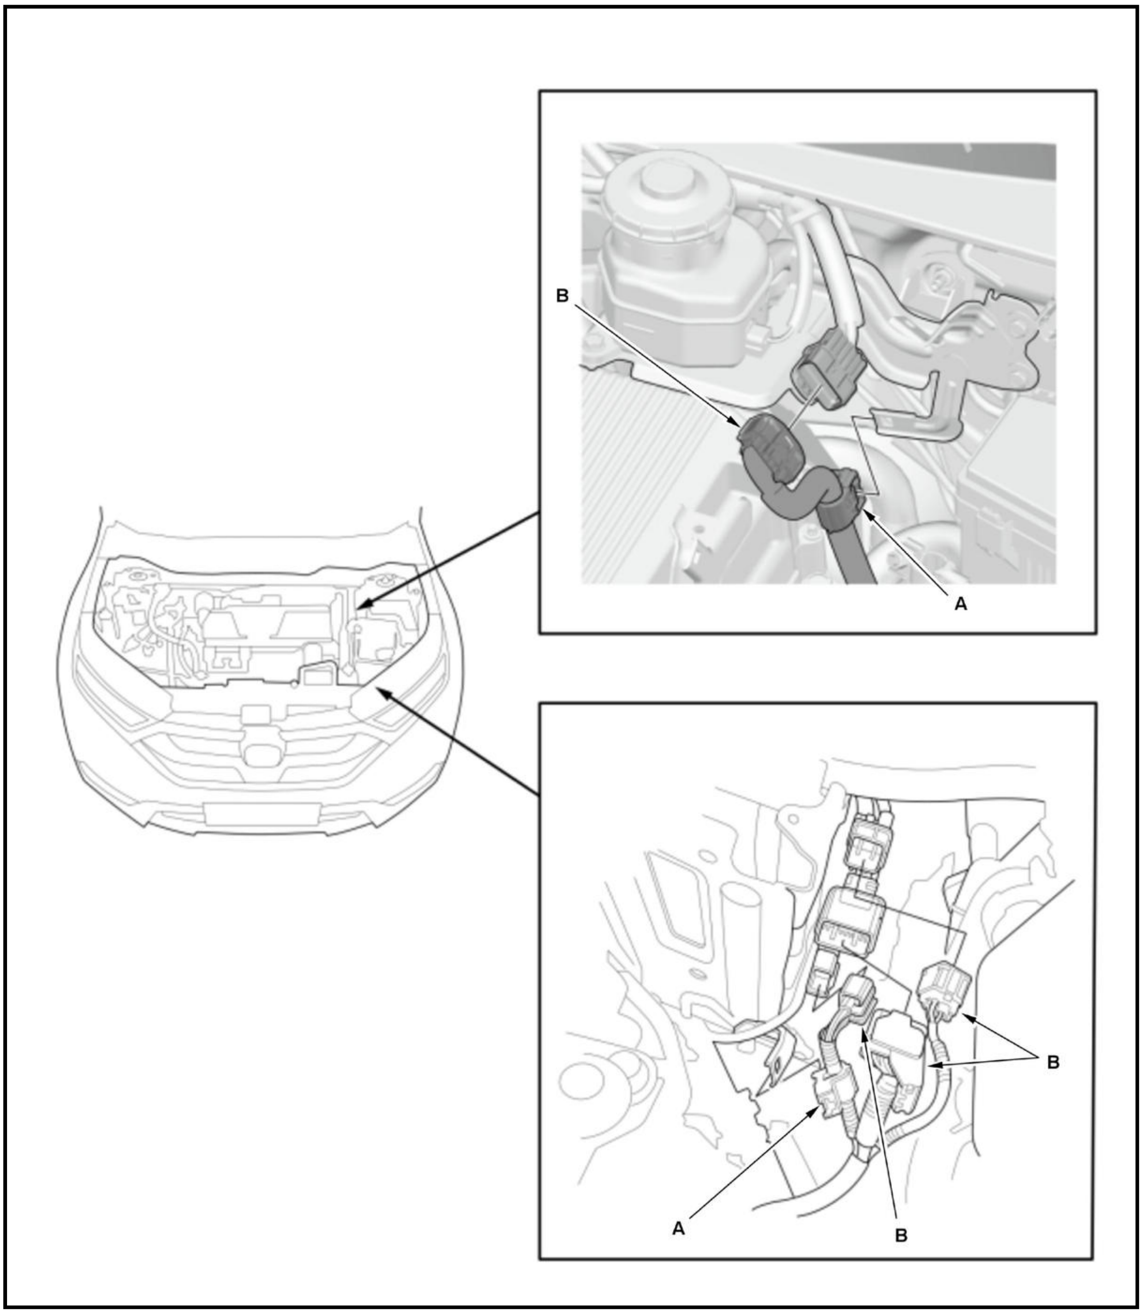


31. Fuel Feed Hose and EVAP Canister Purge Hose - Connect

	1. **Connect the fuel feed hose (A), then install the quick-connect fitting cover (B)** . 2. **Connect the EVAP canister purge hose (C)** .

32. **Cooling Hose - Connect**
33. **PCU - Install**
34. Connector (Engine Wire Harness and Park Pawl Actuator Harness) - Connect

    1. Install the harness clamps (A).



2. Connect the connectors (B).

35. 12 Volt Battery Base - Install
36. PCM - Install
37. Air Intake Tube B - Install
38. Intake Air Resonator - Install
39. Service Plug - Turn On
40. 12 Volt Battery - Install
41. ATF - Refill
42. PCU Coolant - Refill
43. Engine Oil - Refill
44. Engine Coolant - Refill
45. Fuel Leak - Check

> 1. Turn the vehicle to the ON mode, but do not turn the READY TO DRIVE mode. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three time, then check for fuel leakage.

46. Fluid Leak - Check
47. Front Bulkhead Cover - Install

48. Vehicle - Lift

    1. Raise the vehicle.

49. Engine Undercover - Install
50. Front Wheel - Install
51. Vehicle - Lower
52. PCM - Reset
53. CKP Pattern - Clear/Learn
54. Idle Speed - Inspect
55. Ignition Timing - Inspect
56. Wheel Alignment - Check
57. VSA Sensor Neutral Position - Memorize

INJECTOR REMOVAL AND INSTALLATION

Removal

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the Fuel and Emissions Systems Service Precautions before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

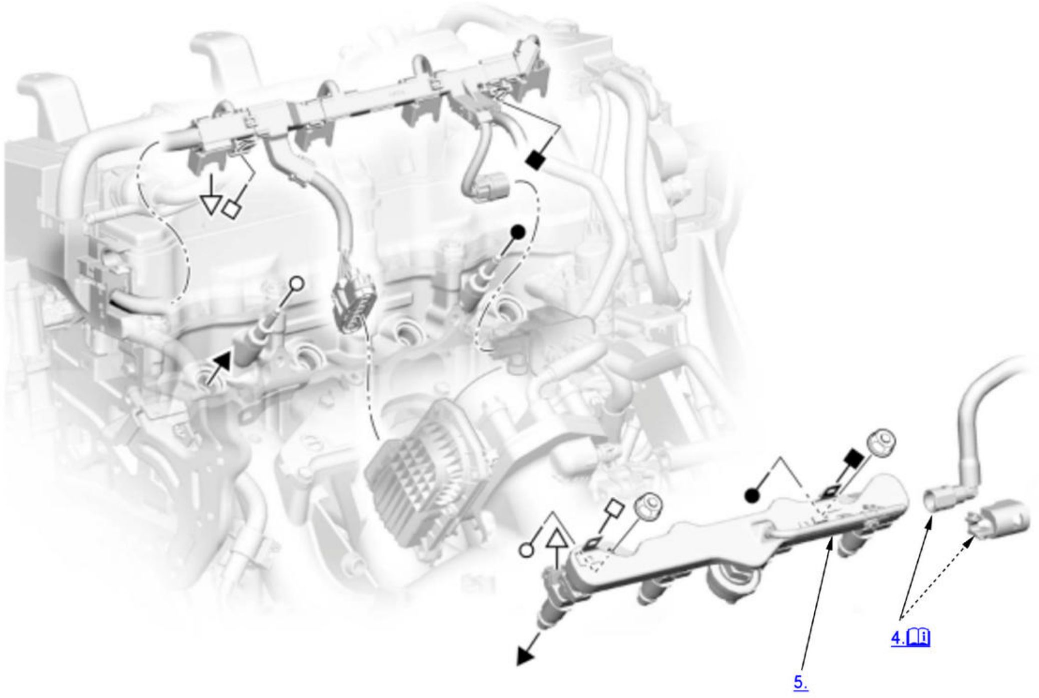


Fig. 37: Exploded View Of Injector Components For Removal (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

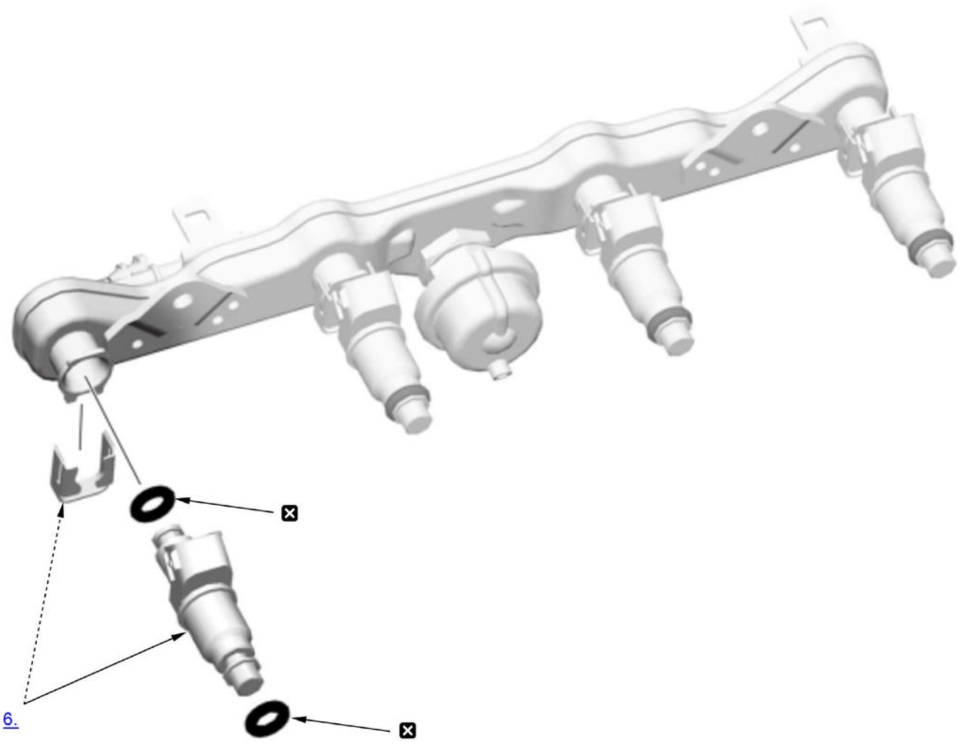

Fig. 38: Exploded View Of Injector Components For Removal (2 Of 2)
Courtesy of HONDA, U.S.A., INC.

☒	Replace

1. **Fuel Pressure - Relieve**
2. **Intake Air Resonator - Remove**
3. **Air Cleaner - Remove**
4. Quick-Connector Fitting - Disconnect
    1. **Disconnect the quick-connect fitting** from the fuel rail.
5. Fuel Rail and Injector - Remove
6. Injector - Remove

Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

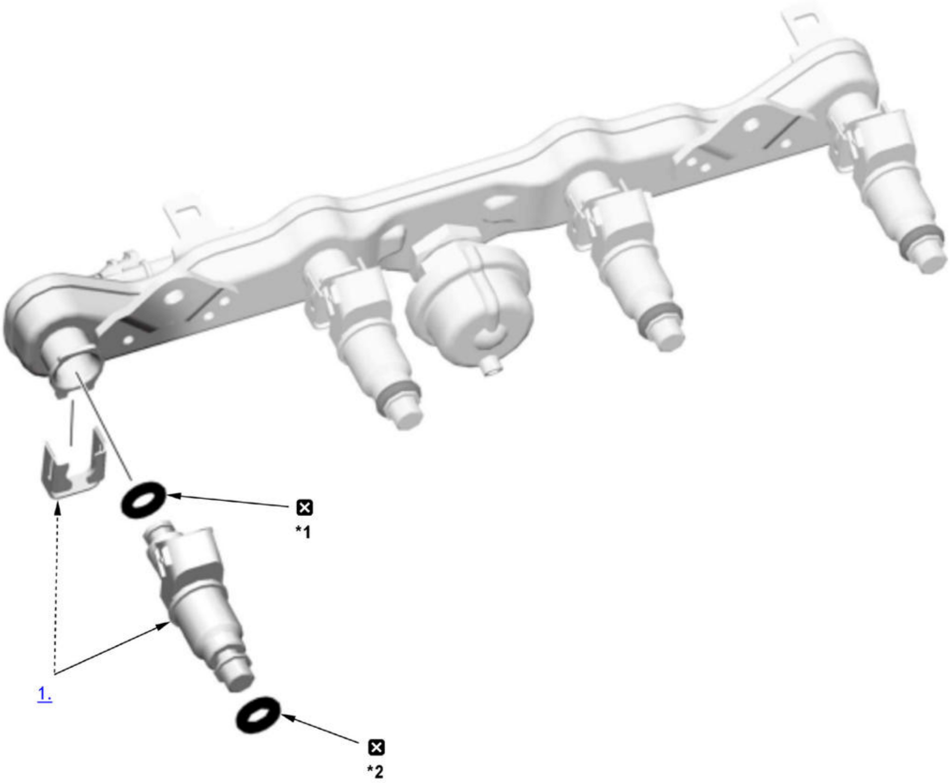

Fig. 39: Exploded View Of Injector Components For Installation (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

☒	Replace
*1	O-rings (black); coat the clean engine oil
*2	O-rings (brown); coat the clean engine oil

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

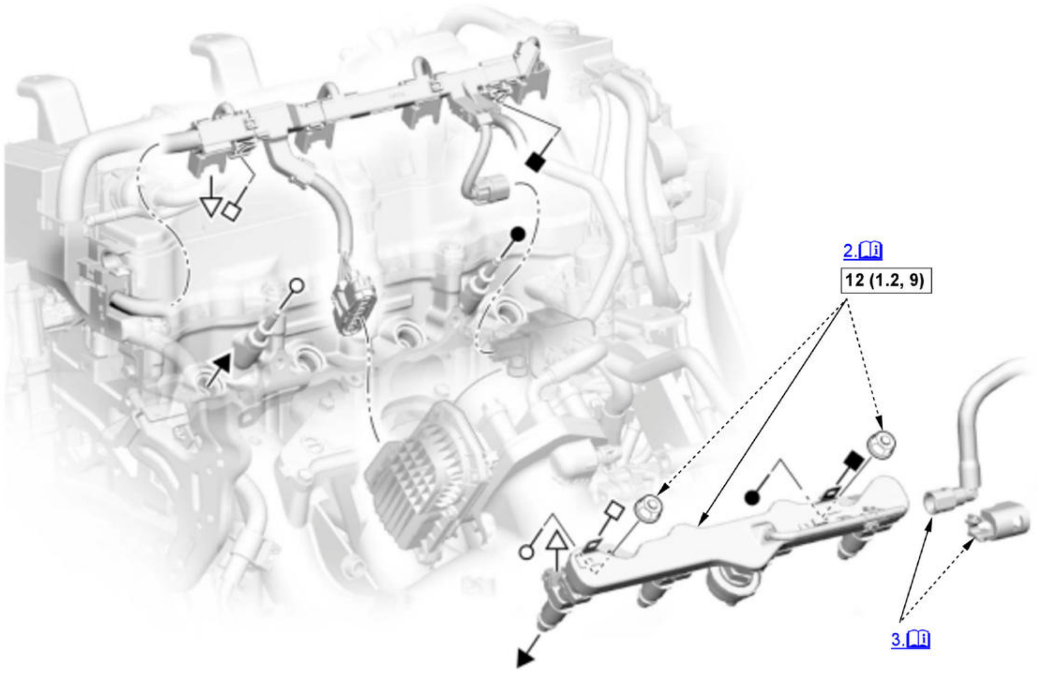

Fig. 40: Exploded View Of Injector Components With Torque Specifications For Installation (2 Of 2)
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

1. Injector - Install
2. Fuel Rail and Injector - Install

   NOTE: Carefully install the fuel rail and the injectors to the cylinder head.

3. Quick-Connector Fitting - Connect

   1. Connect the quick-connect fitting to the fuel rail.

4. Fuel Leak - Check

   1. Turn the vehicle to the ON mode, but do not turn the READY TO DRIVE mode. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three times, then check for fuel leakage.

5. Air Cleaner - Install
6. Intake Air Resonator - Install

INTAKE MANIFOLD REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

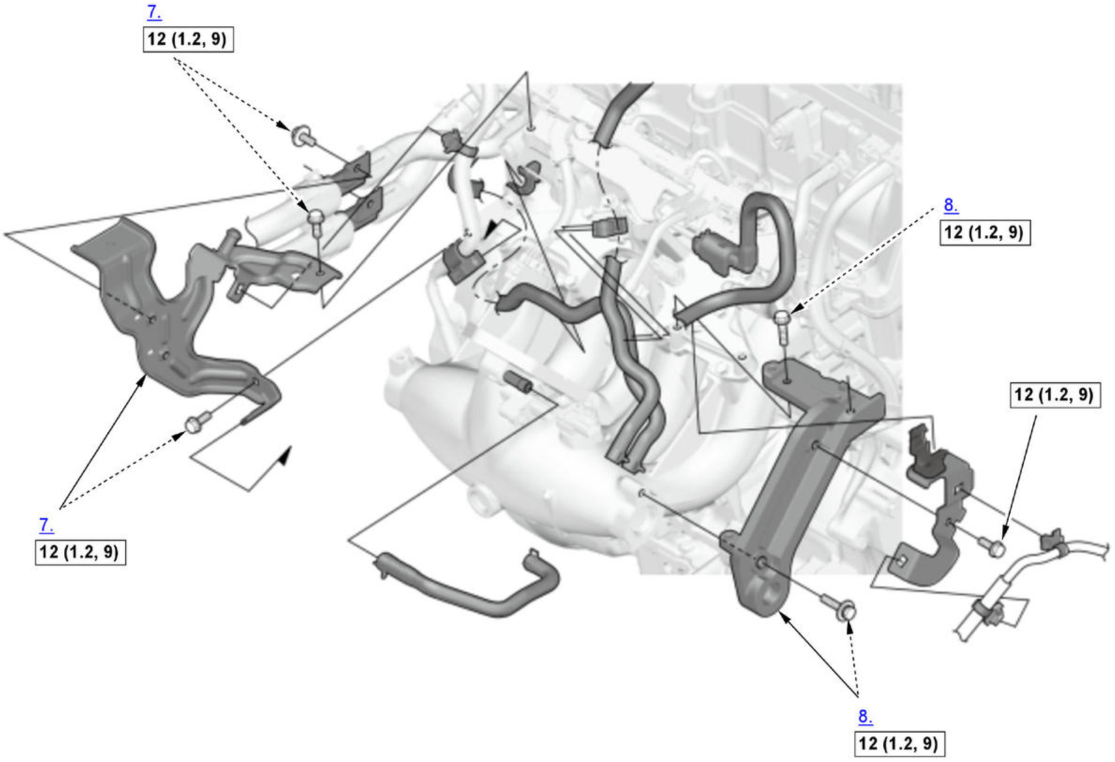

Fig. 41: Exploded View Of Intake Manifold Components With Torque Specifications (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

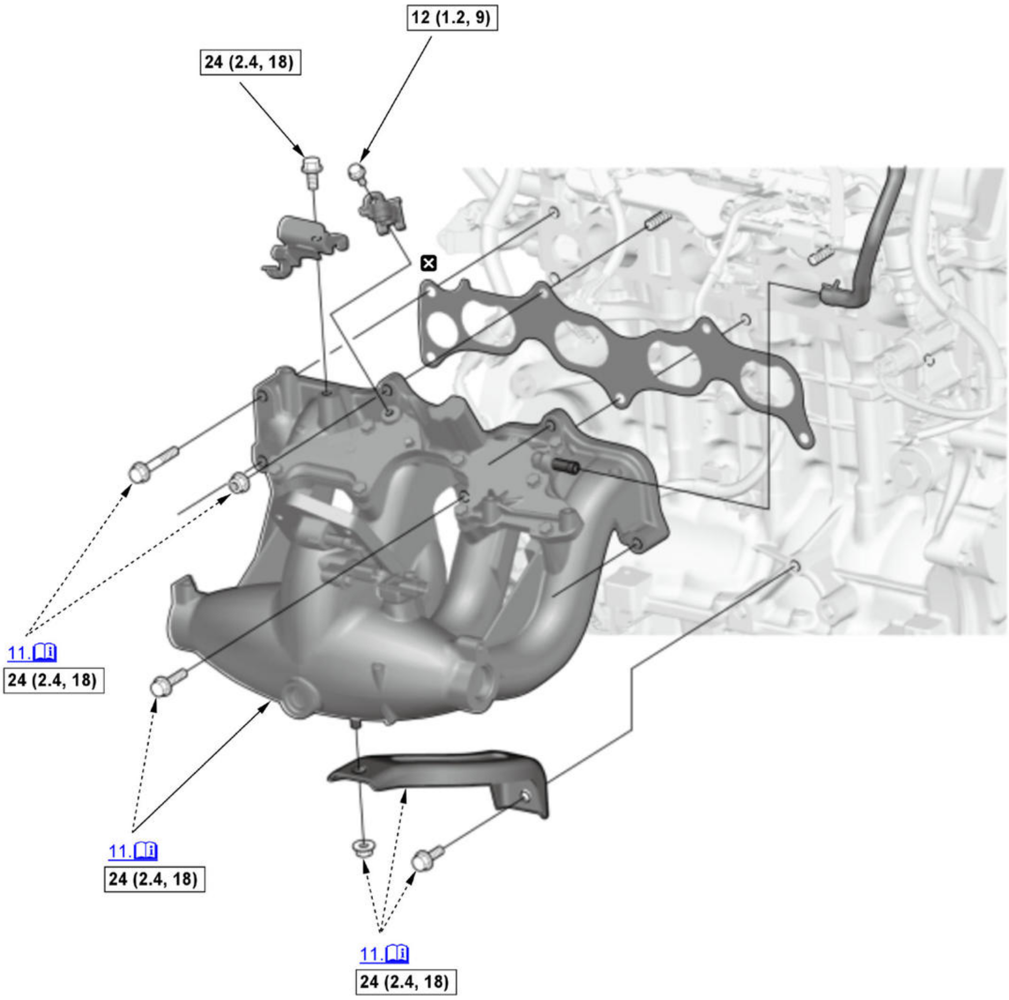

Fig. 42: Exploded View Of Intake Manifold Components With Torque Specifications (2 Of 2)
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Engine Undercover - Remove
2. Center Cowl Cover - Remove
3. Intake Air Resonator - Remove
4. Air Cleaner - Remove
5. EVAP Canister Purge Valve 1/2 and 3-Way Joint - Remove
6. Throttle Body - Move

   NOTE:

   - Do not disconnect the water bypass hoses.
   - Do not bend the water bypass hoses excessively.
7. Air Cleaner Bracket - Remove
8. PCS Guard - Remove
9. Connector (IAT Sensor 2) - Disconnect

10. **Connector (MAP Sensor) - Disconnect**
11. Intake Manifold Assembly - Remove

Note for installation

- Tighten the bolts and nuts in a crisscross pattern in three steps, beginning with the inner bolt.
- After installation, check that all tubes, hoses, and connectors are installed correctly.

12. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

KNOCK SENSOR REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

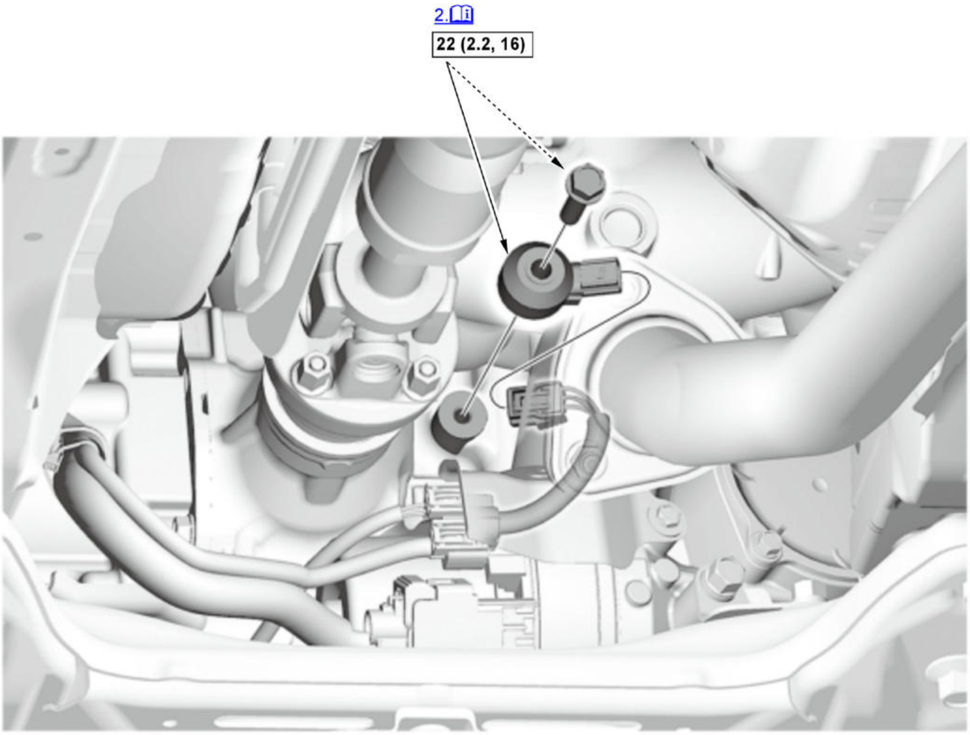

Fig. 43: Exploded View Of Knock Sensor Components With Torque Specifications
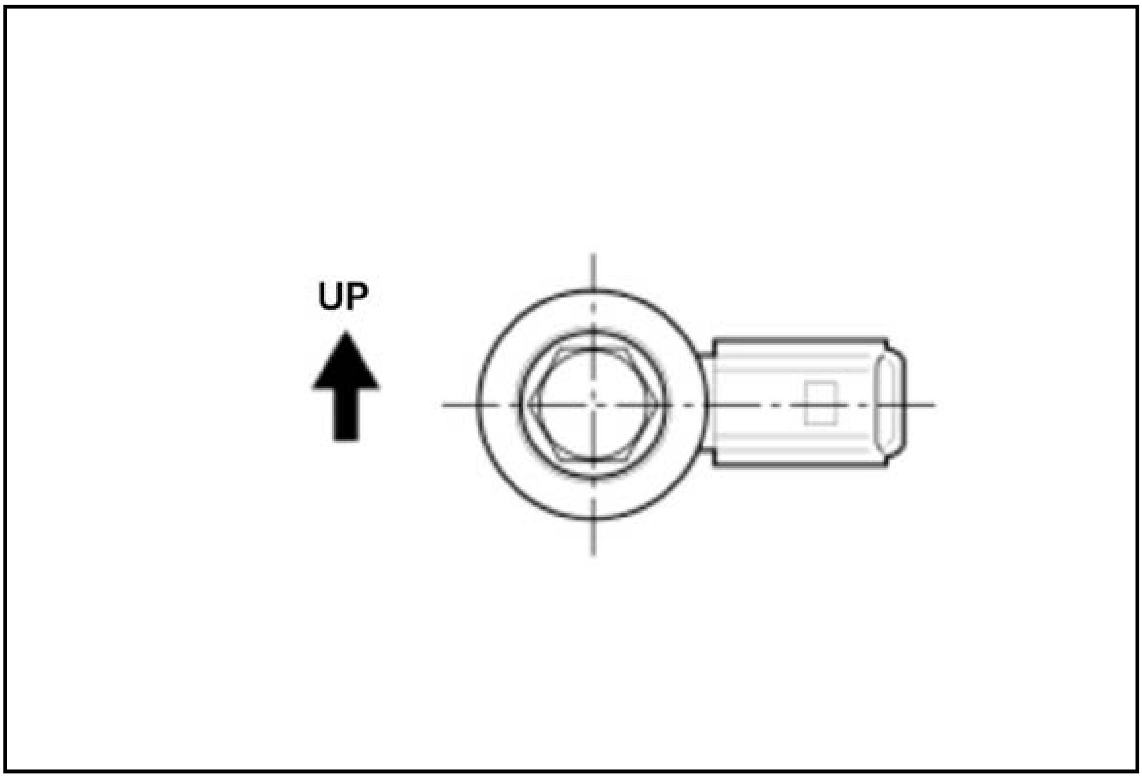
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

1. **Engine Undercover Lid - Remove**
2. Knock Sensor - Remove



Note for installation

Make sure the direction of the sensor connector as shown.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

MAP SENSOR/MAF SENSOR/IAT SENSOR REMOVAL AND INSTALLATION

Removal and Installation

MAP Sensor, IAT Sensor 2

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

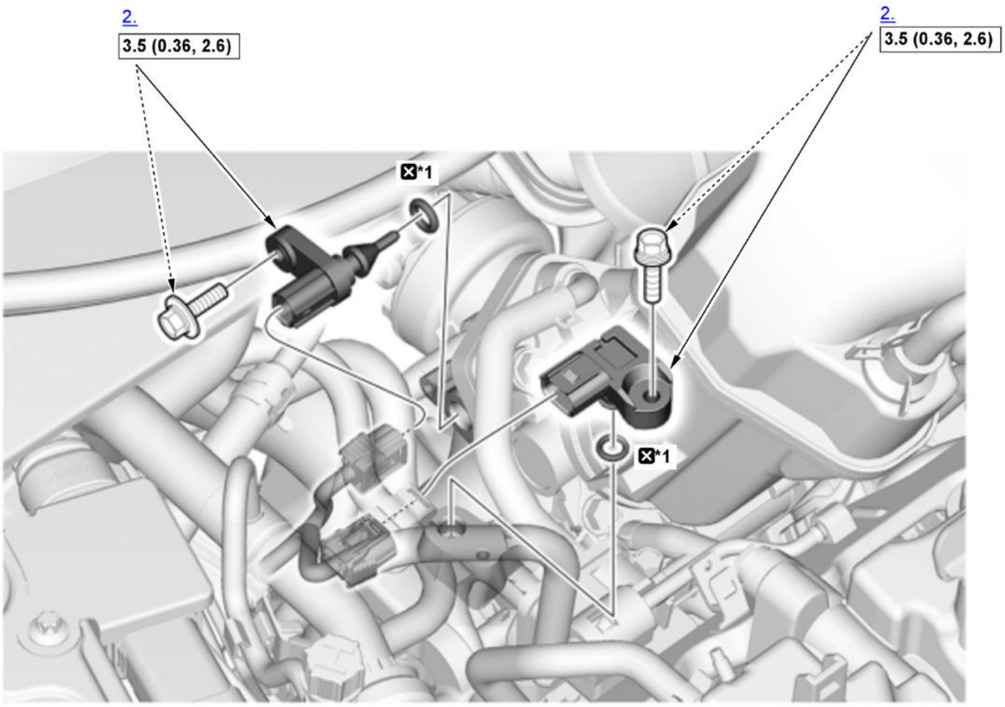


Fig. 44: Exploded View Of MAP Sensor, IAT Sensor 2 Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	Coat the clean engine oil

MAP Sensor

1. EVAP Canister Purge Valve 1 - Remove
2. MAP Sensor - Remove
3. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.

IAT Sensor 2

1. EVAP Canister Purge Valve 1 - Remove
2. IAT Sensor 2 - Remove
3. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.

MAF Sensor/IAT Sensor 1

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

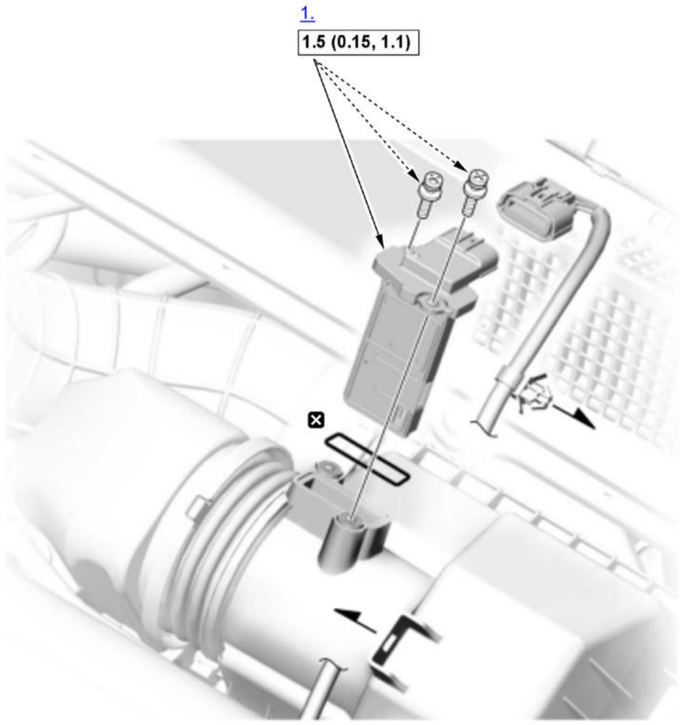

Fig. 45: Exploded View Of MAF Sensor/IAT Sensor 1 Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. MAF Sensor/IAT Sensor 1 - Remove
2. All Removed Parts - Install
    1. Install the parts in the reverse order of removal.

PCM REMOVAL AND INSTALLATION

Removal

NOTE:

- Make sure the HDS or the MVCI has the latest HDS software version.
- If you are replacing the PCM after substituting a known-good PCM, reinstall the original PCM, then do this procedure.
- If you are replacing the PCM, do the all procedures.
- If you are removing or substituting the PCM, skip the procedures of READ DATA (Engine Oil Life).

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

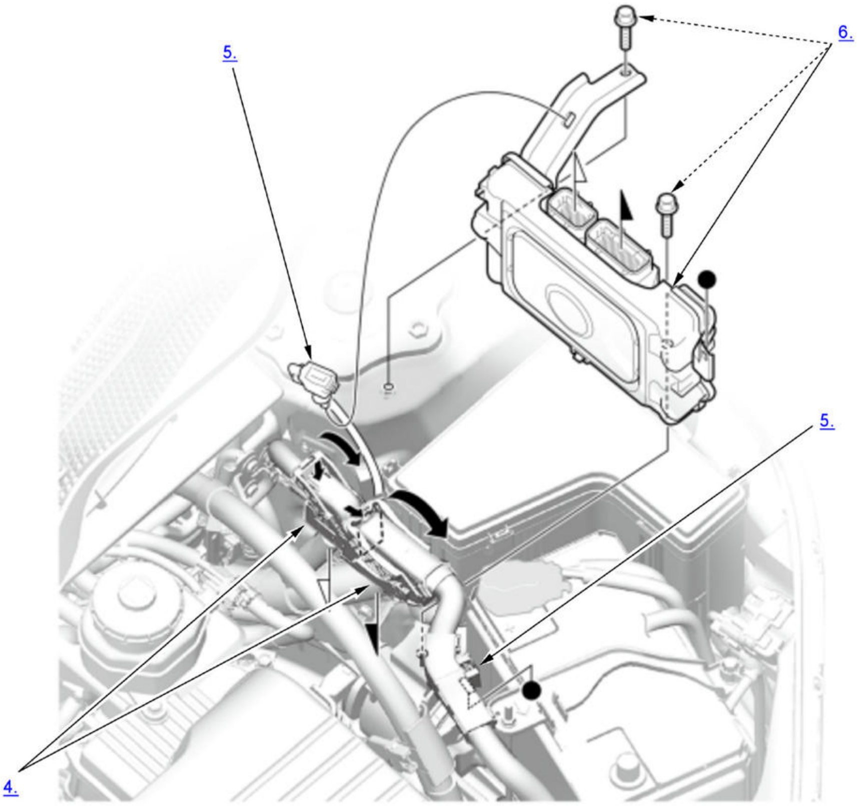

Fig. 46: Exploded View Of PCM Components For Removal (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

NOTE: Numbered call-outs in figure pertain to list numbers in following procedure.

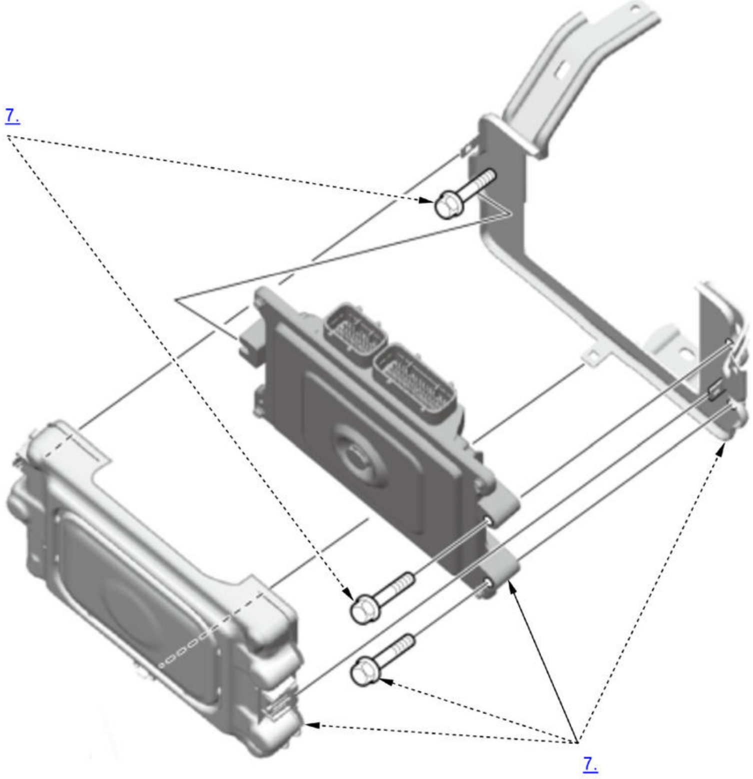

Fig. 47: Exploded View Of PCM Components For Removal (2 Of 2)
Courtesy of HONDA, U.S.A., INC.

1. HDS - Connect
2. READ DATA - Select

1. Select the PGM-FI system with the HDS. 2. Select the ECU Replacement Menu with the HDS, then select READ DATA, and follow the screen prompts. **NOTE:** • Doing this step copies (READS) the data from the original PCM so you can later download (WRITES) them into the new PCM. • If the READ DATA indicates FAILED, continue with this procedure.

3. SCS - Short

1. Turn the vehicle to the OFF (LOCK) mode. 2. Jump the SCS line with the HDS, and wait more than 1 minute.

4. Connector (PCM) - Disconnect
5. Harness Clamp - Remove
6. PCM assembly - Remove
7. PCM - Remove

Installation

NOTE:

- If you are replacing the PCM, do the all procedures.
- If you are removing the PCM, skip the procedures of using the HDS.

- If you are substituting the PCM, skip the procedures of WRITE DATA (Engine Oil Life).

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

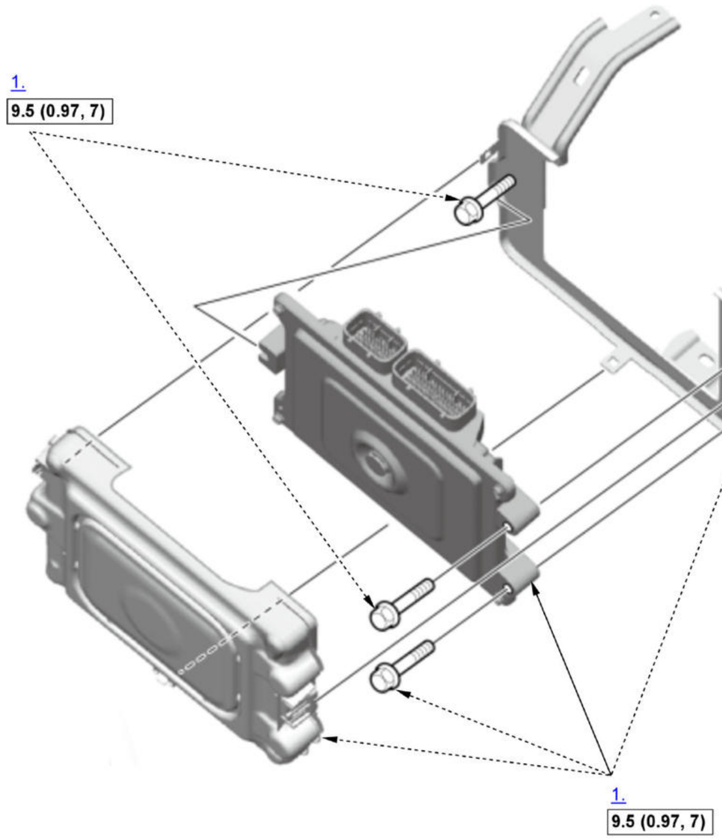

Fig. 48: Exploded View Of PCM Components With Torque Specifications For Installation (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

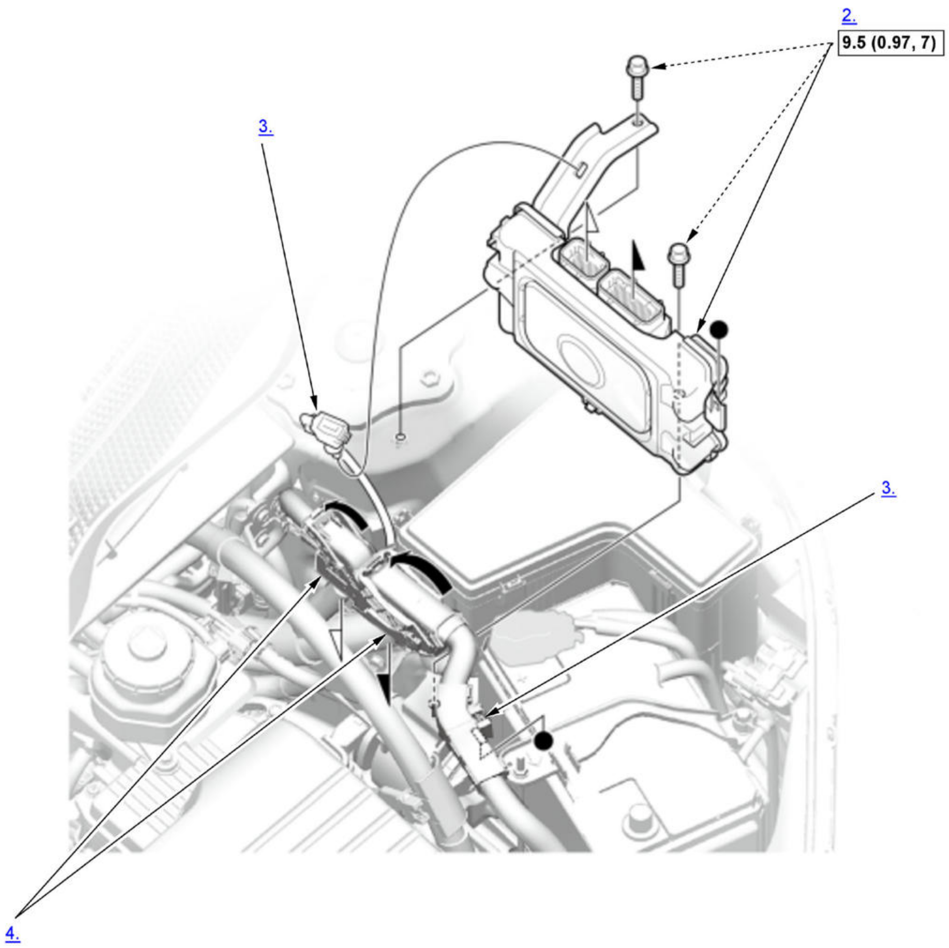

Fig. 49: Exploded View Of PCM Components With Torque Specifications For Installation (2 Of 2)
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. PCM - Install
2. PCM assembly - Install
3. Harness Clamp - Install
4. Connector (PCM) - Connect
5. SCS - Open

1. Exit the SCS mode with the HDS.

Procedure After Replacing PCM

6. VIN - Input

1. Turn the vehicle to the ON mode.

NOTE: DTC P0630 VIN Not Programmed or Mismatch may be stored because the VIN has not been programmed into the PCM; ignore it, and continue this procedure.

2. Manually input the VIN to the PCM with the HDS.

7. Keyless Access System - Registration
8. WRITE DATA (Engine Oil Life) - Select

NOTE: If the READ DATA (Engine Oil Life) failed in "READ DATA (Engine Oil Life) - Select", skip this procedure.

1. Select the ECU Replacement Menu with the HDS, then select WRITE DATA, and follow the screen prompts.

9. Other Procedures for PCM Replacement - Do

1. If the READ DATA failed in "READ DATA (Engine Oil Life) - Select", do these procedures:
    - **Replace the engine oil** .
    - **Replace the engine oil filter** .

10. DTC - Clear

1. Clear the Pending or Confirmed DTCs with the HDS.

11. **PCM - Update**
12. **CKP Pattern - Clear/Learn**

ROCKER ARM OIL CONTROL VALVE/ROCKER ARM OIL PRESSURE SENSOR REMOVAL AND INSTALLATION

Removal and Installation

Rocker Arm Oil Control Valve

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

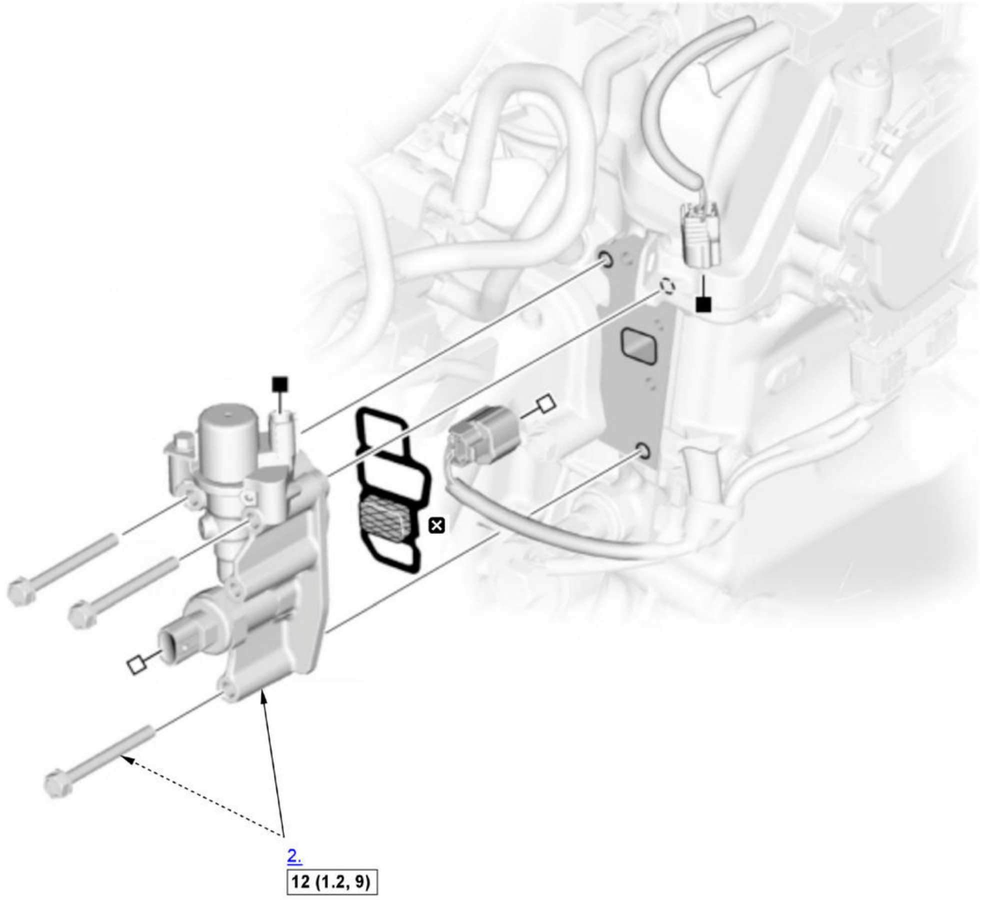

Fig. 50: Exploded View Of Rocker Arm Oil Control Valve Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Air Intake Tube B - Remove
2. Rocker Arm Oil Control Valve - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Rocker Arm Oil Pressure Sensor

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

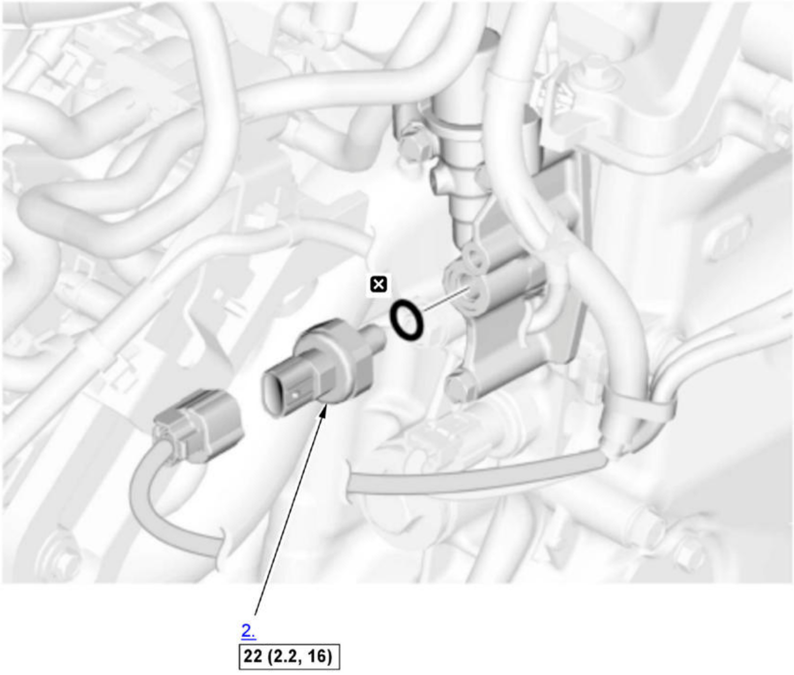

Fig. 51: Exploded View Of Rocker Arm Oil Pressure Sensor Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Air Intake Tube B - Remove
2. Rocker Arm Oil Pressure Sensor - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SECONDARY HO2S REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	O2 Sensor Socket Wrench Snap-on SWR2 or Snap-on YA8875, commercially available

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

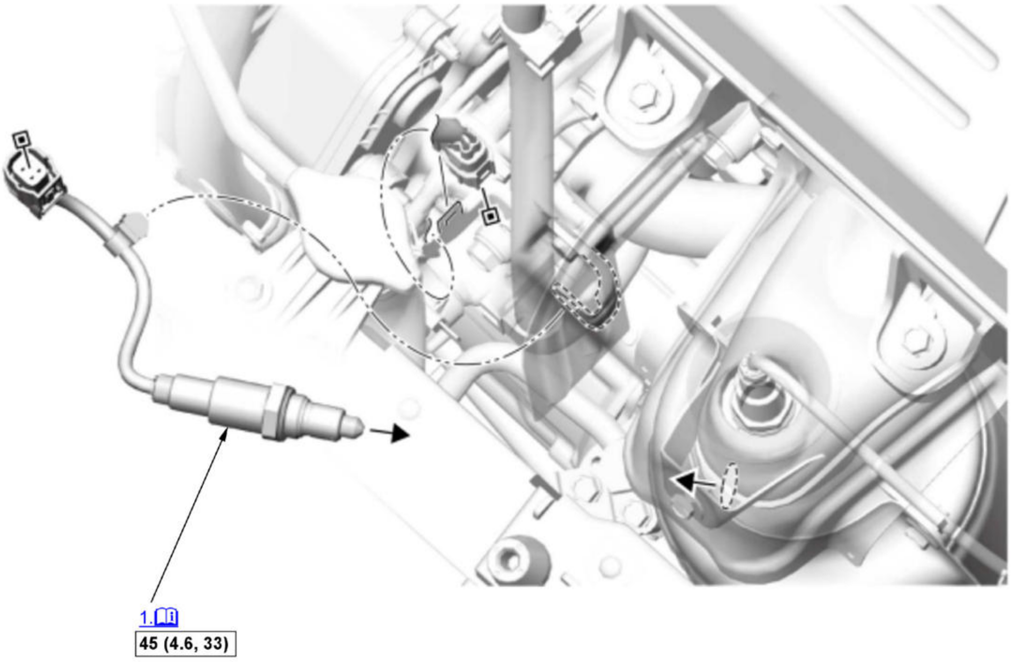

Fig. 52: Exploded View Of Secondary HO2S Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. Secondary HO2S - Remove

 A Snap-on SWR2 or Snap-on YA8875, commercially available	1. Using the O2 sensor wrench (A), remove secondary HO2S.

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SHUTTER GRILLE REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

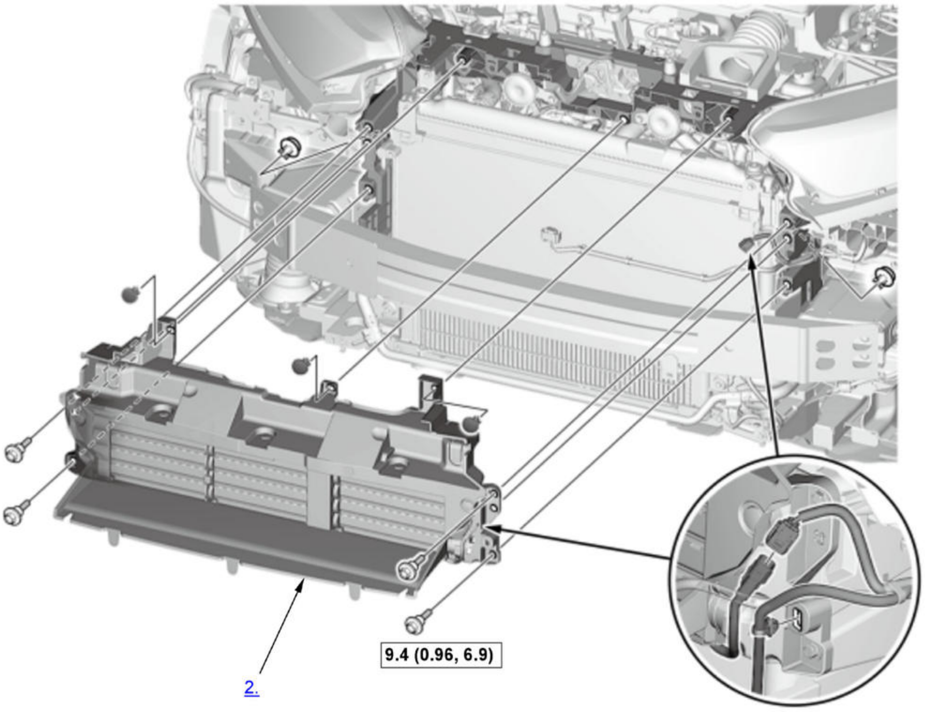

Fig. 53: Exploded View Of Shutter Grille Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. **Millimeter Wave Radar Assembly - Remove** (If Necessary)
2. Shutter Grille Assembly - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

4. **Millimeter Wave Radar - Update**
5. **Millimeter Wave Radar - Aim**

REMOVAL INSTALLATION AND TEST

EVAP SYSTEM REMOVAL, INSTALLATION, AND TEST (1.5 L ENGINE (KA/KC))

Removal and Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- Although a numbered sequence is shown, these "*1" indicated parts are separate components. If removal or replacement of one of the components is needed, it is not necessary to remove the other.

☐	Torque: N.m (kgf.m, lbf.ft)

EVAP Canister/EVAP Leak Check Module

1. Vehicle - Lift
2. Heat Shield - Remove
3. EVAP Leak Check Module Assembly - Remove
4. EVAP Leak Check Module - Remove
5. Heat Shield - Remove
6. EVAP Canister - Remove
7. Bracket - Remove
8. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

    EVAP Canister Purge Valve

9. Intake Air Resonator - Remove
10. EVAP Canister Purge Valve - Remove
11. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

EVAP Canister Purge Nozzle

12. EVAP Canister Purge Nozzle - Remove
13. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

EVAP Canister Drain Pipe/EVAP Canister One Way Valve

14. Rear Inner Fender (Right Side) - Remove
15. EVAP Canister Drain Pipe - Remove
16. EVAP Canister One Way Valve - Remove
17. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Inspection

WARNING:

Flammable - Keep Fire Away

NOTE: Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.

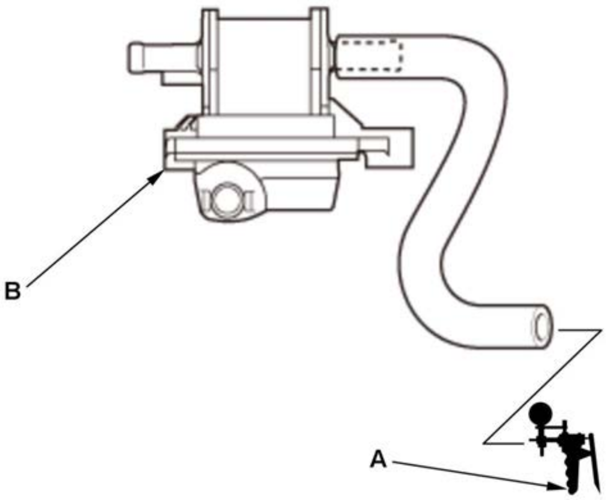
Non-Return Valve Inspection

1. EVAP Canister Purge Valve Hose - Disconnect

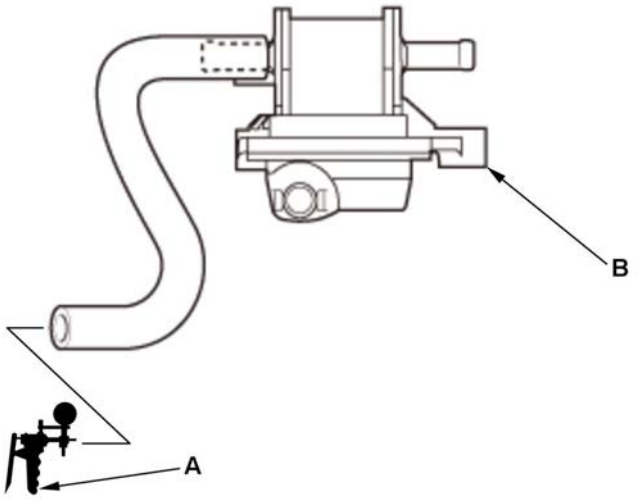
	1. Disconnect the EVAP canister purge valve hoses (A).

2. HDS - Connect
3. Non-return Valve - Inspection

Non-Return Valve A (Intake Manifold Side)



Non-Return Valve B (Turbocharger Side)



1. Select the PGM-FI system with the HDS.

2. Select the INSPECTION MENU, then select EVAP TEST (ELCM), and follow the screen prompts.

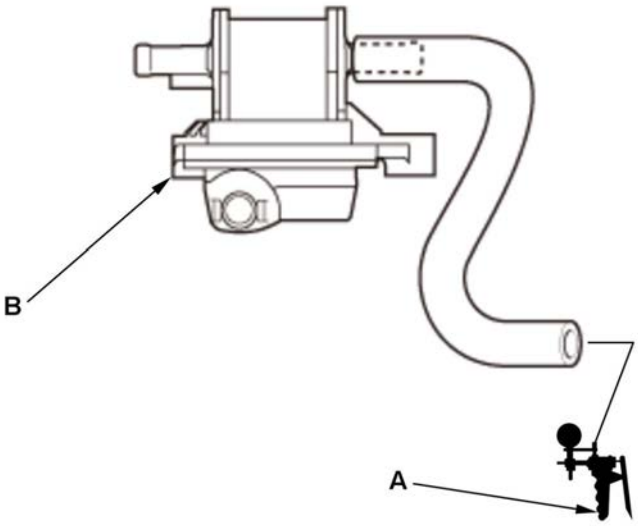
3. Select the Single Solenoid Test, then select PCS ON, and follow the screen prompts.

4. Connect the vacuum pump (A) to the EVAP canister purge valve (B) as shown.

5. Apply vacuum to the valve.

- If it holds vacuum, replace the EVAP canister purge valve.
- If it doesn't hold the vacuum, go to next step.

Non-Return Valve A (Intake Manifold Side)



6. Connect the vacuum pump (A) to the EVAP canister purge valve (B) as shown.

7. Apply pressure to the valve.

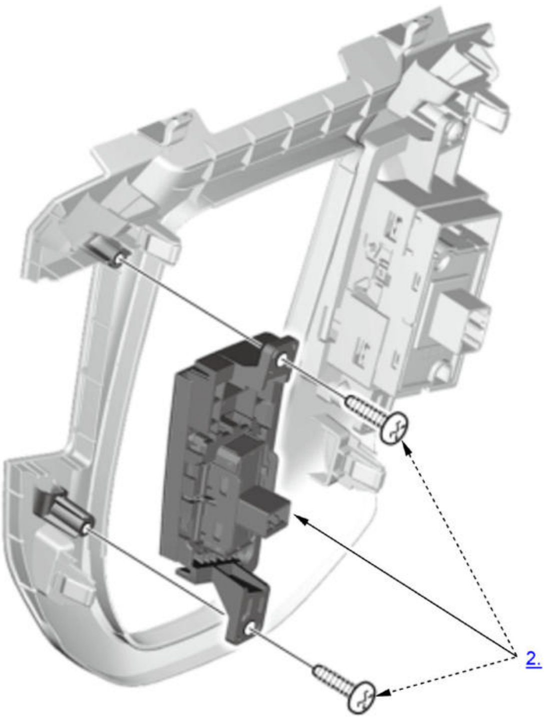
- If it holds pressure, the EVAP canister purge valve is OK.
- If it doesn't hold the pressure, replace the EVAP canister purge valve.

Non-Return Valve B (Turbocharger Side)  	

IDLE STOP OFF SWITCH REMOVAL, INSTALLATION, AND TEST (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Removal and Installation

1



1. Shift Lever Panel - Remove
2. Idle Stop Off Switch - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. Idle Stop Off Switch - Test

	**Contact point - Test** 1. Check for continuity between idle stop off switch connector terminals according to the table. If the result is not normal, replace the Idle stop off switch.

Connector		
Idle stop off switch 5P connector (male terminals): ①		
Test terminal	**Switch position**	**Normal**
No. 1 - No. 3	pressed	continuity
	not pressed	not continuity

	**LED - Test** **NOTE:** - When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED. - Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction. 2. Connect the 12 volt battery to the Idle stop off switch according to the table. 3. Check that the LED of the idle stop off switch comes on.If the LED does not come on, replace the idle stop off switch.

Connector	
Idle stop off switch 5P connector (male terminals): ①	
Terminal	**12 volt battery**
No. 4	+
No. 5	-

VTC OIL CONTROL SOLENOID VALVE REMOVAL, INSTALLATION, AND TEST (1.5 L ENGINE)

Removal and Installation

NOTE: Although a numbered sequence is shown, these "*1" indicated parts are separate components. If removal or replacement of one of the components is needed, it is not necessary to remove the other.

Intake Side (VTC Oil Control Solenoid Valve A)*1

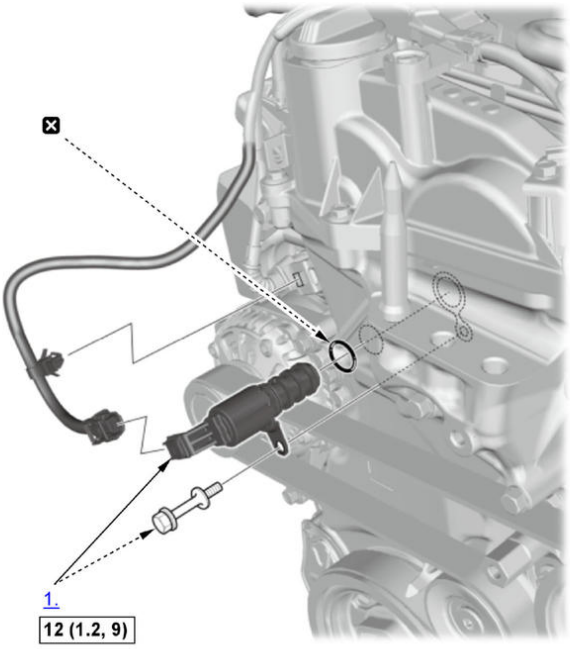


Fig. 7: Intake Side VTC Oil Control Solenoid Valve A Replacement Components With Torque Specifications (1.5 L Engine)
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

2

Exhaust Side (VTC Oil Control Solenoid Valve B)*1

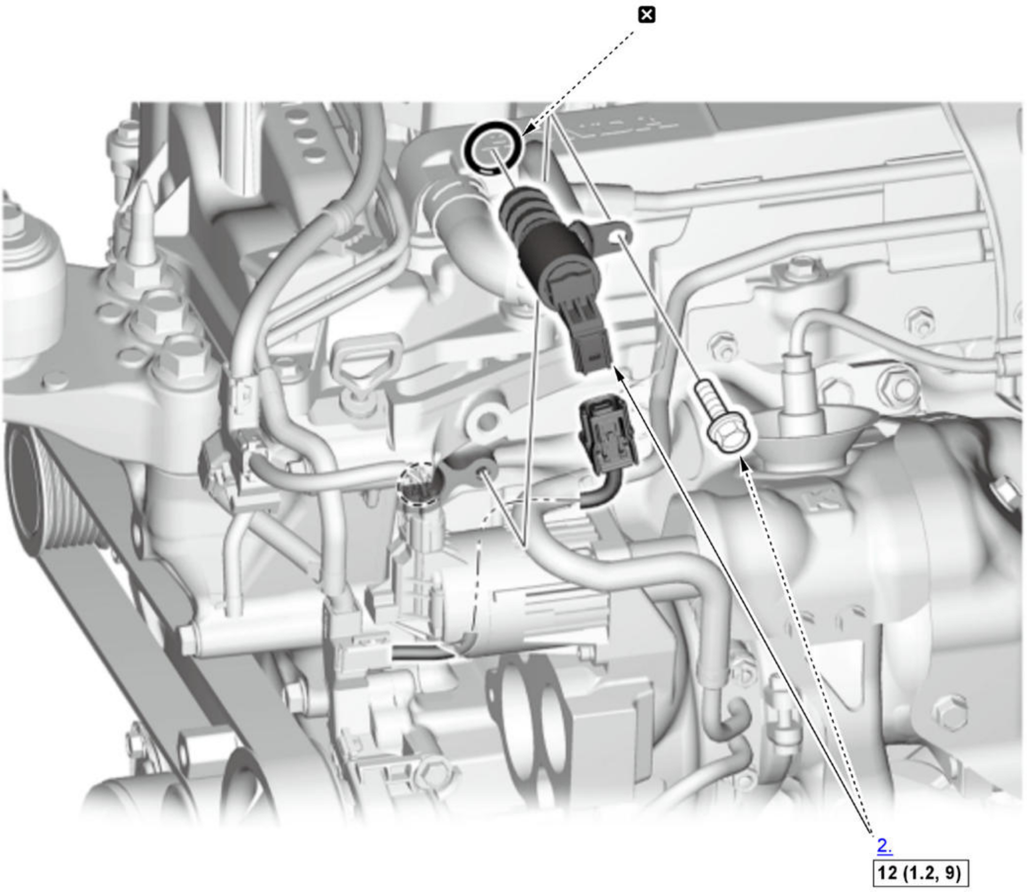

Fig. 8: Exhaust Side VTC Oil Control Solenoid Valve B Replacement Components With Torque Specifications (1.5 L Engine)
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

Intake Side (VTC Oil Control Solenoid Valve A)

1. VTC Oil Control Solenoid Valve A - Remove
2. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal with a new O-ring.
>   - Coat the new O-ring with clean engine oil.
>   - Clean and dry the mating surface of the valve.

Exhaust Side (VTC Oil Control Solenoid Valve B)

3. Turbocharger Joint - Remove
4. VTC Oil Control Solenoid Valve B - Remove
5. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal with a new O-ring.
>   - Coat the new O-ring with clean engine oil.
>   - Clean and dry the mating surface of the valve.

Test

1. VTC Oil Control Solenoid Valve - Test

	1. Check for any blockage in the ports of the VTC oil control solenoid valve. 2. Connect VTC oil control solenoid valve 2P connector (male terminals) No. 1 to the 12 volt battery positive terminal with a jumper wire: ① Connect VTC oil control solenoid valve 2P connector (male terminals) No. 2 to the 12 volt battery negative terminal with a jumper wire: ① 3. It is normal to a click sound by the valve function when turning on electricity. If the no sound heard, replace the VTC oil control solenoid valve because of a functional malfunction.

VTC OIL CONTROL SOLENOID VALVE REMOVAL, INSTALLATION, AND TEST (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

NOTE: Although a numbered sequence is shown, these "*1" indicated parts are separate components. If removal or replacement of one of the components is needed, it is not necessary to remove the other.

1

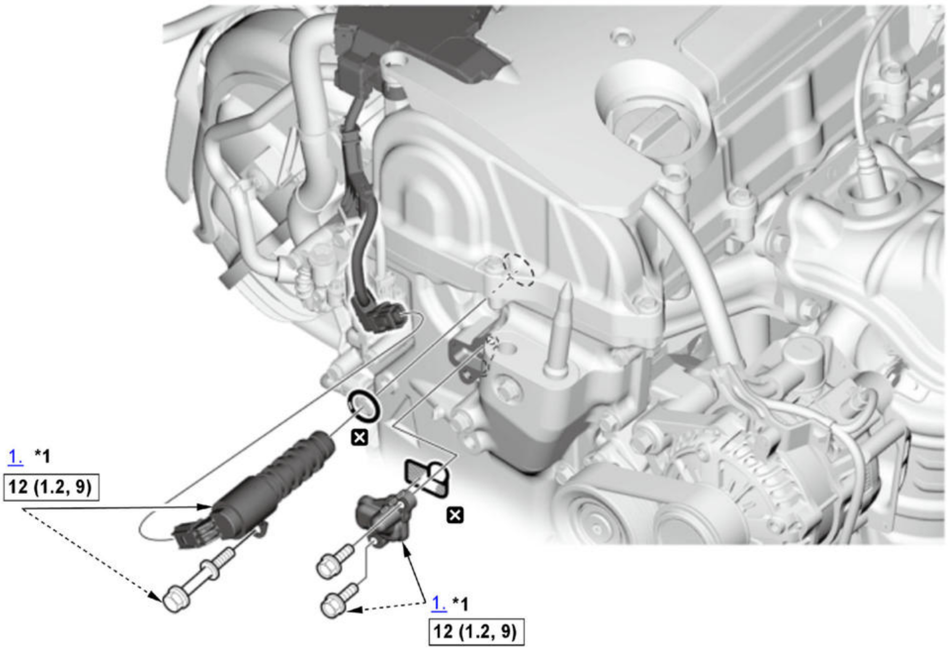

Fig. 9: VTC Oil Control Solenoid Valve Replacement Components With Torque Specifications 2.4 L Engine (2017 2018 2019)
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

VTC Oil Control Solenoid Valve

1. VTC Oil Control Solenoid Valve - Remove
2. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal with a new O-ring.
>   - Coat the new O-ring with clean engine oil.
>   - Clean and dry the mating surface of the valve.

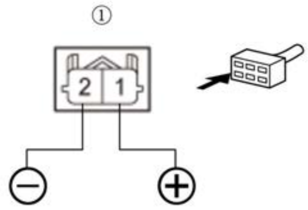
VTC Strainer

3. VTC Strainer - Remove
4. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal with a new filter.

Test

1. VTC Oil Control Solenoid Valve - Test



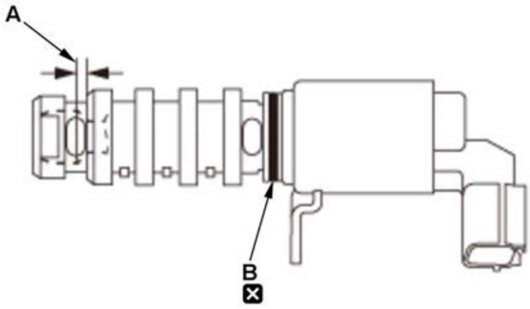
1. Check for any blockage in the ports of the VTC oil control solenoid valve.

2. Connect VTC oil control solenoid valve 2P connector (male terminals) No. 1 to the 12 volt battery positive terminal with a jumper wire:

①

Connect VTC oil control solenoid valve 2P connector (male terminals) No. 2 to the 12 volt battery negative terminal with a jumper wire:

①



3. Measure the clearance of the valve (A). The clearance should be at least 1.2 mm (0.047 in).

- If the clearance is as specified, the valve is OK; reinstall it with a new O-ring (B).
- If the clearance is not as specified, install a new valve and O-ring.

REMOVAL AND INSTALLATION

A/F SENSOR REMOVAL AND INSTALLATION (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	O2 Sensor Wrench Snap-on S6176 or equivalent, commercially available

Removal and Installation

NOTE: ℹ Where icon is shown for further information in the information below.

1

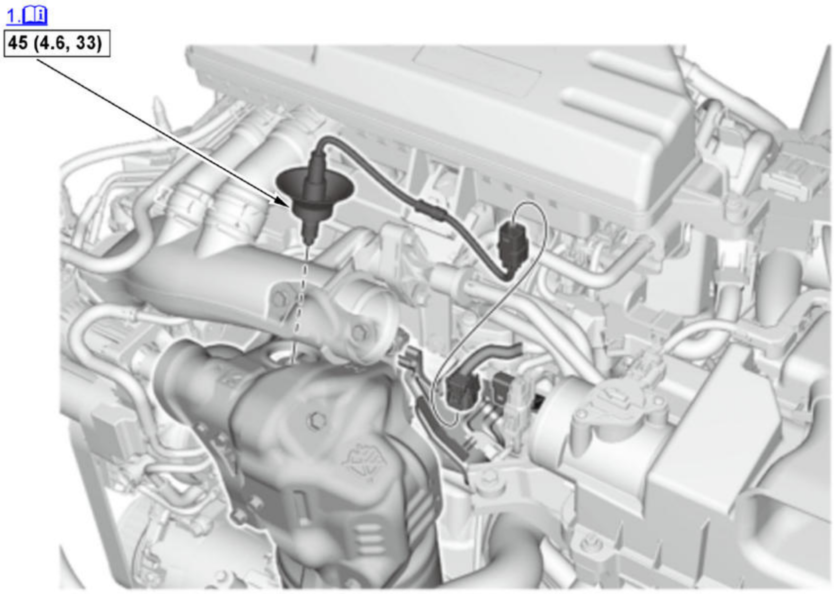


Fig. 10: A/F Sensor Replacement Components With Torque Specifications (1.5 L Engine)
Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. A/F Sensor - Remove

	1. Using a commercially available O2 sensor wrench, remove the A/F sensor.

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

A/F SENSOR REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

Intake Side (CMP Sensor A)

1. Intake Air Resonator - Remove

   NOTE: Remove intake pipe as needed to access CMP Sensor A.

2. CMP Sensor A - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal with a new O-ring.

4. CKP Pattern - Clear/Learn

   NOTE: When replacing the CMP sensor A, do this procedure.

   Exhaust Side (CMP Sensor B)

5. Intake Air Resonator - Remove

   NOTE: Remove intake pipe as needed to access CMP Sensor B.

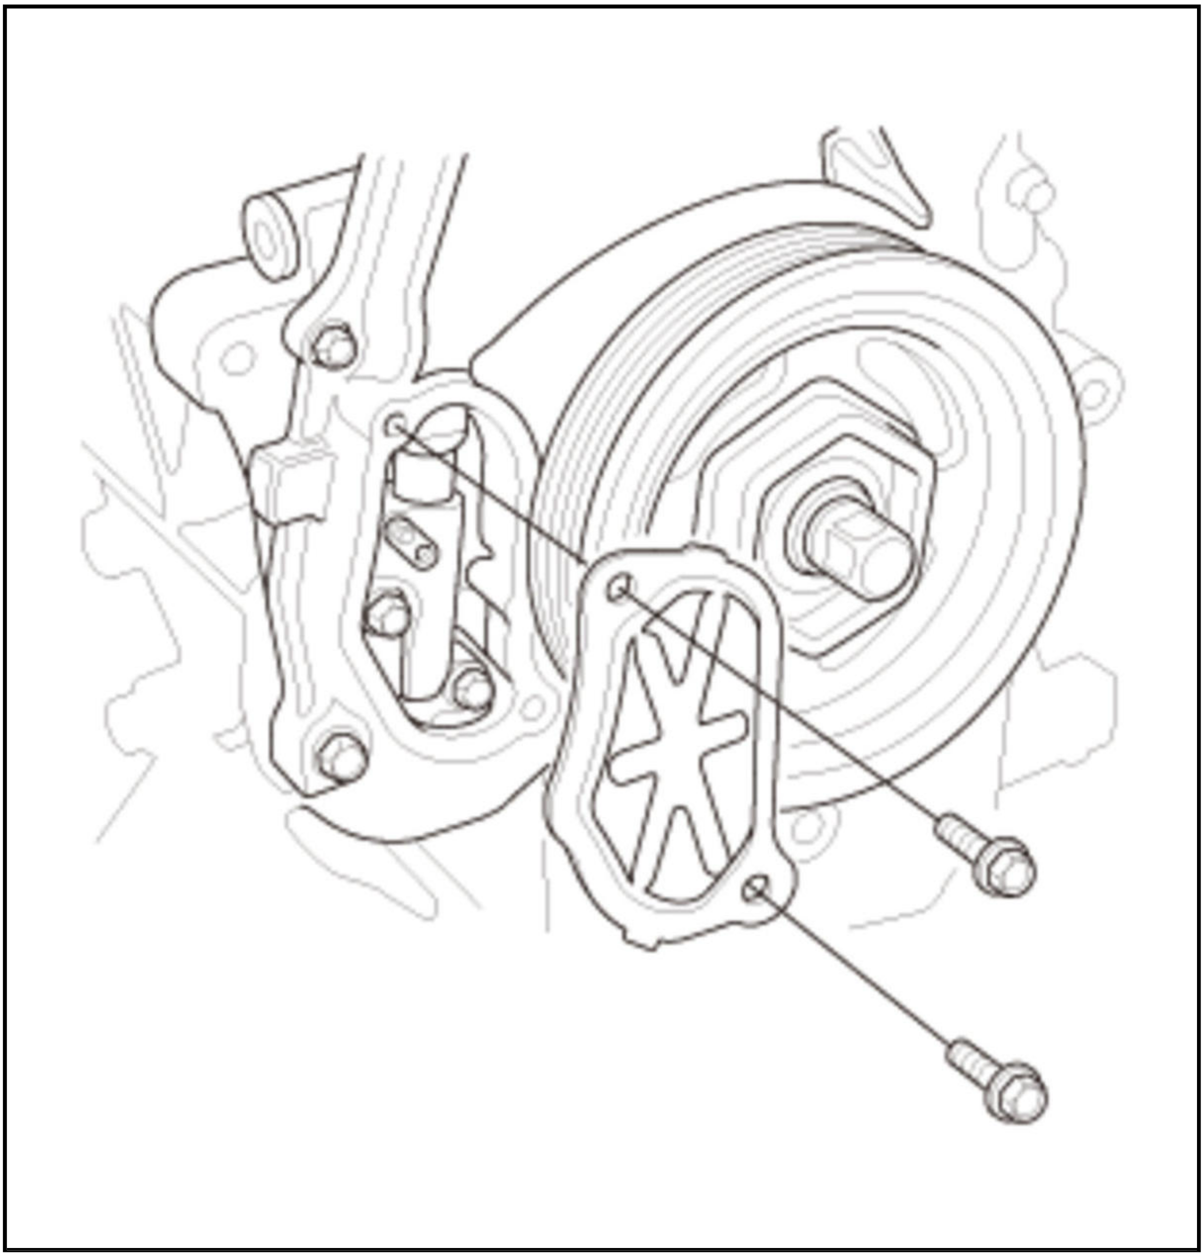
6. CMP Sensor B - Remove
7. All Removed Parts - Install

1. Install the parts in the reverse order of removal with a new O-ring.

CAM CHAIN AUTO-TENSIONER REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal

1. Right Front Wheel - Remove
2. Engine Undercover - Remove
3. Chain Case Cover - Remove



4. Cam Chain Auto-Tensioner - Remove

	1. Turn the crankshaft counterclockwise to compress the cam chain auto-tensioner.

	2. Rotate the crankshaft counterclockwise to align the holes on the lock (A) and the cam chain auto-tensioner (B), then insert a 1.2 mm (3/64 in) diameter pin (C) into the holes. Turn the crankshaft clockwise to secure the pin. **NOTE:** If the holes in the lock and the cam chain auto-tensioner do not align, continue to rotating the crankshaft counterclockwise until the holes align, then install the pin.

	3. Remove the cam chain auto-tensioner (A) and the cam chain auto-tensioner filter (B). **NOTE:** Check the cam chain auto-tensioner filter for damage. If filter is damaged, replace it.

Installation

NOTE: How to read the torque specifications .

1. Cam Chain Auto-Tensioner - Install

	1. Compress the cam chain auto-tensioner when replacing the cam chain. Remove the pin (A) from the cam chain auto-tensioner that was installed during removal. Turn the plate (B) counterclockwise, to release the lock, then press the rod (C), and set the first cam (D) to the first edge of the rack (E). Insert the 1.2 mm (3/64 in) diameter pin back into the holes (F). **NOTE:** If the cam chain auto-tensioner is not set up as described, the cam chain auto-tensioner will be damaged.

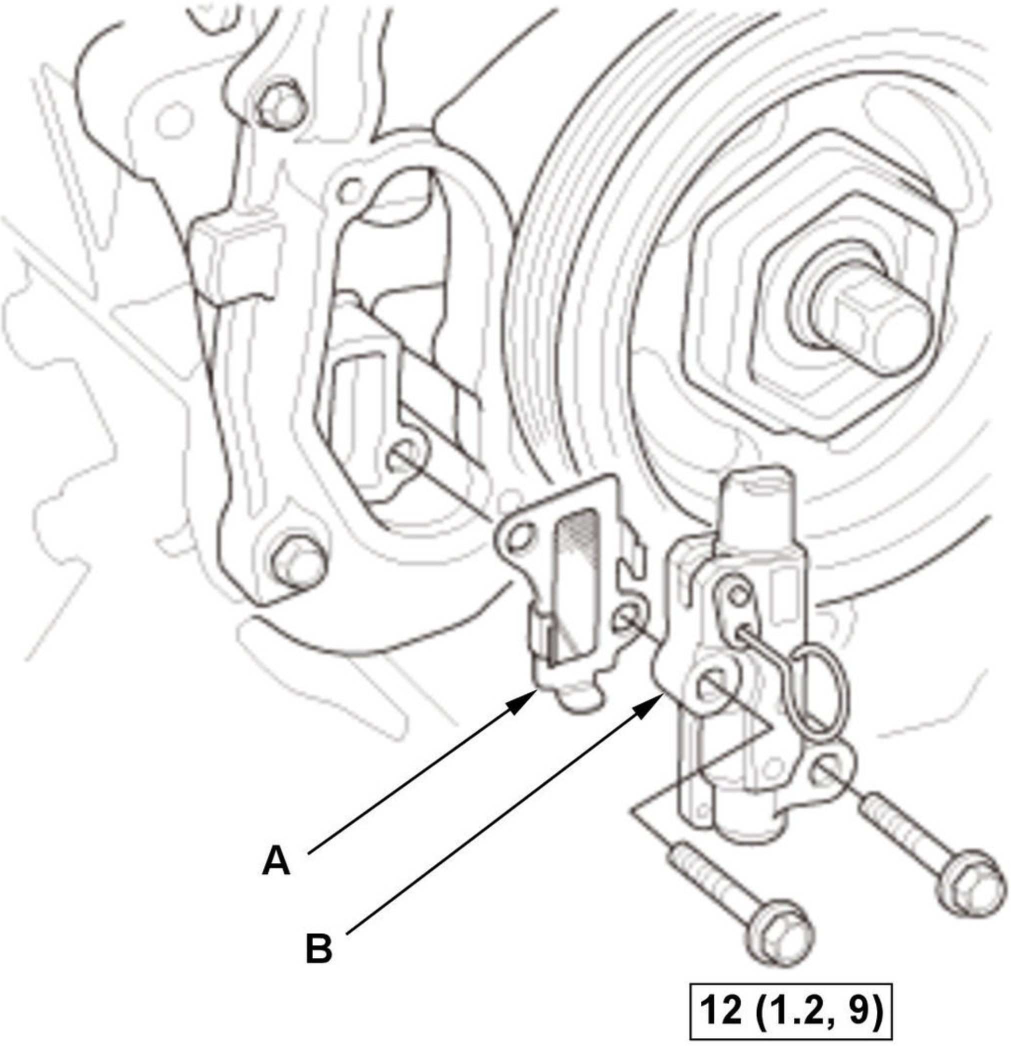


Fig. 18: Cam Chain Auto-Tensioner Replacement Components With Torque Specifications (1.5 L Engine)
Courtesy of HONDA, U.S.A., INC.

2. Install the cam chain auto-tensioner filter (A) and the cam chain auto-tensioner (B).

	3. Remove the pin (A) from the cam chain auto-tensioner.

2. Chain Case Cover - Install

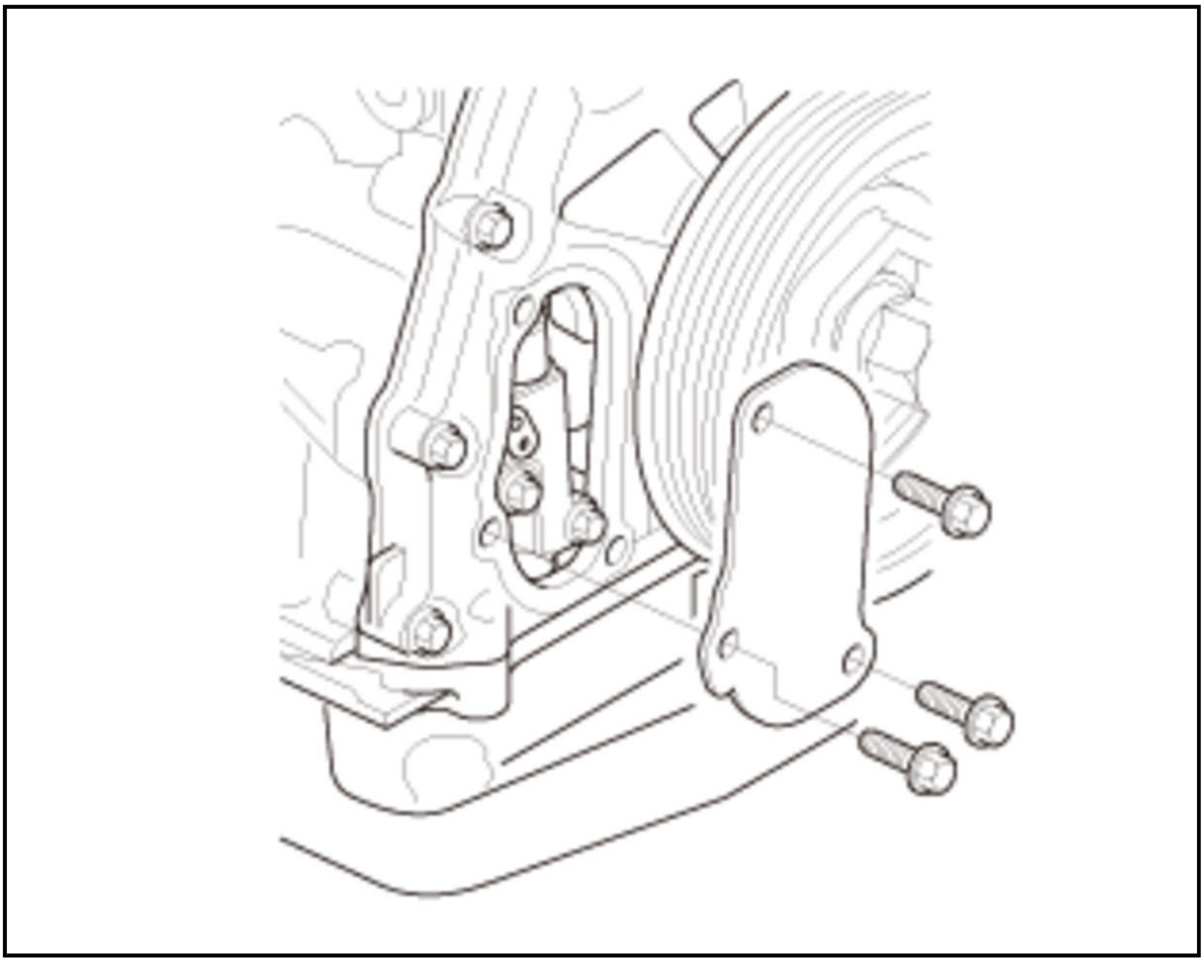
	1. **Apply liquid gasket** to the cam chain case mating surface of the chain case cover, and to the inside edge of the threaded bolt holes. 2. Install the chain case cover.

3. **Engine Undercover - Install**
4. **Right Front Wheel - Install**

CAM CHAIN AUTO-TENSIONER REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal

1. **Right Front Wheel - Remove**
2. **Engine Undercover - Remove**
3. Chain Case Cover - Remove



4. Cam Chain Auto-Tensioner - Remove

	1. Turn the crankshaft counterclockwise to compress the cam chain auto-tensioner.
	2. Rotate the crankshaft counterclockwise to align the holes on the lock (A) and the cam chain auto-tensioner (B), then insert a 1.2 mm (3/64 in) diameter pin (C) into the holes. Turn the crankshaft clockwise about 90 deg. to secure the pin. **NOTE:** If the holes in the lock and the cam chain auto-tensioner do not align, continue to rotating the crankshaft counterclockwise until the holes align, then install the pin.

	3. Remove the cam chain auto-tensioner (A) and the cam chain auto-tensioner filter (B). **NOTE:** Check the cam chain auto-tensioner filter for damage. If filter is damaged, replace it.

Installation

NOTE: How to read the torque specifications .

1. Cam Chain Auto-Tensioner - Install

	1. Compress the cam chain auto-tensioner when replacing the cam chain. Remove the pin (A) from the cam chain auto-tensioner that was installed during removal. Turn the plate (B) counterclockwise, to release the lock, then press the rod (C), and set the first cam (D) to the first edge of the rack (E). Insert the 1.2 mm (3/64 in) diameter pin back into the holes (F). **NOTE:** If the cam chain auto-tensioner is not set up as described, the cam chain auto-tensioner will be damaged.

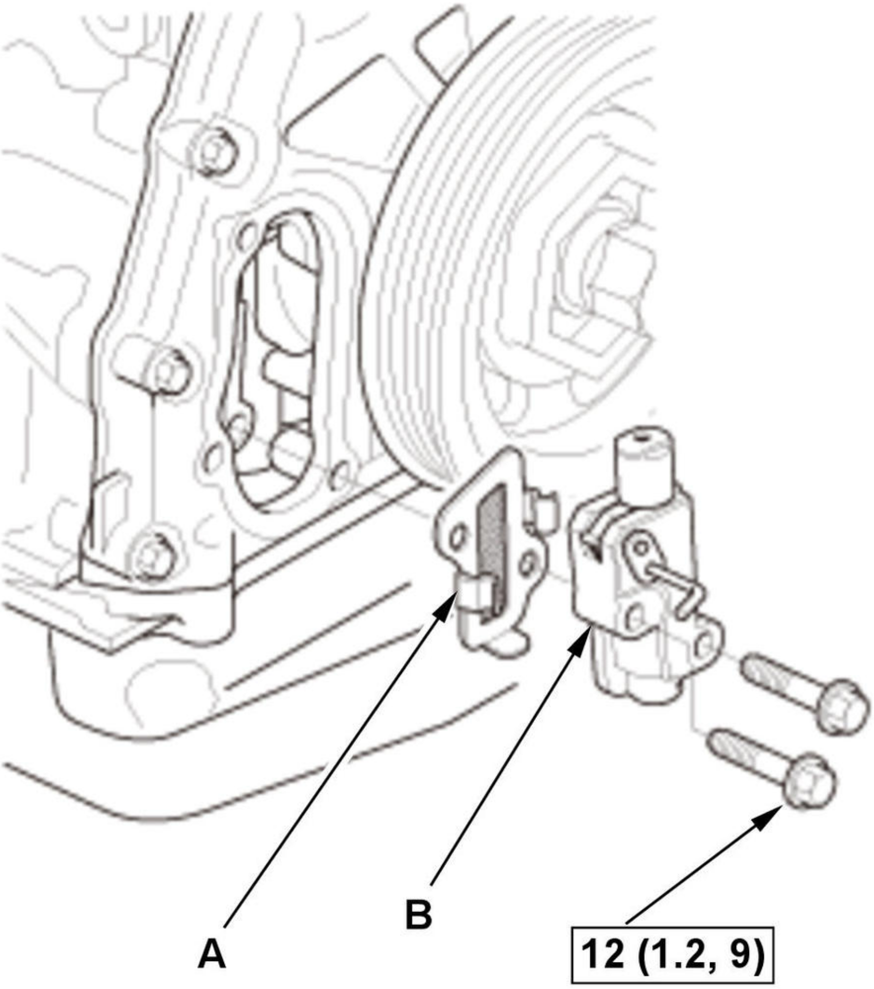


Fig. 19: Cam Chain Auto-Tensioner Replacement Components With Torque Specifications (2.4 L Engine) (2017 2018 2019)

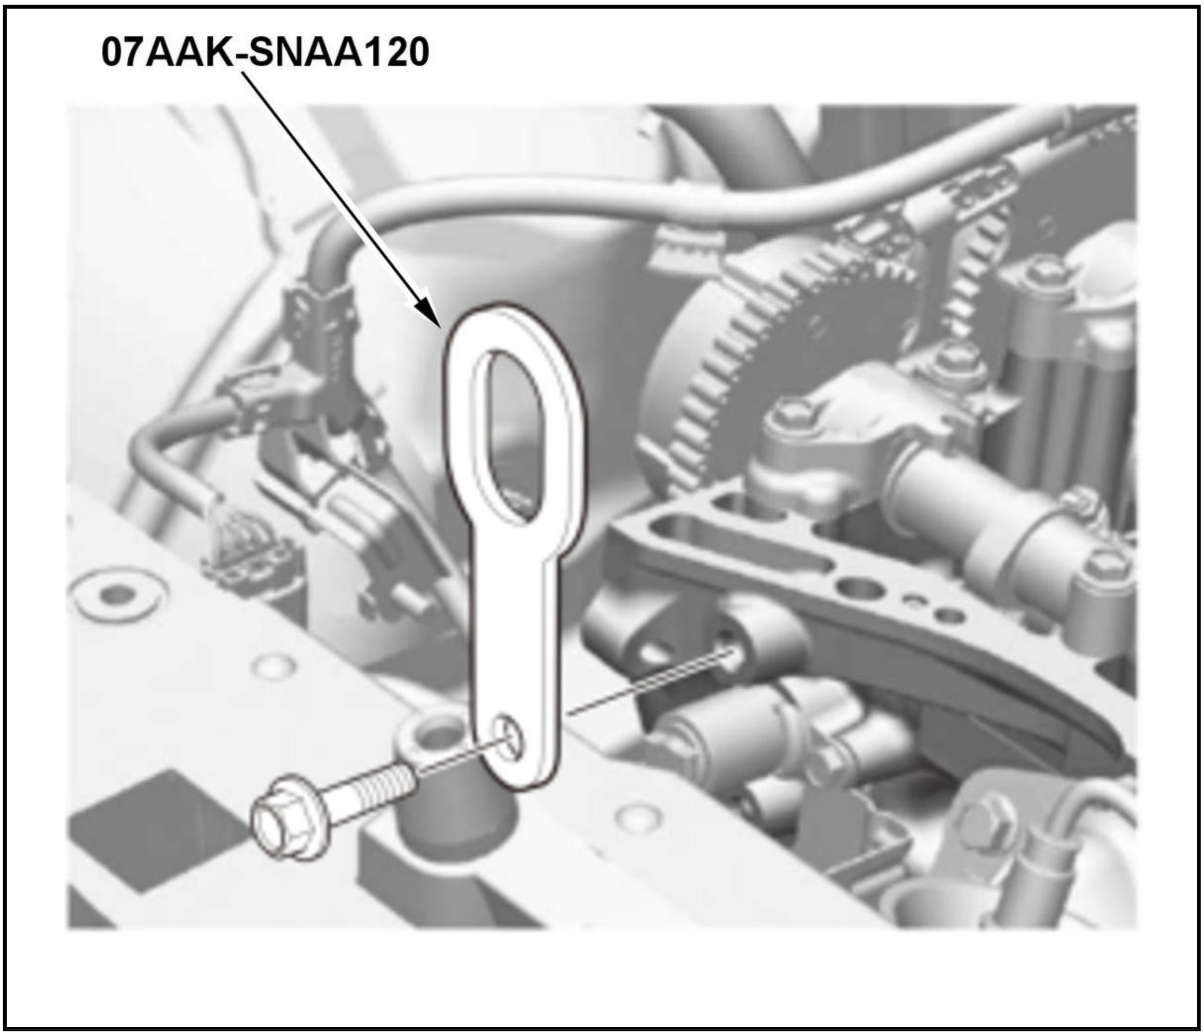
1. **Front Bulkhead Cover - Remove**
2. **Cowl Cover - Remove**
3. **Expansion Tank Bracket - Remove**
4. **Turbocharger Joint - Remove**
5. **Cam Chain - Remove**
6. Cam Chain Drive Sprocket - Remove

	1. Remove the key (A) and the cam chain drive sprocket (B). **NOTE:** Check the direction of the key. When the key is installed, install the key as same direction of the original one.

7. Sub Hanger Stay - Install

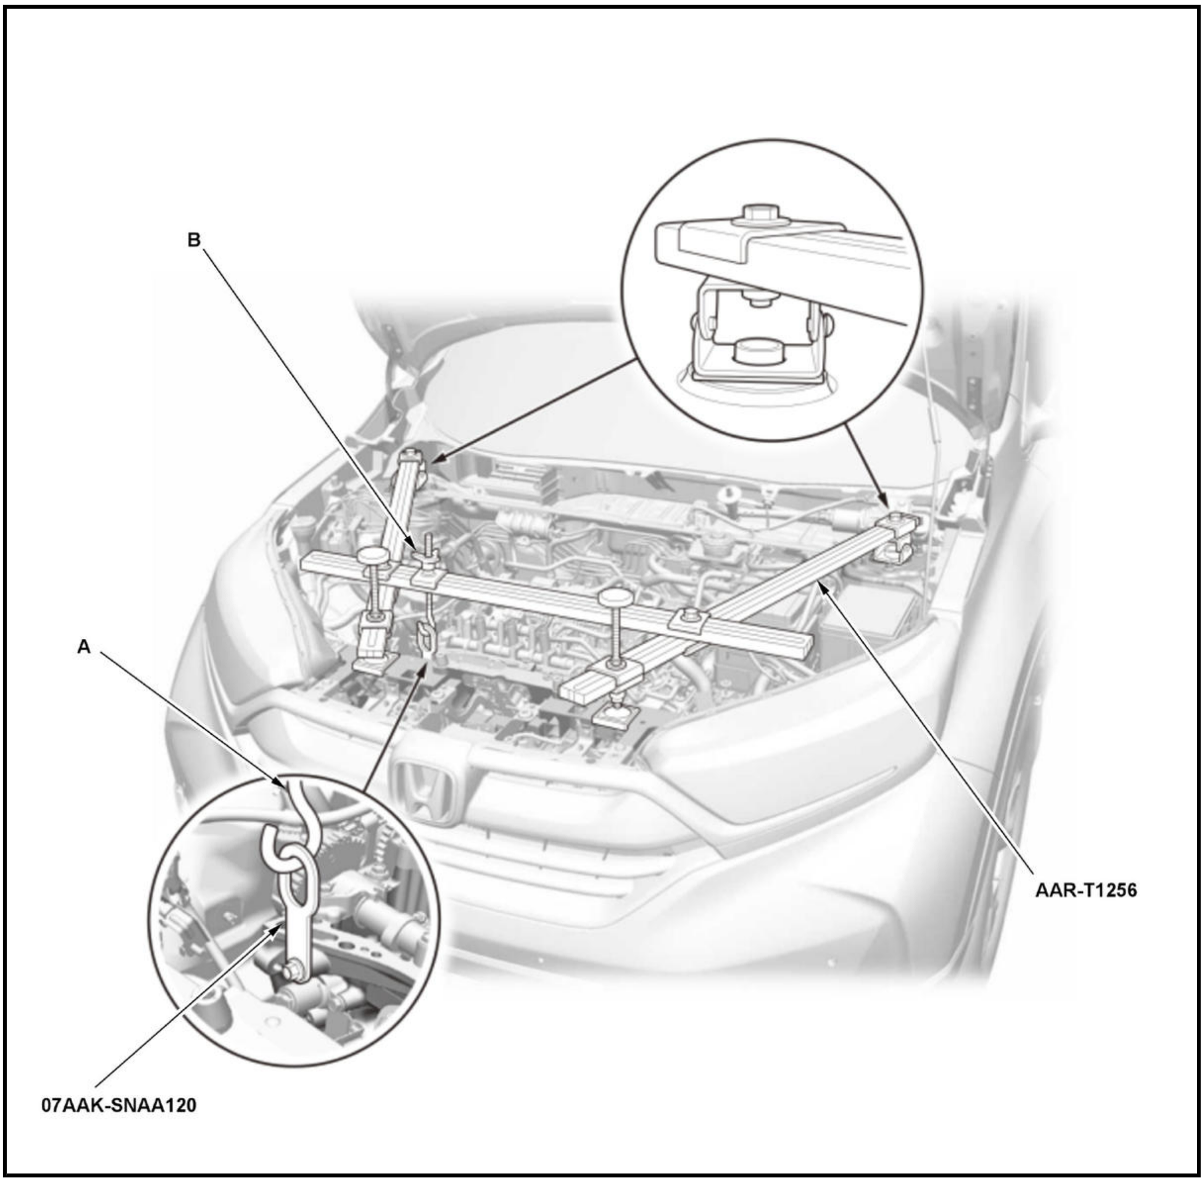


07AAK-SNAA120

8. Engine Support Hanger - Install

NOTE: Be careful when working around the windshield.

1. Remove the front damper caps.



B
A
AAR-T1256
07AAK-SNAA120

2. Install the engine support hanger onto the vehicle as shown.

3. Attach the hook (A) to the slotted hole in the universal lifting eyelet.

4. Tighten the wing nut (B) by hand, and lift and support the engine.

9. **Oil Pan - Remove**
10. Oil Pump - Remove

	1. Remove the oil strainer (A) and the oil pump (B).

Installation

NOTE: How to read the torque specifications .

1. Oil Pump - Install

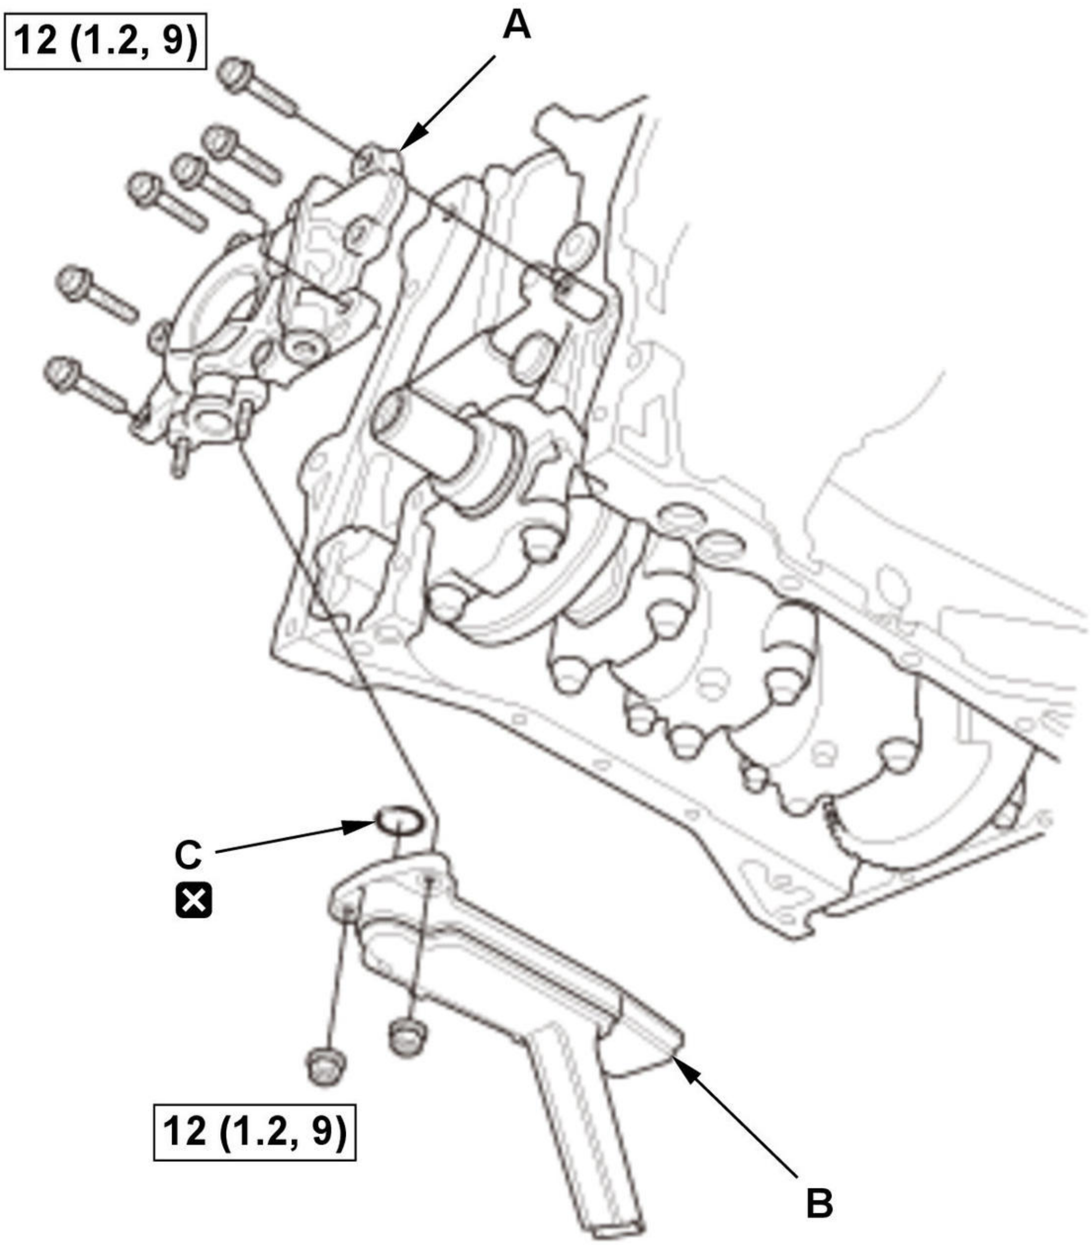


Fig. 35: Engine Oil Pump Replacement Components With Torque Specifications (1.5 L Engine)
Courtesy of HONDA, U.S.A., INC.

1. Install the oil pump (A).

2. Install the oil strainer (B) with a new O-ring (C).

2. **Oil Pan - Install**
3. Engine - Support

1. Lift and support the engine with a jack and a wood block under the oil pan.

4. Engine Support Hanger and Sub Hanger Stay - Remove
5. **Expansion Tank Bracket - Install**
6. Cam Chain Drive Sprocket - Install

	1. Install the cam chain drive sprocket (A) and the key (B).

7. **Cam Chain - Install**
8. **Cowl Cover - Install**
9. **Front Bulkhead Cover - Install**
10. **Engine Oil - Refill**

ENGINE REMOVAL AND INSTALLATION (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Subframe Adapter VSB02C000016*

Image	Description/Tool Number
	Universal Lifting Eyelet 07AAK-SNAA120

Removal

NOTE:

- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Hood - Wide Open

	1. Open the hood. 2. Remove and relocate the hood support rod (A) to the wide-open positions (B) and secure the hood.

2. **Fuel Pressure - Relieve**
3. **Front Bulkhead Cover - Remove**
4. **12 Volt Battery - Remove**
5. **12 Volt Battery Base - Remove**
6. **Intake Parts - Remove**
7. Connector (Engine Wire Harness) and Positive Cable (Under-Hood Fuse/Relay Box) - Disconnect

    1. Remove the cables (A).

   2. Disconnect the connectors (B).

   3. Remove the harness clips (C).

   4. Remove the harness holder (D).

   5. Remove the harness clamp (E).

8. **Throttle Body Inlet Pipe - Remove**
9. **Shift Cable (Transmission Side) - Disconnect**
10. **Fuel Feed Hose - Disconnect**
11. **Steering Joint - Disconnect**

    NOTE: Hold the steering wheel with the steering wheel holder tool.

12. Vehicle - Lift

    1. **Raise and support the vehicle** .

13. **Front Wheel - Remove**
14. **Engine Undercover - Remove**
15. **Engine Coolant - Drain**
16. **Engine Oil - Drain**
17. **Transmission Fluid - Drain**
18. **Drive Belt - Remove**

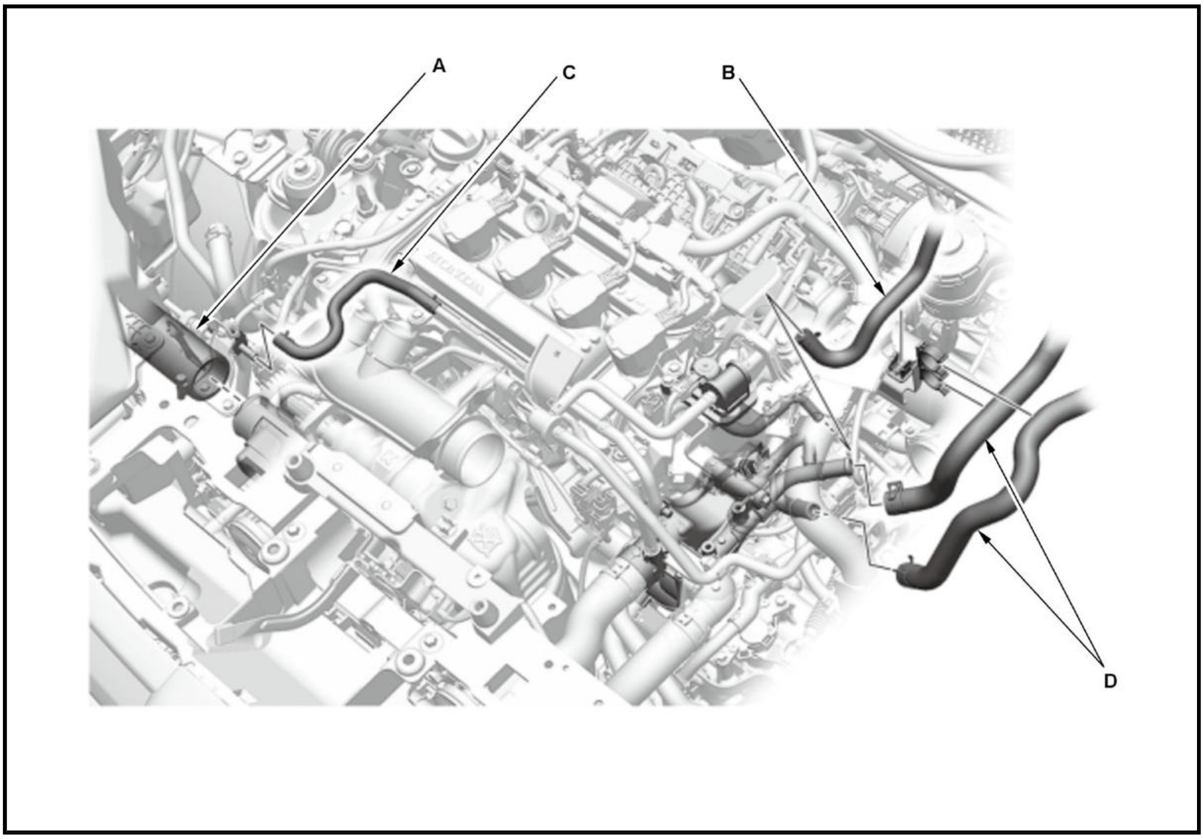
19. Radiator Assembly - Remove
20. A/C Compressor - Move

    NOTE:

    - Do not disconnect the suction hose and the discharge hose.
    - Do not bend the suction hose and the discharge hose excessively.
    - Hang the A/C compressor with a wire tie.
21. Connector (EPS Subharness) - Disconnect
22. Exhaust Pipe A - Remove
23. Tie-Rod End Ball Joint - Disconnect
24. Front Stabilizer Link Ball Joint - Disconnect
25. Lower Arm Ball Joint - Disconnect
26. Front Driveshaft - Remove
27. Propeller Shaft - Remove (AWD)
28. Transfer Assembly - Remove (AWD)
29. Vehicle - Lift

    1. Lower the vehicle.
30. Expansion Tank - Remove
31. Intercooler Inlet Hose, EVAP Canister Purge Hose, Heater Hose and Water Bypass Hose - Disconnect

    1. Disconnect the intercooler inlet hose (A), the EVAP canister purge hose (B), the water bypass hose (C) and the heater hoses (D).



32. Vehicle - Lift

    1. Raise the vehicle.
33. Lower Torque Rod - Remove

34. Front Lower Arm Mounting Bolt - Remove

	1. **Remove both sides of the front lower arm mounting bolt from the body** .

35. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

36. **Front Subframe - Remove**

37. Vehicle - Lift

1. Lower the vehicle.

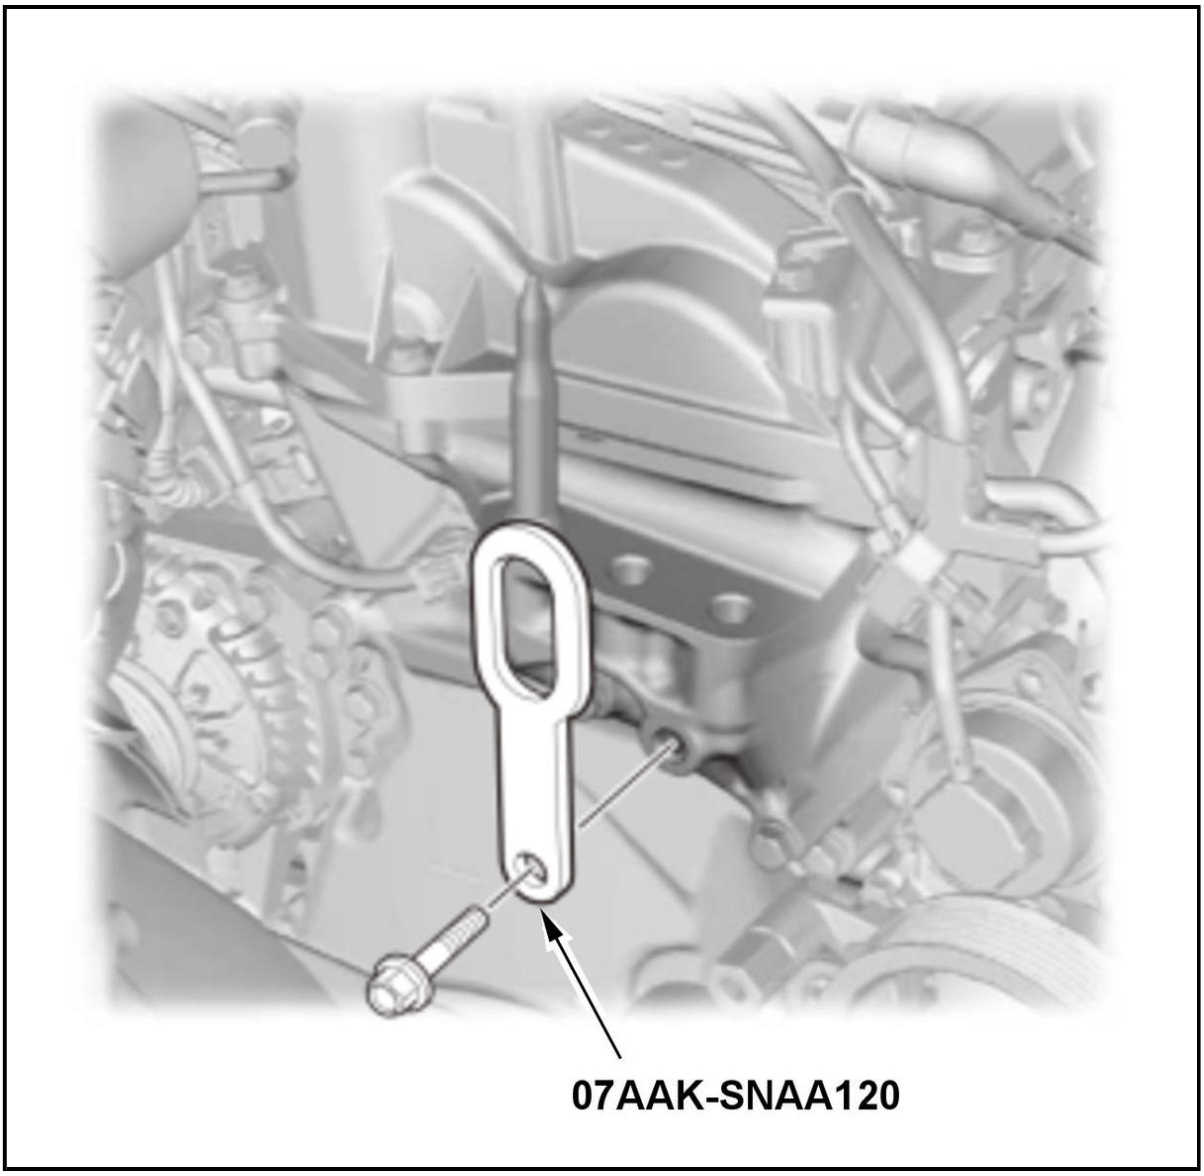
38. Engine - Support

1. Lift and support the engine with a jack and a wood block under the oil pan.

39. **Upper Torque Rod - Remove**

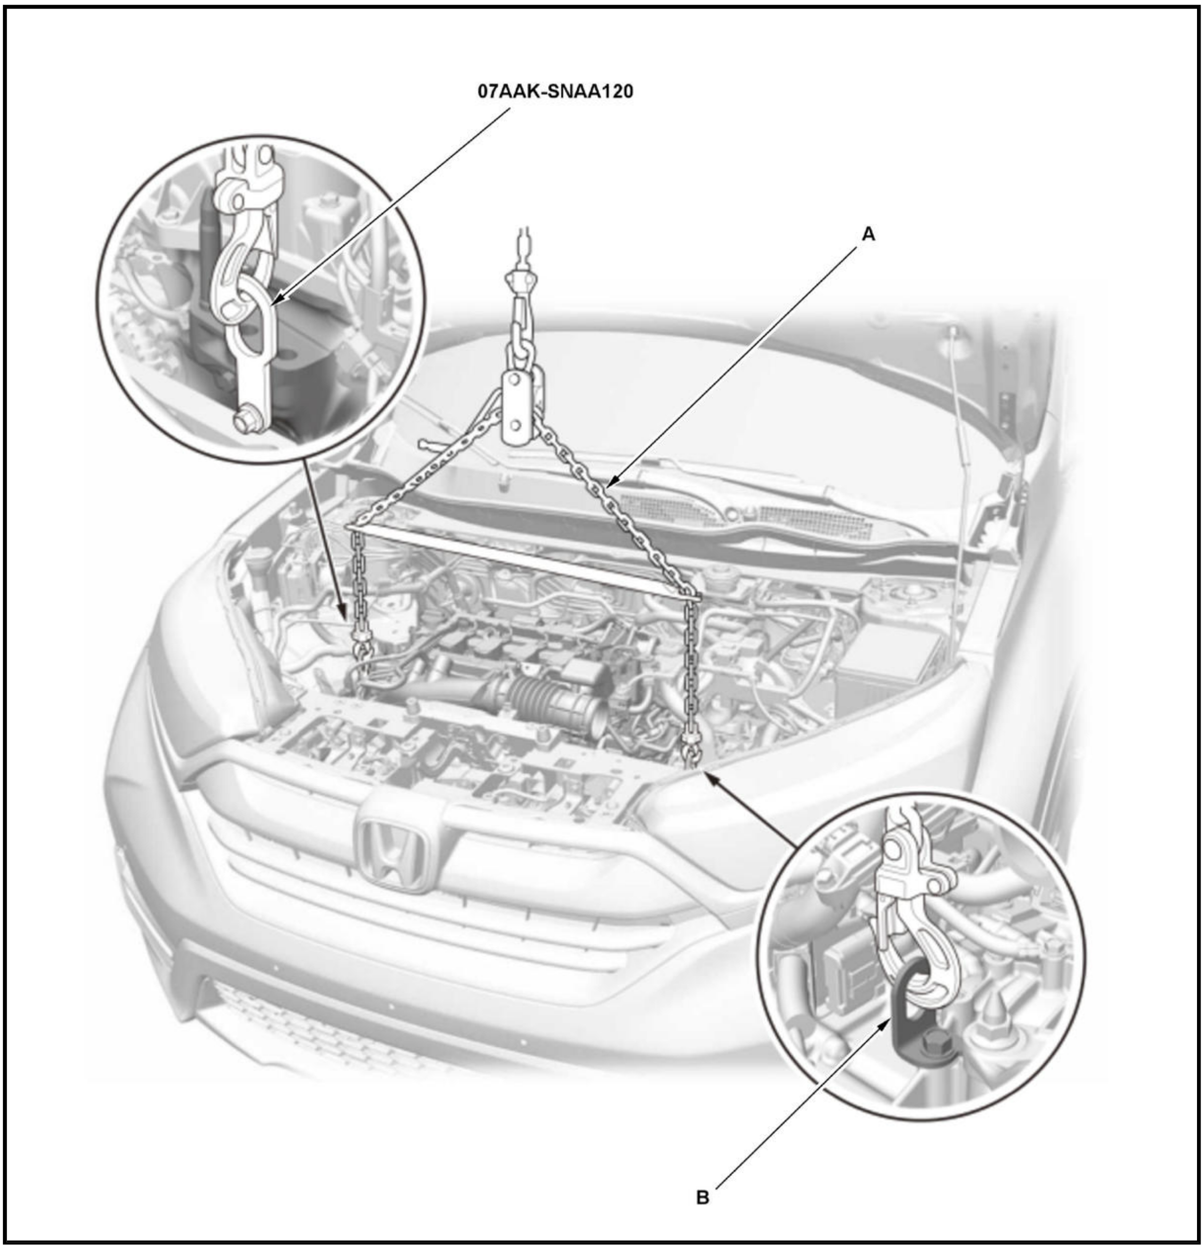
40. **Side Engine Mount - Remove**

41. Universal Lifting Eyelet - Install



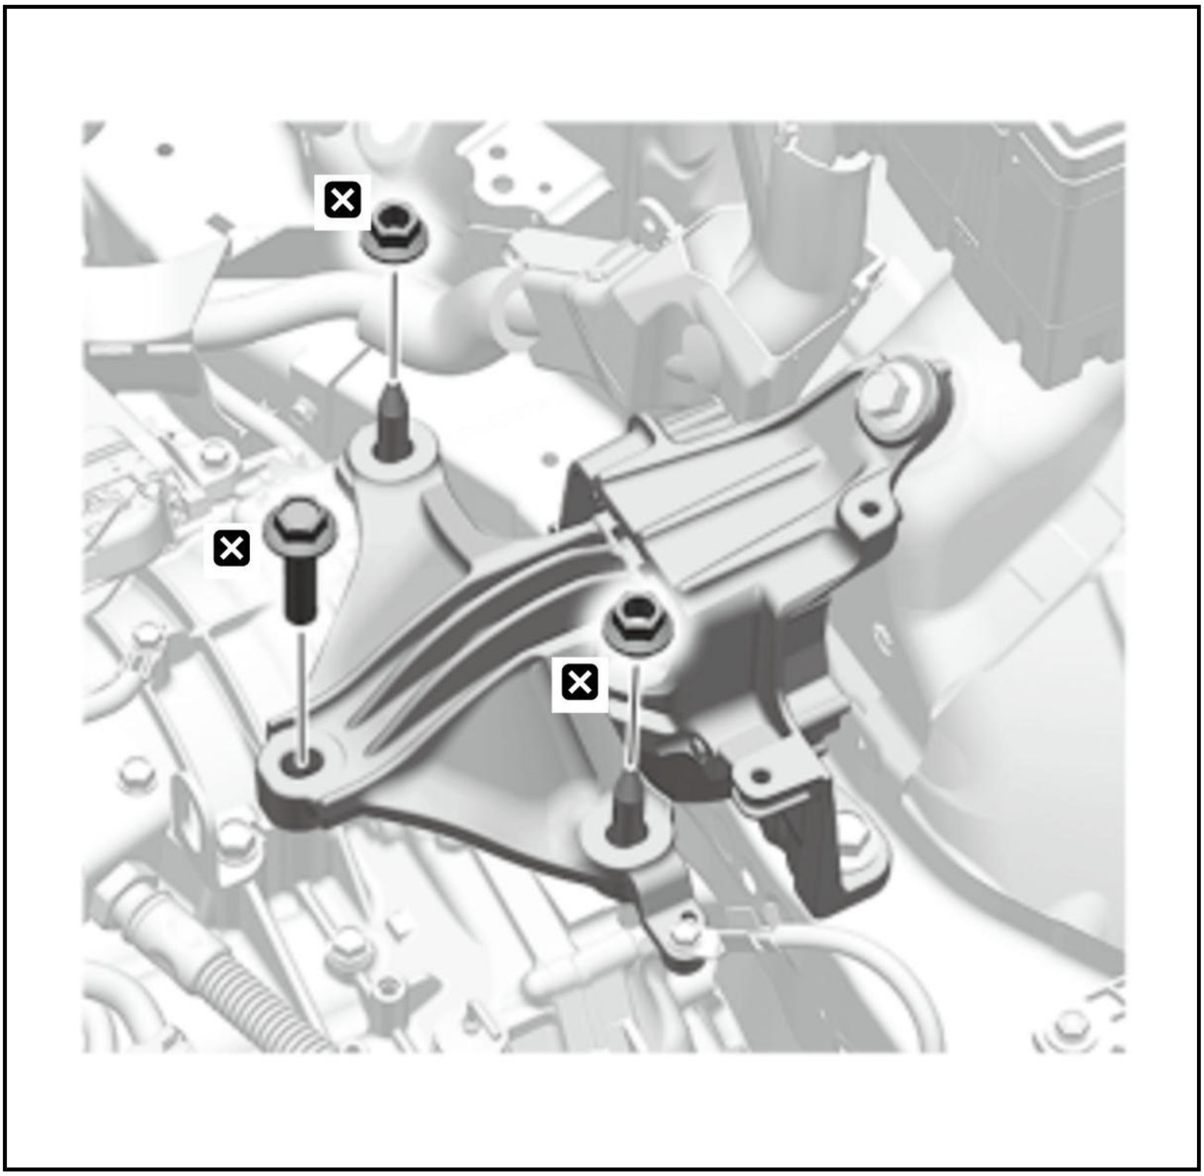
42. Chain Hoist - Install

1. Attach a chain hoist (A) to the universal lifting eyelet and the transmission hanger (B), then lift the engine/transmission until it is securely supported by the chain hoist.



07AAK-SNAA120
A
B

43. Transmission Mount Bracket Mounting Bolt and Nut - Remove



44. Engine - Remove

1. Check that the engine/transmission is completely free of the vacuum hoses, the fuel hoses, the coolant hoses, and the electrical wiring.

2. Slowly lower the engine/transmission about 150 mm (5.91 in). Check once again that all the hoses and the electrical wiring are disconnected and free from the engine/transmission, then lower it all the way and support it.

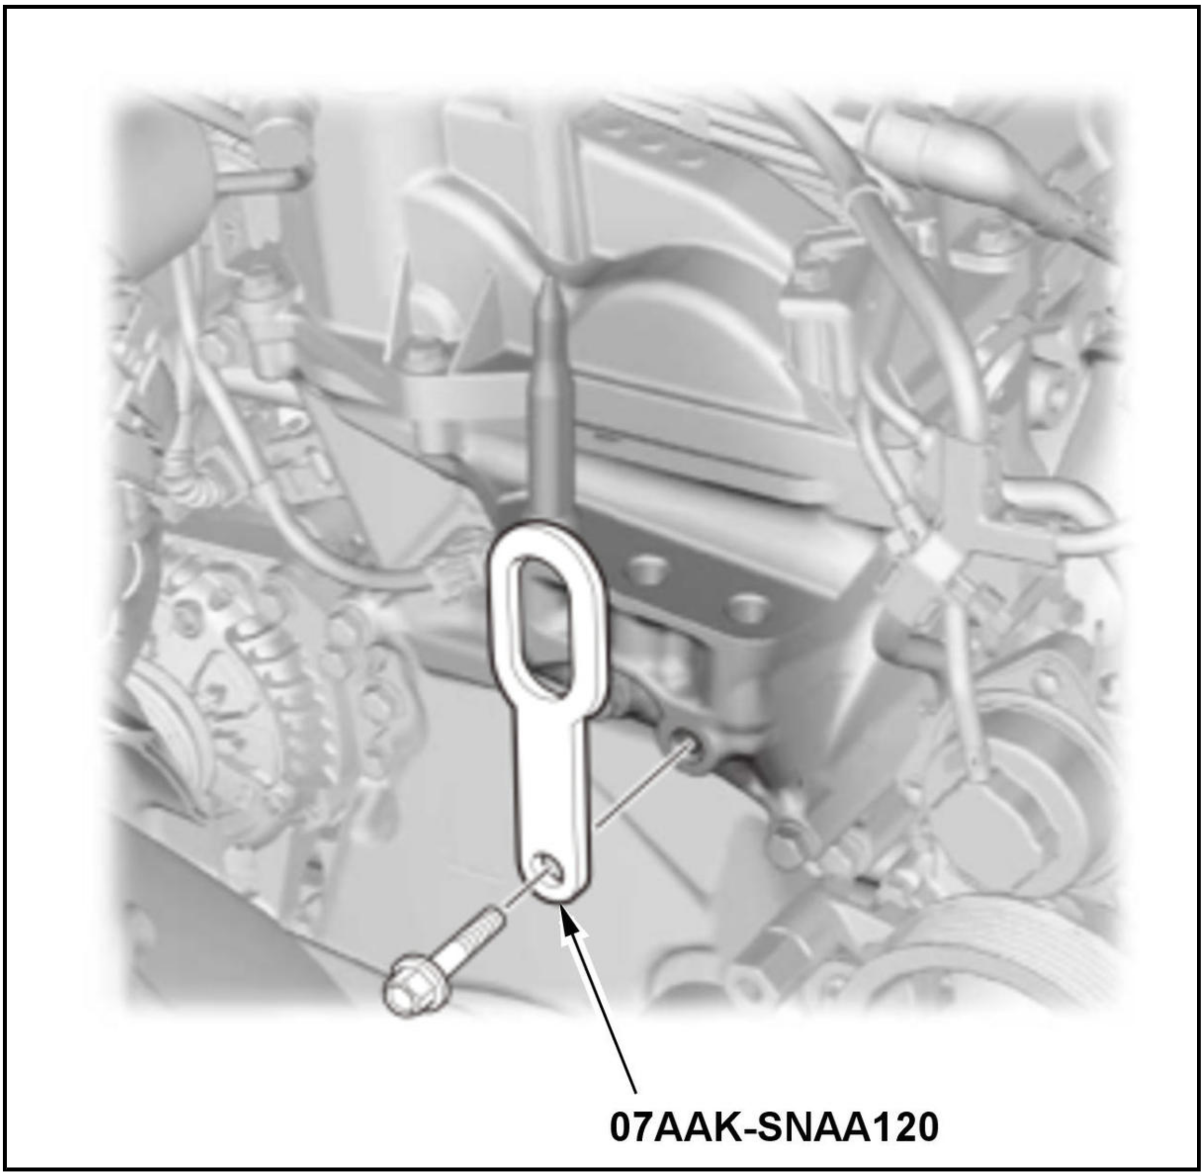
3. Remove the chain hoist from the engine/transmission.

4. Raise the vehicle, and remove the engine/transmission from under the vehicle.

Installation

NOTE: How to read the torque specifications.

1. **Lower Torque Rod Bracket - Install**
2. Universal Lifting Eyelet - Install

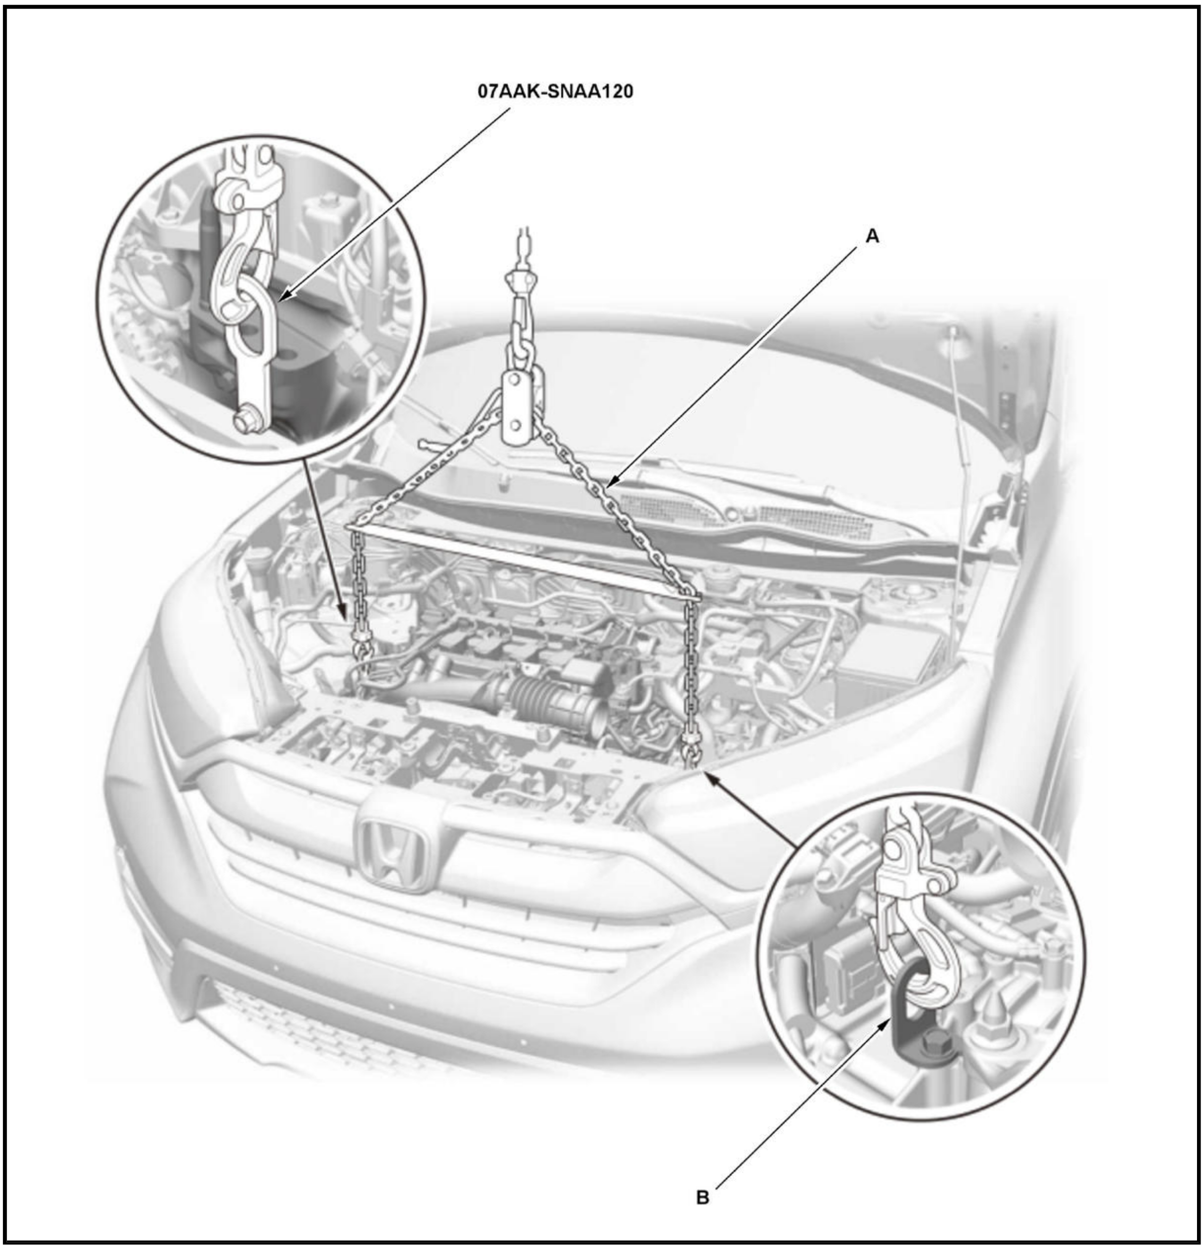


3. Engine/Transmission Assembly - Position

1. Position the engine/transmission assembly under the vehicle, and be sure that they are properly positioned. Carefully lower the vehicle, and stop with the installation position of the engine/transmission assembly.

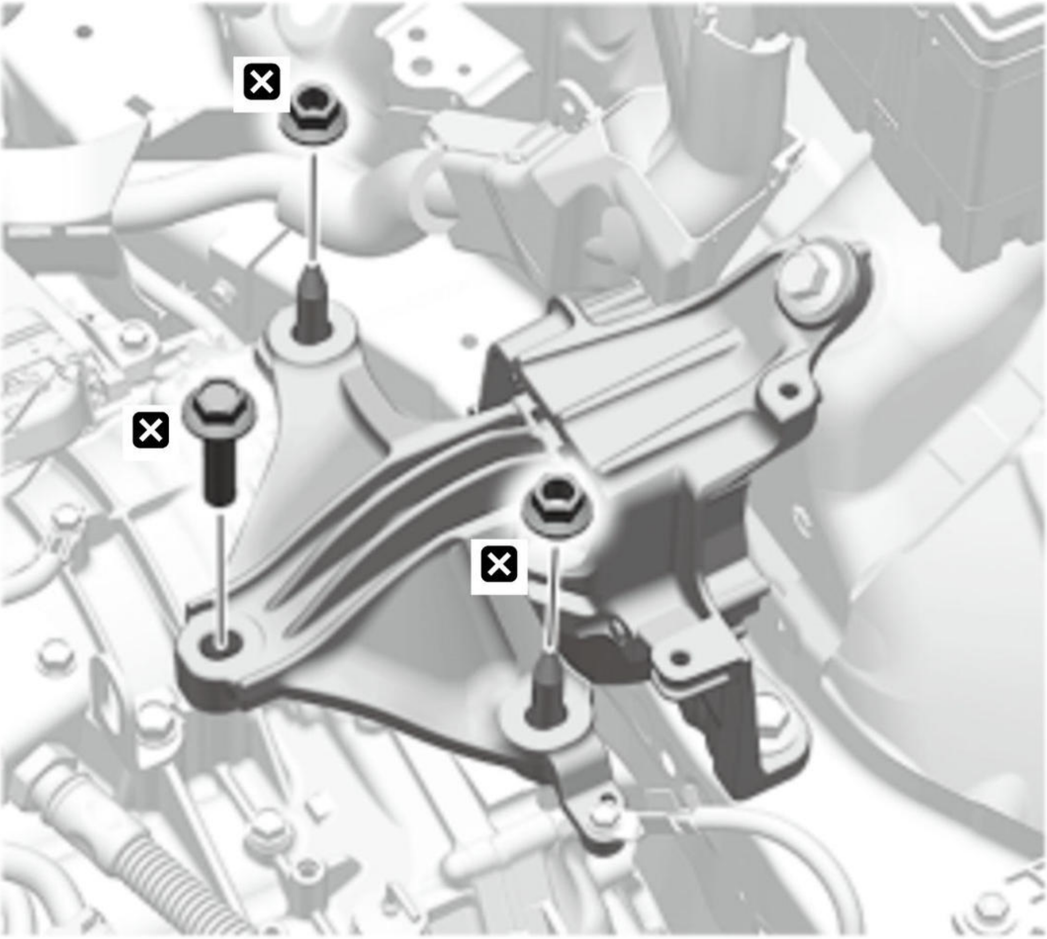
4. Chain Hoist - Install

1. Attach a chain hoist (A) to the universal lifting eyelet and the transmission hanger (B), then lift the engine/transmission until it is securely supported by the chain hoist.



07AAK-SNAA120
A
B

5. Transmission Mount Bracket Mounting Bolt and Nut - Loosely Install



6. Engine - Support

1. Lift and support the engine with a jack and a wood block under the oil pan.

7. Chain Hoist and Universal Lifting Eyelet - Remove
8. **Side Engine Mount - Loosely Install**
9. **Upper Torque Rod - Loosely Install**
10. Vehicle - Lift

1. Raise the vehicle.

11. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

12. Front Subframe - Install
13. Front Lower Arm Mounting Bolt - Install

	1. Install both sides of the front lower arm mounting bolt to the body .

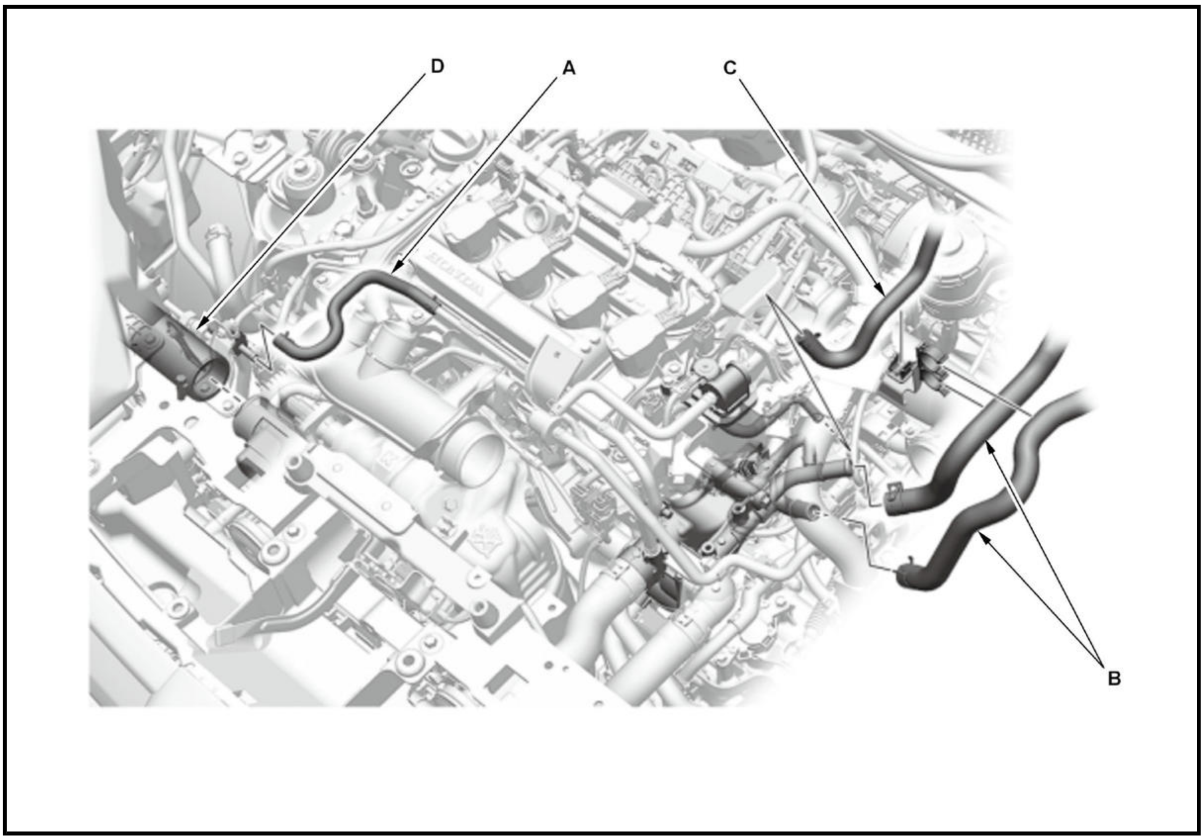
14. Lower Torque Rod - Loosely Install
15. All Engine Mount Mounting Bolt and Nut - Tighten
16. Transfer Assembly - Install (AWD)
17. Propeller Shaft - Install (AWD)
18. Front Driveshaft - Install
19. Lower Arm Ball Joint - Connect
20. Front Stabilizer Link Ball Joint - Connect
21. Tie-Rod End Ball Joint - Connect
22. Exhaust Pipe A - Install
23. Connector (EPS Subharness) - Connect
24. A/C Compressor - Install
25. Radiator Assembly - Install
26. Drive Belt - Install
27. Engine Undercover - Install
28. Vehicle - Lift

1. Lower the vehicle.

29. Steering Joint - Connect
30. Water Bypass Hose, Heater Hose, Intercooler Inlet Hose, and EVAP Canister Purge Hose - Connect

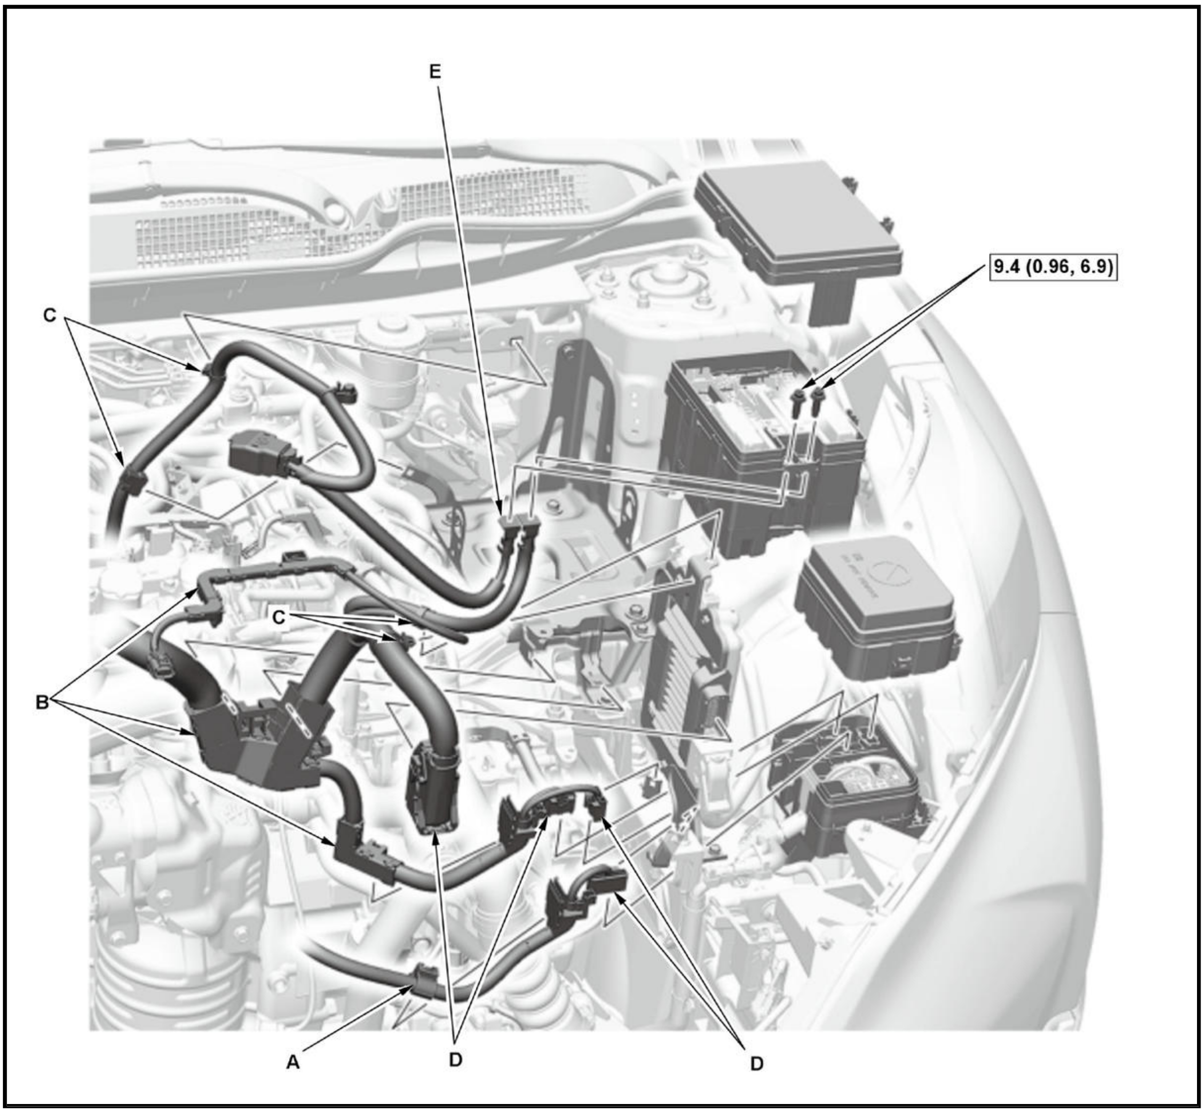
1. Connect the water bypass hose (A), the heater hoses (B), the EVAP canister purge hose (C), and the intercooler inlet hose (D).

NOTE: **Make sure the end of hose band is aligned with the mark on the hose band after the intercooler inlet hose is installed.**



31. **Expansion Tank - Install**
32. **Fuel Feed Hose - Connect**
33. **Shift Cable (Transmission Side) - Connect**
34. **Throttle Body Inlet Pipe - Install**
35. Connector (Engine Wire Harness) and Positive Cable (Under-Hood Fuse/Relay Box) - Connect

1. Install the harness clamp (A).



2. Install the harness holder (B).

3. Install the harness clips (C).

4. Connect the connectors (D).

5. Install the cables (E).

36. **Intake Parts - Install**
37. **12 Volt Battery Base - Install**
38. **12 Volt Battery - Install**
39. **Front Bulkhead Cover - Install**
40. **Transmission Fluid - Refill**
41. **Engine Oil - Refill**
42. **Engine Coolant - Refill**
43. Fuel Leak (Low Pressure Side) - Check

1. Turn the vehicle to the ON mode, but do not start the engine. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three time, then check for fuel leakage.

44. **Fuel Leak (High Pressure Side) - Check**
45. Fluid Leak - Check
46. **Front Wheel - Install**
47. **PCM - Reset**

48. CKP Pattern - Clear/Learn
49. PCM Idle - Learn
50. Idle Speed - Inspect
51. Ignition Timing - Inspect
52. Wheel Alignment - Check
53. VSA Sensor Neutral Position - Memorize

Removal

NOTE:

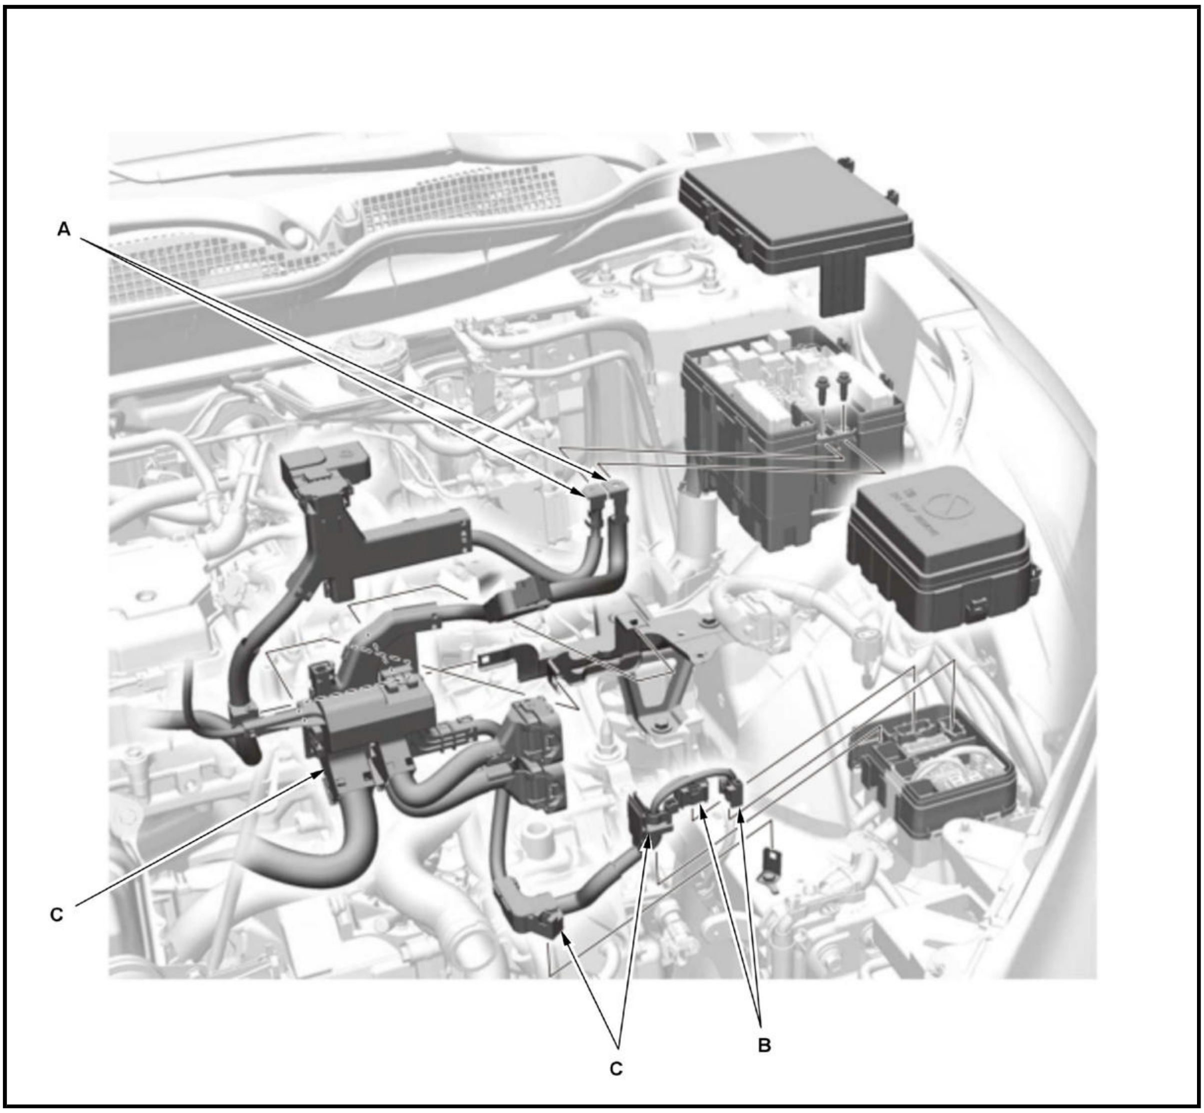
- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Hood - Wide Open

	1. Open the hood. 2. Remove and relocate the hood support rod (A) to the wide-open positions (B) and secure the hood.

2. **Fuel Pressure - Relieve**
3. **Front Bulkhead Cover - Remove**
4. **12 Volt Battery - Remove**
5. **12 Volt Battery Base - Remove**
6. **Air Cleaner - Remove**
7. **PCM - Remove**
8. Connector (Engine Wire Harness) and Positive Cable (Under-Hood Fuse/Relay Box) - Disconnect

    1. Remove the positive cables (A).



2. Disconnect the connectors (B).

3. Remove the harness holders (C).

9. Shift Cable (Transmission Side) - Disconnect
10. Fuel Feed Hose - Disconnect
11. Steering Joint - Disconnect
12. Vehicle - Lift

1. Raise and support the vehicle .

13. Front Wheel - Remove
14. Engine Undercover - Remove
15. Engine Coolant - Drain
16. Engine Oil - Drain
17. Transmission Fluid - Drain
18. Drive Belt - Remove
19. Radiator Assembly - Remove
20. A/C Compressor - Move

NOTE:

- Do not disconnect the suction hose and the discharge hose.
- Do not bend the suction hose and the discharge hose excessively.

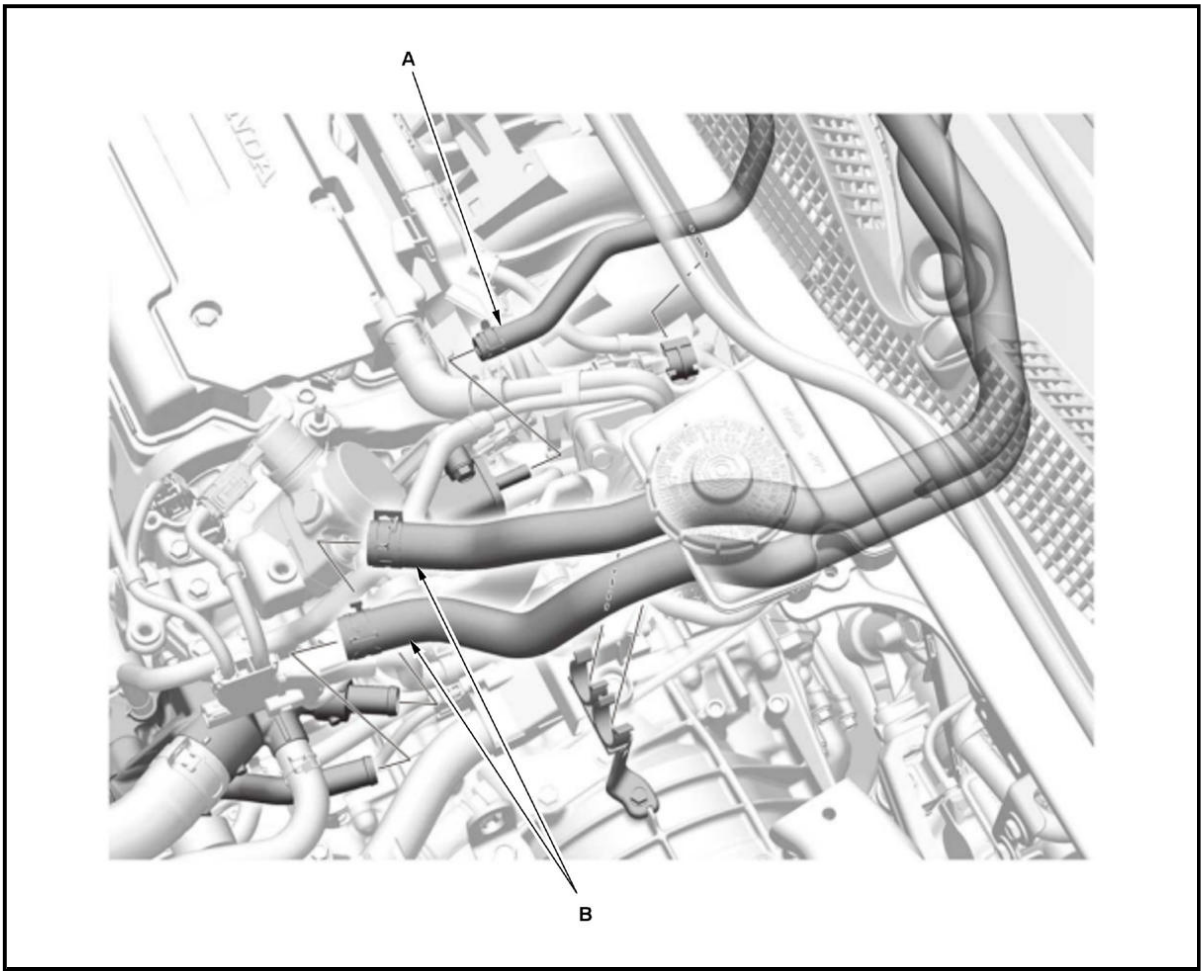
- Hang the A/C compressor with a wire tie.

21. Connectors (EPS Subharness) - Disconnect
22. Exhaust Pipe A - Remove
23. Tie-Rod End Ball Joint - Disconnect
24. Front Stabilizer Link Ball Joint - Disconnect
25. Lower Arm Ball Joint - Disconnect
26. Front Driveshaft - Remove
27. Propeller Shaft - Remove (AWD)
28. Transfer Assembly - Remove (AWD)
29. Vehicle - Lift

1. Lower the vehicle.

30. EVAP Canister Purge Hose and Heater Hose - Disconnect

1. Disconnect the EVAP canister purge hose (A).



2. Disconnect the heater hoses (B).

31. Vehicle - Lift

1. Raise the vehicle.

32. Lower Torque Rod - Remove
33. Front Lower Arm Mounting Bolt - Remove

	1. **Remove both sides of the front lower arm mounting bolt from the body** .

34. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

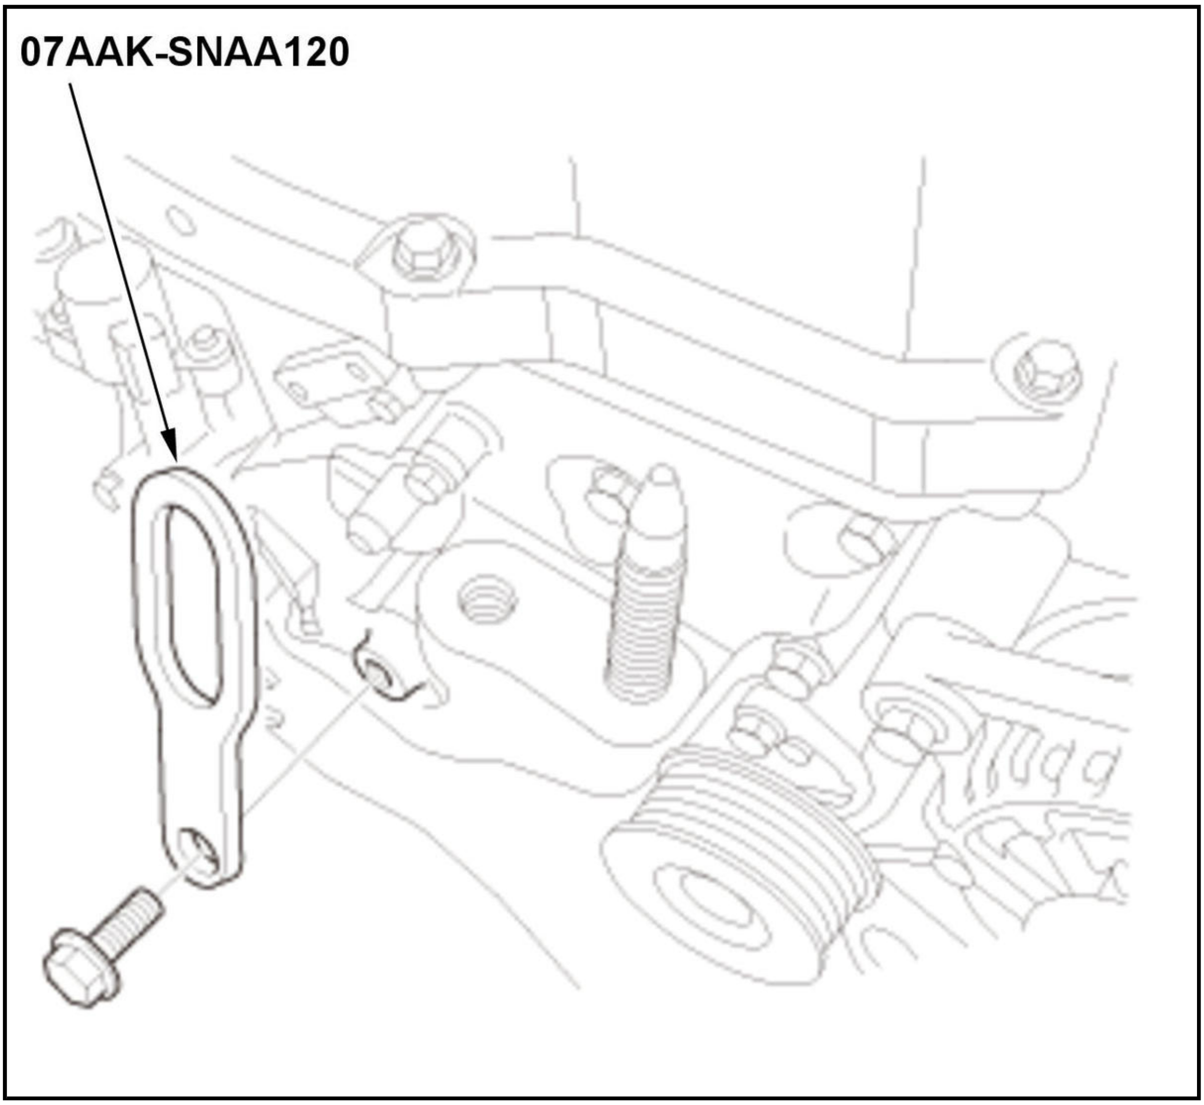
35. **Front Subframe - Remove**
36. Vehicle - Lift

1. Lower the vehicle.

37. Engine - Support

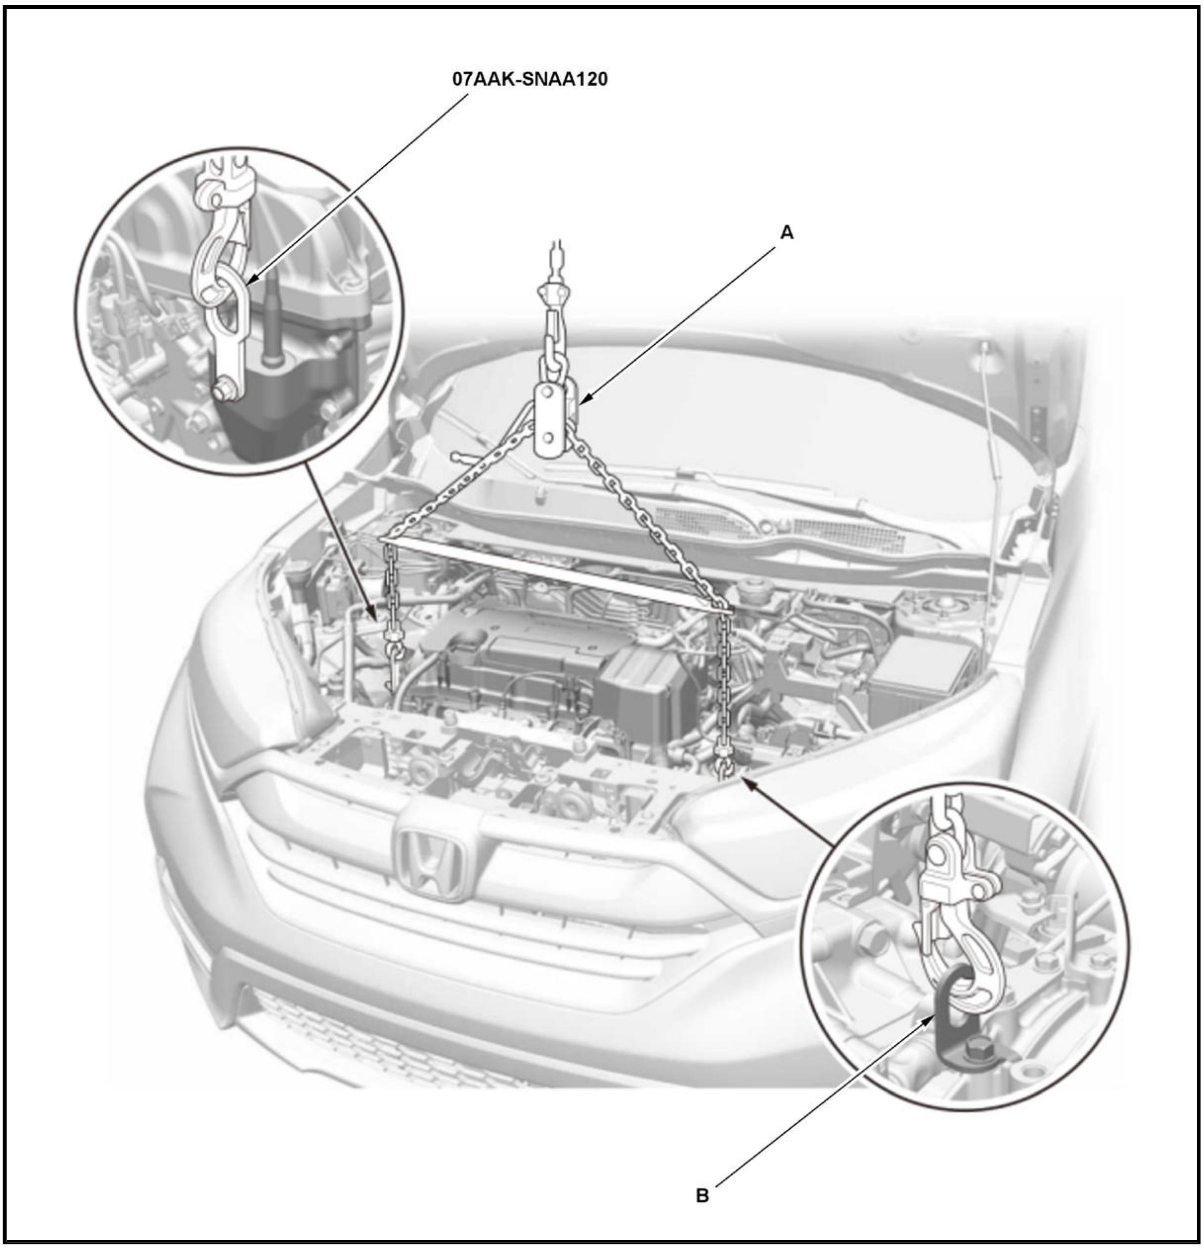
1. Lift and support the engine with a jack and a wood block under the oil pan.

38. **Upper Torque Rod - Remove**
39. **Side Engine Mount - Remove**
40. Universal Lifting Eyelet - Install



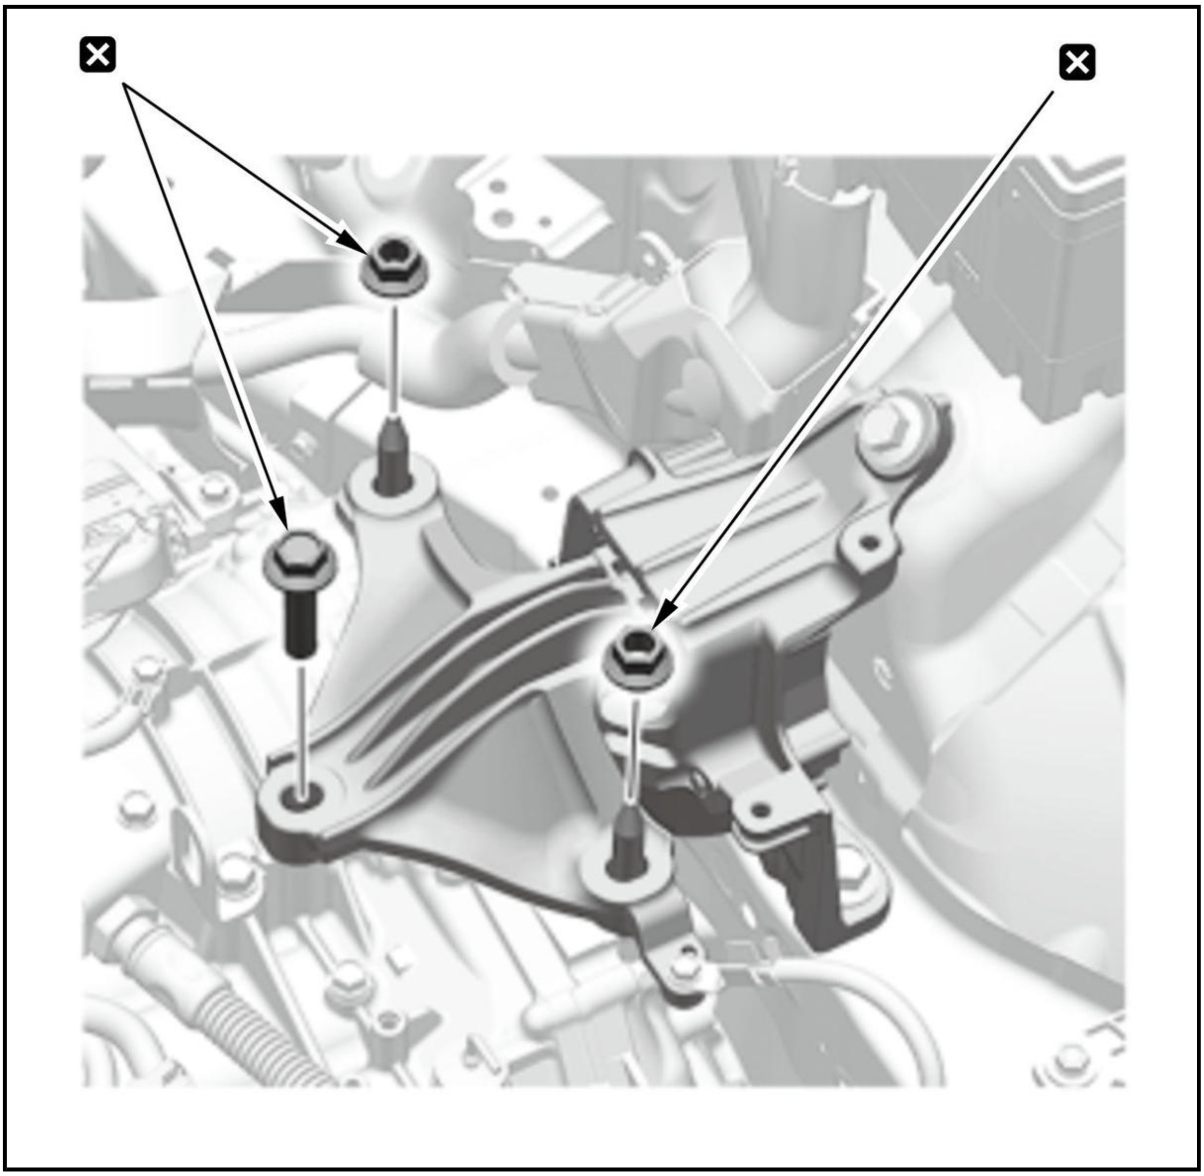
41. Chain Hoist - Install

1. Attach a chain hoist (A) to the universal lifting eyelet and the transmission hanger (B), then lift the engine/transmission until it is securely supported by the chain hoist.



07AAK-SNAA120
A
B

42. Transmission Mount Bracket Mounting Bolt and Nut - Remove



43. Engine - Remove

1. Check that the engine/transmission is completely free of the vacuum hoses, the fuel hoses, the coolant hoses, and the electrical wiring.

2. Slowly lower the engine/transmission about 150 mm (5.91 in). Check once again that all the hoses and the electrical wiring are disconnected and free from the engine/transmission, then lower it all the way and support it.

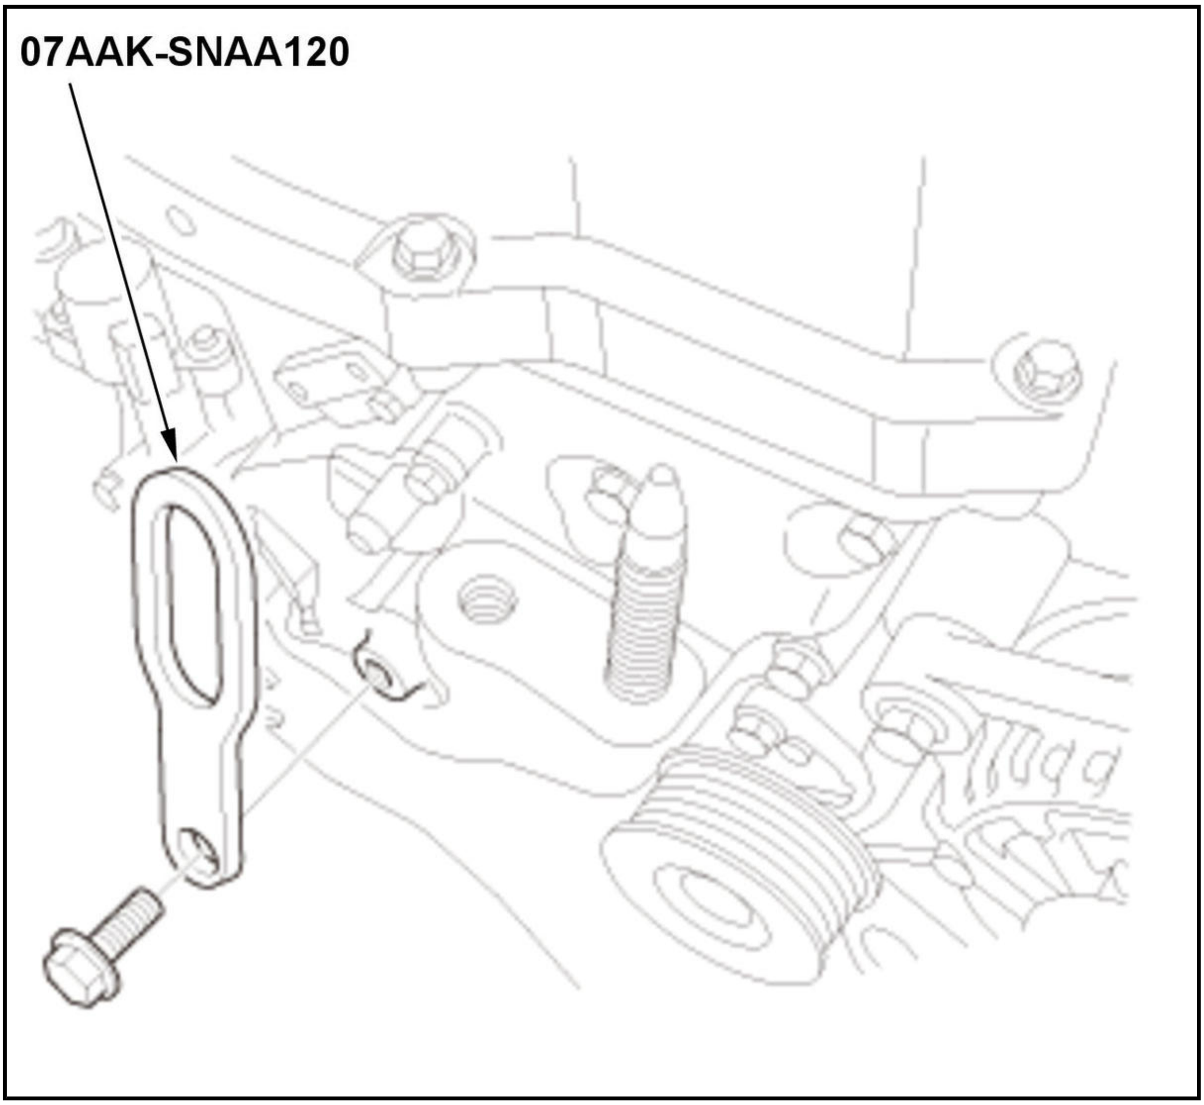
3. Remove the chain hoist and universal lifting eyelet from the engine/transmission.

4. Raise the vehicle, and remove the engine/transmission from under the vehicle.

Installation

NOTE: How to read the torque specifications .

1. Lower Torque Rod Bracket - Install
2. Universal Lifting Eyelet - Install



3. Engine/Transmission Assembly - Position

1. Position the engine/transmission assembly under the vehicle, and be sure that they are properly positioned. Carefully lower the vehicle, and stop with the installation position of the engine/transmission assembly.

4. Chain Hoist - Install

1. Attach the chain hoist (A) to the universal lifting eyelet and the transmission hanger (B), then lift the engine/transmission until it is securely supported by the chain hoist.

INJECTOR REMOVAL AND INSTALLATION (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Pick Up Tool 070AC-5A00100
	Injector Seal Installer Kit 070AG-5A00100

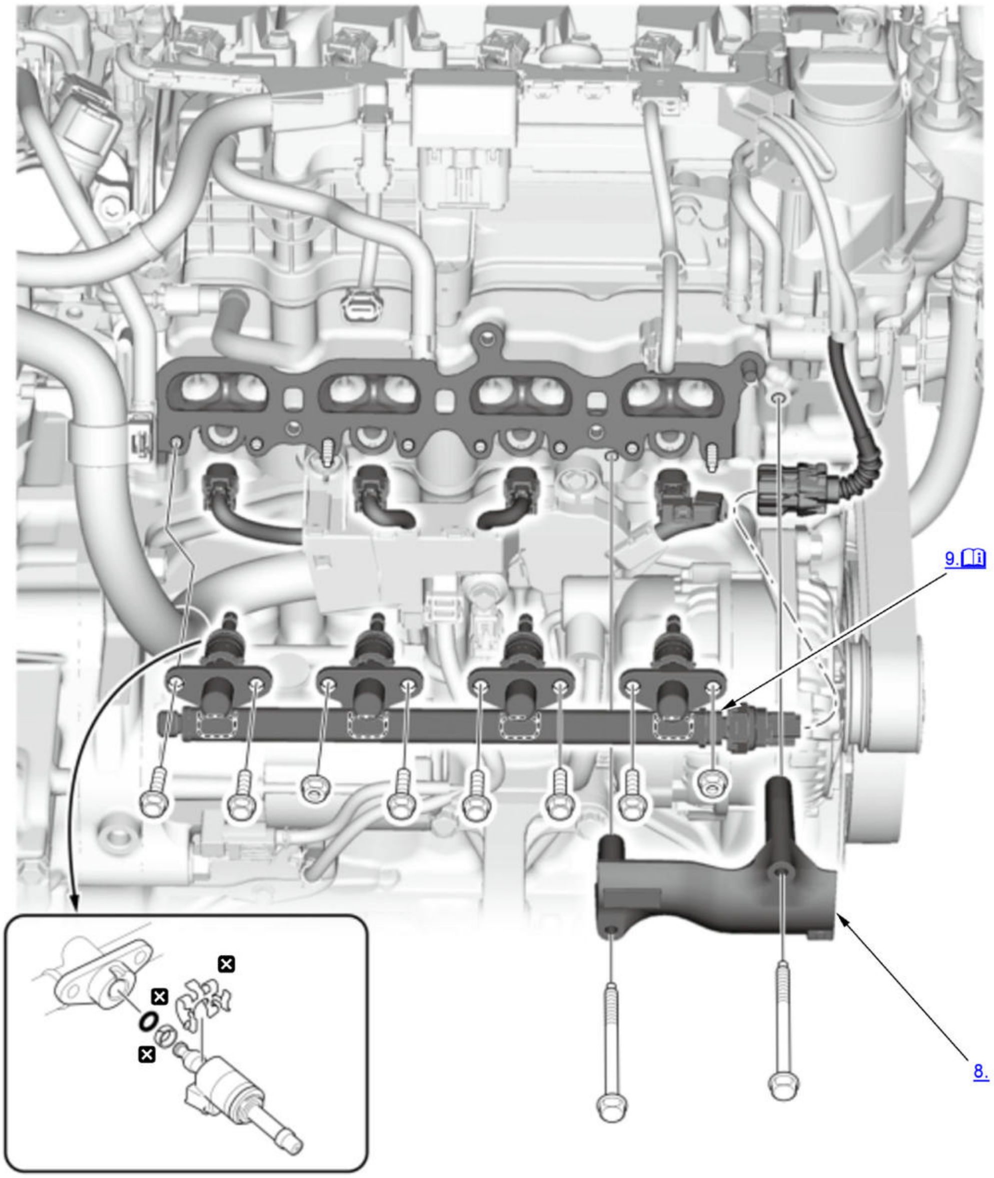
Removal

WARNING:

Flammable - Keep Fire Away

NOTE:

- Where icon is shown continue to the information below.
- Refer to the Fuel and Emissions Systems Service Precautions before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- When replacing the injector, you must replace all injectors on the fuel rail as a set and the fuel joint pipe.Failure to do so will cause poor engine performance and fuel leaks.

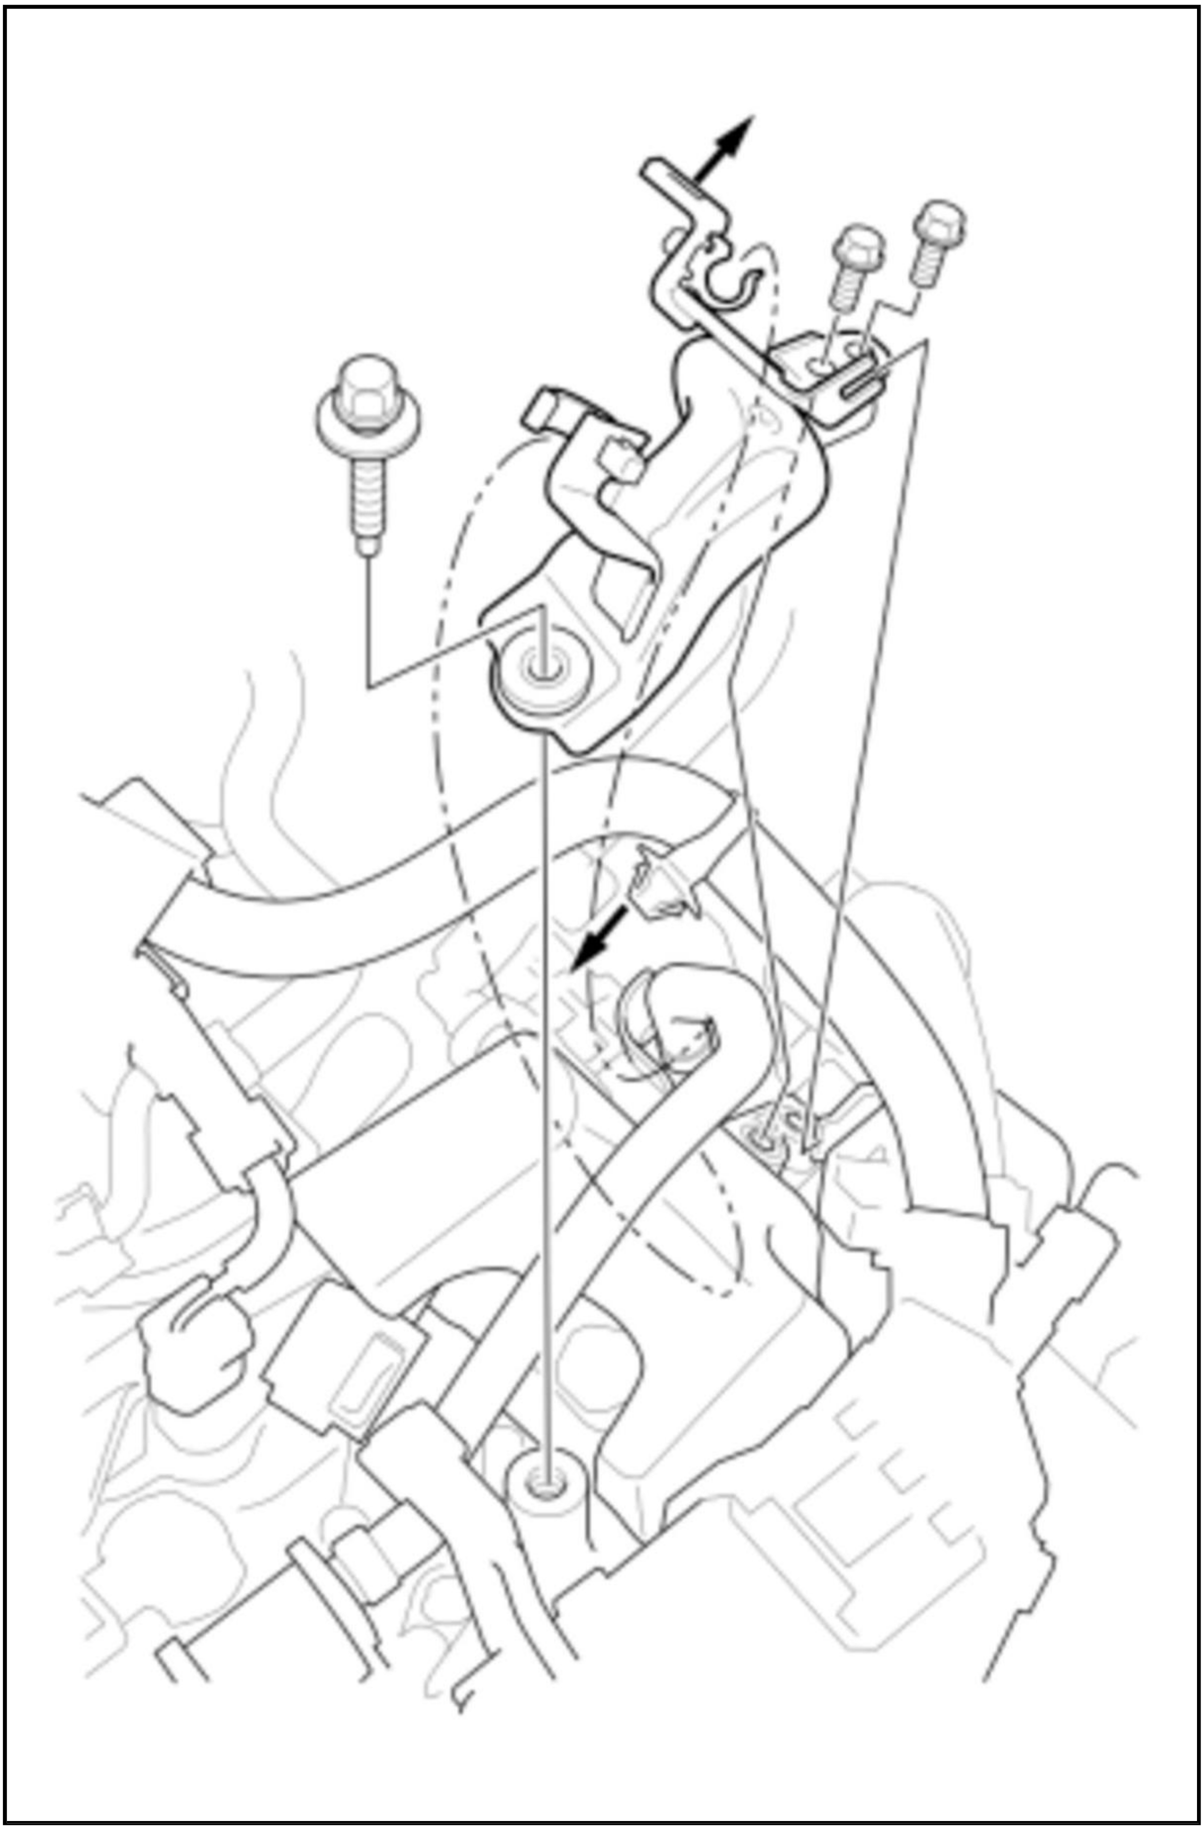


ℹ	Detailed information, notes and precautions
☒	Replace

1. **Fuel Pressure - Relieve**
2. **Intake Air Resonator - Remove**
3. **Throttle Body - Move**

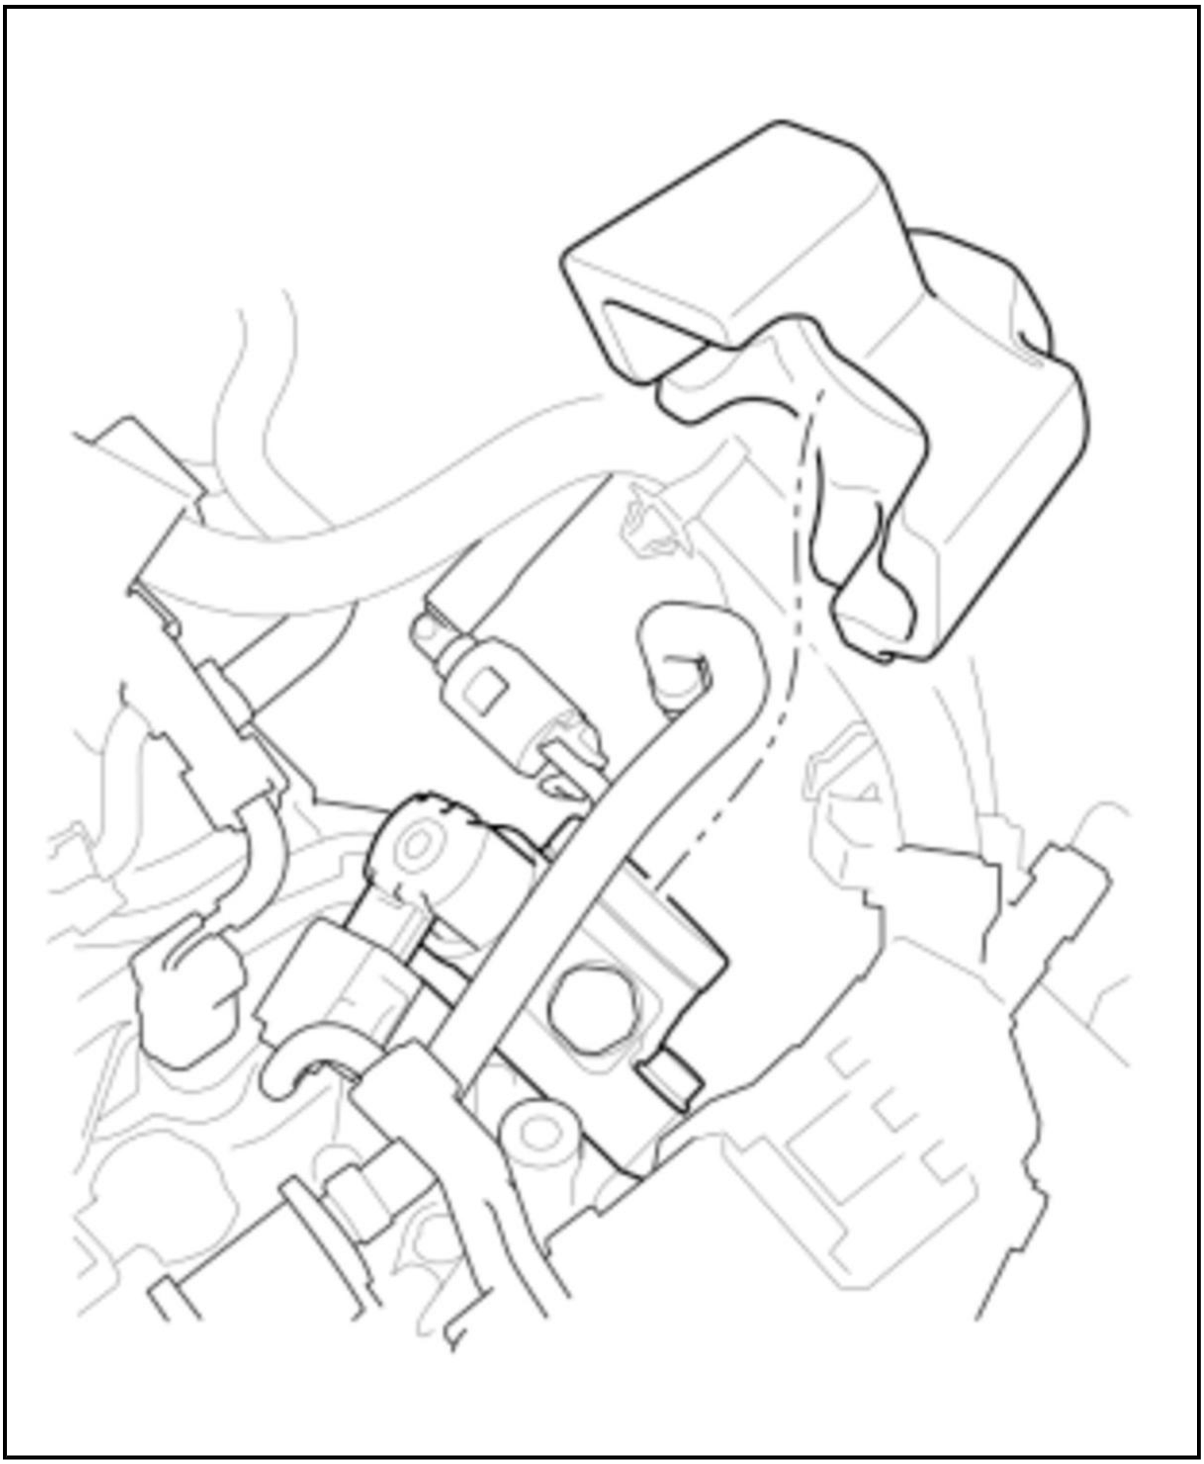
   NOTE:

   - Do not disconnect the water bypass hoses.
   - Do not bend the water bypass hoses excessively.
4. Intake Manifold Bracket - Remove



5. **Intake Manifold - Remove**

6. High Pressure Fuel Pump Cover - Remove



7. **Fuel Joint Pipe - Remove**
8. Bracket - Remove
9. Fuel Rail and Injector - Remove

1. Carefully remove the fuel rail with the injectors straight from the cylinder head.

NOTE:

- If the injector remains on the cylinder head, carefully remove the injector straight from the cylinder head.
- Note the cylinder number of the injector, and install it to the same cylinder when reinstalling.
- If you replace the injector, the fuel rail, or the cylinder head, use a new injector clip.

10. Injector - Remove

	1. Remove the injectors (A) from the fuel rail. 2. Remove the injector clip (B), the O-ring (C), and the back-up ring (D) from the injector. **NOTE:** If you replace the injector, the fuel rail, or the cylinder head, use a new injector clip, O-ring, and back-up ring.

	3. Using the pick up tool (A), carefully remove the seal (B) from the injector.

Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

- ℹ Where icon is shown continue to the information below.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- When replacing the injector, you must replace all injectors on the fuel rail as a set.

1

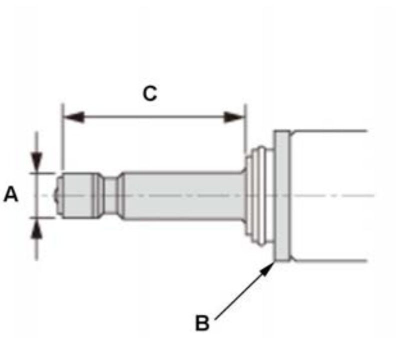
ℹ	Detailed information, notes and precautions
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	Coat the clean engine oil

1. Injector Seal - Install



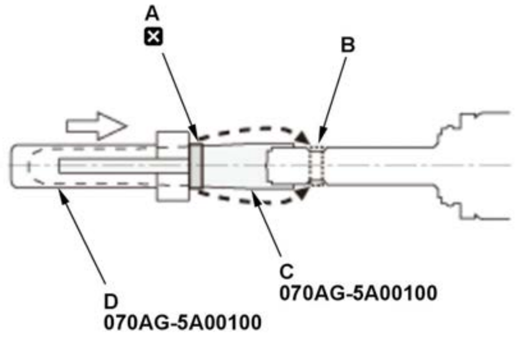
The illustration shows an example.

NOTE:

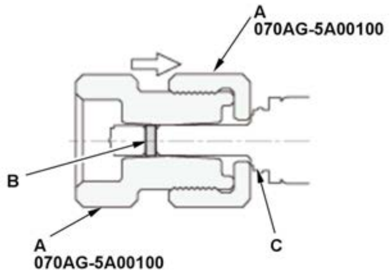
- Do not wipe off the tip area (A) of the injector as it may be damaged.
- If the tip of the injector is dirty or clogged, it must be replaced. The injectors cannot be cleaned.

1. Use compressed air to ensure that there are no dust or debris around the ring (B).

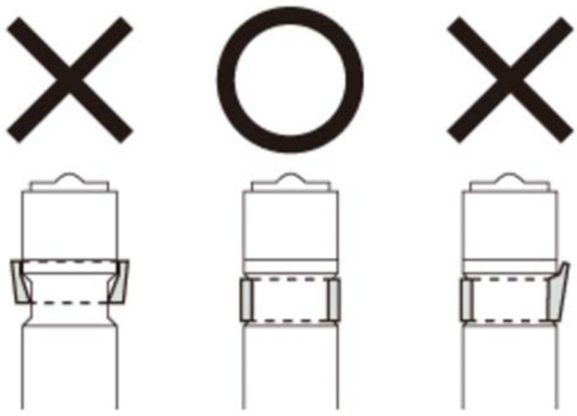
2. With a paper towel, carefully wipe off any carbon from the area (C) shown.



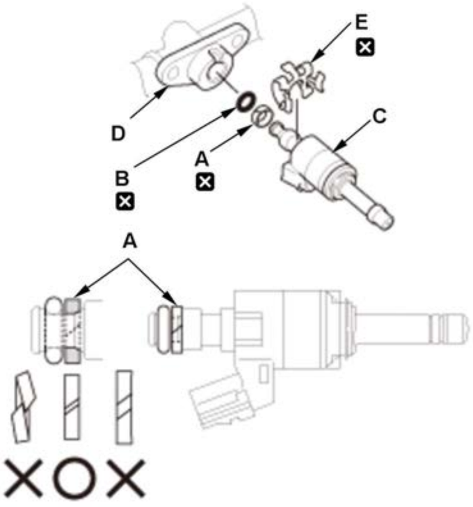
3. Quickly push a new seal (A) down to the groove (B) of the injector using the seal guide tool (C) and the seal installer (D).



4. Joint the sizing tools (A), then slide them as a set onto the seal (B) until tools touch to the injector stepped surface (C) as shown, and hold the tools to reform the seal for 30 seconds or more.



5. Remove the sizing tools, and check that the seal is installed correctly.
NOTE: When cleaning the sizing tool, be careful not to scratch the sizing tool bore.



6. Install a new back-up ring (A) and a new O-ring (B) on the injector (C).

NOTE:

- Set the direction of the back-up ring as shown
- Check that the back-up ring sets correctly after installation.

7. Coat the O-ring with clean engine oil, then install the injector onto the fuel rail (D) with a new clip (E).

NOTE: When installing the injector, be sure to protect the injector from dust or debris.

2. Fuel Rail and Fuel Injector - Install

1. Carefully install the fuel rails with the injectors into the cylinder head straight and equal.

NOTE: When installing the injector, protect the tip of the injector from dust or debris.

2. Install the nuts, and tighten them slowly in an alternating pattern until the fuel rail sits on the cylinder head.

3. Tighten the nuts and the bolts to the specified torque.

3. **Fuel Joint Pipe - Install**

NOTE: Failure to install a new fuel joint pipe will cause fuel leaks.

4. Bracket - Install
5. **Fuel Leak - Check**
6. High Pressure Fuel Pump Cover - Install

 	1. Install the high pressure fuel pump cover (A).. **NOTE:** The cover will be reinstalled after the fuel leak check

   NOTE: Do not disconnect the water bypass hoses.

6. Fuel Bracket - Remove
7. Fuel Feed Hose (Fuel Rail Side) - Disconnect

8. MAP Sensor - Remove
9. Intake Manifold Bracket - Remove
10. Intake Manifold - Remove

    NOTE: Replace if cracked or if mating surface is damaged.

11. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- Tighten the bolts/nuts in three steps; tighten the bolts/nuts until the bolts/nuts sit on the intake manifold, tighten the bolts/nuts until the gasket is compressed, tighten the bolts/nuts to specified torque.
- Turn the vehicle to the ON mode, but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail will be pressurized. Repeat this two or three times, then check for fuel leakage.
- After installation, check that all tubes, hoses, and connectors are installed correctly.

INTERCOOLER REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal and Installation

1

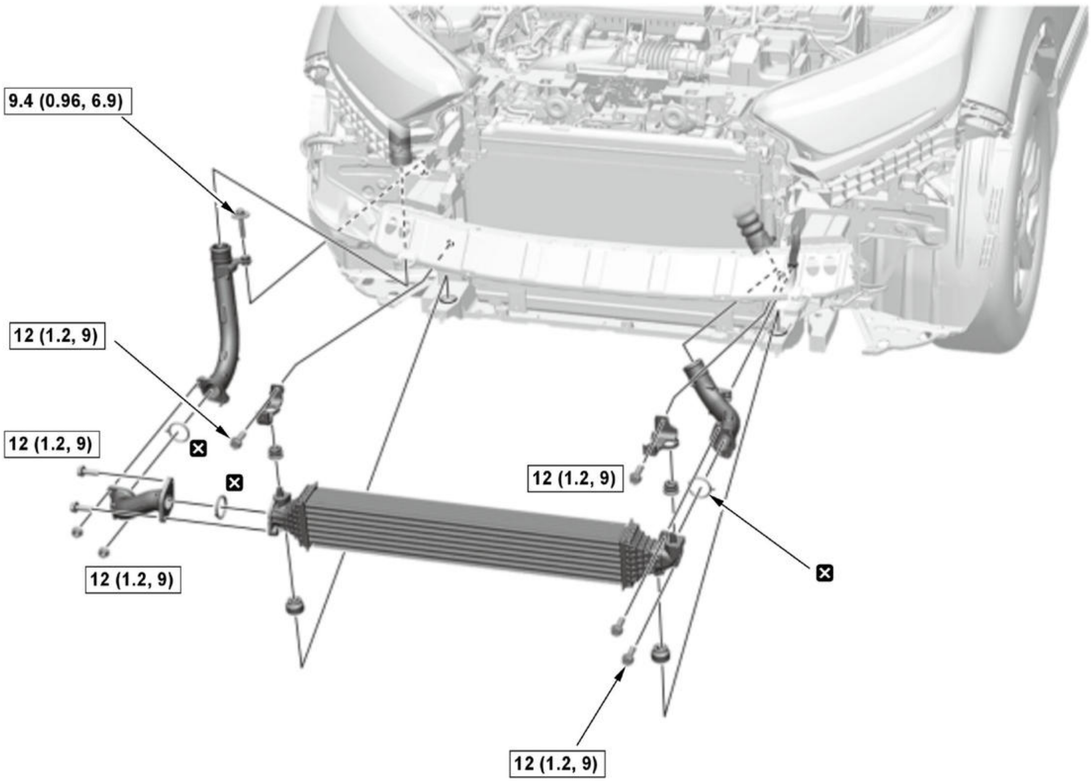

Fig. 40: Intercooler Replacement Components With Torque Specifications (1.5 L Engine)

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

MAP Sensor

1. MAP Sensor - Remove
2. All Removed Parts - Install

    1. Install the parts in the reverse order of removal with a new O-ring.

    MAF Sensor/IAT Sensor

3. MAF Sensor/IAT Sensor - Remove
4. All Removed Parts - Install

    1. Install the parts in the reverse order of removal with a new O-ring.

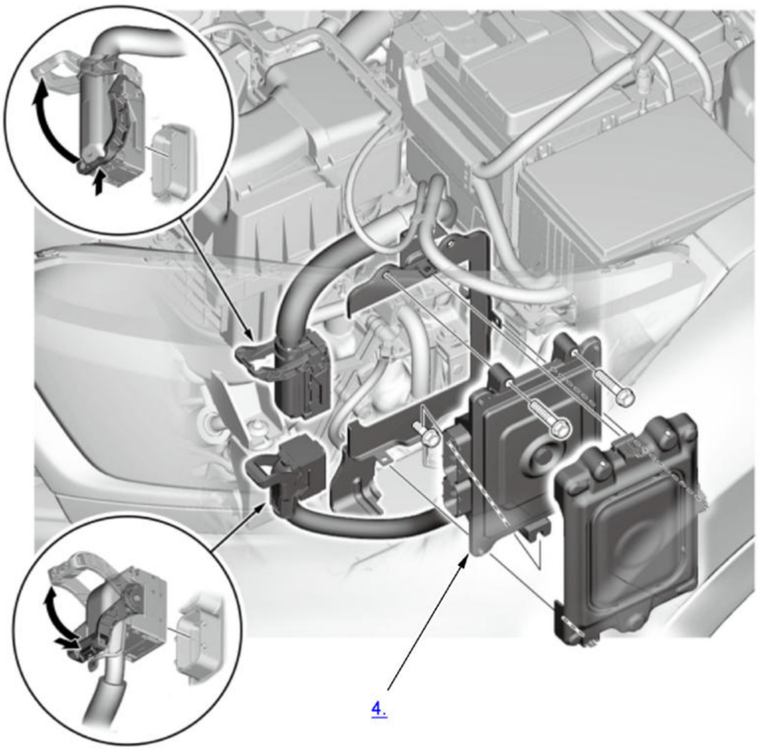
PCM REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal

NOTE:

- Make sure the HDS or the MVCI has the latest HDS software version.
- If you are replacing the PCM after substituting a known-good PCM, reinstall the original PCM, then do this procedure.
- If you are replacing the PCM, do the all procedures.
- If you are removing or substituting the PCM, skip the procedures of READ DATA (Engine Oil Life).

1



1. **HDS - Connect**
2. READ DATA - Select

1. Select the REPLACE PCM MENU, then select READ DATA, and follow the screen prompts.
NOTE:
- Doing this step copies (READS) the engine oil life data from the original PCM so you can later download (WRITES) them into the new PCM.
- If the READ DATA indicates FAILED, go to next step.

3. SCS - Short

1. Turn the vehicle to the OFF (LOCK) mode.

2. Jump the SCS line with the HDS, and wait more than 1 minute.

4. PCM - Remove

Installation

NOTE:

- If you are removing the PCM, skip the procedures of using the HDS.
- If you are substituting the PCM, skip the procedures of WRITE DATA (Engine Oil Life).
- If you are replacing the PCM, do the all procedures.

1

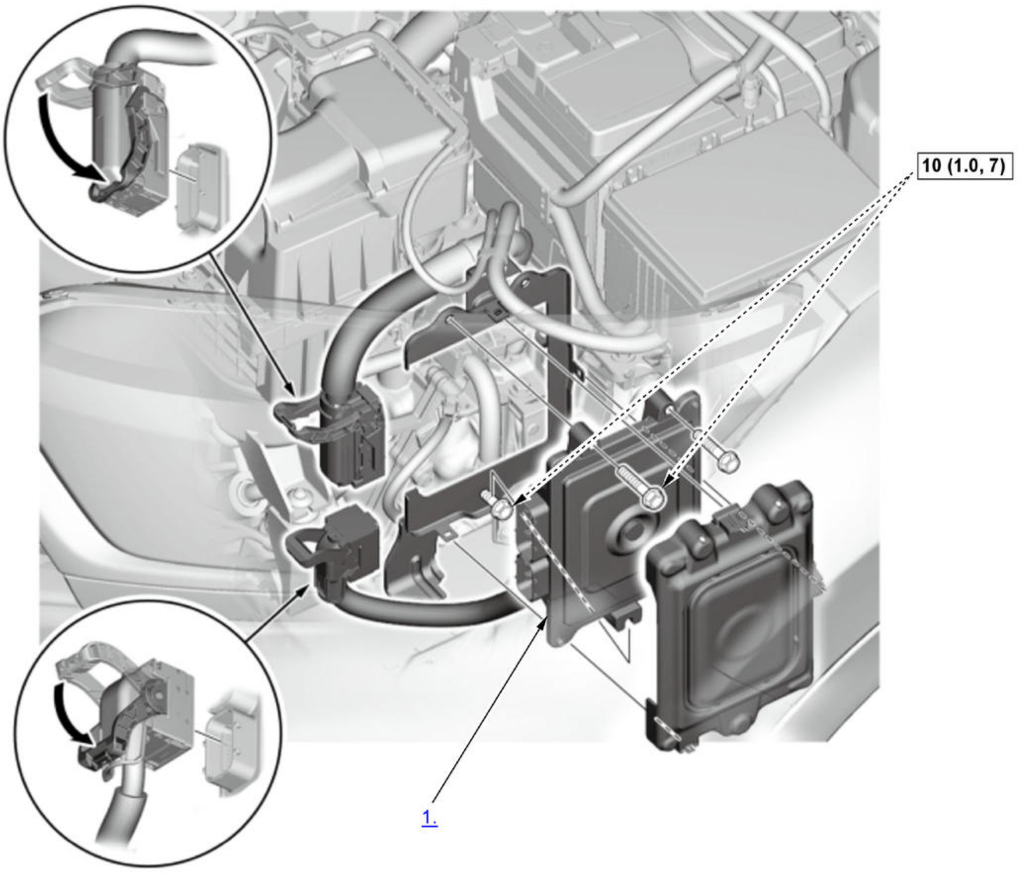


Fig. 48: PCM Replacement Components With Torque Specifications (1.5 L Engine)
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

1. PCM - Install
2. SCS - Open

   1. Exit the SCS mode with the HDS.

   Procedure After Replacing PCM

3. HDS - Connect
4. VIN - Input

   1. Turn the vehicle to the ON mode.

   NOTE: DTC P0630 VIN Not Programmed or Mismatch may be stored because the VIN has not been programmed into the PCM; ignore it, and continue this procedure.

   2. Manually input the VIN to the PCM with the HDS.

5. WRITE DATA (Engine Oil Life) - Select

   NOTE: If the READ DATA (Engine Oil Life) failed in "READ DATA (Engine Oil Life) - Select", skip this procedure.

   1. Select the REPLACE PCM MENU, then select WRITE DATA, and follow the screen prompts.

6. Other Procedures for PCM Replacement - Do

1. If the READ DATA failed in "READ DATA (Engine Oil Life) - Select", do these procedures:
   - Replace the engine oil .
   - Replace the engine oil filter .

7. Keyless Access System - Registration
8. DTC - Clear

1. Clear the Pending or Confirmed DTCs with the HDS.

9. PCM - Update
10. PCM - Idle Learn
11. CKP Pattern - Clear/Learn

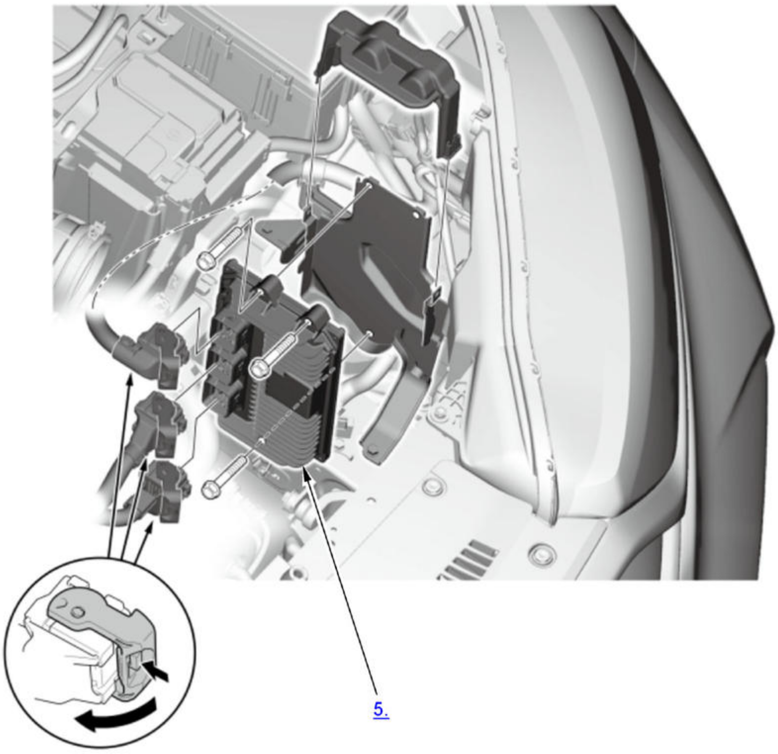
PCM REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal

NOTE:

- Make sure the HDS or the MVCI has the latest HDS software version.
- If you are replacing the PCM after substituting a known-good PCM, reinstall the original PCM, then do this procedure.
- If you are replacing the PCM, do the all procedures.
- If you are removing or substituting the PCM, skip the procedures of READ DATA.

1



1. HDS - Connect
2. READ DATA (Engine Oil Life) - Select (USA models)

1. Select the REPLACE PCM MENU, then select READ DATA, and follow the screen prompts.

NOTE:

- Doing this step copies (READS) the engine oil life data from the original PCM so you can later download (WRITES) them into the new PCM.
- If the READ DATA indicates FAILED, go to next step.

3. SCS - Short

1. Turn the vehicle to the OFF (LOCK) mode.

2. Jump the SCS line with the HDS, and wait more than 1 minute.

4. **Air Cleaner - Remove**
5. PCM - Remove

Installation

NOTE:

- If you are removing the PCM, skip the procedures of using the HDS.

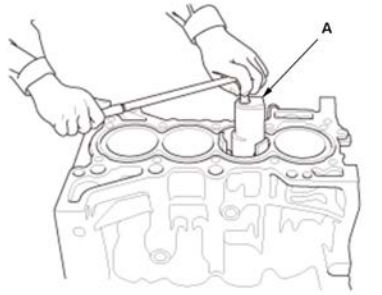
1. Clear the Pending or Confirmed DTCs with the HDS.

9. **PCM - Update**
10. **PCM - Idle Learn**
11. **CKP Pattern - Clear/Learn**
12. **Air Cleaner - Install**

PISTON, RING, PIN, AND CONNECTING ROD REMOVAL AND INSTALLATION (1.5 L ENGINE)

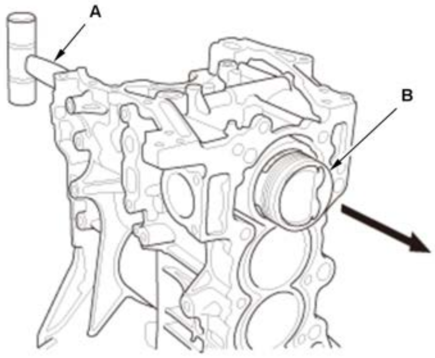
Removal

1. **Crankshaft - Remove**
2. **Oil Jet - Remove**
3. Metal or Hard Carbon - Remove



1. If you can feel a ridge of metal or hard carbon around the top of each cylinder, remove it with a ridge reamer (A). Follow the reamer manufacturer's instructions. If the ridge is not removed, it may damage the piston as it is pushed out.

4. Piston/Connecting Rod Assembly - Remove



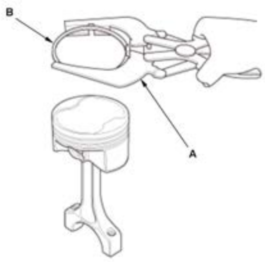
1. Use the wooden handle of a hammer (A) to drive out the piston/connecting rod assembly (B). Take care not to damage the cylinder with the connecting rod.

2. Reinstall the connecting rod bearings and caps after removing each piston/connecting rod assembly.

NOTE:

- Mark each piston/connecting rod assembly with its cylinder number to make sure they are reinstalled in the original order.
- The existing number on the connecting rod does not indicate its position in the engine, it indicates the rod bore size.

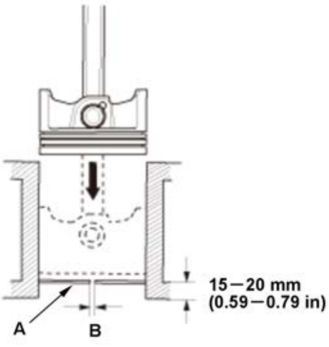
5. Piston Ring End Gap - Inspect



1. Using a ring expander (A), remove the old piston rings (B).

2. Clean all ring grooves thoroughly with a squared-off broken ring or a ring groove cleaner with a blade to fit the piston grooves. The top ring groove is 1.2 mm (0.047 in) wide. The second ring groove is 1.0 mm (0.039 in) wide. The oil ring groove is 2.0 mm (0.079 in) wide. File down a blade if necessary. Do not use a wire brush to clean the ring grooves, or cut the ring grooves deeper with the cleaning tools.

NOTE: If the piston is to be separated from the connecting rod, do not install new rings yet.



3. Using a piston that has its rings removed, push a new ring (A) into the cylinder bore 15-20 mm (0.59-0.79 in) from the bottom.

4. Measure the piston ring end-gap (B) with a feeler gauge:

- If the gap is too small, check to see if you have the proper rings for your engine.
- If the gap is too large, **recheck the cylinder bore diameter against the wear limits** . If the bore is beyond the service limit, the engine block must be rebored.

Oil Ring:	
Standard (New):	**0.20-0.50 mm (0.008-0.019 in)**
Service Limit:	**0.80 mm (0.031 in)**

Second Ring:	
Standard (New):	**0.25-0.37 mm (0.010-0.014 in)**
Service Limit:	**0.60 mm (0.023 in)**

Piston Ring End-Gap	
Top Ring:	
Standard (New):	**0.15-0.20 mm (0.006-0.007 in)**
Service Limit:	**0.55 mm (0.021 in)**

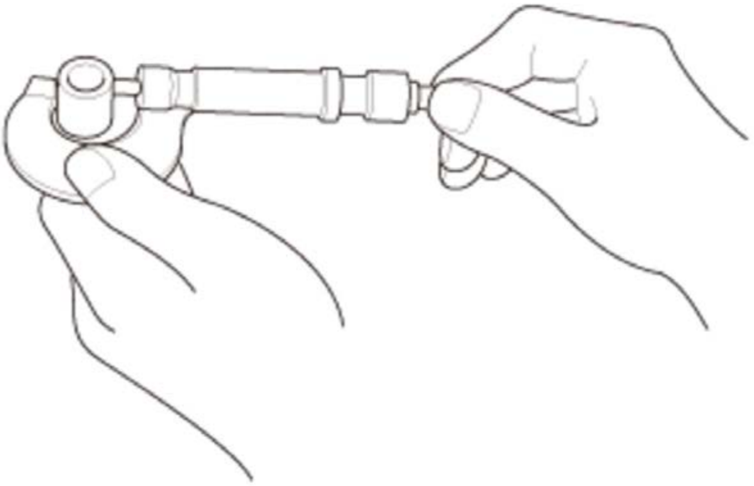
6. Piston Pin - Remove

	1. Apply new engine oil to the snap rings (A), and turn them in the ring grooves until the end gaps are lined up with the cutouts in the piston pin bores (B). **NOTE:** Take care not to damage the ring grooves.

	2. Remove the snap rings (A) from both sides of each piston. Start at the cutout in the piston pin bore. Remove the snap rings carefully so they do not go flying or get lost. Wear eye protection.

	3. Heat the piston and connecting rod assembly to about 158 deg.F (70 deg.C). 4. Remove the piston pin.

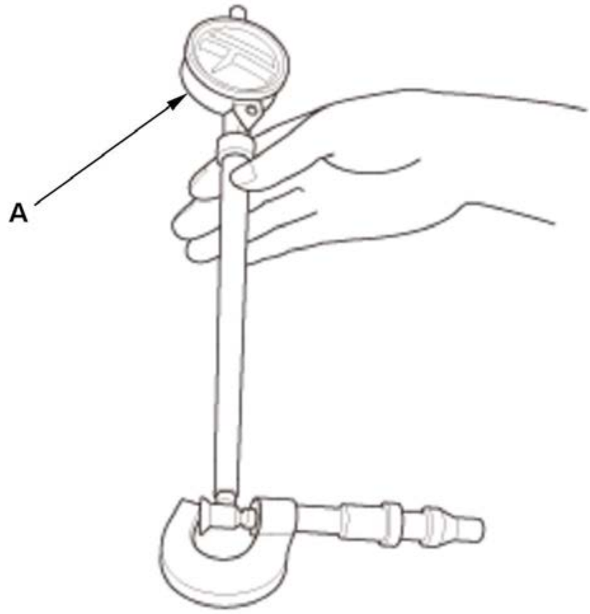
7. Piston Pin - Inspect



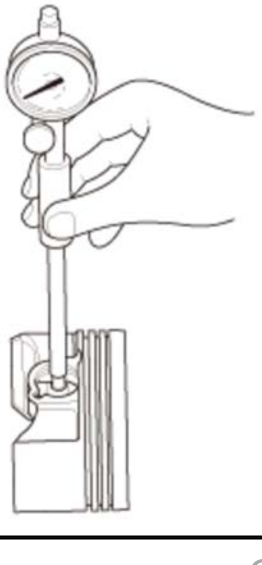
1. Measure the diameter of the piston pin.

Service Limit:	19.960 mm (0.78583 in)

Piston Pin Diameter	
Standard (New):	19.960-19.964 mm (0.78583-0.78598 in)



2. Zero the dial indicator (A) to the piston pin diameter.



3. Check the difference between the piston pin diameter and the piston pin hole diameter in the piston.

Piston Pin-to-Piston Clearance	
Standard (New):	**-0.004-0.003 mm (-0.00016-0.00012 in)**
Service Limit:	**0.006 mm (0.00024 in)**

	4. Measure the piston pin-to-connecting rod clearance.

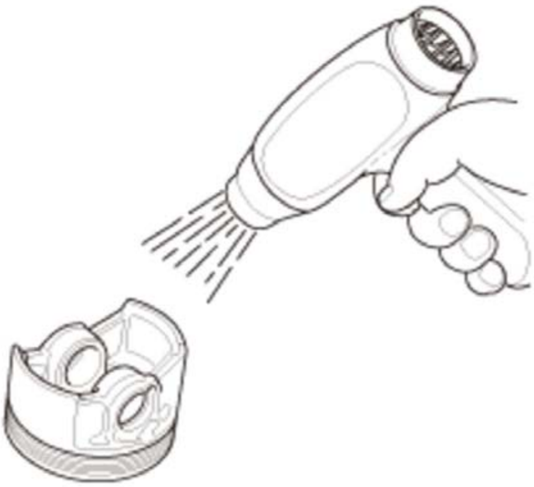
Service Limit:	**0.020 mm (0.00079 in)**

Piston Pin-to-Connecting Rod Clearance	
Standard (New):	**0.004-0.016 mm (0.00016-0.00063 in)**

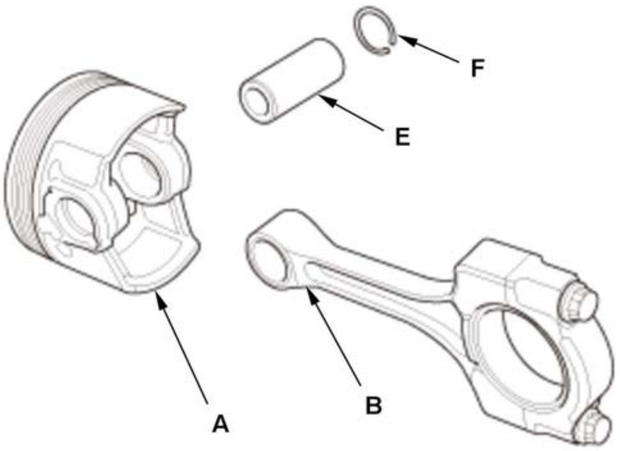
Installation

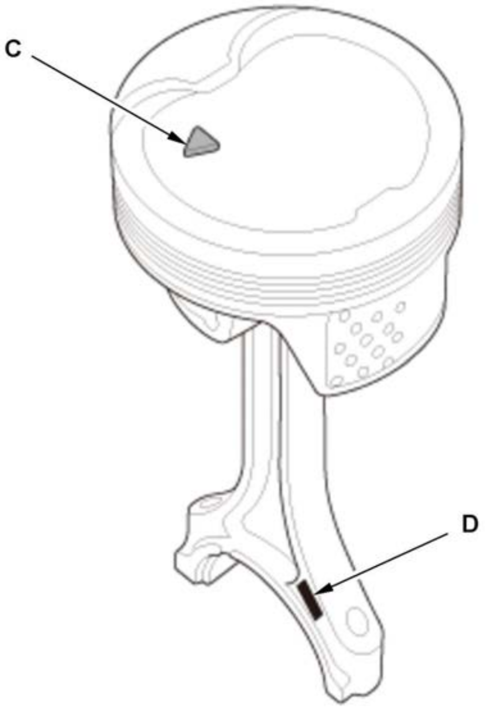
1. Piston Pin - Install

	1. Install a snap ring (A) only on one side. 2. Coat the piston pin bore in the piston, the bore in the connecting rod, and the piston pin with new engine oil.



3. Heat the piston to about 158 deg.F (70 deg.C).





4. Assemble the piston (A) and the connecting rod (B) with the arrow (C) and the embossed mark (D) on the same side. Install the piston pin (E).

5. Install the remaining snap ring (F).

6. Turn the snap rings in the ring grooves until the end gaps are positioned at the bottom of the piston.

2. Piston Ring - Install

   **Top Ring (Standard):** **A: 2.3 mm (0.091 in)** **B: 1.2 mm (0.047 in)** **Second Ring (Standard):** **A: 2.3 mm (0.091 in)** **B: 1.0 mm (0.039 in)**	1. Install the piston rings as shown. The top ring (A) has a 1RF mark, and the second ring (B) has a 2RF mark. The manufacturing marks (C) must be facing upward.

	2. After installing a new set of rings, measure the ring-to-groove clearances:

Service Limit:	**0.120 mm (0.004 in)**

Second Ring Clearance	
Standard (New):	**0.030-0.055 mm (0.002 in)**

Top Ring Clearance	
Standard (New):	**0.040-0.065 mm (0.002 in)**
Service Limit:	**0.130 mm (0.005 in)**

 OIL RING GAP About 90 ° SECOND RING GAP About 45 ° TOP RING GAP and SPACER RING GAP OIL RING GAP PISTON PIN	3. Rotate the rings in their grooves to make sure they do not bind. 4. Position the ring end gaps as shown.

3. Piston/Connecting Rod Assembly - Install

 	1. Remove the connecting rod caps. Check that the bearing is securely in place. 2. Apply new engine oil to the piston, the inside of the ring compressor, and the cylinder bore, then attach the ring compressor to the piston/connecting rod assembly. 3. Position the piston/connecting rod assembly with the arrow (A) facing the cam chain side of the engine block.

 	4. Position the piston/connecting rod assembly in the cylinder, and tap it in using the wooden handle of a hammer. Push down on the ring compressor (A) to prevent the rings from expanding before entering the cylinder bore. 5. Stop after the ring compressor pops free, and check the connecting rod-to-rod journal alignment before pushing the piston into place.

4. **Oil Jet - Install**
5. **Crankshaft - Install**

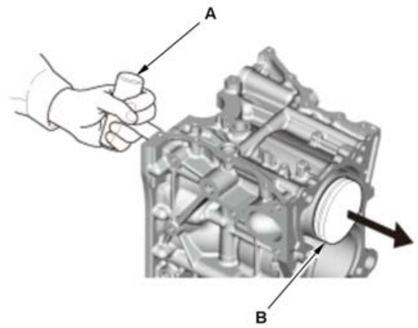
PISTON, RING, PIN, AND CONNECTING ROD REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal

1. **Crankshaft - Remove**
2. Metal or Hard Carbon - Remove

 	1. If you can feel a ridge of metal or hard carbon around the top of each cylinder, remove it with a ridge reamer (A). Follow the reamer manufacturer's instructions. If the ridge is not removed, it may damage the piston as it is pushed out.

3. Piston/Connecting Rod Assembly - Remove



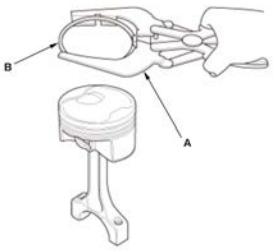
1. Use the wooden handle of a hammer (A) to drive out the piston/connecting rod assembly (B). Take care not to damage the oil jets or cylinder with the connecting rod.

2. Reinstall the connecting rod bearings and caps after removing each piston/connecting rod assembly.

NOTE:

- Mark each piston/connecting rod assembly with its cylinder number to make sure they are reinstalled in the original order.
- The existing number on the connecting rod does not indicate its position in the engine, it indicates the rod bore size.

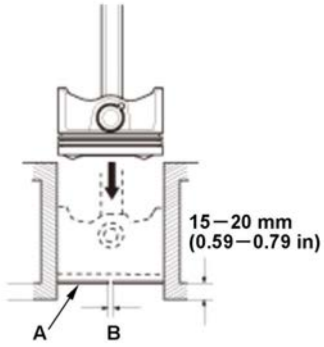
4. Piston Ring End Gap - Inspect



1. Using a ring expander (A), remove the old piston rings (B).

2. Clean all ring grooves thoroughly with a squared-off broken ring or a ring groove cleaner with a blade to fit the piston grooves. The top ring groove is 1.2 mm (0.047 in) wide. The second ring groove is 1.0 mm (0.039 in) wide. The oil ring groove is 2.0 mm (0.079 in) wide. File down a blade if necessary. Do not use a wire brush to clean the ring grooves, or cut the ring grooves deeper with the cleaning tools.

NOTE: If the piston is to be separated from the connecting rod, do not install the new rings yet.



3. Using a piston that has its rings removed, push a new ring (A) into the cylinder bore 15-20 mm (0.59-0.79 in) from the bottom.

4. Measure the piston ring end-gap (B) with a feeler gauge:

- If the gap is too small, check to see if you have the proper rings for your engine.
- If the gap is too large, recheck the cylinder bore diameter against the wear limits .

  If the bore is beyond the service limit, the engine block must be rebored.

Oil Ring:	
Standard (New):	**0.10-0.40 mm (0.004-0.015 in)**
Service Limit:	**0.60 mm (0.023 in)**

Second Ring:	
Standard (New):	**0.29-0.41 mm (0.012-0.016 in)**
Service Limit:	**0.45 mm (0.017 in)**

Piston Ring End-Gap
Top Ring:

Standard (New):	**0.20-0.28 mm (0.008-0.011 in)**
Service Limit:	**0.50 mm (0.019 in)**

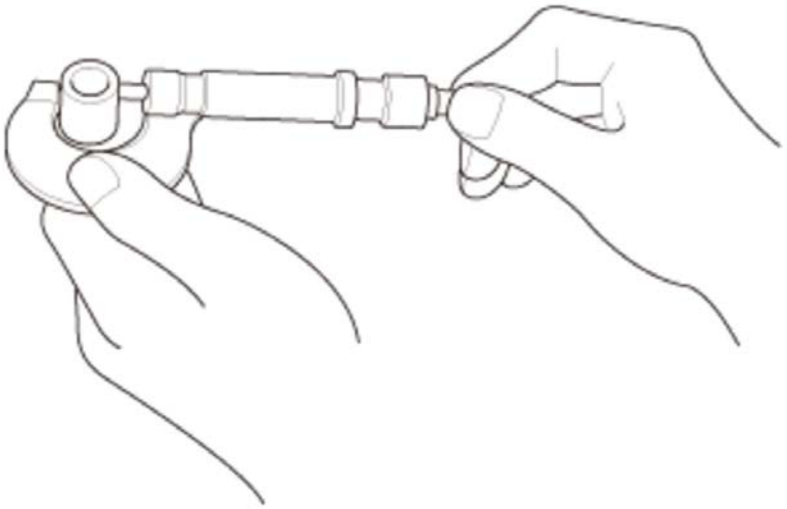
5. Piston Pin - Remove

	1. Apply new engine oil to the piston pin snap rings (A), and turn them in the ring grooves until the end gaps are lined up with the cutouts in the piston pin bores (B). **NOTE:** Take care not to damage the ring grooves.

	2. Remove the snap rings (A) from both sides of each piston. Start at the cutout in the piston pin bore. Remove the snap rings carefully so they do not go flying or get lost. Wear eye protection.

	3. Heat the piston and the connecting rod assembly to about 70 deg.C (158 deg.F), then remove the piston pin.

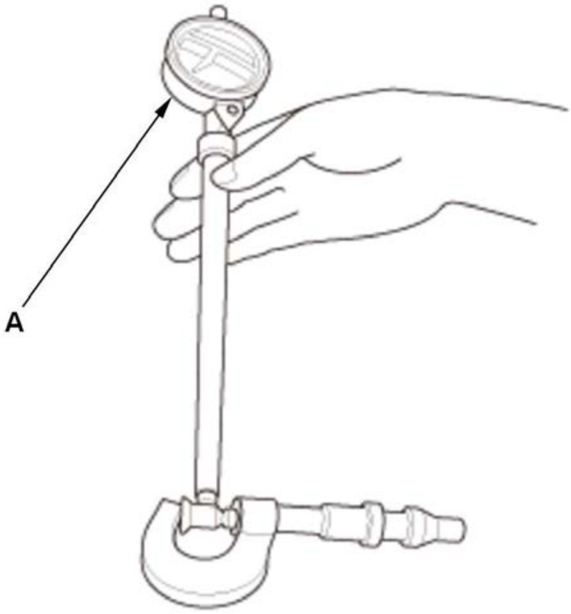
6. Piston Pin - Inspect



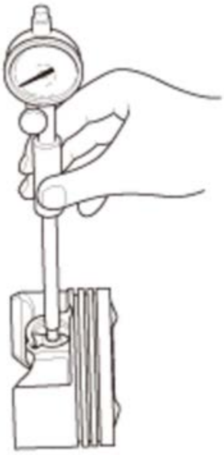
1. Measure the diameter of the piston pin.

Piston Pin Diameter

Standard (New):	**21.961-21.965 mm (0.86460-0.86476 in)**
Service Limit:	**21.953 mm (0.86429 in)**



2. Zero the dial indicator (A) to the piston pin diameter.



3. Check the difference between the piston pin diameter and the piston pin hole diameter in the piston.

Piston Pin-to-Piston Clearance	
Standard (New):	**-0.005-0.002 mm (-0.00020-0.00008 in)**
Service Limit:	**0.005 mm (0.00020 in)**

	4. Measure the piston pin-to-connecting rod clearance.

Service Limit:	**0.02 mm (0.0008 in)**

Piston Pin-to-Connecting Rod Clearance	
Standard (New):	**0.005-0.015 mm (0.00020-0.00059 in)**

Installation

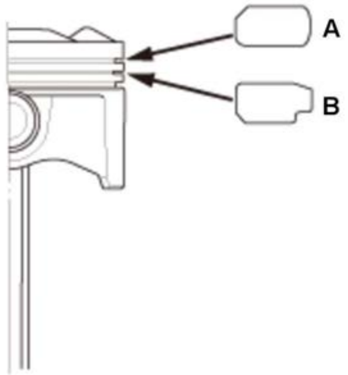
1. Piston Pin - Install

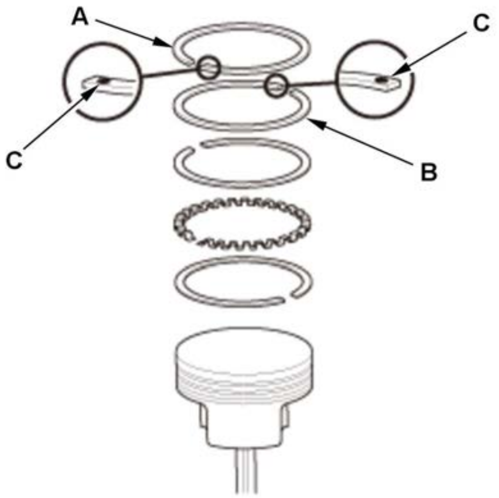
	1. Install a piston pin snap ring (A) only on one side. 2. Coat the piston pin bore in the piston, the bore in the connecting rod, and the piston pin with new engine oil.

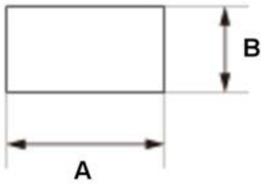
	3. Heat the piston to about 70 deg.C (158 deg.F).

	4. Assemble the piston (A) and the connecting rod (B) with the arrow (C) and the embossed mark (D) on the same side. Install the piston pin (E). 5. Install the remaining snap ring (F). 6. Turn the snap rings in the ring grooves until the end gaps are positioned at the bottom of the piston.

2. Piston Ring - Install



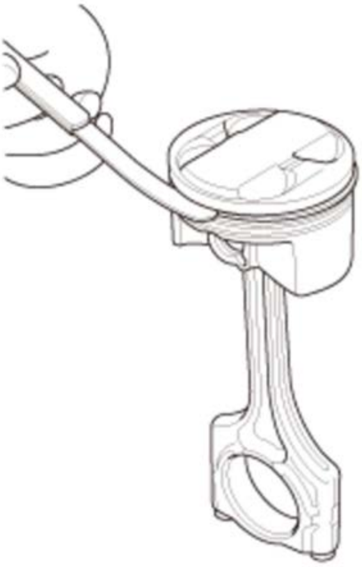




Top Ring (Standard):
A: 2.7 mm (0.106 in)
B: 1.2 mm (0.047 in)

Second Ring (Standard):
A: 2.5 mm (0.098 in)
B: 1.0 mm (0.039 in)

1. Install the top ring and the second ring as shown. The top ring (A) has a 1R mark, and the second ring (B) has a 2R mark. The manufacturing marks (C) must face upward.



2. After installing a new set of rings, measure the ring-to-groove clearances.

Top Ring Clearance

Second Ring Clearance

3. Rotate the rings in their grooves to make sure they do not bind.

Standard (New):	**0.035-0.060 mm (0.002 in)**

Service Limit:	**0.13 mm (0.005 in)**

Standard (New):	**0.060-0.085 mm (0.003 in)**

ROCKER ARM ASSEMBLY REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal and Installation

NOTE: How to read the torque specifications .

1. Air Cleaner - Remove
2. 12 Volt Battery - Remove

3. **Throttle Body Inlet Pipe - Remove**
4. **Camshaft - Remove**
5. Sealing Bolt - Remove

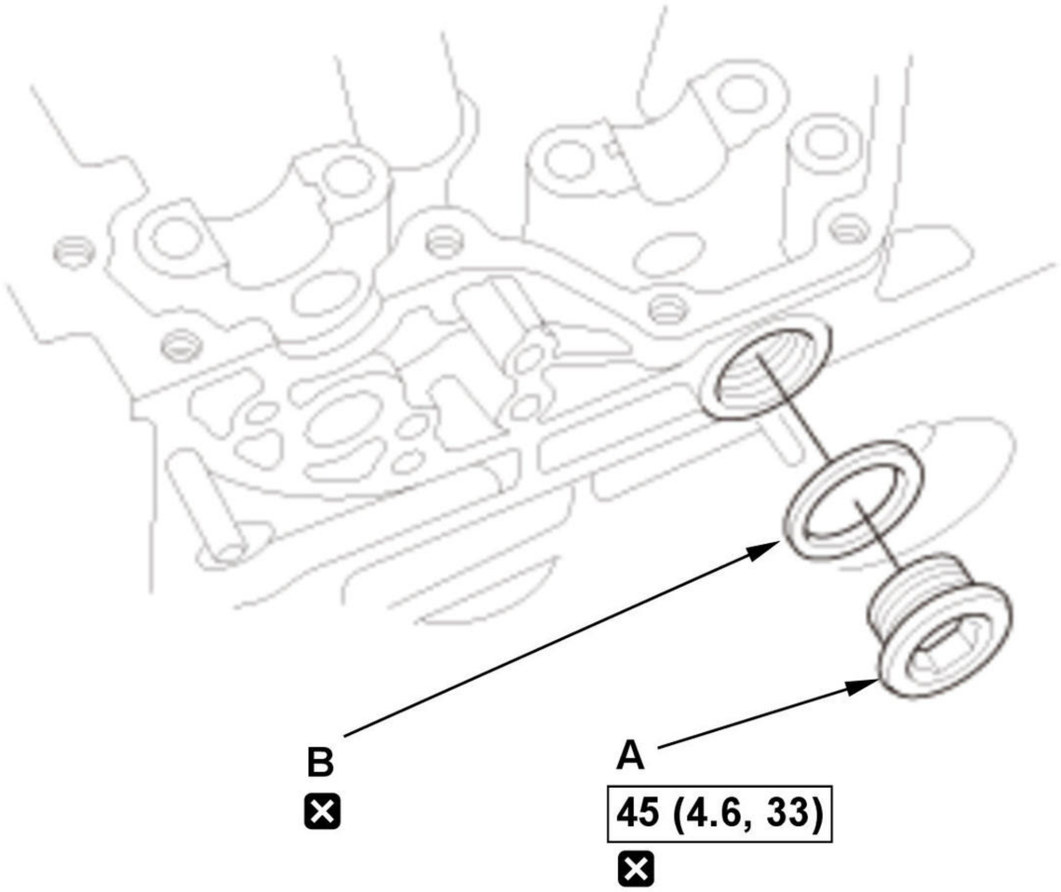

Fig. 50: Sealing Bolt Replacement Components With Torque Specifications (1.5 L Engine)
Courtesy of HONDA, U.S.A., INC.

1. Remove the sealing bolt (A) and the washer (B).

NOTE: When the new washer is installed, apply new engine oil to the new washer surfaces.

6. Rocker Arm Assembly - Remove

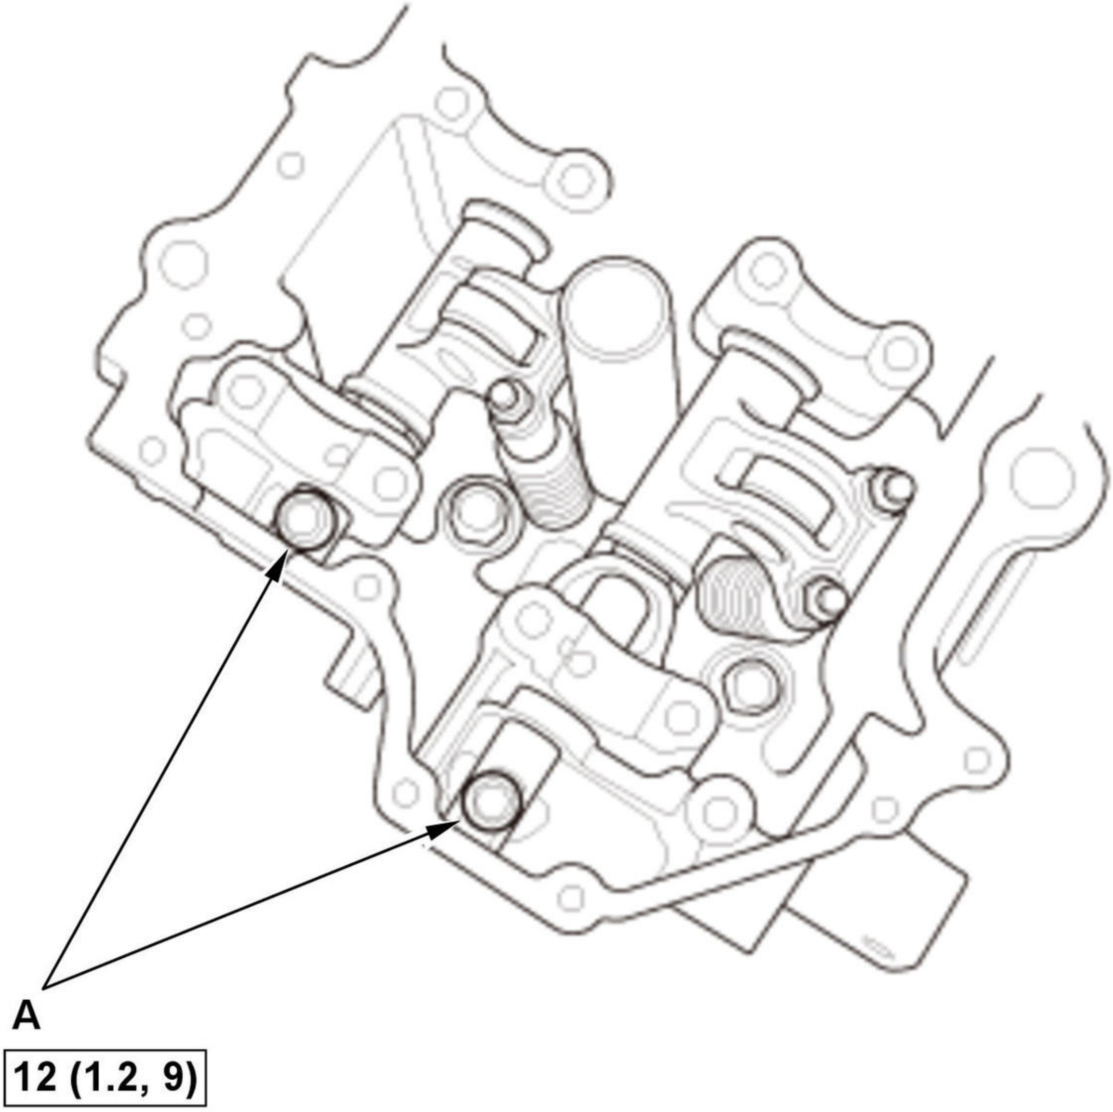

Fig. 51: Rocker Arm Assembly Replacement Components With Torque Specifications (1.5 L Engine)
Courtesy of HONDA, U.S.A., INC.

1. Remove the rocker shaft bolts (A).

	2. Remove the intake rocker shaft (A), the exhaust rocker shaft (B), the intake rocker arm assemblies (C), the exhaust rocker arm assemblies (D), and the thrust washers (E).

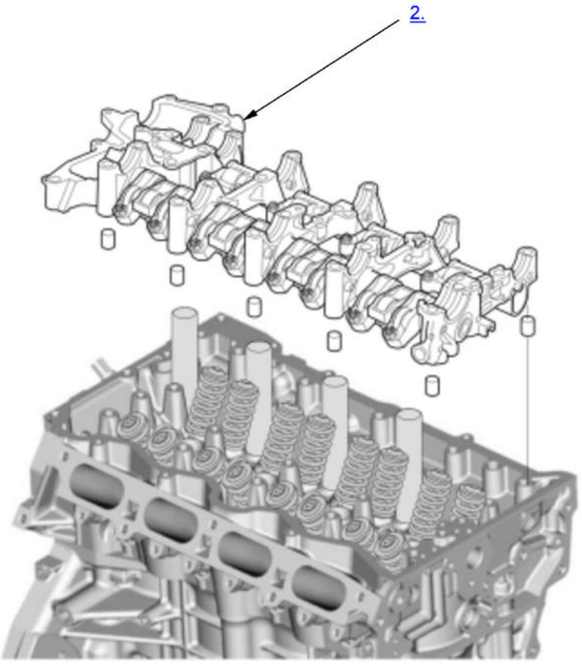
7. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

ROCKER ARM ASSEMBLY REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal

1

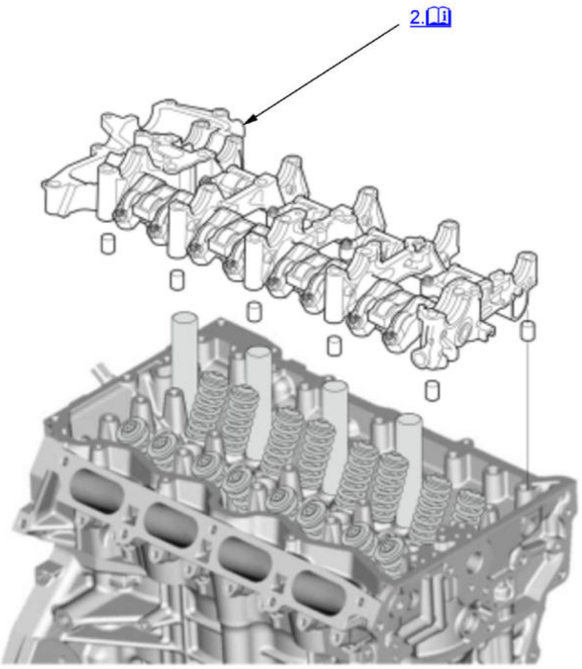


1. Intake Camshaft and Exhaust Camshaft - Remove
2. Rocker Arm Assembly - Remove

Installation

NOTE: Where icon is shown continue to the information below.

1



📖	Detailed information, notes, and precautions

1. Rocker Arm Assembly - Reassemble

   1. If the rocker arm assembly is disassembled, **reassemble the rocker arm assembly** .

2. Rocker Arm Assembly - Install

   1. **Apply liquid gasket** to the cylinder head mating surface of the No. 5 rocker shaft holder and to the inside edge of the threaded bolt holes.

   2. Install the lost motion assembly in the cylinder head.

   NOTE: Apply new engine oil to the lost motion assembly.

   3. Install the rocker arm assembly on the cylinder head.

3. **Intake Camshaft and Exhaust Camshaft - Install**

ROCKER ARM OIL CONTROL VALVE/ROCKER ARM OIL PRESSURE SWITCH REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

NOTE: Although a numbered sequence is shown, these "*1" indicated parts are separate components. If removal or replacement of one of the components is needed, it is not necessary to remove the other.
